Exchange Server 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-20*

Welcome to Microsoft Exchange Server 2013! We know you're eager to get started, but there are a few things you should be aware of before you start working with Exchange 2013 and using this content.

- If you want a quick overview of what's new in Exchange 2013, check out What's new in Exchange 2013.
- If you want to learn more about Exchange 2013, check out the Exchange Server 2013 TechCenter.
- If you need more help or want to share ideas, the Exchange Server forums are a great place to start.
- To get started with Exchange 2013, head for Planning and deployment. It lays out the recommended sequence for preparing for and then installing Exchange 2013 and includes the following important topics:
  - Exchange 2013 system requirements
  - Exchange 2013 prerequisites
  - Prepare Active Directory and domains
  - Install Exchange 2013 using the Setup wizard
  - Install Exchange 2013 using unattended mode
  - Exchange 2013 post-Installation tasks

Tip:

Have you heard about the Exchange Server Deployment Assistant? It's a free online tool that helps you quickly deploy Exchange 2013 in your organization by asking you a few questions and creating a customized deployment checklist just for you. If you want to learn more about it, go to Exchange Server Deployment Assistant.

Important:

Make sure you read Release notes for Exchange 2013 before you begin your deployment. The release notes contain important information about issues you might run into during and after your deployment.

- For information on how to download Exchange 2013, see Updates for Exchange 2013.

Exchange 2013 Help

The Help content for Exchange 2013 consists of the following top-level categories:

- What's new in Exchange 2013
- Planning and deployment
- Permissions
- Messaging policy and compliance
- Anti-spam and anti-malware protection
- Mail flow
- Recipients
- Collaboration
- Email addresses and address books
- Sharing
- Clients and mobile
- Unified Messaging
- Mailbox and Client Access servers
- Edge Transport servers
- High availability and site resilience
- Exchange Management Shell
- Exchange admin center in Exchange 2013
- Server health and performance
- About Exchange documentation

Note:
Check out our other Exchange content: **Exchange Online** **Exchange Server 2013 Hybrid Deployments** **Exchange Online Protection**

Download the Exchange 2013 Help file

Looking for an offline version of Exchange 2013 Help content? Download the Help file from the Microsoft Download Center. (The online Help content may be more up-to-date than the offline Help file.)

Tell us what you think

If you have comments or questions about our topics or about the overall Help experience, we'd love to hear from you. Just send your feedback to Exchange 2013 Help Feedback. Your comments will help us provide the most accurate and concise content.

What's new in Exchange 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-19*

Microsoft Exchange Server 2013 brings a new rich set of technologies, features, and services to the Exchange Server product line. Its goal is to support people and organizations as their work habits evolve from a communication focus to a collaboration focus. At the same time, Exchange Server 2013 helps lower the total cost of ownership whether you deploy Exchange 2013 on-premises or provision your mailboxes in the cloud. New features and functionality in Exchange 2013 are designed to do the following:

- **Support a multigenerational workforce** Social integration and making it easier to find people is important to users. *Smart Search* learns from users' communication and collaboration behavior to enhance and prioritize search results in Exchange. Also, with Exchange 2013, users can merge contacts from multiple sources to provide a single view of a person, by linking contact information pulled from multiple locations.
- **Provide an engaging experience** Microsoft Outlook 2013 and Microsoft Outlook Web App have a fresh new look. Outlook Web App emphasizes a streamlined user interface that also supports the use of touch, enhancing the mobile device experience with Exchange.
- **Integrate with SharePoint and Lync** Exchange 2013 offers greater integration with Microsoft SharePoint 2013 and Microsoft Lync 2013 through site mailboxes and In-Place eDiscovery. Together, these products offer a suite of features that make scenarios such as enterprise eDiscovery and collaboration using site mailboxes possible.
- **Help meet evolving compliance needs** Compliance and eDiscovery are challenging for many organizations. Exchange 2013 helps you to find and search data not only in Exchange, but across your organization. With improved search and indexing, you can search across Exchange 2013, Lync 2013, SharePoint 2013, and Windows file servers. In addition, data loss prevention (DLP) can help keep your organization safe from users mistakenly sending sensitive information to unauthorized people. DLP helps you identify, monitor, and protect sensitive data through deep content analysis.
- **Provide a resilient solution** Exchange 2013 builds upon the Exchange Server 2010 architecture and has been redesigned for simplicity of scale, hardware utilization, and failure isolation.

For information about the changes made to Exchange Server 2013 since release to manufacturing (RTM), see Updates for Exchange 2013.

See the following sections for more information about what's new in Exchange 2013:

Exchange admin center

Exchange 2013 architecture

Setup

Messaging policy and compliance

Anti-malware protection

Mail flow

Recipients

Sharing and collaboration

Integration with SharePoint and Lync

Clients and mobile

Unified Messaging

Batch mailbox moves

High availability and site resilience

Exchange workload management

Note:

For information about features in earlier versions of Exchange that have been removed, discontinued, or replaced in Exchange Server 2013, see What's discontinued in Exchange 2013. Also, you may be interested in Release notes for Exchange 2013.

Exchange admin center

Exchange 2013 provides a single unified management console that allows for ease of use and is optimized for management of on-premises, online, or hybrid deployments. The *Exchange admin center* (EAC) in Exchange 2013 replaces the Exchange 2010 Exchange Management Console (EMC) and the Exchange Control Panel (ECP). (However, "ECP" is still the name of the virtual directory used by the EAC.) Some EAC features include:

- **List view** The list view in EAC has been designed to remove key limitations that existed in ECP. ECP was limited to displaying up to 500 objects and, if you wanted to view objects that weren't listed in the details pane, you needed to use searching and filtering to find those specific objects. In Exchange 2013, the viewable limit from within the EAC list view is approximately 20,000 objects. After the EAC returns the results, the EAC client performs the searching and sorting, which greatly increases the performance compared to the ECP in Exchange 2010. In addition, paging has been added so that you can page to the results. You can also configure page size and export to a .csv file.
- **Add/Remove columns to the Recipient list view** You can choose which columns to view, and with local cookies, you can save your custom list views per machine that you use to access the EAC.
- **Secure the ECP virtual directory** You can partition access from the Internet and intranets from within the ECP IIS virtual directory to allow or disallow management features. With this feature, you can permit or deny access to users trying to access the EAC from the Internet outside of your organizational environment, while still allowing access to an end-user's Outlook Web App Options.
- **Public Folder management** In Exchange 2010 and Exchange 2007, public folders were managed through the Public Folder administration console. Public folders are now in the EAC, and you don't need a separate tool to manage them.

- **Notifications** In Exchange 2013, the EAC now has a Notification viewer so that you can view the status of long-running processes and, if you choose, receive notification via an email message when the process completes.
- **Role Based Access Control (RBAC) User Editor** In Exchange 2010, you could use the RBAC User Editor in the Exchange Toolbox to add users to management role groups. In Exchange 2013, the RBAC User Editor functionality is now in the EAC and you don't need a separate tool to manage RBAC.
- **Unified Messaging Tools** In Exchange 2010, you could use the Call Statistics and User Call Logs tools to help provide UM statistics and information about specific calls for a UM-enabled user. In Exchange 2013, the Call Statistics and User Call Logs tools are now in the EAC and you don't need a separate tool to manage them.
- **Groups enhancements** The Exchange Admin Center (EAC) can now display up to 10,000 recipients in the **Groups Select Members** window. By default, up to 500 recipients are returned when you open the **Select Members** window, however, you can choose to list up to 10,000 recipients by clicking **Get All Results** beneath the recipient list. We now support browsing more than 500 recipients by using the scroll bar and we've also added enhanced search features to enable you to filter recipients that are displayed in the recipient list. You can filter by:
  - city
  - company
  - country/region
  - department
  - office
  - title

For more information, see Exchange admin center in Exchange 2013.

Exchange 2013 architecture

Previous versions of Exchange were optimized and architected with certain technological constraints that existed at that time. For example, during development for Exchange 2007, one of the key constraints was CPU performance. To alleviate that constraint, Exchange 2007 was split into different server roles that allowed scale out through server separation. However, server roles in Exchange 2007 and Exchange 2010 were tightly coupled. The tight coupling of the roles had several downsides including version dependency, geo-affinity (requiring all roles in a specific site), session affinity (requiring expensive layer 7 hardware load balancing), and namespace complexity.

Today, CPU horsepower is significantly less expensive and is no longer a constraining factor. With that constraint lifted, the primary design goal for Exchange 2013 is for simplicity of scale, hardware utilization, and failure isolation. With Exchange 2013, we reduced the number of server roles to two: the Client Access server role and the Mailbox server role.

Currently, there isn't an Exchange 2013 version of the Edge Transport server. If you need an Edge Transport server, you can install an Exchange 2007 or Exchange 2010 Edge Transport server in your perimeter network. For more information, see Use an Exchange 2010 or 2007 Edge Transport server

in Exchange 2013.

The Mailbox server includes all the traditional server components found in Exchange 2010: the Client Access protocols, Transport service, Mailbox databases, and Unified Messaging. The Mailbox server handles all activity for the active mailboxes on that server. The Client Access server provides authentication, limited redirection, and proxy services. The Client Access server itself doesn't do any data rendering. The Client Access server is a thin and stateless server. There is never anything queued or stored on the Client Access server. The Client Access server offers all the usual client access protocols: HTTP, POP and IMAP, and SMTP.

With this new architecture, the Client Access server and the Mailbox server have become “loosely coupled”. All processing and activity for a specific mailbox occurs on the Mailbox server that houses the active database copy where the mailbox resides. All data rendering and data transformation is performed local to the active database copy, eliminating concerns of version compatibility between the Client Access server and the Mailbox server.

The Exchange 2013 architecture provides the following benefits:

- **Version upgrade flexibility** No more rigid upgrade requirements. A Client Access server can be upgraded independently and in any order in relation to the Mailbox server.
- **Session indifference** With Exchange 2010, session affinity to the Client Access server role was required for several protocols. In Exchange 2013, the client access and mailbox components reside on the same Mailbox server. Because the Client Access server simply proxies all connections for a user to a specific Mailbox server, no session affinity is required at the Client Access servers. This allows inbound connections to Client Access servers to be balanced using techniques provided by load-balancing technology like least connection or round-robin.
- **Deployment simplicity** With an Exchange 2010 site-resilient design, you needed up to eight different namespaces: two Internet Protocol namespaces, two for Outlook Web App fallback, one for Autodiscover, two for RPC Client Access, and one for SMTP. A legacy namespace was also required if you were upgrading from Exchange 2003 or Exchange 2007. With Exchange 2013, the minimum number of namespaces drops to two. If you’re coexisting with Exchange 2007, you still need to create a legacy hostname, but if you’re coexisting with Exchange 2010 or you’re installing a new Exchange 2013 organization, the minimum number of namespaces you need is two: one for client protocols and one for Autodiscover. You may also need an SMTP namespace.

As a result of these architectural changes, there have been some changes to client connectivity. First, RPC is no longer a supported direct access protocol. This means that all Outlook connectivity must take place using RPC over HTTP (also known as Outlook Anywhere). At first glance, this may seem like a limitation, but it actually has some added benefits. The most obvious benefit is that there is no need to have the RPC client access service on the Client Access server. This results in the reduction of two namespaces that would normally be required for a site-resilient solution. In addition, there is no longer any requirement to provide affinity for the RPC client access service.

Second, Outlook clients no longer connect to a server FQDN as they have done in all previous versions of Exchange. Outlook uses Autodiscover to create a new connection point comprised of mailbox GUID, @ symbol, and the domain portion of the user’s primary SMTP address. This simple

change results in a near elimination of the unwelcome message of “Your administrator has made a change to your mailbox. Please restart.” Only Outlook 2007 and higher versions are supported with Exchange 2013.

The high availability model of the mailbox component has not changed significantly since Exchange 2010. The unit of high availability is still the database availability group (DAG). The DAG still uses Windows Server failover clustering. Continuous replication still supports both file mode and block mode replication. However, there have been some improvements. Failover times have been reduced as a result of transaction log code improvements and deeper checkpoint on the passive databases. The Exchange Store service has been re-written in managed code (see the "Managed Store" section later in this topic). Now, each database runs under its own process, allowing for isolation of store issues to a single database.

Managed Store

In Exchange 2013, the *Managed Store* is the name of the newly rewritten Information Store processes, Microsoft.Exchange.Store.Service.exe and Microsoft.Exchange.Store.Worker.exe. The new Managed Store is written in C# and tightly integrated with the Microsoft Exchange Replication service (MSExchangeRepl.exe) to provide higher availability through improved resiliency. In addition, the Managed Store has been architected to enable more granular management of resource consumption and faster root cause analysis through improved diagnostics.

The Managed Store works with the Microsoft Exchange Replication service to manage mailbox databases, which continues to use Extensible Storage Engine (ESE) as the database engine. Exchange 2013 includes significant changes to the mailbox database schema that provide many optimizations over previous versions of Exchange. In addition to these changes, the Microsoft Exchange Replication service is responsible for all service availability related to Mailbox servers. The architectural changes enable faster database failover and better physical disk failure handling.

The Managed Store is also integrated with the Search Foundation search engine (the same search engine used by SharePoint 2013) to provide more robust indexing and searching when compared to Microsoft Search in previous versions of Exchange.

For more information, see High availability and site resilience.

Certificate management

Managing digital certificates is one of the most important security-related tasks for your Exchange organization. Ensuring that certificates are appropriately configured is key to delivering a secure messaging infrastructure for the enterprise. In Exchange 2010, the Exchange Management Console was the primary method of managing certificates. In Exchange 2013, certificate management functionality is provided in the Exchange admin center, the new Exchange 2013 administrator user interface.

The work in Exchange 2013 related to certificates focused around minimizing the number of

certificates that an Administrator must manage, minimizing the interaction the Administrator must have with certificates, and allowing management of certificates from a central location. Benefits resulting from the changes in certificate management are:

- Certificate management can be performed on the Client Access server or the Mailbox server. The Mailbox server has a self-signed certificate installed by default. The Client Access server automatically trusts the self-signed certificate on the Exchange 2013 Mailbox server, so clients will not receive warnings about a self-signed certificate not being trusted provided that the Exchange 2013 Client Access server has a non-self-signed certificate from either a Windows certificate authority (CA) or a trusted third party.
- In previous versions of Exchange, it was difficult to see when a digital certificate was nearing expiration. In Exchange 2013, the Notifications center will display warnings when a certificate stored on any Exchange 2013 server is about to expire. Administrators can also choose to receive these notifications via email.

For more information, see Digital certificates and SSL.

Setup

Setup has been completely rewritten so that installing Exchange 2013 and making sure you've got the latest product rollups and security fixes is easier than ever. Here are some of the improvements we've made:

- **Always up-to-date Setup** When you run the Setup wizard, you'll be given the option to download and use the latest product rollups, security fixes, and language packs. This option doesn't just update the files that'll be used to run Exchange; Setup itself can be updated. This design enables us to continue to improve Setup post-release and include and update readiness checks as requirements are updated or changed.

If you're using unattended Setup mode, we can't automatically download updates. However, you can still take advantage of running the latest version of Setup by downloading the latest updates beforehand, and use the `/UpdatesDir: <path>` parameter to allow Setup to update itself before the installation process begins.

- **Improved readiness checks** Readiness checks make sure that your computer and your organization are ready for Exchange 2013. After you've provided the necessary information about your installation to Setup, the readiness checks are run before installation begins. The new readiness check engine now runs through all checks before reporting back to you on what actions need to be performed before Setup can continue, and it does so faster than ever. As with previous versions of Exchange, you can tell Setup to install the Windows features required by Setup so you don't have to install them manually.
- **Simplified and modern wizard** We've removed all the steps in the Setup wizard that aren't absolutely required for you to install Exchange. What's left is an easy-to-follow wizard that takes you through the installation process one step at a time.

For more information, see Planning and deployment.

Messaging policy and compliance

There are two new message policy and compliance features in Exchange 2013: Data loss prevention and the Microsoft Rights Management connector.

Data loss prevention (DLP) capabilities help you protect your sensitive data and inform users of internal compliance policies. DLP can also help keep your organization safe from users who might mistakenly send sensitive information to unauthorized people. DLP helps you identify, monitor, and protect sensitive data through deep content analysis. Exchange 2013 offers built-in DLP policies based on regulatory standards such as personally identifiable information (PII) and payment card industry data security standards (PCI), and is extensible to support other policies important to your business. Additionally, the new PolicyTips in Outlook 2013 inform users about policy violations before sensitive data is sent.

The Microsoft Rights Management connector (RMS connector) is an optional application that helps you enhance data protection for your Exchange 2013 server by connecting to cloud-based Microsoft Rights Management services. Once you install the RMS connector, it provides continuous data protection throughout the lifespan of the information and because these services are customizable, you can define the level of protection you need. For example, you can limit email message access to specific users or set view-only rights for certain messages.

To learn more about these features see:

Data loss prevention

Rights Management connector

In-place Archiving, retention, and eDiscovery

Exchange 2013 includes the following improvements to In-Place Archiving, retention, and eDiscovery to help your organization meet its compliance needs:

- **In-Place Hold** In-Place Hold is a new unified hold model that allows you to meet legal hold requirements in the following scenarios:
  - Preserve the results of the query (query-based hold), which allows for scoped immutability across mailboxes.
  - Place a time-based hold to meet retention requirements (for example, retain all items in a mailbox for seven years, a scenario that required the use of Single Item Recovery/Deleted Item Retention in Exchange 2010).
  - Place a mailbox on indefinite hold (similar to litigation hold in Exchange 2010).
  - Place a user on multiple holds to meet different case requirements.
- **In-Place eDiscovery** In-Place eDiscovery allows authorized users to search mailbox data across all mailboxes and In-Place Archives in an Exchange 2013 organization and copy messages to a discovery mailbox for review. In Exchange 2013, In-Place eDiscovery has been enhanced to allow discovery managers to perform more efficient searches and hold. These enhancements include:
  - **Federated search** allows you to search and preserve data across multiple data repositories.

With Exchange 2013, you can perform in-place eDiscovery searches across Exchange, SharePoint 2013, and Lync 2013. You can use the eDiscovery Center in SharePoint 2013 to perform In-Place eDiscovery search and hold.

- **Query-based In-Place Hold** allows you to save the results of the query, which allows for scoped immutability across mailboxes.
- **Export search results** Discovery Managers can export mailbox content to a .pst file from the SharePoint 2013 eDiscovery Console. Mailbox export request cmdlets are no longer required to export a mailbox to a .pst file.
- **Keyword statistics** Search statistics are offered on a per search term basis. This enables a Discovery Manager to quickly make intelligent decisions about how to further refine the search query to provide better results. eDiscovery search results are sorted by relevance.
- **KQL syntax** Discovery Managers can use Keyword Query Language (KQL) syntax in search queries. KQL is similar to the Advanced Query Syntax (AQS), which was used for discovery searches in Exchange 2010.
- **In-Place eDiscovery and Hold wizard** Discovery Managers can use the new In-Place eDiscovery and Hold wizard to perform eDiscovery and hold operations.

Note:

If SharePoint 2013 isn't available, a subset of the eDiscovery functionality is available in the Exchange admin center.

- **Search across primary and archive mailboxes in Outlook Web App** Users can search across their primary and archive mailboxes in Outlook Web App. Two separate searches are no longer necessary.
- **Archive Lync content** Exchange 2013 supports archiving of Lync 2013 content in a user's mailbox. You can place Lync content on hold using In-Place Hold and use In-Place eDiscovery to search Lync content archived in Exchange.
- **Retention policies** Retention policies help your organization reduce risks associated with email and other communications and also meet email retention requirements. Retention policies include the following enhancements:
  - **Support for Calendar and Tasks retention tags** You can create retention policy tags for the Calendar and Tasks default folders to expire items in these folders. Items in these folders are also moved to the user's archive based on the archive policy settings applied to the mailbox.
  - **Improved ability to retain items for a specified period** You can use retention policy and a time-based In-Place Hold to enforce retention of items for a set period.

For more information, see Messaging policy and compliance.

Transport rules

Transport rules in Exchange Server 2013 are a continuation of the features that are available in Exchange Server 2010. However, several improvements have been made to transport rules in Exchange 2013. The most important change is the support for data loss prevention (DLP). There are also new predicates and actions, enhanced monitoring, and a few architectural changes.

For detailed information, see What's new for transport rules.

Information Rights Management

Information Rights Management (IRM) is compatible with Cryptographic Mode 2, an Active Directory Rights Management Services (AD RMS) cryptography mode that supports stronger encryption by allowing you to use 2048-bit keys for RSA and 256-bit keys for SHA-1. Additionally, Mode 2 enables you to use the SHA-2 hashing algorithm. For more information about cryptographic modes in AD RMS, see AD RMS Cryptographic Modes.

Auditing

Exchange 2013 includes the following improvements to auditing:

- **Auditing reports** The EAC includes auditing functionality so that you can run reports or export entries from the mailbox audit log and the administrator audit log. The mailbox audit log records whenever a mailbox is accessed by someone other than the person who owns the mailbox. This can help you determine who has accessed a mailbox and what they have done. The administrator audit log records any action, based on an Exchange Management Shell cmdlet, performed by an administrator. This can help you troubleshoot configuration issues or identify the cause of problems related to security or compliance. For more information, see Exchange auditing reports.
- **Viewing the administrator audit log** Instead of exporting the administrator audit log, which can take up to 24 hours to receive in an email message, you can view administrator audit log entries in the EAC. To do this, go to **Compliance Management** > **Auditing** and click **View the administrator audit log**. Up to 1000 entries will be displayed on multiple pages. To narrow the search, you can specify a date range. For more information, see View the administrator audit log.

Anti-malware protection

The built-in malware filtering capabilities of Exchange 2013 helps protect your network from malicious software transferred through email messages. All messages sent or received by your Exchange server are scanned for malware (viruses and spyware). If malware is detected, the message is deleted. Notifications may also be sent to senders or administrators when an infected message is deleted and not delivered. You can also choose to replace infected attachments with either default or custom messages that notify the recipients of the malware detection.

For more information about anti-malware protection, see Anti-malware protection.

Mail flow

How messages flow through an organization and what happens to them has changed significantly in Exchange 2013. Following is a brief overview of the changes:

- **Transport pipeline** The transport pipeline in Exchange 2013 is now made up of several different

services: the Front End Transport service on Client Access servers, the Transport service on Mailbox servers, and the Mailbox Transport service on Mailbox servers. For more information, see Mail flow.

- **Routing** Mail routing in Exchange 2013 recognizes DAG boundaries as well as Active Directory site boundaries. Also, mail routing has been improved to queue messages more directly for internal recipients. For more information, see Mail routing.
- **Connectors** The default maximum message size for a Send connector or a Receive connector, as specified by the *MaxMessageSize* parameter, has been increased from 10MB to 25MB. For more information about how to set parameters on a connector, see Set-SendConnector and Set-ReceiveConnector.

You can set a Send connector in the Transport service of a Mailbox server to route outbound mail through a Front End transport server in the local Active Directory site, by means of the *FrontEndProxyEnabled* parameter of the **Set-SendConnector** cmdlet, thus consolidating how email is routed from the Transport service.

- **Edge Transport** Currently, there isn't an Exchange 2013 version of the Edge Transport server. If you need an Edge Transport server, you can install an Exchange 2007 or Exchange 2010 Edge Transport server in your perimeter network. For more information, see Use an Exchange 2010 or 2007 Edge Transport server in Exchange 2013.

Recipients

This section describes the enhancements for managing recipients in Exchange 2013:

- **Group naming policy** Administrators can now use the EAC to create a *group naming policy*, which lets you standardize and manage the names of distribution groups created by users in your organization. You can require a specific prefix and suffix be added to the name for a distribution group when it's created, and you can block specific words from being used. This capability helps you minimize the use of inappropriate words in group names.

For more information, see Create a distribution group naming policy.

- **Message tracking** Administrators can also use the EAC to track delivery information for email messages sent to or received by any user in your organization. You just select a mailbox, and then search for messages sent to or received by a different user. You can narrow the search by searching for specific words in the subject line. The resulting delivery report tracks a message through the delivery process and specifies if the message was successfully delivered, pending delivery, or if it wasn't delivered.

For more information, see Track messages with delivery reports.

Sharing and collaboration

This section describes the sharing and collaboration enhancements in Exchange 2013.

- **Public folders** Public folders now take advantage of the existing high availability and storage technologies of the mailbox store. The public folder architecture uses specially designed mailboxes to store both the hierarchy and the public folder content. This new design also means

that there is no longer a public folder database. Public folder replication now uses the continuous replication model. High availability for the hierarchy and content mailboxes is provided by the database availability group (DAG). With this design, we're moving away from a multi-master replication model to a single-master replication model.

For more information, see Public folders.

- **Site mailboxes** Email and documents are traditionally kept in two unique and separate data repositories. Most teams would typically collaborate using both mediums. The challenge is that email and documents are accessed using different clients, which usually results in a reduction in user productivity and a degraded user experience.

The *site mailbox* is a new concept in Exchange 2013 that attempts to solve these problems. Site mailboxes improve collaboration and user productivity by allowing access to both documents in a SharePoint site and email messages in Outlook 2013, using the same client interface. A site mailbox is functionally comprised of SharePoint site membership (owners and members), shared storage through an Exchange mailbox for email messages and a SharePoint site for documents, and a management interface that addresses provisioning and lifecycle needs.

For more information, see Site mailboxes.

- **Shared mailboxes** In previous versions of Exchange, creating a shared mailbox was a multi-step process in which you had to use the Exchange Management Shell to set the delegate permissions. In Exchange 2013, you can now create a shared mailbox in one step via the Exchange admin center. In the EAC, go to **Recipients** > **Shared Mailboxes** to create a shared mailbox. Shared mailbox is now a recipient type, so you can easily search for your shared mailboxes in either the user interface or by using the Shell.

For more information, see Shared mailboxes.

Integration with SharePoint and Lync

Exchange 2013 offers greater integration with SharePoint 2013 and Lync 2013. Benefits of this enhanced integration include:

- Exchange 2013 integrates with SharePoint 2013 to allow users to collaborate more effectively by using site mailboxes.
- Lync Server 2013 can archive content in Exchange 2013 and use Exchange 2013 as a contact store.
- Discovery Managers can perform In-Place eDiscovery and Hold searches across SharePoint 2013, Exchange 2013, and Lync 2013 data.
- Oauth authentication allows partner applications to authenticate as a service or impersonate users where required.

For more information, see Integration with SharePoint and Lync.

Clients and mobile

The Outlook Web App user interface is new and optimized for tablets and smartphones as well as desktop and laptop computers. New features include apps for Outlook, which allow users and

administrators to extend the capabilities of Outlook Web App; Contact linking, the ability for users to add contacts from their LinkedIn accounts; and updates to the look and features of the calendar.

For more information, see What's new for Outlook Web App in Exchange 2013.

Unified Messaging

Unified Messaging in Exchange 2013 contains essentially the same voice mail features included in Exchange 2010. However, some new and enhanced features and functionality have been added to those existing features. More importantly, architectural changes in Exchange 2013 Unified Messaging resulted in components, services, and functionality that were included with the Unified Messaging server role in Exchange 2010 to be divided between the Exchange 2013 Client Access and Mailbox server roles.

For more details, see What's new for Unified Messaging in Exchange 2013.

Batch mailbox moves

Exchange 2013 introduces the concept of batch moves. The new move architecture is built on top of MRS (Mailbox Replication service) moves with enhanced management capability. The new batch move architecture features the following enhancements:

- Ability to move multiple mailboxes in large batches.
- Email notification during move with reporting.
- Automatic retry and automatic prioritization of moves.
- Primary and personal archive mailboxes can be moved together or separately.
- Option for manual move request finalization, which allows you to review a move before you complete it.
- Periodic incremental syncs to migrate the changes.

For more information, see Manage on-premises moves.

High availability and site resilience

Exchange 2013 uses DAGs and mailbox database copies, along with other features such as single item recovery, retention policies, and lagged database copies, to provide high availability, site resilience, and Exchange native data protection. The high availability platform, the Exchange Information Store and the Extensible Storage Engine (ESE), have all been enhanced to provide greater availability, easier management, and to reduce costs. These enhancements include:

- **Managed availability** With managed availability, internal monitoring and recovery-oriented features are tightly integrated to help prevent failures, proactively restore services, and initiate server failovers automatically or alert administrators to take action. The focus is on monitoring and managing the end user experience rather than just server and component uptime to help keep the service continuously available.

- **Managed Store** The Managed Store is the name of the newly rewritten Information Store processes in Exchange 2013. The new Managed Store is written in C# and tightly integrated with the Microsoft Exchange Replication service (MSExchangeRepl.exe) to provide higher availability through improved resiliency.
- **Support for multiple databases per disk** Exchange 2013 includes enhancements that enable you to support multiple databases (mixtures of active and passive copies) on the same disk, thereby leveraging larger disks in terms of capacity and IOPS as efficiently as possible.
- **Automatic reseed** Enables you to quickly restore database redundancy after disk failure. If a disk fails, the database copy stored on that disk is copied from the active database copy to a spare disk on the same server. If multiple database copies were stored on the failed disk, they can all be automatically re-seeded on a spare disk. This enables faster reseeds, as the active databases are likely to be on multiple servers and the data is copied in parallel.
- **Automatic recovery from storage failures** This feature continues the innovation introduced in Exchange 2010 to allow the system to recover from failures that affect resiliency or redundancy. In addition to the Exchange 2010 bugcheck behaviors, Exchange 2013 includes additional recovery behaviors for long I/O times, excessive memory consumption by MSExchangeRepl.exe, and severe cases where the system is in such a bad state that threads can't be scheduled.
- **Lagged copy enhancements** Lagged copies can now care for themselves to a certain extent using automatic log play down. Lagged copies will automatically play down log files in a variety of situations, such as single page restore and low disk space scenarios. If the system detects that page patching is required for a lagged copy, the logs will be automatically replayed into the lagged copy to perform page patching. Lagged copies will also invoke this auto replay feature when a low disk space threshold has been reached, and when the lagged copy has been detected as the only available copy for a specific period of time. In addition, lagged copies can leverage Safety Net, making recovery or activation much easier. *Safety Net* is improved functionality in Exchange 2013 based on the transport dumpster of Exchange 2010.
- **Single copy alert enhancements** The single copy alert introduced in Exchange 2010 is no longer a separate scheduled script. It's now integrated into the managed availability components within the system and is a native function within Exchange.
- **DAG network auto-configuration** DAGs networks can be automatically configured by the system based on configuration settings. In addition to manual configuration options, DAGs can also distinguish between MAPI and Replication networks and configure DAG networks automatically.

For more information about both of these features, see High availability and site resilience and Changes to high availability and site resilience over previous versions.

Exchange workload management

An Exchange workload is an Exchange server feature, protocol, or service that has been explicitly defined for the purposes of Exchange system resource management. Each Exchange workload consumes system resources such as CPU, mailbox database operations, or Active Directory requests to execute user requests or run background work. Examples of Exchange workloads include Outlook

Web App, Exchange ActiveSync, mailbox migration, and mailbox assistants.

There are two ways to manage Exchange workloads in Exchange 2013:

- **Monitor the health of system resources** Managing workloads based on the health of system resources is new in Exchange 2013.
- **Control how resources are consumed by individual users** Controlling how resources are consumed by individual users was possible in Exchange 2010 (where it's called user throttling), and this capability has been expanded for Exchange 2013.

For more information about these features, see Exchange workload management.

What's discontinued in Exchange 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-25*

This topic discusses the components, features, or functionality that have been removed, discontinued, or replaced in Microsoft Exchange Server 2013.

Note:

The following topics may also interest you:

- What's new in Exchange 2013 Information about new features and functionality in Exchange Server 2013.
- Developer roadmap for Exchange 2013 See the "Development technologies removed from Exchange" section for information about the API and Development features discontinued in Exchange 2013.

Discontinued features from Exchange 2010 to Exchange 2013

This section lists the Exchange Server 2010 features that are no longer available in Exchange 2013.

Architecture

Feature	Comments and mitigation
Hub Transport server role	The Hub Transport server role has been replaced by Transport services which run on

	the Mailbox and Client Access server roles. The Mailbox server role includes the Microsoft Exchange Transport, Microsoft Exchange Mailbox Transport Delivery, and the Microsoft Exchange Mailbox Transport Submission service. The Client Access server role includes the Microsoft Exchange Frontend Transport service. For more information, see Mail flow.
Unified Messaging server role	The Unified Messaging server role has been replaced by Unified Messaging services which run on the Mailbox and Client Access server roles. The Mailbox server role includes the Microsoft Exchange Unified Messaging service and the Client Access server role includes the Microsoft Exchange Unified Messaging Call Router service. For more information, see Voice architecture changes.

Management interfaces

Feature	Comments and mitigation
Exchange Management Console and Exchange Control Panel	The Exchange Management Console and the Exchange Control Panel have been replaced by the Exchange Admin Center (EAC). EAC uses the same virtual directory (/ecp) as the Exchange Control Panel. For more information, see Exchange admin center in Exchange 2013.

Client access

Feature	Comments and mitigation
Outlook 2003 is not supported	To connect Microsoft Outlook to Exchange 2013, the use of the Autodiscover service is required. However, Microsoft Outlook 2003

	doesn't support the use of the Autodiscover service.
RPC/TCP access for Outlook clients	In Exchange 2013, Microsoft Outlook clients can connect using Outlook Anywhere (RPC/HTTP) or MAPI over HTTP in Exchange 2013 Service Pack 1 and Outlook 2013 Service Pack 1 and later. If you have Outlook clients in your organization, using Outlook Anywhere and/or MAPI over HTTP is required. For more information, see Outlook Anywhere and MAPI over HTTP.

Outlook Web App and Outlook

Feature	Comments and mitigation
Spell check	Outlook Web App no longer has built-in spell check services. Instead, it uses the spell check features in your Web browsers.
Customizable filters	Outlook Web App no longer has customizable filtered views and no longer supports saving filtered views to Favorites. Customizable filters have been replaced by fixed filters that can be used to view all messages, unread messages, messages sent to the user, or flagged messages.
Message flags	The ability to set a custom date on a message flag isn't available in Outlook Web App. You can use Outlook to set custom dates.
Chat contact list	The chat contact list that appeared in the folder list in Outlook Web App for Exchange 2010 is no longer available.

Search folders	The ability for users to use Search folders isn't currently available in Outlook Web App.

Mail flow

Feature	Comments and mitigation
Linked connectors	The ability to link a Send connector to a Receive connector has been removed. Specifically, the *LinkedReceiveConnector* parameter has been removed from New-SendConnector and Set-SendConnector.

Anti-spam and anti-malware

Feature	Comments and mitigation
Anti-spam agent management in the EMC	In Exchange 2010, when you enabled the anti-spam agents on a Hub Transport server, you could manage the anti-spam agents in the Exchange Management Console (EMC). In Exchange 2013, when you enable the anti-spam agents on a Mailbox server, you can't manage the agents using the EAC. You can only use the Shell. For information about how to enable the anti-spam agents on a Mailbox server, see Enable anti-spam functionality on Mailbox servers.
Connection Filtering agent on Hub Transport servers	In Exchange 2010, when you enabled the anti-spam agents on a Hub Transport server, the Attachment Filter agent was the only anti-spam agent that wasn't available. In Exchange 2013, when you enable the anti-spam agents on a Mailbox server, the Attachment Filter agent and the Connection Filtering agent aren't available. The Connection Filtering agent provides IP

	Allow List and IP Block List capabilities. For information about how to enable the anti-spam agents on a Mailbox server, see Enable anti-spam functionality on Mailbox servers. **Note:** You can't enable the anti-spam agents on an Exchange 2013 Client Access server. Therefore, the only way to get the Connection Filtering agent is to install an Edge Transport server in the perimeter network. For more information, see Edge Transport servers.

Messaging policy and compliance

Feature	Comments and mitigation
Managed Folders	In Exchange 2010, you use managed folders for messaging retention management (MRM). In Exchange 2013, managed folders aren't supported. You must use retention policies for MRM. **Note:** Cmdlets related to managed folders are still available. You can create managed folders, managed content settings and managed folder mailbox policies, and apply a managed folder mailbox policy to a user, but the MRM assistant skips processing of mailboxes that have a managed folder mailbox policy applied.
Port Managed Folder wizard	In Exchange 2010, you use the Port Managed Folder wizard to create retention tags based on managed folder and managed content settings. In Exchange 2013, the Exchange admin center doesn't include this functionality. You can use the **New-RetentionPolicyTag** cmdlet with the *ManagedFolderToUpgrade* parameter to create a retention tag based on a managed folder.

Unified Messaging and voice mail

Feature	Comments and mitigation
Directory lookups using Automatic Speech Recognition (ASR)	In Exchange 2010, Outlook Voice Access users can use speech inputs using Automatic Speech Recognition (ASR) to search for users listed in the directory. Speech inputs could be also used in Outlook Voice Access to navigate menus, messages, and other options. However, even if an Outlook Voice Access user is able to use speech inputs, they have to use the telephone key pad to enter their PIN, and navigate personal options. In Exchange 2013, authenticated and non-authenticated Outlook Voice Access users can't search for users in the directory using speech inputs or ASR in any language. However, callers that call into an auto attendant can use speech inputs in multiple languages to navigate auto attendant menus and search for users in the directory.

Tools

Feature	Comments and mitigation
Exchange Best Practice Analyzer	In Exchange 2010, the Exchange Best Practice Analyzer examined your Exchange deployment and determined whether the configuration was in line with Microsoft best practices. In Exchange 2013, the Exchange Best Practice Analyzer has been replaced by the Office 365 Best Practices Analyzer for Exchange Server 2013.

Mail flow troubleshooter	In Exchange 2010, the mail flow troubleshooter assisted you in troubleshooting common mail flow problems. In Exchange 2013, the mail flow troubleshooter has been retired. You can now use the messaging tracking feature in EAC in Exchange 2013. For more information, see Track messages with delivery reports.
Performance monitor	In Exchange 2010, the Performance Monitor was included in the Exchange toolbox to allow you to collect information about the performance of your messaging system. Performance Monitor is commonly used to view key parameters while troubleshooting performance problems. In Exchange 2013, the Performance Monitor has been retired from the toolbox. You can still find the Performance Monitor under **Administrative Tools** in Windows Server 2008.
Performance troubleshooter	In Exchange 2013, the Performance Troubleshooter has been retired.
Routing Log Viewer	In Exchange 2013, the routing log viewer has been retired.

Discontinued features from Exchange 2007 to Exchange 2013

This section lists the Exchange Server 2007 features that are no longer available in Exchange 2013.

APIs and development

Feature	Comments and mitigation
Exchange WebDAV	Use Exchange Web Services or EWS Managed

	API. Alternatively, you can maintain an Exchange 2007 server for mailboxes that are managed by applications that use WebDAV. For more information, see Migrating from WebDAV.

Architecture

Feature	Comments and mitigation
Storage groups	Exchange 2013 no longer uses the storage group construct, and instead you simply manage mailbox databases. For more information, see Manage mailbox databases in Exchange 2013.
Extensible Storage Engine (ESE) streaming backup APIs	Exchange 2013 supports only Exchange-aware Volume Shadow Copy Service (VSS)-based backups. Exchange 2013 does include a plug-in for Windows Server Backup that enables you to backup and restore data. For information, see Backup, restore, and disaster recovery.
User Datagram Protocol (UDP) notifications	Support for User Datagram Protocol (UDP) notifications is removed from Exchange 2013. This affects the user experience when Outlook 2003 clients connect to their mailboxes on an Exchange 2013 server. For more information, see Microsoft Knowledge Base article 2009942, Folders take a long time to update when an Exchange Server 2010 user uses Outlook 2003 in online mode.

High availability

Feature	Comments and mitigation

Cluster continuous replication (CCR)	Exchange 2013 uses database availability groups (DAGs) and mailbox database copies. For information, see High availability and site resilience.
Local continuous replication (LCR)	Exchange 2013 uses DAGs and mailbox database copies. For information, see High availability and site resilience.
Standby continuous replication (SCR)	Exchange 2013 uses DAGs and mailbox database copies. For information, see High availability and site resilience.
Single copy cluster (SCC)	Exchange 2013 uses DAGs and mailbox database copies. For information, see High availability and site resilience.
Setup /recoverCMS	Exchange 2013 uses Setup /m:recoverServer. For information, see Recover an Exchange Server.
Clustered mailbox servers	Exchange 2013 uses DAGs and mailbox database copies. For information, see High availability and site resilience.

Client access

Feature	Comments and mitigation
Client authentication using Integrated Windows authentication (NTLM) for POP3 and IMAP4 users	NTLM isn't supported for POP3 or IMAP4 client connectivity in Exchange 2013. Connections from POP3 or IMAP4 client programs using NTLM will fail. If you're running the RTM version of Exchange 2013, the recommended alternative to NTLM is to use Plain Text Authentication with SSL. If you're using Exchange 2013, to use NTLM,

	you must retain an Exchange 2007 server in your Exchange 2013 organization.

Outlook Web App and Outlook

Feature	Comments and mitigation
Document access	Outlook Web App can't be used to access Microsoft SharePoint document libraries and Windows file shares.
Message flags	The ability to set a custom date on a message flag isn't available in Outlook Web App 2013. You can use Outlook to set custom dates.
Spell check	Outlook Web App uses the spell check features in your Web browser.
Search Folders	The ability for users to use Search folders isn't currently available in Outlook Web App.
Maximum Cached Views	Exchange 2007 supported modifying the maximum number of cached views per database (msExchMaxCachedViews) parameter for Outlook clients. Exchange 2013 no longer uses this parameter.

Recipient-related features

Feature	Comments and mitigation
Export-Mailbox and **Import-Mailbox** cmdlets	In Exchange 2013, use export requests or import requests. For more information, see Mailbox import and export requests.
Move-Mailbox cmdlet set	In Exchange 2013, use move requests to move mailboxes. For information, see Mailbox moves in Exchange 2013.

ISInteg	In Exchange 2013, use New-MailboxRepairRequest.

Messaging policy and compliance

Feature	Comments and mitigation
Managed Folders	In Exchange 2007, you use managed folders for messaging retention management (MRM). In Exchange 2013, managed folders aren't supported. You must use retention policies for MRM. **Note:** Cmdlets related to managed folders are still available. You can create managed folders, managed content settings and managed folder mailbox policies, and apply a managed folder mailbox policy to a user, but the MRM assistant skips processing of mailboxes that have a managed folder mailbox policy applied.

Unified Messaging and voice mail

Feature	Comments and mitigation
Directory lookups using Automatic Speech Recognition (ASR) for Outlook Voice Access	In Exchange 2007, Outlook Voice Access users can use speech inputs using Automatic Speech Recognition (ASR) in English (US) – (en-US) to search for users listed in the directory. Speech inputs could be also used in Outlook Voice Access to navigate menus, messages, and other options. However, even if an Outlook Voice Access user is able to use speech inputs, they have to use the telephone key pad to enter their PIN, and navigate personal options. In Exchange 2013, authenticated and non-authenticated Outlook Voice Access users can't search for users in the directory using speech

	inputs or ASR in any language. However, callers that call into an auto attendant can use speech inputs in multiple languages to navigate auto attendant menus and search for users in the directory.

What's new for Outlook Web App in Exchange 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-09-04*

For Microsoft Exchange Server 2013, we've added several new features to Microsoft Outlook Web App and updated its design.

Note:

For more details about using Outlook Web App in your Exchange Server 2013 organization, see Outlook Web App.

Apps in Outlook Web App

We've added several apps for Outlook: Bing Maps, Suggested Appointments, and Action Items. These apps are integrated with Outlook and Outlook Web App and extend the information and functionality of messages and calendar items.

Apps in Outlook attempt to anticipate your needs and automatically propose actions you might want to take by using the contents of the email message. For example, if an email message contains a street address, the Bing Maps app offers you a Bing tab with a quick link to a map and directions. Or, if a phrase in the email message suggests a possible action item, the Action Items app creates a suggested Task for your review. An offer to meet is suggested as an Appointment to be added to your calendar, thanks to the Suggested Appointments app.

Apps for Outlook aren't dependent on the version of Exchange Server that you're using. You won't have to worry about breaking or losing any apps for Outlook that you have added when you upgrade Exchange servers or move to a new Exchange version.

Administrators can use the Exchange admin center (EAC) to manage the apps available to users in the organization. Users can then manage their apps. Administrators can also allow users to

download apps from Office.com. For more information about the EAC, see Exchange admin center in Exchange 2013.

In addition, we encourage third-party developers to create additional apps for Outlook and then offer them at Office.com. To learn more, see Build Apps for Office for background information and Mail apps for Outlook for detailed information about building apps for Outlook.

People

- Now, users can link multiple entries for the same person and view the information in a single contact card. For example, if a user has two entries for Holly Holt in his Contacts folder, one entry copied from the organization's address list and one entry that he added manually, he can link the two entries in his Contacts folder and view all the information in one place. Contact linking is done automatically, but the user can also manually link and unlink contacts.
- Connected accounts have been extended to include the ability to connect to a user's LinkedIn account. After the link is established, Outlook Web App automatically adds the user's LinkedIn contacts to the Contacts folder.

Calendar

- Users can now view multiple calendars in a merged view. Entries from each calendar have their own color, making it easy for users to identify which calendar an entry belongs to. In the day view, users can view multiple calendars in a merged view or in separate columns.
- The month view now includes an agenda for the selected day, providing users with helpful information as they review the day's activities.
- In all calendar views, users can click an item to view a pop-up of the item's details. In addition to the details, controls are now available to accept or decline the item if it's a meeting, to edit or delete if it's an appointment, or, if a meeting item, to join the meeting if an online meeting link is included.

Tablets and smartphones

Outlook Web App emphasizes a streamlined user interface that also supports the use of touch, enhancing the mobile device experience with Exchange.

Supported browsers

To experience all Outlook Web App features, use one of the operating system and browser combinations labeled "Best", as noted in the tables below. Outlook Web App is supported by many operating system and web browser combinations, but not all Outlook Web App features are available in all combinations. Some browsers support only the light version of Outlook Web App.

Supported browsers on desktop and laptop computers

In the table below, the following definitions apply:

- Best: All Outlook Web App features are supported.
- Good: Most Outlook Web App features are supported.
- Light: The browser displays the light version of Outlook Web App

Windows operating system and browser combination

Web browser	Windows XP and Windows Server 2003	Windows Vista and Windows Server 2008	Windows 7	Windows 8
Internet Explorer 7	Light	Not available	Not available	Not available
Internet Explorer 8	Light	Light	Light	Not available
Internet Explorer 9	Not available	Best	Best	Not available
Internet Explorer 10	Not available	Not available	Best – plus offline access	Best – plus offline access
Internet Explorer 11	Not available	Not available	Best – plus offline access	Best – plus offline access
Firefox 17 or later	Good	Good	Best	Best
Safari 5 or later	Light	Light	Light	Light
Chrome 24 or later	Good – plus offline access	Good – plus offline access	Best – plus offline access	Best – plus offline access

Note:

In previous versions, Outlook Web App had a built-in spell checker. In Exchange Server 2013, Outlook Web App relies on the web browser for spell checking, which Internet Explorer prior to version 10 doesn't provide.

Note:

Office 365 users will be limited to the light version of Outlook Web App when using Internet Explorer 8. Users whose mailboxes are on a locally managed Exchange server will continue to see the standard version of Outlook Web App when using Internet Explorer 8, but may experience slow or otherwise unsatisfactory performance.

Other Windows operating system and browser combination

Web browser	Mac OS X v10.5	Mac OS X v10.6 and v10.7	Linux
Firefox 17 or later versions	Best	Best	Best
Safari 6 or later versions	Best – plus offline access	Best – plus offline access	Not available
Chrome 24 or later versions	Best – plus offline access	Best – plus offline access	Best – plus offline access

Note:

Operating system and browser combinations not listed display the light version of Outlook Web App.

Supported browsers for tablets and smartphones

You can use the web browser on a tablet or smartphone to sign in to Outlook Web App. The available Outlook Web App features depends on the operating system and browser combination in use, as follows:

- Best: All Outlook Web App features for smartphones and tablets are supported.
- Light: The browser displays the light version of Outlook Web App.

Outlook Web App features available on tablets and smartphones

Device	Application	Support
Windows 8 tablet	Web browser	Best
iOS 6 or later for iPhone 4s or later	Web browser	Best
iOS 6 or later for iPad 2 or later	Web browser	Best
All other smartphones and tablets	Web browser	Light

OWA for Devices app

The OWA for Devices app lets users in an Exchange 2013 on-premises deployment with an Office 365 mailbox or in an Office 365 only organization use their iPhone or iPad access their mailbox. The OWA for iPhone and OWA for iPad apps simplify signing in to their mailbox and allows them access their mailbox even when they don't have an Internet connection. The OWA for iPhone or OWA for iPad apps are recommended instead of using your iPhone's or iPad's browser. For Exchange on-premises deployments, you need to enable push notifications for OWA for Devices to work, see Configuring push notifications proxying for OWA for Devices.

You can download the OWA for iPhone and OWA for iPad apps from the Apple App Store by searching for OWA for iPhone or OWA for iPad or download them from OWA for iPhone in the Apple Store or OWA for iPad in the Apple Store. The table below shows the versions of iPad and iPhone that are supported.

Device	**OS version required**
iPhone 4S, iPhone 5, iPhone 5c or iPhone 5s. This app is optimized for iPhone 5.	iOS 6 or later versions
iPad Wi-Fi (3rd generation), iPad Wi-Fi + Cellular (3rd generation), iPad Wi-Fi (4th generation), iPad Wi-Fi + Cellular (4th generation), iPad mini Wi-Fi, iPad mini Wi-Fi + Cellular, iPad Air, iPad Air Wi-Fi + Cellular, iPad mini with Retina display, iPad mini with Retina display Wi-Fi + Cellular	iOS 6 or later versions

Unavailable features

The following Outlook Web App features are currently unavailable in Exchange 2013. Some of these features may be included in a future release.

- **Distribution list moderation** The ability to moderate distribution lists from Microsoft Outlook Web App isn't currently available in Exchange 2013.
- **Custom date on message flags** The ability to set a custom date on a message flag isn't available in Outlook Web App 2013. You can use Outlook to set custom dates.
- **Reading pane at the bottom of the window** The option to display the reading pane at the bottom of the Outlook Web App window isn't currently available in Exchange 2013.
- **Reply to embedded email messages** The ability for users to reply to email messages sent as attachments isn't currently available in Exchange 2013.

- **Search folders** The ability for users to use Search folders isn't currently available in Exchange 2013.
- **Access to legacy public folders** The ability for users to access public folders located on servers running previous versions of Exchange isn't currently available in Exchange 2013.

What's new for Unified Messaging in Exchange 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-05*

In Microsoft Exchange Server 2013, we're enhancing earlier releases of Exchange by introducing new features and architectural changes. Unified Messaging (UM) in Exchange 2013 includes the same feature set as Exchange 2010 and Exchange 2007, however Unified Messaging is no longer a separate server role. It's now a component of the voice-related features offered in Exchange 2013.

Changes in the Voice architecture

The architecture of Exchange 2013 is different than it was in Exchange 2010 and Exchange 2007. In previous versions of Exchange UM, all the components for Unified Messaging were included on a server that had the UM server role installed. In Exchange 2013, all the Unified Messaging components are split between a Client Access server running the Microsoft Exchange Unified Messaging Call Router service and a Mailbox server running the Microsoft Exchange Unified Messaging service. All the functionality, including the services and worker processes for Unified Messaging, is located on each Mailbox server, with the exception of the Client Access server running the Microsoft Exchange Unified Messaging Call Router service, which proxies incoming calls to the Mailbox server. For details, see Voice architecture changes.

Support for IPv6

Internet Protocol version 6 (IPv6) is the most recent version of the Internet Protocol. IPv6 is intended to correct many of the shortcomings of IPv4, which was the previous version of the IP. As in Exchange 2010, Exchange 2013 Client Access and Mailbox servers fully support IPv6 networks. For details, see IPv6 support in Unified Messaging.

Support for UCMA 4.0 API

Since Service Pack 1 for Exchange 2010, the Unified Messaging role has relied on Unified Communications Managed API v2.0 (UCMA) for signaling and media. Therefore, UCMA 2.0 is a prerequisite for Exchange 2010 UM setup. UCMA 2.0 is downloaded separately and deployed manually by administrators on Unified Messaging servers running Exchange 2010 SP1 or a later version. For Exchange 2013, UCMA 4.0 is required. However, given that the UM server is no longer a separate server role in Exchange 2013, now it's the Client Access and Mailbox servers that require UCMA 4.0.

UCMA 4.0 supports new features in Unified Messaging, such as using the same version of the Speech Engine for both Text-to-Speech (TTS) and Automatic Speech Recognition (ASR). The platform that's used for Exchange 2013, .NET 4.0, includes a single installer file and enables backward compatibility with Exchange 2010 and Exchange 2007 UM servers.

In Exchange 2010 SP2 and SP1, UCMA 2.0 installation is required prior to installing the service pack on a Unified Messaging server. However, UCMA 2.0 had several limitations. UCMA 4.0 corrects many of the shortcomings. In Exchange Server 2013, UM continues to use UCMA. However, the move to the newest version of UCMA provides these benefits:

- The newest build of UCMA incorporates hotfixes and patches.
- UCMA requires .NET 4.0, which is the platform used by Exchange Server 2013. (UCMA 2.0 doesn't support .NET 4.0.)
- UCMA 4.0 supports IPv6.
- Simplified and automated deployment of UCMA 4.0. Exchange 2013 Setup performs a single check for UCMA 4.0.
- UCMA 4.0 setup includes all prerequisites for Exchange 2013.

Note:

UCMA 4.0 is installed when you're installing Exchange 2013. For details about UCMA 4.0 and setup requirements, see Exchange 2013 prerequisites. To upgrade to the most recent version of UCMA, you must first uninstall any previous versions of UCMA that are installed using Add/Remove programs.

Improvements to Voice Mail Preview

Some enhancements to the speech-related services are offered for Exchange Server 2013 UM via the Speech Engine 11.0 and UCMA 4.0. Grammar generation and language improvements are included. In addition, Exchange Server 2013 UM includes several enhancements to the UI and improvements for confidence and accuracy for Voice Mail Preview. For details, see Voice mail preview enhancements.

Enhanced caller ID support

In previous releases of Exchange Unified Messaging, a UM server that took a call used caller ID to try to look up the identity of the calling party. This search extended across Active Directory and the UM user's personal contacts stored in their mailbox.

Exchange users are often annoyed by failures to identify Exchange or personal contacts from their caller ID. Until now, only the default contact folder in Exchange UM was used for this search. But Exchange Server 2013 users are likely to have contacts aggregated from external social networks or contacts in unique folders that the users have created manually. Exchange 2013 supports contact aggregation from external social networks, provides intelligence to link multiple contacts referring to the same person, and uses that data to present person-centric (rather than contact-centric) views. The contacts that are aggregated from external networks are placed in contact folders along with any additional contact folders that users created.The features in Exchange 2013 UM extend the scope of the search to include the user's other Exchange and personal contact folders that were created manually.

Caller ID look-up is integrated with contact aggregation, so that it searches across external contacts. The PersonID property, where present and with a non-null value, improves the user experience for caller ID resolution by suppressing duplicate matches to contacts that are associated with the same person. Because the PersonID property is the same on both results, UM treats this as a match to a single contact.

Enhancements to speech platform and speech recognition

Exchange Server 2013 UM introduces some enhancements to the speech platform and speech recognition, including the following:

- Enhancements and improved accuracy for Voice Mail Preview.
- Support for the Microsoft Speech Platform – Runtime (Version 11.0).
- Speech grammar generation using the system mailbox for an organization.

Exchange Unified Messaging uses static and dynamic speech grammars to recognize commands, names of contacts in the global address list, and names of personal contacts in the user's mailbox. Today, in Exchange Server 2013, every Mailbox server running the Microsoft Exchange Unified Messaging service generates grammars for all UM languages installed on it and stores them in directories. Every Mailbox server stores every possible grammar, which it generates based on the number of dial plans, auto attendants, and the UM languages that are installed.

Grammar files are used as inputs to the speech recognition process and are generated on a periodic basis. The GGG.exe command in Exchange 2007 and Exchange 2010 allowed you to manually update the grammar files without waiting for the scheduled update. In Exchange Server 2013, to address ASR grammar-generation scalability issues for UM, the speech GAL grammar generation no longer happens on the server with the Unified Messaging server role installed. Instead, it happens periodically using the Mailbox Assistant, on the Mailbox server running the Microsoft Exchange Unified Messaging service that hosts the organization's arbitration mailbox. The GAL speech grammar file is stored in the arbitration mailbox for an organization and then later downloaded to all Mailbox servers in that Exchange organization. By default, the Mailbox Assistant runs every 24 hours. You can adjust the frequency by using the **Set-MailboxServer** cmdlet.

Cmdlet updates

For Exchange 2013, many UM cmdlets have been brought over from Exchange 2010, but there have been changes in some of those cmdlets, and new cmdlets have been added for new functionality. For details, see Unified Messaging cmdlet updates.

What's new for transport rules

Exchange Server 2013 > What's new in Exchange 2013 >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-07-03*

In Microsoft Exchange Server 2013, several improvements have been made to transport rules. This topic provides a brief overview of some of the key changes and enhancements. To learn more about transport rules, see Transport rules.

Support for data loss prevention policies

Data loss prevention (DLP) features in Exchange 2013 can help organizations reduce unintentional disclosure of sensitive data. Transport rules have been updated to support creating rules that accompany and enforce DLP policies. To learn more about DLP support in transport rules, see the following topics:

Integrating sensitive information rules with transport rules

Data loss prevention

New predicates and actions

The functionality of transport rules has been extended via the addition of new predicates and actions. Each predicate listed below can be used as a condition or an exception when you're creating transport rules.

For detailed information about using these new predicates and actions, see Transport rule conditions (predicates) and Transport rule actions.

New predicates

AttachmentExtensionMatchesWords Used to detect messages that contain attachments with specific extensions.

AttachmentHasExecutableContent Used to detect messages that contain attachments with executable content.

HasSenderOverride Used to detect messages where the sender has chosen to override a DLP policy restriction.

MessageContainsDataClassifications Used to detect sensitive information in the message body and any of the attachments. For a list of data classifications available, see Sensitive information types inventory.

MessageSizeOver Used to detect messages whose overall size is greater than or equal to the specified limit.

SenderIPRanges Used to detect messages sent from a specific set of IP address ranges.

New actions

GenerateIncidentReport Generates an incident report that is sent to a specified SMTP address. The action also has a parameter called *IncidentReportOriginalMail* that accepts one of two values: IncludeOriginalMail or DoNotIncludeOriginalMail.

NotifySender Controls how the sender of a message that goes against a DLP policy is notified. You can choose to simply inform the sender and route the message normally, or you can choose to reject the message and notify the sender.

StopRuleProcessing Stops the processing of all subsequent rules on the message.

ReportSeverityLevel Sets the specified severity level in the incident report. Values for the action are: Informational, Low, Medium, High, and Off.

RouteMessageOutboundRequireTLS Requires Transport Layer Security (TLS) encryption when routing this message outside your organization. If TLS encryption isn't supported, the message is rejected and not delivered.

Other changes in Transport rules

- **Support for extended regular expression syntax** Transport rules in Exchange 2013 are based on the Microsoft.NET Framework regular expression (regex) functionality and now support extended regular expression syntax.

- **Transport rules agent invocation** The key architectural change in Exchange 2013 for Transport rules is the Transport Rules Agent is invoked on onResolvedMessage. In previous versions of Exchange, the Rules Agent was invoked on onRoutedMessage. This change allowed us to add new actions, such as requiring TLS, which can change how a message is routed. To learn more about the transport rules architecture in Exchange 2013, see Transport rules.
- **Detailed Transport rule information in message tracking logs** Detailed information about Transport rules is now included in message tracking logs. The information includes which rules were triggered for a specific message and the actions taken as a result of processing those rules.
- **New rule monitoring functionality** Exchange 2013 monitors Transport rules that are configured and measures the cost of running these rules both when you're creating the rule and also during regular operation. Exchange can detect and generate alerts for rules that are causing delays in mail delivery.
- **Rule size limit changes** The following changes have been made to Transport rule limits:
  - Maximum size of each rule is 4 kilobytes (KB).
  - The character limit for all regular expressions used in all Transport rules is 20 KB. This limit applies to total number of characters used by all regular expressions, including keywords.

Release notes for Exchange 2013

Exchange Server 2013 > What's new in Exchange 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-25*

Welcome to Microsoft Exchange Server 2013! This topic contains important information that you need to know to successfully deploy Cumulative Update 6 for Exchange 2013. Please read this topic completely before beginning your deployment.

This topic contains the following sections:

- Setup and deployment
- Mailbox
- Public folders
- Mail flow
- Client connectivity
- Exchange 2010 coexistence

Setup and deployment

- **Setup incorrectly requests .NET Framework 4.0** If you attempt to install Exchange 2013 without .NET Framework installed on the computer, Setup incorrectly requests that you install .NET Framework 4.0 when, in fact, .NET Framework 4.5 is required.

To work around this issue, install .NET Framework 4.5. You don’t need to install .NET Framework 4.0.

For a complete list of prerequisites, see Exchange 2013 prerequisites.

- **Exchange XML application configuration files are overwritten during cumulative update installation** Any customized per-server settings you make in Exchange XML application configuration files, for example, web.config files on Client Access servers or the EdgeTransport.exe.config file on Mailbox servers, will be overwritten when you install an Exchange Cumulative Update or Service Pack. Make sure that you save this information so you can easily re-configure your server after the install. You must re-configure these settings after you install an Exchange Cumulative Update or Service Pack.
- **MAPI virtual directory isn't created during server recovery** When you run Setup.exe with the *RecoverServer* switch on a server that has the Client Access server role installed, the MAPI virtual directory isn't created. If the MAPI virtual directory doesn't exist, clients that use the MAPI over HTTP protocol to connect to the Exchange server, such as Outlook, won't be able to connect.

Note:
This is only an issue if the MAPI over HTTP protocol is enabled on your Client Access servers. It's disabled by default. If MAPI over HTTP is disabled, clients use the RPC over HTTP protocol instead.

To resolve this issue, follow the steps in Knowledge Base article KB2931223 (MAPI virtual directory is missing from default Web Site node).

For more information about how to install Exchange 2013, see Planning and deployment.

Mailbox

- **Mailbox size increase when migrating from previous Exchange versions** When you move a mailbox from a previous version of Exchange to Exchange 2013, the mailbox size reported may increase 30 percent to 40 percent. Disk space used by the mailbox database has not increased, only the attribution of space used by each mailbox has increased. The increase in mailbox size is due to the inclusion of all item properties into quota calculations, providing a more accurate computation of space consumed by items within their mailbox. This increase may cause some users to exceed their mailbox size quotas when their mailbox is moved to Exchange 2013.

To prevent users from exceeding their mailbox size quotas, increase the database or mailbox quota values to accommodate the new quota calculation. To configure database or mailbox quota values, use the *IssueWarningQuota*, *ProhibitSendQuota*, and *ProhibitSendReceiveQuota* parameters on the **Set-MailboxDatabase** and **Set-Mailbox** cmdlets, respectively.

- **Outlook 2007 and Outlook 2010 clients may be unable to download the Offline Address Book** If the Offline Address Book (OAB) internal URL isn't accessible from the Internet, Outlook 2007 and Outlook 2010 clients may be unable to download the OAB.

To work around this issue for Outlook 2007 and Outlook 2010 clients, make the OAB internal URL accessible from the Internet. Outlook 2013 isn't affected by this issue.

- **Installing Exchange 2013 in an existing Exchange organization may cause all clients to download the OAB** Installing the first Exchange 2013 server into an existing Exchange 2007 or Exchange 2010 organization may cause all clients in the organization to download a new copy of

the OAB, resulting in network saturation and server performance issues. This issue occurs because Exchange 2013 creates a new default OAB in the organization that supersedes the Exchange 2007 or Exchange 2010 OAB. Mailboxes that don't have a specific OAB assigned, or that are located on a mailbox database that doesn't have a specific OAB assigned, will download the new default OAB.

To prevent clients from downloading a new copy of the OAB when Exchange 2013 is installed, assign an OAB to every mailbox or to the mailbox database the mailboxes are located on. This must be done prior to Exchange 2013 being installed in the organization.

- **Users may be routed to an OAB generation mailbox that's not responsible for the requested OAB** Exchange 2013 CU5 and later CUs have changed how OABs are linked to OAB generation mailboxes. This change makes it possible for a user to be routed to an OAB generation mailbox that isn't responsible for the OAB that the user is requesting. This can happen if all of the following are true:
  - You have more than one OAB generation mailbox in your organization.
  - You upgrade the Mailbox servers that host OAB generation mailboxes before you upgrade your Client Access servers.
  - You're upgrading your Exchange 2013 servers from a release prior to CU5 to a later release (for example, upgrading from Exchange 2013 CU3 to Exchange 2013 CU6).
  - Your Client Access servers are running a release prior to CU5.

To work around this issue, make sure that you upgrade your Client Access servers to Exchange 2013 CU6 before you upgrade your Mailbox servers. This will make sure the Client Access servers know how to proxy the requests to the OAB generation mailbox that is responsible for generating the user's OAB..

To read more about the OAB changes in Exchange 2013 CU5, see OAB Improvements in Exchange 2013 Cumulative Update 5.

Public folders

- **Unauthorized senders can no longer send messages to mail-enabled public folders** Prior to Exchange 2013 CU6, unauthorized senders could send messages to mail-enabled public folders. This allowed the possibility for external senders to send mail to mail-enabled public folders regardless of the permissions set on the public folder.

Starting with Exchange 2013 CU6, if you want external senders to send mail to a mail-enabled public folders, the **Anonymous** user needs to be granted at least the **Create Items** permission. If you've set up mail-enabled public folders and haven't done this, external senders will receive a delivery failure notification and the messages won't be delivered to the mail-enabled public folder.

You can use the Shell or Outlook to set the permissions on the Anonymous user. To read more about how to set permissions on the Anonymous user, see Mail-enable or mail-disable a public folder.

- **Legacy public folders can't be accessed via Exchange Web Services** Public folders that are located on Exchange 2007 or Outlook 2010 servers can't be accessed by clients that connect to Exchange 2013 using Exchange Web Services (EWS). Clients that use EWS include Mac Outlook

and Outlook Web App. If an EWS client attempts to access a legacy public folder, they'll receive an error.

The only workaround at this time is to migrate legacy public folders to Exchange 2013. However, there are some issues that must be considered before you migrate your public folders. For more information, see Public folders.

Mail flow

- **TransportAgent cmdlets on Client Access servers require local Windows PowerShell** An issue exists with the ***-TransportAgent** cmdlets that prevents those cmdlets from installing, uninstalling, and managing transport agents on Client Access servers using the Exchange Management Shell. To install, uninstall, and manage transport agents on Client Access servers, you must manually load the Exchange Windows PowerShell snap-in and then run the ***-TransportAgent** cmdlets. If you attempt to install, uninstall, or manage transport agents using the Exchange Management Shell, your changes will be applied to the Exchange 2013 Mailbox server you're connected to.

To install, uninstall, or manage transport agents on Client Access servers, do the following on the Client Access server you want to manage:

Caution:

Loading the `Microsoft.Exchange.Management.PowerShell.SnapIn` Windows PowerShell snap-in and running cmdlets other than the ***-TransportAgent** cmdlets is not supported and may result in irreparable damage to your Exchange deployment.
You must be a local Administrator on the Client Access server where you want to install, uninstall, or manage transport agents. We do not support the modification of access control lists (ACLs) on Exchange files, directories, or Active Directory objects.

Important:

Perform the following procedure on Client Access servers only. You don't need to load the Exchange Windows PowerShell snap-in if you want to manage transport agents on Mailbox servers.

1. Open a new Windows PowerShell window.
2. Run the following command.

```
Add-PSSnapin
Microsoft.Exchange.Management.PowerShell.SnapIn
```

3. Perform transport agent management tasks as normal.
4. Repeat this procedure on each Client Access server you want to manage.

Client connectivity

- **NTLM authentication fails for non-domain joined clients** Authentication between a client, such as Windows Live Mail, and Exchange 2013 may fail when the following conditions are true:
  - Then authentication method the client uses is NTLM.

- The computer isn't joined to the domain.

To work around this issue, you can do one of the following:

- Join the computer the client is running on to the domain.
- Change the authentication type the client uses from NTLM to Basic Auth over TLS.

- **GSSAPI authentication fails when used with the Send-MailMessage cmdlet** Generic Security Service Application Program Interface (GSSAPI) authentication may fail when the **Send-MailMessage** cmdlet, which is included with default installs of Windows PowerShell, is used to send authenticated mail to Exchange 2013. When this happens, you'll see an entry in the **Application** event log on the Exchange 2013 Client Access server that received the connection with the following information:
  - **Source** MSExchangeFrontEndTransport
  - **Event ID** 1035
  - **Description** Inbound authentication failed with error `IllegalMessage` for Receive connector Client Frontend <*server name*>. The authentication mechanism is Gssapi. The source IP address of the client who tried to authenticate to Exchange is [<*client IP address*>].

To work around this issue, you need to remove the `Integrated` authentication method from the client receive connector on your Exchange 2013 Client Access servers. To remove the `Integrated` authentication method from a client receive connector, run the following command on each Exchange 2013 Client Access server that could receive connections from computers running the **Send-MailMessage** cmdlet:

```
Set-ReceiveConnector "<server name>\Client Frontend <server name>" -AuthMechanism Tls, BasicAuth, BasicAuthRequireTLS
```

- **MAPI over HTTP may experience poor performance when you upgrade to Exchange 2013 SP1** If you upgrade from an Exchange 2013 cumulative update to Exchange 2013 SP1 and enable MAPI over HTTP, clients that connect to an Exchange 2013 SP1 server using the protocol may experience poor performance. This is because required settings aren't configured during an upgrade from a cumulative update to Exchange 2013 SP1. This issue doesn't occur if you upgrade to Exchange 2013 SP1 from Exchange 2013 RTM or if you install a new Exchange 2013 SP1 or later server.

Note:

This is only an issue if the MAPI over HTTP protocol is enabled on your Client Access servers. It's disabled by default. If MAPI over HTTP is disabled, clients use the RPC over HTTP protocol instead.

To work around this issue, do the following:

- On servers running the Client Access server role, run the following commands in a Windows Command Prompt:

```
set AppCmdLocation=%windir%\System32\inetsrv
set ExchangeLocation=%ProgramFiles%\Microsoft\Exchange Server\V15
```

```
%AppCmdLocation%\appcmd.exe SET AppPool
"MSExchangeMapiFrontEndAppPool" /CLRConfigFile:"%
ExchangeLocation%\bin
\MSExchangeMapiFrontEndAppPool_CLRConfig.config"
%AppCmdLocation%\appcmd.exe RECYCLE AppPool
"MSExchangeMapiFrontEndAppPool"
```

- On servers running the Mailbox server role, run the following commands in a Windows Command Prompt:

```
set AppCmdLocation=%windir%\System32\inetsrv
set ExchangeLocation=%ProgramFiles%\Microsoft\Exchange
Server\V15
%AppCmdLocation%\appcmd.exe SET AppPool
"MSExchangeMapiMailboxAppPool" /CLRConfigFile:"%
ExchangeLocation%\bin
\MSExchangeMapiMailboxAppPool_CLRConfig.config"
%AppCmdLocation%\appcmd.exe RECYCLE AppPool
"MSExchangeMapiMailboxAppPool"
%AppCmdLocation%\appcmd.exe SET AppPool
"MSExchangeMapiAddressBookAppPool" /CLRConfigFile:"%
ExchangeLocation%\bin
\MSExchangeMapiAddressBookAppPool_CLRConfig.config"
%AppCmdLocation%\appcmd.exe RECYCLE AppPool
"MSExchangeMapiAddressBookAppPool"
```

Exchange 2010 coexistence

- **Requests to access Exchange 2010 mailboxes may not work when proxied through Exchange 2013 Client Access servers** In some situations, the proxy request between the Exchange 2013 and Exchange 2010 Service Pack 3 (SP3) Client Access servers without any update rollups installed may not work correctly and an error appears. This can happen if all of the following conditions are true:
  - A user with an Exchange 2013 mailbox tries to open an Exchange 2010 mailbox using one of the following methods:
    - The **Open Another Mailbox** option in Outlook Web App **-OR-**
    - The **Another user** option in the Exchange admin center
  - The Client Access server the user connected to is running Exchange 2013.
  - The Exchange 2010 Client Access server was upgraded to Exchange 2010 SP3 from the release to manufacturing (RTM) version of Exchange 2010 or a previous Exchange 2010 service pack.

If all the conditions above are true, the user won't be able to access the other user's Exchange 2010

Outlook Web App options and a blank page may appear.

To work around this issue, install Exchange 2010 SP3 Update Rollup 1 or later on each Exchange 2010 server.

Updates for Exchange 2013

Exchange Server 2013 > What's new in Exchange 2013 >

Applies to: *Exchange Server 2013, Exchange Server, Exchange Online*

Topic Last Modified: *2014-08-27*

With Microsoft Exchange Server 2013, we've changed the way we deliver hotfixes and service packs. Instead of the priority-driven hotfix release and rollup update model used by previous versions of Microsoft Exchange, Exchange 2013 now adheres to a scheduled delivery model. In this model, cumulative updates are released quarterly.

For more information about Exchange 2013 Cumulative Update 6 (CU6), see Released: Exchange Server 2013 Cumulative Update 6 and Public Folder Updates in Exchange 2013 CU6: Improving Scale and More.

To download Exchange 2013, see Microsoft Exchange Server 2013 Cumulative Update 6.

Note:
Exchange 2013 cumulative updates and service packs include all the changes from previous updates and are full builds of the product. You don't have to install the previous cumulative updates or service packs to get the latest features.

For more information about updates as they relate to Exchange 2013, including an extensive FAQ, see Servicing Exchange 2013 and “Servicing Model Update” in Released: Exchange Server 2013 Cumulative Update 2.

The following table links to "What's New" topics and Exchange Team blog posts for each release of Exchange 2013. Click on the link for a release to learn more about the changes included in that release.

Exchange 2013 Release	Link
Exchange 2013 CU5	Released: Exchange Server 2013 Cumulative Update 5
Exchange 2013 SP1	New features and improvements included in Exchange 2013 SP1 Released: Exchange Server 2013 Service Pack 1

Exchange 2013 CU3	Released: Exchange Server 2013 Cumulative Update 3
Exchange 2013 CU2	Released: Exchange Server 2013 Cumulative Update 2
Exchange 2013 CU1	Released: Exchange Server 2013 Cumulative Update 1
Exchange 2013 RTM	What's new in Exchange 2013 Exchange Server 2013 Reaches General Availability

New features and improvements included in Exchange 2013 SP1

Windows Server 2012 R2 support

Windows Server 2012 R2 is now a supported operating system in Exchange 2013 SP1. Exchange 2013 SP1 also supports installation in Active Directory environments running Windows Server 2012 R2. For more information, see Exchange 2013 system requirements.

Edge Transport servers return

Edge Transport servers minimize attack surface by handling all Internet-facing mail flow, which provides SMTP relay and smart host services for your Exchange organization, including connection filtering, attachment filtering and address rewriting. For more information, see Edge Transport servers.

OWA Junk Email Reporting

Outlook Web App customers can report missed spam in the inbox (false negative) and misclassified as spam (false positive) messages to Microsoft for analysis by using its built-in junk email reporting options. Depending on the results of the analysis, we can then adjust the anti-spam filter rules for our Exchange Online Protection (EOP) service. For more information, see **Junk Email Reporting in OWA**.

S/MIME for Message Signing and Encryption

Exchange 2013 SP1 now supports S/MIME-based message security with Outlook Web App. Secure/Multipurpose Internet Mail Extensions (S/MIME) allows people to help protect sensitive information by sending signed and encrypted email within their organization. Administrators can enable S/MIME for mailboxes by synchronizing user certificates and then configuring Outlook Web App to support S/MIME. For more information, see S/MIME for message signing and encryption and the Get-SmimeConfig cmdlet reference.

DLP Policy Tips available in the desktop and mobile version of Outlook Web App

Data loss prevention (DLP) Policy Tips are informative notices that are displayed to senders in Outlook when they try sending sensitive information. In Exchange 2013 SP1, this functionality has been extended to both the desktop version of Outlook Web App and the mobile version (named OWA for Devices). You'll see it in action if you have an existing DLP policy with Policy Tips turned on for Outlook. If your policy already includes Policy Tips for Outlook, you don't need to set up anything else. Go ahead and try it out!

Not currently using Policy Tips? To get started, Create a DLP policy from a template, then add a policy tip by editing the policy and adding a **Notify the sender with a Policy Tip** action.

DLP Classification based on Document Fingerprints

Deep content analysis is a cornerstone of DLP in Exchange. Document Fingerprinting expands this capability to enable you to identify standard forms used in your organization, which may contain sensitive information. For example, you can create a fingerprint based off a blank employee information form, and then detect all employee information forms with sensitive content filled in.

DLP sensitive information types for new regions

Exchange 2013 SP1 provides an expanded set of standard DLP sensitive information types covering an increased set of regions, which makes it easier to start using the DLP features. Exchange 2013 SP1 adds region support for Poland, Finland and Taiwan. To learn more about the new DLP sensitive information types, see Sensitive information types inventory.

Using AD FS claims-based authentication with Outlook Web App and ECP

Deploying and configuring Active Directory Federation Services (AD FS) using claims means multifactor authentication can be used with Exchange 2013 SP1 including supporting smartcard and certificate-based authentication in Outlook Web App. In a nutshell, to implement AD FS to support multifactor authentication:

- Install and configure Windows Server 2012 R2 AD FS (this is the most current version of AD FS and contains additional support for multifactor authentication). To learn more about setting up AD FS, see Active Directory Federation Services (AD FS) Overview
- Create relying party trusts and the required AD FS claims.
- Publish Outlook Web App through Web Application Proxy (WAP) on Windows Server 2012 R2.
- Configure Exchange 2013 to use AD FS authentication.
- Configure the Outlook Web App virtual directory to use only AD FS authentication. All other methods of authentication should be disabled.
- Restart Internet Information Services on each Client Access server to load the configuration.

For details, see Using AD FS claims-based authentication with Outlook Web App and EAC

SSL Offloading support

SSL offloading is supported for all of the protocols and related services on Exchange 2013 Client Access servers. By enabling SSL offloading, you terminate the incoming SSL connections on a hardware load balancer instead of on the Client Access servers. Using SSL offloading moves the SSL workloads that are CPU and memory intensive from the Client Access server to a hardware load balancer.

SSL offloading is supported with following protocols and services:

- Outlook Web App
- Exchange Admin Center (EAC)
- Outlook Anywhere
- Offline Address Book (OAB)
- Exchange ActiveSync (EAS)
- Exchange Web Services (EWS)
- Autodiscover
- Mailbox Replication Proxy Service (MRSProxy)
- MAPI virtual directory for Outlook clients

If you have multiple Client Access servers, each Client Access server in your organization must be configured identically. You need to perform the required steps for each protocol or service on every Client Access server in your on-premises organization. For details, see Configuring SSL offloading in Exchange 2013

Public Attachment Handling in Exchange Online

Although there are both private (internal network) and public (external network) settings to control

attachments using Outlook Web App mailbox policies, admins require more consistent and reliable attachment handling when a user signs in to Outlook Web App from a computer on a public network such as at a coffee shop or library. Go here for details, Public Attachment Handling in Exchange Online.

Browser Support for AppCache

Internet Explorer 10 and Windows Store apps using JavaScript support the Application Cache API (or AppCache), as defined in the HTML5 specification, which allows you to create offline web applications. AppCache enables webpages to cache (or save) resources locally, including images, script libraries, style sheets, and so on. In addition, AppCache allows URLs to be served from cached content using standard Uniform Resource Identifier (URI) notation. The following is a list of the browsers that support AppCache:

- Internet Explorer 10 or later versions
- Google Chrome 24 or later versions
- Firefox 23 or later versions
- Safari 6 or later (only on OS X/iOS) versions

Exchange OAuth authentication protocol

Information workers in Exchange on-premises organizations need to collaborate with information workers in Exchange Online organizations when they are connected via an Exchange hybrid deployment. New in Exchange 2013 SP1, this connection can now be enabled and enhanced by using the new Exchange OAuth authentication protocol. The new Exchange OAuth authentication process will replace the Exchange federation trust configuration process and currently enables the following Exchange features:

- Exchange hybrid deployment features, such as shared free/busy calendar information, MailTips, and Message Tracking.
- Exchange In-place eDiscovery

For more information, see Configure OAuth authentication between Exchange and Exchange Online organizations.

Hybrid deployments with multiple Active Directory forests

New in Exchange 2013 SP1, hybrid deployments are now supported in organizations with multiple Active Directory forests. For hybrid deployment features and considerations, multi-forest organizations are defined as organizations having Exchange servers deployed in multiple Active Directory forests. Organizations that utilize a resource forest for user accounts, but maintain all Exchange servers in a single forest, aren't classified as multi-forest in hybrid deployment scenarios. These types of organizations should consider themselves a single forest organization when planning and configuring a hybrid deployment.

For more information, see **Hybrid deployments with multiple Active Directory forests**.

Database Availability Group without an Administrative Access Point

Windows Server 2012 R2 enables you to create a failover cluster without an administrative access point. Exchange 2013 SP1 introduces the ability to leverage this capability and create a database availability group (DAG) without a cluster administrative access point. Creating a DAG without an administrative access point reduces complexity and simplifies DAG management. In addition, it reduces the attack surface of a DAG by removing the cluster/DAG name from DNS, thereby making it unresolvable over the network.

For more information, see High availability and site resilience.

UM Language Packs

The UM language packs for Exchange 2013 SP1 are available. If you install SP1 on your Mailbox servers, you must install the Exchange 2013 SP1 UM language packs. See Exchange Server 2013 SP1 UM Language Packs to download them. UM language packs are specific to the version of Exchange and the Service Pack (SP) installed.

Planning and deployment

Exchange Server 2013 >

Applies to: *Exchange Server*

Topic Last Modified: *2014-01-28*

The following sections contain links to information about planning for and then deploying Microsoft Exchange Server 2013.

Important:
Make sure you read the Release notes for Exchange 2013 topic before you begin your deployment. The release notes contain important information on issues you might encounter during and after your deployment.

Contents

Planning for Exchange 2013

Use the following links to access information to help you plan the deployment of Exchange Server 2013 into your organization.

Important:
See Establish a Test Environment later in this topic about installing Exchange 2013 in a test environment.

Mailbox and Client Access servers

Learn about the Mailbox and Client Access server roles that are included with Exchange 2013.

Exchange 2013 system requirements

Understand the system requirements that need to be satisfied in your organization before you can install Exchange 2013.

Exchange 2013 prerequisites

Learn which Windows Server 2008 R2 Service Pack 1 (SP1) or Windows Server 2012 features and the other software that needs to be installed to perform a successful installation of Exchange 2013.

Exchange Server Deployment Assistant

Use this tool to generate a customized checklist for planning, installing, or upgrading to Exchange 2013. Guidance is available for multiple scenarios, including an on-premises, hybrid, or cloud deployment.

Active Directory

Read this topic to learn about how Exchange 2013 uses Active Directory and how your Active Directory deployment affects your Exchange deployment.

Anti-malware protection

Read this topic to understand anti-malware protection options for Exchange 2013.

Exchange Server 2013 Hybrid Deployments

Read this topic to help you with planning a hybrid deployment with Microsoft Office 365 and your on-premises Exchange 2013 organization.

Planning for high availability and site resilience

Read this topic to help you with planning to achieve your high availability and business continuity requirements.

Integration with SharePoint and Lync

Read this topic to learn about integrating Exchange 2013, Microsoft SharePoint 2013, and Microsoft Lync 2013 to enable cross-product archiving, hold, and eDiscovery; site mailboxes; authentication; Lync presence; and more.

Planning for Unified Messaging

Read this topic to learn more about planning for Exchange 2013 Unified Messaging.

Exchange 2013 storage configuration options

Read this topic to learn about the storage architectures, disk types, and storage configurations supported by the Exchange 2013 Mailbox server role.

Exchange 2013 virtualization

Read this topic to learn more about how you can deploy Exchange 2013 in a virtualized environment.

Multi-tenancy in Exchange 2013

Read this topic to learn more about how you can configure Exchange 2013 to host multiple and discrete organizations or business units that ordinarily don't share email, data, users, global address lists (GALs), or other commonly used Exchange objects.

Exchange Development Technologies

This topic contains important information about Application Programming Interfaces (APIs) that are available for applications that use Exchange 2013.

Establish a test environment

Before installing Exchange 2013 for the first time, we recommend that you install it in an isolated test environment. This approach reduces the risk of end-user downtime and negative ramifications to the production environment.

The test environment will act as your "proof of concept" for your new Exchange 2013 design and make it possible to move forward or roll back any implementations before deploying into your production environments. Having an exclusive test environment for validation and testing allows you to do pre-installation checks for your future production environments. By installing in a test environment first, we believe that your organization will have a better likelihood of success in a full production implementation.

For many organizations, the costs of building a test lab may be high because of the need to duplicate the production environment. To reduce the hardware costs associated with a prototype lab, we recommend the use of virtualization by using Windows Server 2008 R2 or Windows Server 2012 Hyper-V technologies. Hyper-V enables server virtualization, allowing multiple virtual operating systems to run on a single physical machine.

For more detailed information about Hyper-V, see Server Virtualization. For information about Microsoft support of Exchange 2013 in production on hardware virtualization software, see "Hardware virtualization" in Exchange 2013 system requirements.

Deploying Exchange 2013

The deployment phase is the period during which you install Exchange 2013 into your organization. Before you begin the deployment phase, you should plan your Exchange organization. For more information, see the Planning section earlier in this topic.

Use the following links to access the information you need to help you with deploying Exchange 2013.

Prepare Active Directory and domains

Learn about the steps you need to take to prepare your Active Directory forest for Exchange 2013 and the changes Exchange makes to your forest.

Install Exchange 2013 using the Setup wizard

Follow the steps in this topic to use the Exchange 2013 Setup wizard to install Exchange 2013 into a new Exchange organization.

Install Exchange 2013 using unattended mode

Follow the steps in this topic to use Exchange 2013 unattended setup to install Exchange 2013 into a new Exchange organization.

Install the Exchange 2013 Edge Transport role using the Setup wizard

Follow the steps in this topic to use the Exchange 2013 Setup wizard to install the Exchange 2013 Edge Transport role into a perimeter network.

Upgrade Exchange 2013 to the latest cumulative update or service pack

Follow the steps in this topic to apply the latest cumulative update or service pack to Exchange 2013 servers in your organization.

Upgrade from Exchange 2010 to Exchange 2013

Follow the steps in this topic to install Exchange 2013 into an existing Exchange 2010 organization.

Upgrade from Exchange 2007 to Exchange 2013

Follow the steps in this topic to install Exchange 2013 into an existing Exchange 2007 organization.

Deploy multiple forest topologies for Exchange 2013

Read this topic for information that will help you deploy Exchange 2013 in an organization that contains more than one Active Directory forest.

Deploying voice mail and UM

Read this topic for information that will help you understand deploying Exchange 2013 Unified Messaging, whether a new deployment or an upgrade.

Hybrid Deployment procedures

Read this topic for information that will help you deploy Exchange 2013 in an existing hybrid deployment.

Exchange 2013 post-Installation tasks

Learn about post-installation tasks to complete your Exchange 2013 installation.

Understanding Exchange 2013 Setup

You can use different types and modes of Exchange 2013 Setup to install and maintain the various editions and versions of Exchange 2013.

Exchange editions and versions

Exchange 2013 is available in two server editions: Standard Edition and Enterprise Edition. These are licensing editions that are defined by a product key. For more information, see Exchange Server

Licensing.

Types of Exchange Setup

You have the following options for Exchange 2013 Setup:

- **Exchange Setup UI** Running Setup.exe without any command-line switches provides an interactive experience where you are guided by the Exchange 2013 Setup wizard.
- **Exchange Unattended Setup** Running Setup.exe with command-line switches enables you to install Exchange from an interactive command line or through a script.

Setup.exe is available from the Exchange 2013 DVD or the downloaded source files.

Modes of Exchange Setup

Setup for Exchange 2013 includes several installation modes:

- **Install** Use this mode when you're installing a new server role or adding a server role to an existing installation (maintenance mode). You can use this mode from both the Exchange Setup wizard and the unattended install.
- **Uninstall** Use this mode when you're removing the Exchange installation from a computer. You can use this mode from both the Exchange Setup wizard and the unattended install.
- **Upgrade** Select this mode used when you have an existing installation of Exchange and you're installing a cumulative update or service pack. You can use this mode from both the Exchange Setup wizard and the unattended install.

Note:

Exchange 2013 doesn't support in-place upgrades from previous versions of Exchange. This mode is used only to install cumulative updates or service packs.

- **RecoverServer** Use this mode when there has been a catastrophic failure of a server, and you need to recover data. You must install a server using the same fully qualified domain name (FQDN) as the failed server, and then run Setup with the **/m:RecoverServer** switch. Don't specify the roles to restore. Setup detects the Exchange Server object in Active Directory and installs the corresponding files and configuration automatically. After you recover the server, you can restore databases and reconfigure any additional settings. To run in **RecoverServer** mode, you can't have Exchange installed on the server. The Exchange server object must exist in Active Directory. You can only use this mode during an unattended installation.

Note:

You must complete one mode of Setup before you can use another mode.

Exchange Server Deployment Assistant

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013, Exchange Server, Exchange Online*

Topic Last Modified: *2013-08-27*

The Exchange Server Deployment Assistant is a Web-based tool that can help you with your Microsoft Exchange Server 2013 deployment. The Deployment Assistant asks you a few questions about your current environment and then generates a custom checklist and procedures that help simplify your deployment. To access the Deployment Assistant, see Exchange Server Deployment Assistant.

You can use the Deployment Assistant for the following deployment scenarios:

- **On-Premises only**
  - New installation of Exchange Server 2013
  - Upgrade from Exchange Server 2010 to Exchange 2013
  - Upgrade from Exchange Server 2007 to Exchange 2013
  - Upgrade from a mixed Exchange 2007 and Exchange 2010 organization to Exchange 2013

For more information about this scenario, see Planning and deployment.

- **Hybrid (On-Premises + Exchange Online)**
  - Exchange 2013 on-premises with Exchange Online
  - Exchange 2010 on-premises with Exchange Online
  - Exchange 2007 on-premises with Exchange Online

For more information about this scenario, see **Exchange Server 2013 Hybrid Deployments**.

Important:
If you have an Exchange 2003 on-premises organization and want to configure a new hybrid deployment with Office 365, you must add one or more servers running Exchange 2010 Server Service Pack 3, not Exchange 2013 servers, to your on-premises organization. To do that, we strongly recommend that you use the Exchange 2010 hybrid deployment option in the Exchange Server Deployment Assistant.

- **Cloud only**

For more information about this scenario, see **Understanding Cloud-Only Deployments**.

In addition to the above Exchange 2013 deployment scenarios, the Deployment Assistant also has deployment scenarios for Exchange 2010.

Active Directory

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-11*

Microsoft Exchange Server 2013 uses Active Directory to store and share directory information with Windows. Active Directory forest design for Exchange 2013 is similar to Exchange Server 2010, except in a few ways, which are discussed below.

Active Directory driver

The Active Directory driver is the core Microsoft Exchange component that allows Exchange services to create, modify, delete, and query for Active Directory Domain Services (AD DS) data. In Exchange 2013, all access to Active Directory is done using the Active Directory driver itself. Previously, in Exchange 2010, DSAccess provided directory lookup services for components such as SMTP, message transfer agent (MTA), and the Exchange store.

The Active Directory driver also uses Microsoft Exchange Active Directory Topology (MSExchangeADTopology), which allows the Active Directory driver to use Directory Service Access (DSAccess) topology data. This data includes the list of available domain controllers and global catalog servers available to handle Exchange requests. For more information about the Active Directory Driver, see Active Directory Domain Services.

Active Directory schema changes

Exchange 2013 adds new attributes to the Active Directory domain service schema and also makes other modifications to existing classes and attributes. For more information about Active Directory changes when you install Exchange 2013, see Exchange 2013 Active Directory schema changes.

For more information

To learn more about how Exchange 2013 stores and retrieves information in Active Directory so that you can plan access to it, see Access to Active Directory.

For more information about Active Directory forest design, see AD DS Design Guide.

To learn more about computers running Windows in an Active Directory domain and deploying Exchange 2013 in a domain that has a disjoint namespace, see Disjoint namespace scenarios.

Access to Active Directory

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-05-17*

Microsoft Exchange Server 2013 stores all configuration and recipient information in the Active Directory directory service database. When a computer running Exchange 2013 requires information about recipients and information about the configuration of the Exchange organization, it must query Active Directory to access the information. Active Directory servers must be available for Exchange 2013 to function correctly.

This topic explains how Exchange 2013 stores and retrieves information in Active Directory so that you can plan access to Active Directory. This topic also discusses issues you should be aware of if you try to recover deleted Exchange 2013 Active Directory objects.

Exchange information stored in Active Directory

The Active Directory database stores information in three types of logical partitions that are described in the following sections:

- Schema partition
- Configuration partition
- Domain partition

Schema partition

The schema partition stores the following two types of information:

- **Schema classes** define all the types of objects that can be created and stored in Active Directory.
- **Schema attributes** define all the properties that can be used to describe the objects that are stored in Active Directory.

When you install the first Exchange 2013 server role in the forest or run the Active Directory preparation process, the Active Directory preparation process adds many classes and attributes to the Active Directory schema. The classes that are added to the schema are used to create Exchange-specific objects, such as agents and connectors. The attributes that are added to the schema are used to configure the Exchange-specific objects and the mail-enabled users and groups. These attributes include properties, such as Microsoft Office Outlook Web Access settings and Microsoft Exchange Unified Messaging (UM) settings. Every domain controller and global catalog server in the forest contains a complete replica of the schema partition.

For more information about schema modifications in Exchange 2013, see Exchange 2013 Active Directory schema changes.

Configuration partition

The configuration partition stores information about the forest-wide configuration. This configuration information includes the configuration of Active Directory sites, Exchange global settings, transport settings, and mailbox policies. Each type of configuration information is stored in a container in the configuration partition. Exchange configuration information is stored in a subfolder under the configuration partition's Services container. The information that is stored in this container includes the following:

- Address lists
- Address book mailbox policies
- Administrative groups
- Client access settings
- Connections
- Mobile Mailbox Settings
- Global settings
- Monitoring Settings
- System policies
- Retention policies container
- Transport settings

Every domain controller and global catalog server in the forest contains a complete replica of the configuration partition.

Domain partition

The domain partition stores information in default containers and in organizational units that are created by the Active Directory administrator. These containers hold the domain-specific objects. This data includes Exchange system objects and information about the computers, users, and groups in that domain. When Exchange 2013 is installed, Exchange updates the objects in this partition to support Exchange functionality. This functionality affects how recipient information is stored and accessed.

Each domain controller contains a complete replica of the domain partition for the domain for which it is authoritative. Every global catalog server in the forest contains a subset of the information in every domain partition in the forest.

How Exchange 2013 accesses information in Active Directory

Exchange 2013 uses an Active Directory API to access information that is stored in Active Directory. The Microsoft Exchange Active Directory Topology service runs on all Exchange 2013 server roles.

This service reads information from all Active Directory partitions. The data that is retrieved is cached and is used by Exchange 2013 servers to discover the Active Directory site location of all Exchange services in the organization.

For more information about topology and service discovery, see Planning to use Active Directory sites for routing mail.

Exchange 2013 is an Active Directory site-aware application that prefers to communicate with the directory servers that are located in the same site as the Exchange server to optimize network traffic. Each Exchange 2013 organizational server role must communicate with Active Directory to retrieve information about recipients and information about the other Exchange 2013 server roles. The data that each server role obtains is described in the following sections.

By default, whenever an Exchange 2013 server starts, it binds to a randomly selected domain controller and global catalog server in its own site. You can view the selected directory servers by using the **Get-ExchangeServer** cmdlet in the Exchange Management Shell. You can also use the **Set-ExchangeServer** cmdlet to configure a static list of domain controllers to which an Exchange 2013 server should bind or a list of domain controllers that should be excluded.

Important:
A Windows Server 2008 domain controller can be configured as a read-only directory server. This configuration is useful when you want to deploy a domain controller or global catalog server in a remote site for authentication and authorization purposes, but you don't want to allow administrators in that site to write changes to Active Directory. However, you can't deploy an Exchange 2013 server in any site that contains only read-only directory servers.

Mailbox server role

The Mailbox server role stores configuration information about mailbox users and stores in Active Directory. Additionally, for Exchange 2013, the Mailbox server includes all the traditional server components found in Exchange 2010: the Client Access protocols, Transport service, Mailbox databases, and Unified Messaging. The Mailbox server handles all activity for the active mailboxes on that server.

Client access server role

In Exchange 2013, the Client Access server provides authentication, limited redirection, and proxy services. The Client Access server itself doesn't do any data rendering. The Client Access server is a thin and stateless server. There is never anything queued or stored on the Client Access server. The Client Access server offers all the usual client access protocols: HTTP, POP and IMAP, and SMTP.

Recovery of deleted Exchange objects

Active Directory Recycle Bin helps minimize directory service downtime by enhancing your ability to preserve and recover accidentally deleted Active Directory objects without restoring Active

Directory data from backups, restarting Active Directory Domain Services (AD DS), or rebooting domain controllers.

The most important thing to understand about recovering deleted Exchange-related Active Directory objects is that Exchange objects don't exist in isolation. For example, when you mail-enable a user, several different policies and links are calculated for the user based on your current Exchange configuration. Two problems that may arise when you restore a deleted Exchange configuration or recipient object are:

- **Collisions** Some Exchange attributes must be unique across a forest. For example, proxy (email) addresses must not be the same for two different users. Active Directory doesn't enforce proxy address uniqueness—Exchange administrative tools check for uniqueness. Exchange email address policies also automatically resolve possible conflicts in proxy address assignment based on deterministic rules. Therefore, it's possible to restore an Exchange user object and, as a result, create a collision with proxy addresses or other attributes that should be unique.
- **Misconfigurations** Exchange has automated rules that assign various policies or settings. If you delete a recipient, and then change the rules or policies, restoring an Exchange user object may result in a user being assigned to the wrong policy (or even to a policy that no longer exists).

The following guidelines will help you minimize problems or issues when you recover deleted Exchange-related objects:

- If you deleted an Exchange configuration object using Exchange management tools, don't restore the object. Instead, create the object again using the Exchange management tools (Exchange admin center or Exchange Management Shell).
- If you deleted an Exchange configuration object without using the Exchange management tools, recover the object as soon as possible. The more administrative and configuration changes that have been made in the system since the deletion, the more likely it is that restoring the objects will result in misconfiguration.
- If you recover deleted Exchange recipients (contacts, users, or distribution groups), monitor closely for collisions and errors relating to the recovered objects. If Exchange policies or other configuration relating to recipients may have been modified since the deletion, re-apply current policies to the restored recipients to ensure that they're configured correctly.

Exchange 2013 Active Directory schema

changes

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-06*

Microsoft Exchange Server 2013 adds new and modifies existing Active Directory schema classes and attributes. This reference topic provides a summary of the Active Directory schema changes that are made when you install the release to manufacturing (RTM) version of Exchange 2013 or any of its cumulative updates or service packs. Refer to the .ldf files for more information about changes to the Active Directory schema. The .ldf files are located in the \amd64\Setup\Data\ directory in the Exchange installation files.

Note:
The Active Directory schema changes identified in this topic may not apply to all editions of an Exchange Server version. To verify that Active Directory has been successfully prepared, see the "How do you know this worked?" section in Prepare Active Directory and domains.

This document includes the following sections:

- Exchange 2013 CU6 Active Directory schema changes
- Exchange 2013 CU5 Active Directory schema changes
- Exchange 2013 SP1 Active Directory schema changes
- Exchange 2013 CU3 Active Directory schema changes
- Exchange 2013 CU2 Active Directory schema changes
- Exchange 2013 CU1 Active Directory schema changes
- Exchange 2013 RTM Active Directory schema changes

Exchange 2013 CU6 Active Directory schema changes

This section summarizes the changes that are made to the Active Directory schema when you install Exchange 2013 CU6. This section includes the following subsections:

- Classes modified by Exchange 2013 CU6
- Attributes added by Exchange 2013 CU6
- Attributes modified by Exchange 2013 CU6

Classes modified by Exchange 2013 CU6

This section contains the attributes added in Exchange 2013 CU6.

Class	Change	Attribute/Class

Disjoint namespace scenarios

Exchange Server 2013 > Planning and deployment > Active Directory >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-10*

This topic provides information about the concept of disjoint namespaces and the supported scenarios for deploying Microsoft Exchange 2013 in a domain that has a disjoint namespace.

Contents

Exchange 2013 and disjoint namespaces

Allow Exchange 2013 servers to access domain controllers that are disjoint

View DNS and NetBIOS name-related information of a computer running Windows Server 2008

DNS and NetBIOS domain names

First, some background. Every computer that is on the Internet has a Domain Name System (DNS) name. This is also known as the *machine name* or *host name*. Every computer running the Windows operating system with networking capabilities also has a NetBIOS name.

A computer running Windows in an Active Directory domain has both a DNS domain name and a NetBIOS domain name, as follows:

- **DNS domain name** The DNS domain name consists of one or more subdomains separated by a dot (.) and is terminated by a top-level domain name. For example, in the DNS domain name corp.contoso.com, the subdomains are corp and contoso and the top-level domain name is com.
- **NetBIOS domain name** Typically, the NetBIOS domain name is the subdomain of the DNS domain name. For example, if the DNS domain name is contoso.com, the NetBIOS domain name is contoso. If the DNS domain name is corp.contoso.com, the NetBIOS domain name is corp.

Note:

To find DNS and NetBIOS information for computers running Windows Server 2008, see View DNS and NetBIOS name-related information of a computer running Windows Server 2008.

A computer in an Active Directory domain also has a primary DNS suffix and can have additional DNS suffixes. By default, the primary DNS suffix is the same as the DNS domain name. For detailed steps about how to change the primary DNS suffix, see the procedures later in this topic.

You define the DNS domain name and NetBIOS domain name of an Active Directory domain when you configure the first domain controller in the domain. For more information about configuring domain controllers, see Domain Controller Roles and Active Directory Domain Services Overview.

Disjoint namespaces

In most domain topologies, the primary DNS suffix of the computers in the domain is the same as the DNS domain name.

In some cases, you may require these namespaces to be different. This is called a *disjoint namespace*. For example, a merger or acquisition may cause you to have a topology with a disjoint namespace. In addition, if DNS management in your company is split between administrators who manage Active Directory and administrators who manage networks, you may need to have a topology with a disjoint namespace.

A disjoint namespace scenario is one in which the primary DNS suffix of a computer doesn't match the DNS domain name where that computer resides. The computer with the primary DNS suffix that

doesn't match is said to be *disjoint*. Another disjoint namespace scenario occurs if the NetBIOS domain name of a domain controller doesn't match the DNS domain name.

Exchange 2013 and disjoint namespaces

Exchange 2013 supports the following three scenarios for deploying Exchange in a domain that has a disjoint namespace:

- **Primary DNS suffix and DNS domain name are different** The primary DNS suffix of the domain controller isn't the same as the DNS domain name. Computers that are members of the domain can be either disjoint or not disjoint.
- **Member computer is disjoint** A member computer in an Active Directory domain is disjoint, even though the domain controller is not disjoint.
- **NetBIOS name of domain controller differs from subdomain of its DNS domain name** The NetBIOS domain name of the domain controller isn't the same as the subdomain of the DNS domain name of that domain controller.

These scenarios are detailed in the following sections.

Note:

It's supported to run Exchange 2013 in the disjoint namespace scenarios described in this topic. However, if you have a disjoint namespace scenario that isn't one of the scenarios described in this topic, you must work with Microsoft Services to deploy Exchange 2013. For more information, see Microsoft Services.

Scenario: Primary DNS suffix and DNS domain name are different

In this scenario, the primary DNS suffix of the domain controller isn't the same as the DNS domain name. The domain controller is disjoint in this scenario. Computers that are members of the domain, including Exchange servers and Microsoft Outlook client computers, can have a primary DNS suffix that either matches the primary DNS suffix of the domain controller or matches the DNS domain name.

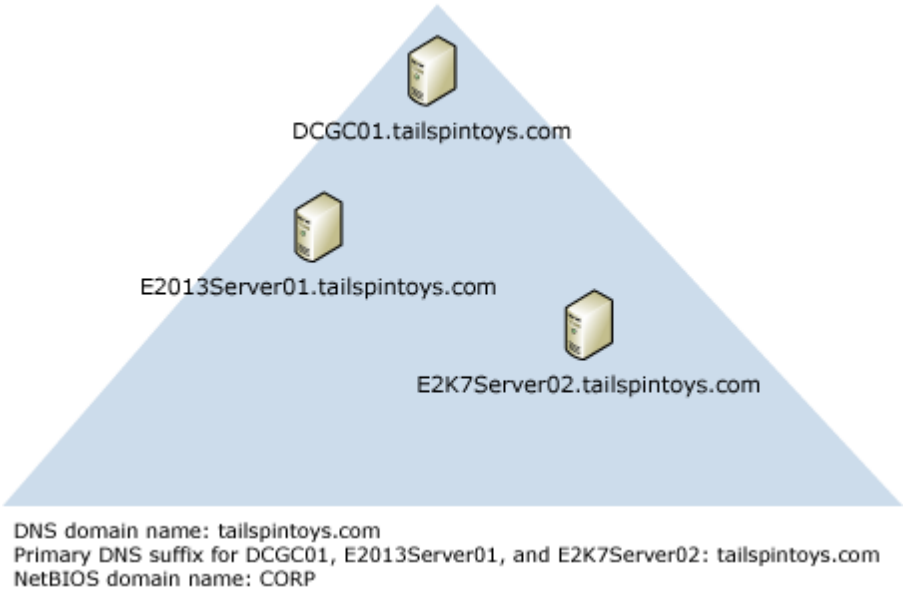
Scenario: Member computer is disjoint

In this scenario, the primary DNS suffix of a member computer on which Exchange 2013 is installed isn't the same as the DNS domain name, even though the primary DNS suffix of the domain controller is the same as the DNS domain name. In this scenario, you have a domain controller that isn't disjoint and a member computer that is disjoint. Member computers that are running Outlook can have a primary DNS suffix that either matches the primary DNS suffix of the disjoint Exchange server or matches the DNS domain name.

Scenario: NetBIOS name of domain controller differs from subdomain of its DNS domain name

In this scenario, the NetBIOS domain name of the domain controller isn't the same as the DNS domain name of the same domain controller.

NetBIOS domain name doesn't match DNS domain name



Allow Exchange 2013 servers to access domain controllers that are disjoint

To allow Exchange 2013 servers to access domain controllers that are disjoint, you must modify the **msDS-AllowedDNSSuffixes** Active Directory attribute on the domain object container. You must add both of the DNS suffixes to the attribute. For detailed steps about how to modify the attribute, see The computer's primary DNS suffix does not match the FQDN of the domain where it resides.

In addition, to make sure that the DNS suffix search list contains all DNS namespaces that are deployed within the organization, you must configure the search list for each computer in the domain that is disjoint. The list of namespaces should include not only the primary DNS suffix of the domain controller and the DNS domain name, but also any additional namespaces for other servers with which Exchange may interoperate (such as monitoring servers or servers for third-party applications). You can do this by setting Group Policy for the domain. For more information about Group Policy, see the following topics:

- Group Policy Frequently Asked Questions (FAQ)
- New group policies for DNS in Windows Server 2003
- Group Policy

For detailed steps about how to configure the DNS suffix search list Group Policy, see Configure the

DNS suffix search list for a disjoint namespace.

View DNS and NetBIOS name-related information of a computer running Windows Server 2008

1. Click **Start**, right-click **Computer**, and then click **Properties**.
2. In **System**, the DNS host name and primary DNS suffix are displayed under **Computer name, domain, and workgroup settings** next to **Full computer name**. The DNS domain name is displayed next to **Domain**.
3. Click **Change settings**.
4. In **System Properties**, on the **Computer Name** tab, click **Change**.
5. In **Computer Name/Domain Changes**, click **More**. The primary DNS suffix is displayed under **Primary DNS suffix of this computer**. The NetBIOS computer name is displayed under **NetBIOS computer name**.

To change the primary DNS suffix, type the new primary DNS suffix under **Primary DNS suffix of this computer**, and then click **OK**.

6. From a Command Prompt window, type **set**. The variable USERDNSDOMAIN displays the DNS domain name. The variable USERDOMAIN displays the NetBIOS domain name.

Configure the DNS suffix search list for a disjoint namespace

Planning and deployment > Active Directory > Disjoint namespace scenarios >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-08*

This topic explains how to use the Group Policy Management console (GPMC) to configure the Domain Name System (DNS) suffix search list. In some Microsoft Exchange 2013 scenarios, if you have a disjoint namespace, you must configure the DNS suffix search list to include multiple DNS suffixes.

What do you need to know before you begin?

- Estimated time to complete: 10 minutes
- To perform this procedure, the account you use must be delegated membership in the Domain Admins group.
- Confirm that you have installed .NET Framework 3.0 on the computer on which you will install the GPMC.

Note:

The current version of the GPMC that you can download from the Microsoft Download Center operates on the 32-bit versions of the Windows Server 2003 and Windows XP operating systems and can remotely manage Group Policy objects on 32-bit and 64-bit domain controllers. This version of the GPMC doesn't include a 64-bit version, and the 32-bit version doesn't run on 64-bit platforms. The 32-bit version of Windows Server 2008 and the 32-bit version of Windows Vista both include a 32-bit version of the GPMC. The 64-bit version of Windows Server 2008 and the 64-bit version of Windows Vista both include a 64-bit version of the GPMC.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the GPMC to configure the DNS suffix search list

1. On a 32-bit computer in your domain, install GPMC with Service Pack 1 (SP1). For download information, see Group Policy Management Console with Service Pack 1.

Note:

If you have a computer in your domain running Windows Server 2008 or Windows Vista, you can skip this step.

2. Click **Start** > **Programs** > **Administrative Tools** > **Group Policy Management**.
3. In **Group Policy Management**, expand the forest and the domain in which you will apply Group Policy. Right-click **Group Policy Objects**, and then click **New**.
4. In **New GPO**, type a name for the policy, and then click **OK**.
5. Right-click the new policy that you created in Step 4, and then click **Edit**.
6. In **Group Policy Management Editor**, expand **Computer Configuration**, expand **Policies**, expand **Administrative Templates**, expand **Network**, and then click **DNS Client**.
7. Right-click **DNS Suffix Search List**, click **All Tasks**, and then click **Edit**.
8. On the **DNS Suffix Search List Properties** page, select **Enabled**. In the **DNS Suffixes** box, type the primary DNS suffix of the disjoint computer, the DNS domain name, and any additional namespaces for other servers with which Exchange may interoperate, such as monitoring servers or servers for third-party applications. Click **OK**.
9. In **Group Policy Management**, expand **Group Policy Objects**, and then select the policy that you created in Step 4. On the **Scope** tab, scope the policy so that it applies to only the computers that are disjoint.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- After you install Exchange 2013, verify that you can send email messages inside and outside your

organization.

Disjoint namespace scenarios

Exchange 2013 system requirements

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-25*

Before you install Microsoft Exchange Server 2013, we recommend that you review this topic to ensure that your network, hardware, software, clients, and other elements meet the requirements for Exchange 2013. In addition, make sure you understand the coexistence scenarios that are supported for Exchange 2013 and earlier versions of Exchange.

Supported coexistence scenarios

The following table lists the scenarios in which coexistence between Exchange 2013 and earlier versions of Exchange is supported.

Coexistence of Exchange 2013 and earlier versions of Exchange Server

Exchange version	Exchange organization coexistence
Exchange Server 2003 and earlier versions	Not supported
Exchange 2007	Supported with the following minimum versions of Exchange: • [1]Update Rollup 10 for Exchange 2007 Service Pack 3 (SP3) on all Exchange 2007 servers in the organization, including Edge Transport servers. • Exchange 2013 Cumulative Update 2 (CU2) or later on all Exchange 2013 servers in the

	organization.
Exchange 2010	Supported with the following minimum versions of Exchange: • [2]Exchange 2010 SP3 on all Exchange 2010 servers in the organization, including Edge Transport servers. • Exchange 2013 CU2 or later on all Exchange 2013 servers in the organization.
Mixed Exchange 2010 and Exchange 2007 organization	Supported with the following minimum versions of Exchange: • [1]Update Rollup 10 for Exchange 2007 SP3 on all Exchange 2007 servers in the organization, including Edge Transport servers. • [2]Exchange 2010 SP3 on all Exchange 2010 servers in the organization, including Edge Transport servers. • Exchange 2013 CU2 or later on all Exchange 2013 servers in the organization.

[1] If you want to create an EdgeSync Subscription between an Exchange 2007 Hub Transport server and an Exchange 2013 SP1 Edge Transport server, you need to install Exchange 2007 SP3 Update Rollup 13 or later on the Exchange 2007 Hub Transport server.

[2] If you want to create an EdgeSync Subscription between an Exchange 2010 Hub Transport server and an Exchange 2013 SP1 Edge Transport server, you need to install Exchange 2010 SP3 Update Rollup 5 or later on the Exchange 2010 Hub Transport server.

Supported hybrid deployment scenarios

Exchange 2013 supports hybrid deployments with Office 365 tenants that have been upgraded to the latest version of Office 365. For more information about specific hybrid deployments, see **Hybrid deployment prerequisites**.

Network and directory servers

The following table lists the requirements for the network and the directory servers in your Exchange 2013 organization.

Network and directory server requirements for Exchange 2013

Component	Requirement
Schema master	By default, the schema master runs on the first Active Directory domain controller installed in a forest. The schema master must be running one of the following: • Windows Server 2012 R2 Standard or Datacenter[1] • Windows Server 2012 Standard or Datacenter • Windows Server 2008 R2 Standard or Enterprise • Windows Server 2008 R2 Datacenter RTM or later • Windows Server 2008 Standard or Enterprise (32-bit or 64-bit) • Windows Server 2008 Datacenter RTM or later • Windows Server 2003 Standard Edition with Service Pack 2 (SP2) or later (32-bit or 64-bit) • Windows Server 2003 Enterprise Edition with SP2 or later (32-bit or 64-bit)
Global catalog server	In each Active Directory site where you plan to install Exchange 2013, you must have at least one global catalog server running one of the following: • Windows Server 2012 R2 Standard or Datacenter[1] • Windows Server 2012 Standard or Datacenter • Windows Server 2008 R2 Standard or Enterprise • Windows Server 2008 R2 Datacenter RTM or later • Windows Server 2008 Standard or Enterprise (32-bit or 64-bit)

	• Windows Server 2008 Datacenter RTM or later • Windows Server 2003 Standard Edition with Service Pack 2 (SP2) or later (32-bit or 64-bit) • Windows Server 2003 Enterprise Edition with SP2 or later (32-bit or 64-bit) For more information about global catalog servers, see What is the Global Catalog.
Domain controller	In each Active Directory site where you plan to install Exchange 2013, you must have at least one writeable domain controller running one of the following: • Windows Server 2012 R2 Standard or Datacenter[1] • Windows Server 2012 Standard or Datacenter • Windows Server 2008 R2 Standard or Enterprise SP1 or later • Windows Server 2008 R2 Datacenter RTM or later • Windows Server 2008 Standard or Enterprise SP1 or later (32-bit or 64-bit) • Windows Server 2008 Datacenter RTM or later • Windows Server 2003 Standard Edition with Service Pack 2 (SP2) or later (32-bit or 64-bit) • Windows Server 2003 Enterprise Edition with SP2 or later (32-bit or 64-bit)
Active Directory forest	Active Directory must be at Windows Server 2003 forest functionality mode or higher[2].
DNS namespace support	Exchange 2013 supports the following domain name system (DNS) namespaces: • Contiguous • Noncontiguous • Single label domains

	• Disjoint For more information about DNS namespaces supported by Exchange, see Microsoft Knowledge Base article 2269838, Microsoft Exchange compatibility with Single Label Domains, Disjoined Namespaces, and Discontiguous Namespaces.
IPv6 support	In Exchange 2013, IPv6 is supported only when IPv4 is also installed and enabled. If Exchange 2013 is deployed in this configuration, and the network supports IPv4 and IPv6, all Exchange servers can send data to and receive data from devices, servers, and clients that use IPv6 addresses. For more information, see IPv6 support in Exchange 2013.

[1] Windows Server 2012 R2 is supported only with Exchange 2013 SP1 or later.

[2] Windows Server 2012 R2 forest functionality mode is supported only with Exchange 2013 SP1 or later.

Directory server architecture

The use of 64-bit Active Directory domain controllers increases directory service performance for Exchange 2013.

Note:

In multi-domain environments, on Windows Server 2008 domain controllers that have the Active Directory language locale set to Japanese, your servers may not receive some attributes that are stored on an object during inbound replication. For more information, see Microsoft Knowledge Base article 949189, A Windows Server 2008 domain controller that is configured with the Japanese language locale may not apply updates to attributes on an object during inbound replication.

Installing Exchange 2013 on directory servers

For security and performance reasons, we recommend that you install Exchange 2013 only on member servers and not on Active Directory directory servers. However, you can't run DCPromo on a computer running Exchange 2013. After Exchange 2013 is installed, changing its role from a

member server to a directory server, or vice versa, isn't supported.

Hardware

The recommended hardware requirements for Exchange 2013 servers vary depending on a number of factors including the server roles that are installed and the anticipated load that will be placed on the servers.

Note:
For information about deploying Exchange in a virtualized environment, see Exchange 2013 virtualization.

Hardware requirements for Exchange 2013

Component	Requirement	Notes
Processor	• x64 architecture-based computer with Intel processor that supports Intel 64 architecture (formerly known as Intel EM64T) • AMD processor that supports the AMD64 platform • Intel Itanium IA64 processors not supported	See the "Operating system" section later in this topic for supported operating systems.
Memory	Varies depending on Exchange roles that are installed: • **Mailbox** 8GB minimum • **Client Access** 4GB minimum • **Mailbox and Client Access combined** 8GB minimum • **Edge Transport** 4GB minimum	None.
Paging file size	The page file size minimum and maximum must be set to physical RAM plus 10 MB	The recommended page file size also accounts for the memory that's needed to collect information if the operating system stops

		unexpectedly. On 64-bit operating systems, memory can be written as a dump file to the paging file. This file must reside on the boot volume of the server. For more information about the configuration options that are available for memory dump data, see Knowledge Base article 254649, Overview of memory dump file options for Windows Vista, Windows Server 2008 R2, Windows Server 2008, Windows Server 2003, Windows XP, and Windows 2000.
Disk space	• At least 30 GB on the drive on which you install Exchange • An additional 500 MB of available disk space for each Unified Messaging (UM) language pack that you plan to install • 200 MB of available disk space on the system drive • A hard disk that stores the message queue database on with at least 500 MB of free space.	The minimum space requirements detailed here don't account for disk subsystem requirements for adequate performance.
Drive	DVD-ROM drive, local or network accessible	None.

Screen resolution	1024 x 768 pixels or higher	None.
File format	Disk partitions formatted as NTFS file systems, which applies to the following partitions: • System partition • Partitions that store Exchange binary files or files generated by Exchange diagnostic logging Disk partitions containing the following types of files can be formatted as ReFS: • Partitions containing transaction log files • Partitions containing database files • Partitions containing content indexing files	None.

Operating system

The following table lists the supported operating systems for Exchange 2013.

Important:

We don't support the installation of Exchange 2013 on a computer that's running in Windows Server Core mode. The computer must be running the full installation of Windows Server. If you want to install Exchange 2013 on a computer that's running in Windows Server Core mode, you must convert the server to a full installation of Windows Server by doing one of the following:

- **Windows Server 2008 R2** Reinstall Windows Server and select the **Full Installation** option.
- **Windows Server 2012 R2** or **Windows Server 2012** Convert your Windows Server Core mode server to a full installation by running the following command.

```
Install-WindowsFeature Server-Gui-Mgmt-Infra, Server-Gui-Shell -Re
```

Supported operating systems for Exchange 2013

Component	Requirement

Mailbox, Client Access, and Edge Transport server roles	One of the following: • Windows Server 2012 R2 Standard or Datacenter[1] • Windows Server 2012 Standard or Datacenter • Windows Server 2008 R2 Standard with Service Pack 1 (SP1) • Windows Server 2008 R2 Enterprise with Service Pack 1 (SP1) • Windows Server 2008 R2 Datacenter RTM or later
Management tools	One of the following: • Windows Server 2012 R2 Standard or Datacenter[1] • Windows Server 2012 Standard or Datacenter • Windows Server 2008 R2 Standard with SP1 • Windows Server 2008 R2 Enterprise with SP1 • Windows Server 2008 R2 Datacenter RTM or later • 64-bit edition of Windows 8.1[2] • 64-bit edition of Windows 8 • 64-bit edition of Windows 7 with Service Pack 1

[1] Windows Server 2012 R2 is supported only with Exchange 2013 SP1 or later.

[2] Windows 8.1 is supported only with Exchange 2013 SP1 or later.

Supported Windows Management Framework versions for Exchange 2013

Exchange version	Windows Management Framework 3.0	Windows Management Framework 4.0
Exchange 2013 CU3	X	
Exchange 2013 SP1 and later	X	X

.NET Framework

We strongly recommend that you use the latest version of .NET Framework that's supported by the release of Exchange you're installing.

Exchange version	.NET Framework 4.5.1	.NET Framework 4.5
Exchange 2013 CU3		X
Exchange 2013 SP1 and later	X	X

Supported clients

Exchange 2013 and Exchange Online support the following minimum versions of Microsoft Outlook and Microsoft Entourage for Mac:

- Outlook 2013 (15.0.4420.1017)
- Outlook 2010 Service Pack 1 with the Outlook 2010 November 2012 update (14.0.6126.5000). For more information, see Description of the Outlook 2010 update: November 13, 2012.
- Outlook 2007 Service Pack 3 with the Outlook 2007 November 2012 update (12.0.6665.5000). For more information, see Description of the Outlook 2007 update: November 13, 2012.
- Entourage 2008 for Mac, Web Services Edition
- Outlook for Mac 2011

Important:

The information above provides the minimum versions required for a client to connect to Exchange and Exchange Online. We strongly recommend that you install the latest available service packs and updates available so that your users receive the best possible experience when connecting to Exchange and Exchange Online.

Outlook clients earlier than Outlook 2007 are not supported. Email clients on Mac operating systems that require DAV, such as Entourage 2008 for Mac RTM and Entourage 2004, are not supported.

Outlook Web App supports several browsers on a variety of operating systems and devices. For detailed information, see What's new for Outlook Web App in Exchange 2013.

Exchange 2013 prerequisites

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-25*

This topic provides the steps for installing the necessary Windows Server 2012 R2, Windows Server 2012 and Windows Server 2008 R2 with Service Pack 1 (SP1) operating system prerequisites for the

Microsoft Exchange 2013 Mailbox, Client Access, and Edge Transport server roles. It also provides the prerequisites required to install the Exchange 2013 management tools on Windows 8, Windows 8.1, and Windows 7 client computers.

What do you need to know before you begin?

- The Edge Transport server role is available starting with Exchange 2013 SP1.
- Make sure that the functional level of your forest is at least Windows Server 2003, and that the schema master is running Windows Server 2003 with Service Pack 2 or later. For more information about the Windows functional level, see Managing Domains and Forests.
- The full installation option of Windows Server 2012 R2, Windows Server 2012 and Windows Server 2008 R2 SP1 must be used for all servers running Exchange 2013 server roles or management tools.
- You must first join the computer to the appropriate internal Active Directory forest and domain.
- Some prerequisites require you to reboot the server to complete installation.
- Install the latest Windows updates on your computer. For more information, see Deployment security checklist.

Note:

If you're installing the Mailbox server role and you intend for the server to be a member of a database availability group (DAG), you must be running Windows Server 2012 R2 Standard or Datacenter Edition, Windows Server 2012 Standard or Datacenter Edition, or Windows Server 2008 R2 SP1 Enterprise Edition. Windows Server 2008 R2 SP 1 Standard Edition doesn't support the features needed for DAGs.
You can't upgrade Windows when Exchange is installed on the server.
To upgrade to Microsoft Unified Communications Managed API (UCMA) 4.0, you must first uninstall any previous versions of UCMA that are installed by using **Add/Remove programs**.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Active Directory preparation

The computer you want to use to prepare Active Directory for Exchange 2013 has specific prerequisites that must be met.

Install the following software on the computer that will be used to prepare Active Directory:

- Microsoft .NET Framework 4.5
- The version of Windows Management Framework that corresponds to the version of Exchange 2013 you're installing.
  - **Exchange 2013 CU3** Windows Management Framework 3.0
  - **Exchange 2013 SP1 or later** Windows Management Framework 4.0

Note:
.NET Framework 4.5 and Windows Management Framework 3.0 are included with Windows Server 2012 and don't need to be installed separately. .NET Framework 4.5 and Windows Management Framework 4.0 are included with Windows Server 2012 R2 and don't need to be installed separately.

After you've installed the software listed above, complete the following steps to install the Remote Tools Administration Pack. After you've installed the Remote Tools Administration Pack you'll be able to use the computer to prepare Active Directory. For more information about preparing Active Directory, see Prepare Active Directory and domains.

1. Open Windows PowerShell.
2. Install the Remote Tools Administration Pack.
   - On a Windows Server 2012 R2 or Windows Server 2012 computer, run the following command.

```
Install-WindowsFeature RSAT-ADDS
```

   - On a Windows Server 2008 R2 SP1 computer, run the following command.

```
Add-WindowsFeature RSAT-ADDS
```

Windows Server 2012 R2 and Windows Server 2012 prerequisites

The prerequisites that are needed to install Exchange 2013 on a Windows Server 2012 R2 or Windows Server 2012 computer depends on which Exchange roles you want to install. Read the section below that matches the roles you want to install.

Mailbox or Client Access server roles

Follow the instructions in this section to install the prerequisites on Windows Server 2012 R2 or Windows Server 2012 computers where you want to do one of the following:

- Install only the Mailbox server role on a computer.
- Install only the Client Access server role on a computer.
- Install both the Mailbox and Client Access server roles on the same computer.

Do the following to install the required Windows roles and features:

1. Open Windows PowerShell.
2. Run the following command to install the required Windows components.

```
Install-WindowsFeature AS-HTTP-Activation, Desktop-Experience, NET-Framework-45-Features, RPC-over-HTTP-proxy, RSAT-Clustering, RSAT-Clustering-CmdInterface, RSAT-Clustering-Mgmt, RSAT-Clustering-PowerShell, Web-Mgmt-Console, WAS-Process-Model, Web-Asp-Net45, Web-Basic-Auth, Web-Client-Auth, Web-Digest-Auth, Web-Dir-Browsing, Web-Dyn-Compression, Web-Http-Errors, Web-Http-Logging, Web-Http-Redirect, Web-Http-Tracing, Web-ISAPI-Ext, Web-ISAPI-Filter, Web-Lgcy-Mgmt-Console, Web-Metabase, Web-Mgmt-Console, Web-Mgmt-Service, Web-Net-Ext45, Web-Request-Monitor, Web-Server, Web-Stat-Compression, Web-Static-Content, Web-Windows-Auth, Web-WMI, Windows-Identity-Foundation
```

After you've installed the operating system roles and features, install Microsoft Unified Communications Managed API 4.0, Core Runtime 64-bit.

Edge Transport server role

Follow the instructions in this section to install the prerequisites on Windows Server 2012 R2 or Windows Server 2012 computers where you want to install the Edge Transport server role on a computer.

Do the following to install the required Windows roles and features:

1. Open Windows PowerShell.
2. Run the following command to install the required Windows components.

```
Install-WindowsFeature ADLDS
```

Windows Server 2008 R2 SP1 prerequisites

The prerequisites that are needed to install Exchange 2013 on a Windows Server 2008 R2 SP1 computer depends on which Exchange roles you want to install. Read the section below that matches the roles you want to install.

Mailbox or Client Access server roles

Follow the instructions in this section to install the prerequisites on Windows Server 2008 R2 SP1

computers where you want to do one of the following:

- Install only the Mailbox server role on a computer.
- Install only the Client Access server role on a computer.
- Install both the Mailbox and Client Access server roles on the same computer.

Do the following to install the required Windows roles and features:

1. Open Windows PowerShell.
2. Run the following command to load the Server Manager module.

```
Import-Module ServerManager
```

3. Run the following command to install the required Windows components.

```
Add-WindowsFeature Desktop-Experience, NET-Framework, NET-HTTP-Activation, RPC-over-HTTP-proxy, RSAT-Clustering, RSAT-Web-Server, WAS-Process-Model, Web-Asp-Net, Web-Basic-Auth, Web-Client-Auth, Web-Digest-Auth, Web-Dir-Browsing, Web-Dyn-Compression, Web-Http-Errors, Web-Http-Logging, Web-Http-Redirect, Web-Http-Tracing, Web-ISAPI-Ext, Web-ISAPI-Filter, Web-Lgcy-Mgmt-Console, Web-Metabase, Web-Mgmt-Console, Web-Mgmt-Service, Web-Net-Ext, Web-Request-Monitor, Web-Server, Web-Stat-Compression, Web-Static-Content, Web-Windows-Auth, Web-WMI
```

After you've installed the operating system roles and features, install the following software in the order shown:

1. Microsoft .NET Framework 4.5
2. The version of Windows Management Framework that corresponds to the version of Exchange 2013 you're installing.
   - **Exchange 2013 CU3** Windows Management Framework 3.0
   - **Exchange 2013 SP1 or later** Windows Management Framework 4.0
3. Microsoft Unified Communications Managed API 4.0, Core Runtime 64-bit
4. Microsoft Knowledge Base article KB974405 (Windows Identity Foundation)
5. Knowledge Base article KB2619234 (Enable the Association Cookie/GUID that is used by RPC over HTTP to also be used at the RPC layer in Windows 7 and in Windows Server 2008 R2)
6. Knowledge Base article KB2533623 (Insecure library loading could allow remote code execution)

Note:

This hotfix may already be installed if you've configured Windows Update to install security updates on your computer.

Edge Transport server role

Follow the instructions in this section to install the prerequisites on Windows Server 2008 R2 SP1

computers where you want to install the Edge Transport server role on a computer.

Do the following to install the required Windows roles and features:

1. Open Windows PowerShell.
2. Run the following command to load the Server Manager module.

```
Import-Module ServerManager
```

3. Run the following command to install the required Windows components.

```
Add-WindowsFeature NET-Framework, ADLDS
```

After you've installed the operating system roles and features, install the following software in the order shown:

1. Microsoft .NET Framework 4.5
2. The version of Windows Management Framework that corresponds to the version of Exchange 2013 you're installing.
   - **Exchange 2013 CU3** Windows Management Framework 3.0
   - **Exchange 2013 SP1 or later** Windows Management Framework 4.0

Windows 7 prerequisites

Follow the instructions in this section to install the prerequisites on domain-joined Windows 7 64-bit computers where you want to install the Exchange management tools.

1. Open **Control Panel**, and then select **Programs**.
2. Click **Turn Windows features on or off**.
3. Navigate to **Internet Information Services** > **Web Management Tools** > **IIS 6 Management Compatibility**.
4. Select the check box for **IIS 6 Management Console**, and then click **OK**.

After you've installed the operating system features, install the following software in the order shown:

1. Microsoft .NET Framework 4.5
2. The version of Windows Management Framework that corresponds to the version of Exchange 2013 you're installing.
   - **Exchange 2013 CU3** Windows Management Framework 3.0
   - **Exchange 2013 SP1 or later** Windows Management Framework 4.0
3. Knowledge Base article KB974405 (Windows Identity Foundation)

Windows 8 and Windows 8.1 prerequisites

The Exchange management tools can be installed on a domain-joined computer with a default install of Windows 8 or Windows 8.1 64-bit.

Prepare Active Directory and domains

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-25*

Before you install Microsoft Exchange Server 2013, you need to prepare your Active Directory forest and its domains. Exchange needs to prepare Active Directory so that it can store information about your users' mailboxes and the configuration of Exchange servers in the organization. If you aren't familiar with Active Directory forests or domains, check out Active Directory Domain Services Overview.

There are a couple of ways you can prepare Active Directory for Exchange. The first is to let the Exchange 2013 Setup wizard do it for you. If you don't have a large Active Directory deployment, and you don't have a separate team that manages Active Directory, we recommend using the wizard. The account you use will need to be a member of both the Schema Admins and Enterprise Admins security groups. For more information about how to use the Setup wizard, check out Install Exchange 2013 using the Setup wizard.

If you have a large Active Directory deployment, or if a separate team manages Active Directory, this topic is for you. Following the steps in this topic gives you much more control over each stage of preparation, and who can do each step. For example, Exchange administrators might not have the permissions needed to extend the Active Directory schema.

What do you need to know before you begin?

1. Extend the Active Directory schema

2. Prepare Active Directory

3. Prepare Active Directory domains

How do you know this worked?

Curious about what's happening when Active Directory is being prepared for Exchange? Check out What changes in Active Directory when Exchange 2013 is installed?

What do you need to know before you begin?

- Estimated time to complete: 10-15 minutes or more (not including Active Directory replication), depending on organization size and the number of child domains.
- The computer you use to run these steps needs to meet the Exchange 2013 system requirements. Also, your Active Directory forest needs to meet the requirements in the "Network and directory servers" section in Exchange 2013 system requirements.
- If your organization has multiple Active Directory domains, we recommend the following:

- Do the steps below from an Active Directory site that has an Active Directory server from every domain.
- Install the first Exchange server in an Active Directory site with a writeable global catalog server from every domain.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

1. Extend the Active Directory schema

The first step in getting your organization ready for Exchange 2013 is to extend the Active Directory schema. Exchange stores a lot of information in Active Directory but before it can do that, it needs to add and update classes, attributes, and other items. If you're curious about what's changed when your schema is extended, check out Exchange 2013 Active Directory schema changes.

Before you extend your schema, there are a few things to keep in mind:

- The account you're logged in as needs to be a member of the Schema Admins and Enterprise Admins security groups.
- The computer where you'll run the command to extend the schema needs to be in the same Active Directory domain and site as the schema master.
- If you use the *DomainController* parameter, make sure to use the name of the domain controller that's the schema master.
- The only way to extend the schema for Exchange is to use the steps in this topic or use Exchange 2013 Setup. Other ways of extending the schema aren't supported.

Tip:

If you don't have a separate team that manages your Active Directory schema, you can skip this step and go directly to Step 2. Prepare Active Directory. If the schema isn't extended in step 1, the commands in step 2 will extend the schema for you. If you decide to skip step 1, the information you need to keep in mind above still applies.

When you're ready, do the following to extend your Active Directory schema. If you have multiple Active Directory forests, make sure you're logged into the right one.

1. Make sure the computer is ready to run Exchange 2013 Setup. To see what you need to run Setup, check out the Active Directory preparation section in Exchange 2013 prerequisites.
2. Open a Windows Command Prompt window and go to where you downloaded the Exchange installation files.
3. Run the following command to extend the schema.

```
Setup.exe /PrepareSchema /IAcceptExchangeServerLicenseTerms
```

After Setup finishes extending the schema, you'll need to wait while Active Directory replicates the changes to all of your domain controllers. If you want to check on how replication is going, you can use the `repadmin` tool. `Repadmin` is included as part of the Active Directory Domain Services Tools

feature in Windows Server 2012 R2, Windows Server 2012, and Windows Server 2008 R2. For more information about how to use it, see Repadmin.

2. Prepare Active Directory

Now that the Active Directory schema has been extended, you can prepare other parts of Active Directory for Exchange 2013. During this step, Exchange will create containers, objects, and other items in Active Directory that it'll use to store information. The collection of all of the Exchange containers, objects, attributes, and so on, is called the *Exchange organization*.

Before you prepare Active Directory for Exchange, there are a few things to keep in mind:

- The account you're logged in as needs to be a member of the Enterprise Admins security group. If you skipped step 1 because you want the *PrepareAD* command to extend the schema, the account you use also needs to be a member of the Schema Admins security group.
- The computer where you'll run the command needs to be in the same Active Directory domain and site as the schema master. It'll also need to contact all of the domains in the forest on TCP port 389.
- Wait until Active Directory has replicated the changes made in step 1 to all of your domain controllers before you do this step.

When you run the command below to prepare Active Directory for Exchange, you'll need to name the Exchange organization. This name is used internally by Exchange and isn't normally seen by users. The name of the company where Exchange is being installed is often used for the organization name. The name you use won't affect the functionality of Exchange or determine what you can use for email addresses. You can name it anything you want, as long as you keep the following in mind:

- You can use any uppercase or lowercase letters from A to Z.
- You can use numbers 0 to 9.
- The name can contain spaces as long as they're not at the beginning or end of the name.
- You can use a hyphen or dash in the name.
- The name can be up to 64 characters but can't be blank.
- The name can't be changed after it's set.

When you're ready, do the following to prepare Active Directory for Exchange. If the organization name you want to use has spaces, enclose the name in quotation marks (").

1. Open a Windows Command Prompt window and go to where you downloaded the Exchange installation files.
2. Run the following command:

```
Setup.exe /PrepareAD /OrganizationName:"<organization name>" /IAcceptExchangeServerLicenseTerms
```

After Setup finishes preparing Active Directory for Exchange, you'll need to wait while Active Directory replicates the changes to all of your domain controllers. If you want to check on how

replication is going, you can use the `repadmin` tool. `repadmin` is included as part of the Active Directory Domain Services Tools feature in Windows Server 2012 R2, Windows Server 2012, and Windows Server 2008 R2. For more information about how to use the tool, see Repadmin.

3. Prepare Active Directory domains

The final step to get Active Directory ready for Exchange is to prepare each of the Active Directory domains where Exchange will be installed or where mail-enabled users will be located. This step creates additional containers and security groups, and sets permissions so that Exchange can access them.

If you have multiple domains in your Active Directory forest, you have a couple of choices in how you prepare them. Select the option that matches what you want to do. If you only have one domain, you can skip this step because the *PrepareAD* command in step 2 already prepared the domain for you.

Prepare all of the domains in my Active Directory forest

To prepare all of your Active Directory domains, you can use the *PrepareAllDomains* parameter when you run Setup. Setup will prepare every domain for Exchange in your Active Directory forest for you.

Before you prepare all of the domains in your Active Directory forest, keep the following in mind:

- The account you use needs to be a member of the Enterprise Admins security group.
- Wait until Active Directory has replicated the changes made in step 2 to all of your domain controllers. If you don't, you might get an error when you try to prepare the domain.

When you're ready, do the following to prepare all of the domains in your Active Directory forest for Exchange.

1. Open a Windows Command Prompt window and go to where you downloaded the Exchange installation files.
2. Run the following command:

```
Setup.exe /PrepareAllDomains /
IAcceptExchangeServerLicenseTerms
```

Let me choose which Active Directory domains I want to prepare

If you want to choose which Active Directory domains you want to prepare, you can use the *PrepareDomain* parameter when you run Setup. When you use the *PrepareDomain* parameter, you need to include the fully qualified domain name (FQDN) of the domain you want to prepare.

Before you prepare the domains in your Active Directory forest, keep the following in mind:

- The account you use needs permissions depending on when the domain was created.
  - **Domain created before PrepareAD was run** If the domain was created **before** you ran the *PrepareAD* command in step 2 above, then the account you use needs to be a member of the Domain Admins group in the domain you want to prepare.
  - **Domain created after PrepareAD was run** If the domain was created **after** you ran the *PrepareAD* command in step 2 above, then the account you use needs to 1) be a member of the Organization Management role group and 2) be a member of the Domain Admins group in the domain you want to prepare.
- Wait until Active Directory has replicated the changes made in step 2 to all of your domain controllers. If you don't, you might get an error when you try to prepare the domain.
- You need to prepare every domain where an Exchange server will be installed. You'll also need to prepare any domain that'll contain mail-enabled users, even if those domains won't contain any Exchange servers.
- You don't need to run the *PrepareDomain* command in the domain where the *PrepareAD* command was run. The *PrepareAD* command prepares that domain automatically.

When you're ready, do the following to prepare an individual domain in your Active Directory forest for Exchange.

1. Open a Windows Command Prompt window and go to where you downloaded the Exchange installation files.
2. Run the following command. Include the FQDN of the domain you want to prepare. If you want to prepare the domain you're running the command in, you don't have to include the FQDN.

```
Setup.exe /PrepareDomain:<FQDN of the domain you want to prepare> /IAcceptExchangeServerLicenseTerms
```

3. Repeat the steps for each Active Directory domain where you'll install an Exchange server or where mail-enabled users will be located.

How do you know this worked?

Once you've done all the steps above, you can check to make sure everything's gone smoothly. To do so, you'll use a tool called Active Directory Service Interfaces Editor (ADSI Edit). ADSI Edit is included as part of the Active Directory Domain Services Tools feature in Windows Server 2012 R2, Windows Server 2012, and Windows Server 2008 R2. If you want to know more about it, check out ADSI Edit (adsiedit.msc).

Warning:
Never change values in ADSI Edit unless you're told to do so by Microsoft support. Changing values in ADSI Edit can cause irreparable harm to your Exchange organization and Active Directory.

The easiest way to check whether Active Directory has been prepared correctly is to check whether the **msExchProductId** property has the right value. It'll have the right value if the schema has been

extended and the *PrepareAD* command completed successfully.

To check whether the **msExchProductId** property has the right value, do the following:

1. Press WIN+R, type `adsiedit.msc`, and then press Enter.
2. In ADSI Edit, right-click **ADSI Edit** in the navigation pane, and then click **Connect to...**
3. In **Connection Settings**, select **Select a well known Naming Context**, and then choose **Configuration**. Click **OK**.
4. Expand **Configuration [<domain FQDN>]**, **CN=Configuration,DC=domain,DC=com**, **CN=Services**, **CN=Microsoft Exchange**.
5. Right-click **CN=<your Exchange organization name>**, and then select **Properties**.
6. Make sure the value in **msExchangeProductId** matches the value in the Exchange 2013 Active Directory versions table for the version of Exchange 2013 you're installing.

If you're separating the steps to extend the schema and prepare Active Directory, you can use ADSI Edit to check additional properties to make sure each step has completed successfully. Use the information in the following list to make sure these properties have the right values.

- In the **Schema** naming context, verify that the **rangeUpper** property on **ms-Exch-Schema-Verision-Pt** is set to the value shown for your version of Exchange 2013 in the Exchange 2013 Active Directory versions table.

- In the **Configuration** naming context, verify that the **objectVersion** property in the CN=<*your organization*>,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<*domain*> container is set to the value shown for your version of Exchange 2013 in the Exchange 2013 Active Directory versions table.

- In the **Default** naming context, verify that the **objectVersion** property in the **Microsoft Exchange System Objects** container under DC=<*root domain* is set to the value shown for your version of Exchange 2013 in the Exchange 2013 Active Directory versions table.

You can also check the Exchange setup log to verify that Active Directory preparation has completed successfully. For more information, see Verify an Exchange 2013 installation. You won't be able to use the **Get-ExchangeServer** cmdlet mentioned in the Verify an Exchange 2013 installation topic until you've completed the installation of at least one Mailbox server role and one Client Access server role in an Active Directory site.

Exchange 2013 Active Directory versions

The following table shows you the Exchange 2013 objects in Active Directory that get updated each time you install a new version of Exchange 2013. You can compare the object versions you see with the values in the table below to verify that the version of Exchange 2013 you installed successfully updated Active Directory during installation.

	Exchange	msExchProduc	rangeUpper	objectVersion	objectVersion

	version	tId			
Naming context		Configuration	Schema	Default	Configuration
Container		CN=<*your organization*>, CN=Microsoft Exchange, CN=Services, CN=Configuration, DC=<*domain*>	ms-Exch-Schema-Version-Pt	Microsoft Exchange System Objects	CN=<*your organization*>, CN=Microsoft Exchange, CN=Services, CN=Configuration, DC=<*domain*>
	Exchange 2013 CU6	15.00.0995.029	15303	13236	15965
	Exchange 2013 CU5	15.00.0913.022	15300	13236	15870
	Exchange 2013 SP1	15.00.0847.032	15292	13236	15844
	Exchange 2013 CU3	15.00.0775.038	15283	13236	15763
	Exchange 2013 CU2	15.00.0712.024 **Important:** If **msExchProductId** is 15.00.712.022, you have an out-of-date version of Exchange 2013 CU2. To avoid problems moving public folder mailboxes and	15281	13236	15688

		to make sure you can install future updates, you need to install the latest version of Exchange 2013 CU2. For more information, see Public folders in Release notes for Exchange 2013.			
	Exchange 2013 CU1	15.00.0620.029	15254	13236	15614
	Exchange 2013 RTM	15.00.0516.032	15137	13236	15449

Deploy a new installation of Exchange 2013

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-31*

Before you begin your installation of Microsoft Exchange Server 2013, see Planning and deployment for important planning information, and information about system requirements and prerequisites.

The following topics provide information about deploying a new installation of Exchange 2013 in your organization:

Checklist: Perform a new installation of Exchange 2013

Install Exchange 2013 using the Setup wizard

Install Exchange 2013 using unattended mode

Install the Exchange 2013 Edge Transport role using the Setup wizard

Delegate the installation of an Exchange 2013 server

After you've completed your installation, see Exchange 2013 post-Installation tasks.

Checklist: Perform a new installation of Exchange 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-28*

Use this checklist to deploy Microsoft Exchange Server 2013. Before you start working with this checklist, make sure you're familiar with the concepts discussed in:

- Planning and deployment
- Deployment security checklist

This checklist is generic in that it provides guidance for a typical scenario.

Note:

The Exchange Server Deployment Assistant provides you with customized step-by-step guidance about how to deploy Exchange Server. The Deployment Assistant can help you deploy a new installation of Exchange Server 2013, upgrade a previous version to Exchange 2013, or configure a hybrid deployment of Exchange 2013 and Exchange Online. To learn more, see Exchange Server Deployment Assistant.

Checklist for a new installation of Exchange 2013

Done?	Task	Topic
	1. Read the release notes.	Release notes for Exchange 2013
2. Verify system requirements.	Exchange 2013 system requirements	
3. Confirm prerequisite steps are done.	Exchange 2013 prerequisites	

4. Configure disjoint namespace. **Note:** This step is optional. It's only necessary if your organization is running a disjoint namespace.	Disjoint namespace scenarios	
5. Install the Mailbox server role.	Install Exchange 2013 using the Setup wizard	
6. Install the Client Access server role.	Install Exchange 2013 using the Setup wizard	
	7. Install the Edge Transport server role. **Note:** This step is optional. It's only necessary if you want to install an Edge Transport server. For more information, see Edge Transport servers.	Install the Exchange 2013 Edge Transport role using the Setup wizard
	8. Create an EdgeSync subscription. This step is optional. It's only necessary if you've installed an Edge Transport server and want to configure an EdgeSync subscription between your Edge Transport server and a Hub Transport server. For more information, see Edge Subscriptions.	Configure Internet mail flow through a subscribed Edge Transport server
	9. Configure Transport.	Create a Send connector
	10. Add additional accepted	Add additional accepted

	domains.	domains
	11. Configure email address policies.	Configure the default email address policy
12. Configure settings on virtual directories, including the offline address book, Exchange Web Services, Exchange Administration Center (EAC), Outlook Web App, and Exchange ActiveSync virtual directories. **Note:** This step is necessary if you want to use Exchange Web Services, Outlook Anywhere, or the offline address book. It also may be required if you need to change any of the default settings for EAC, Outlook Web App, or Exchange ActiveSync.	Configure external URLs Configure internal URLs	
13. Add digital certificates on the Client Access server.	Configure an SSL certificate	
14. Configure Unified Messaging. **Note:** This step is optional. It's only necessary if you want to use Unified Messaging in your organization.	Deploying voice mail and UM	
	15. Configure additional Unified Messaging and Lync Server settings. **Note:** This step is optional. It's only	Deploying Exchange 2013 UM and Lync Server overview

	necessary if you've configured Unified Messaging in your organization and want to integrate it with Lync Server.	
16. Post-installation tasks.	Exchange 2013 post-Installation tasks	

Install Exchange 2013 using the Setup wizard

Exchange Server 2013 > Planning and deployment > Deploy a new installation of Exchange 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-19*

This topic explains how to use the Microsoft Exchange Server 2013 Setup wizard to install the Exchange 2013 Mailbox and Client Access roles on a computer. For more information about planning and deploying Exchange 2013, see Planning and deployment.

If you want to install the Exchange 2013 Edge Transport role on a computer, see Install the Exchange 2013 Edge Transport role using the Setup wizard. The Edge Transport role can't be installed on the same computer as the Mailbox or Client Access server roles.

Tip:

Have you heard about the Exchange Server Deployment Assistant? It's a free online tool that helps you quickly deploy Exchange 2013 in your organization by asking you a few questions and creating a customized deployment checklist just for you. If you want to learn more about it, go to Exchange Server Deployment Assistant.

Note:

After you install any server roles on a computer running Exchange 2013, you can't use the Exchange 2013 Setup wizard to add any additional server roles to this computer. If you want to add more server roles to a computer, you must either use Add or Remove Programs from Control Panel or use Setup.exe from a Command Prompt window.

For information about tasks to complete after installation, see Exchange 2013 post-Installation tasks.

What do you need to know before you begin?

- Estimated time to complete: 60 minutes

- Make sure you've read the release notes prior to installing Exchange 2013. For more information, see Release notes for Exchange 2013.
- Each organization requires at a minimum one Client Access server and one Mailbox server in the Active Directory forest. Additionally, each Active Directory site that contains a Mailbox server must also contain at least one Client Access server. If you're separating your server roles, we recommend installing the Mailbox server role first.
- The computer you install Exchange 2013 on must have a supported operating system (such as Windows Server 2008 R2 with Service Pack 1 (SP1) or Windows Server 2012), have enough disk space, be a member of an Active Directory domain, and satisfy other requirements. For information about system requirements, see Exchange 2013 system requirements.
- To run Exchange 2013 setup, you must install Microsoft .NET Framework 4.5, Windows Management Framework 3.0, and other required software. To understand the prerequisites for all server roles, see Exchange 2013 prerequisites.
- You must ensure the account you use is delegated membership in the Schema Admins group if you haven't previously prepared the Active Directory schema. If you're installing the first Exchange 2013 server in the organization, the account you use must have membership in the Enterprise Admins group. If you've already prepared the schema and aren't installing the first Exchange 2013 server in the organization, the account you use must be a member of the Exchange 2013 Organization Management role group.

Administrators who are members of the Delegated Setup role group can deploy Exchange 2013 servers that have been previously provisioned by a member of the Organization Management management role group.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Caution:

After you install Exchange 2013 on a server, you must not change the server name. Renaming a server after you have installed an Exchange 2013 server role is not supported.

Install Exchange Server 2013

If you're installing the first Exchange 2013 server in the organization, and the Active Directory preparation steps have not been performed, the account you use must have membership in the Enterprise Administrators group. If you haven't previously prepared the Active Directory Schema, the account must also be a member of the Schema Admins group. For information about preparing Active Directory for Exchange 2013, see Prepare Active Directory and domains. If you have already performed the Schema and Active Directory preparation steps, the account you use must be a member of the Delegated Setup management role group or the Organization Management role group.

Note:

To download the latest version of Exchange 2013, see Updates for Exchange 2013.

1. Log on to the computer on which you want to install Exchange 2013.

2. Navigate to the network location of the Exchange 2013 installation files.
3. Start Exchange 2013 Setup by double-clicking `Setup.exe`

Important:

If you have User Access Control (UAC) enabled, you must right-click `Setup.exe` and select **Run as administrator**.

4. On the **Check for Updates?** page, choose whether you want Setup to connect to the Internet and download product and security updates for Exchange 2013. If you select **Connect to the Internet and check for updates**, Setup will download updates and apply them prior to continuing. If you select **Don't check for updates right now**, you can download and install updates manually later. We recommend that you download and install updates now. Click **Next** to continue.
5. The **Introduction** page begins the process of installing Exchange into your organization. It will guide you through the installation. Several links to helpful deployment content are listed. We recommend that you visit these links prior to continuing setup. Click **Next** to continue.
6. On the **License Agreement** page, review the software license terms. If you agree to the terms, select **I accept the terms in the license agreement**, and then click **Next**.
7. On the **Recommended settings** page, select whether you want to use the recommended settings. If you select **Use recommended settings**, Exchange will automatically send error reports and information about your computer hardware and how you use Exchange to Microsoft. If you select **Don't use recommended settings**, these settings remain disabled but you can enable them at any time after Setup completes. For more information about these settings and how information sent to Microsoft is used, click **?**.
8. On the **Server Role Selection** page, choose whether you want to install the **Mailbox role**, the **Client Access role**, both roles, or just the **Management Tools** on this computer. You can add additional server roles later if you choose not to install them during this installation. An organization must have at least one Mailbox role and at least one Client Access server role installed. They can be installed on the same computer or on separate computers. The management tools are installed automatically if you install any server role.

Select **Automatically install Windows Server roles and features that are required to install Exchange Server** to have the Setup wizard install required Windows prerequisites. You may need to reboot the computer to complete the installation of some Windows features. If you don't select this option, you must install the Windows features manually.

Note:

This option installs only the Windows features required by Exchange. You must manually install other prerequisites manually. For more information, see Exchange 2013 prerequisites.

Click **Next** to continue.

9. On the **Installation Space and Location** page, either accept the default installation location or click **Browse** to choose a new location. Make sure that you have enough disk space available in the location where you want to install Exchange. Click **Next** to continue.
10. If this is the first Exchange server in your organization, on the **Exchange Organization** page, type a name for your Exchange organization. The Exchange organization name can contain only the

following characters:

- A through Z
- a through z
- 0 through 9
- Space (not leading or trailing)
- Hyphen or dash

Note:

The organization name can't contain more than 64 characters. The organization name can't be blank.

If you want to use the Active Directory split permissions model, select **Apply Active Directory split permission security model to the Exchange organization**.

Caution:

Most organizations don't need to apply the Active Directory split permissions model. If you need to separate management of Active Directory security principals and Exchange configuration, Role Based Access Control (RBAC) split permissions might work for you. For more information, click **?**.

Click **Next** to continue.

11. If you're installing the Mailbox role, on the **Malware Protection Settings** page, choose whether you want to enable or disable malware scanning. If you disable malware scanning, it can be enabled in the future. Click **Next** to continue.
12. On the **Readiness Checks** page, view the status to determine if the organization and server role prerequisite checks completed successfully. If they haven't completed successfully, you must resolve any reported errors before you can install Exchange 2013. You don't need to exit Setup when resolving some of the prerequisite errors. After resolving a reported error, click **back** and then click **Next** to run the prerequisite check again. Be sure to also review any warnings that are reported. If all readiness checks have completed successfully, click **Next** to install Exchange 2013.
13. On the **Completion** page, click **Finish**.
14. Restart the computer after Exchange 2013 has completed.
15. Complete your deployment by performing the tasks provided in Exchange 2013 post-Installation tasks.

How do you know this worked?

To verify that you've successfully installed Exchange 2013, see Verify an Exchange 2013 installation.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Install Exchange 2013 using unattended mode

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-19*

To perform an unattended setup, you must install Microsoft Exchange Server 2013 from the command prompt. For more information about planning and deploying Exchange 2013, see Planning and deployment.

We recommend that the Edge Transport role be installed in a perimeter network outside of your organization's internal Active Directory forest. While you can install the Edge Transport server role on a domain-joined computer, doing so will only enable domain management of Windows features and settings. The Edge Transport role itself doesn't use Active Directory. Instead, it uses the Active Directory Lightweight Directory Services (AD LDS) Windows feature to store configuration and recipient information. For more information about the Edge Transport role, see Edge Transport servers.

Tip:

Have you heard about the Exchange Server Deployment Assistant? It's a free online tool that helps you quickly deploy Exchange 2013 in your organization by asking you a few questions and creating a customized deployment checklist just for you. If you want to learn more about it, go to Exchange Server Deployment Assistant.

Note:

After you install any server roles on a computer running Exchange 2013, you can't use the Exchange 2013 Setup wizard to add any additional server roles to this computer. If you want to add more server roles to a computer, you must either use Add or Remove Programs from Control Panel or use Setup.exe from a Command Prompt window.
The Edge Transport role can't be installed on the same computer as the Mailbox or Client Access server roles.

For information about tasks to complete after installation, see Exchange 2013 post-Installation tasks.

What do you need to know before you begin?

The following information applies to all Exchange 2013 server roles.

- Make sure you've read the release notes prior to installing Exchange 2013. For more information, see Release notes for Exchange 2013.

- The computer you install Exchange 2013 on must have a supported operating system (such as Windows Server 2008 R2 with Service Pack 1 (SP1), Windows Server 2012 R2, or Windows Server 2012), have enough disk space, and satisfy other requirements. For information about system requirements, see Exchange 2013 system requirements.
- To run Exchange 2013 setup, you must install Microsoft .NET Framework 4.5, Windows Management Framework, and other required software. To understand the prerequisites for all server roles, see Exchange 2013 prerequisites.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Caution:

After you install Exchange 2013 on a server, you must not change the server name. Renaming a server after you have installed an Exchange 2013 server role is not supported.

The following information applies to the Exchange 2013 Mailbox and Client Access server roles.

- Estimated time to complete: 60 minutes
- Each organization requires at a minimum one Client Access server and one Mailbox server in the Active Directory forest. Additionally, each Active Directory site that contains a Mailbox server must also contain at least one Client Access server. If you're separating your server roles, we recommend installing the Mailbox server role first.
- The computer you install Exchange 2013 on must be a member of an Active Directory domain.
- You must ensure the account you use is delegated membership in the Schema Admins group if you haven't previously prepared the Active Directory schema. If you're installing the first Exchange 2013 server in the organization, the account you use must have membership in the Enterprise Admins group. If you've already prepared the schema and aren't installing the first Exchange 2013 server in the organization, the account you use must be a member of the Exchange 2013 Organization Management management role group.

Administrators who are members of the Delegated Setup role group can deploy Exchange 2013 servers that have been previously provisioned by a member of the Organization Management role group.

The following information applies to the Exchange 2013 Edge Transport server role.

- Estimated time to complete: 40 minutes
- The Edge Transport role is available with Exchange 2013 SP1 or later.
- You need to configure the primary DNS suffix on the computer. For example, if the fully qualified domain name of your computer is edge.contoso.com, the DNS suffix for the computer is contoso.com. For more information, see Primary DNS Suffix is missing.
- Exchange 2007 and Exchange 2010 Hub Transport servers need an update before you can create an EdgeSync Subscription between them and an Exchange 2013 Edge Transport server. If you don't install this update, the EdgeSync Subscription won't work correctly. For more information, see the "Supported coexistence scenarios" section in Exchange 2013 system requirements.
- Make sure the account you use is a member of the local Administrators group on the computer you're installing the Edge Transport role.

Use Setup.exe to install Exchange 2013 in unattended mode

Note:
To download the latest version of Exchange 2013, see Updates for Exchange 2013.

1. Log on to the computer on which you want to install Exchange 2013.
2. Navigate to the network location of the Exchange 2013 installation files.
3. At the command prompt, run the applicable command for your organization.

Important:
If you have User Access Control (UAC) enabled, you must run `Setup.exe` from an elevated command prompt.

```
Setup.exe [/Mode:<setup mode>] [/
IAcceptExchangeServerLicenseTerms]
[/Roles:<server roles to install>] [/
InstallWindowsComponents]
[/OrganizationName:<name for the new Exchange
organization>]
[/TargetDir:<target directory>] [/SourceDir:<source
directory>]
[/UpdatesDir:<directory from which to install updates>]
[/DomainController:<FQDN of domain controller>] [/
DisableAMFiltering]
[/AnswerFile:<filename>] [/DoNotStartTransport]
[/EnableErrorReporting] [/CustomerFeedbackEnabled:<True |
False>]
[/AddUmLanguagePack:<UM language pack name>]
[/RemoveUmLanguagePack:<UM language pack name>]
[/NewProvisionedServer:<server>] [/
RemoveProvisionedServer:<server>]
[/MdbName:<mailbox database name>] [/DbFilePath:<Edb file
path>]
[/LogFolderPath:<log folder path>] [/
ActiveDirectorySplitPermissions:<True | False>]
[/TenantOrganizationConfig:<path>]
```

4. Setup copies the setup files locally to the computer on which you're installing Exchange 2013.
5. Setup checks the prerequisites, including all prerequisites specific to the server roles that you're installing. If you haven't met all the prerequisites, Setup fails and returns an error message that

explains the reason for the failure. If you've met all the prerequisites, Setup installs Exchange 2013.

6. Restart the computer after Exchange 2013 has completed.
7. Complete your deployment by performing the tasks provided in Exchange 2013 post-Installation tasks.

Examples

The following are examples of using Setup.exe:

- **Setup.exe /mode:Install /role:ClientAccess,Mailbox /OrganizationName:MyOrg /IAcceptExchangeServerLicenseTerms**

This command creates an Exchange 2013 organization in Active Directory called MyOrg, installs the Client Access server role, Mailbox server role, and the management tools and also accepts the Exchange 2013 licensing terms.

- **Setup.exe /mode:Install /role:ClientAccess,Mailbox /TargetDir:"C:\Exchange Server" /IAcceptExchangeServerLicenseTerms**

This command installs the Client Access server role, the Mailbox server role, and the management tools to the "C:\Exchange Server" directory. This command assumes an Exchange 2013 organization has already been prepared.

- **Setup.exe /mode:Install /r:CA,MB /IAcceptExchangeServerLicenseTerms**

This command installs the Client Access server role, the Mailbox server role, and the management tools to the default installation location.

- **Setup.exe /mode:Install /r:EdgeTransport /IAcceptExchangeServerLicenseTerms**

This command installs the Edge Transport server role and the management tools to the default installation location.

- **Setup.exe /mode:Install /r:ET /IAcceptExchangeServerLicenseTerms**

This command installs the Edge Transport server role and the management tools to the default installation location.

- **Setup.exe /mode:Uninstall /IAcceptExchangeServerLicenseTerms**

This command completely removes Exchange 2013 from the server and removes this server's Exchange configuration from Active Directory.

- **Setup.exe /PrepareAD /on:"My Org" /IAcceptExchangeServerLicenseTerms**

This command creates an Exchange organization called My Org and prepares Active Directory for Exchange 2013.

- **C:\ExchangeServer\bin\Setup.exe /m:Install /r:ClientAccess /SourceDir:d:\amd64 /IAcceptExchangeServerLicenseTerms**

This command adds the Client Access server role to an existing Exchange 2013 server using D:\amd64 as the source directory.

- **Setup.exe /role:ClientAccess,Mailbox /UpdatesDir:"C:\ExchangeServer\New Patches" /IAcceptExchangeServerLicenseTerms**

This command updates ExchangeServer.msi with patches from the specified directory, and then

installs the Client Access server role, Mailbox server role, and the management tools. If a language pack bundle is included in this directory, the language pack is also installed.

- **Setup.exe /mode:Install /role:ClientAccess,Mailbox /DomainController:DC01 /IAcceptExchangeServerLicenseTerms**

This command uses the domain controller DC01 to query and make changes to Active Directory while installing the Client Access server role, Mailbox server role, and the management tools.

- **Setup.exe /mode:Install /role:ClientAccess /AnswerFile:c:\ExchangeConfig.txt /IAcceptExchangeServerLicenseTerms**

This command installs the Client Access server role by using the settings in the ExchangeConfig.txt file.

- **Setup.exe /rprs:Exchange03 /IAcceptExchangeServerLicenseTerms**

This command removes the object Exchange03 from Active Directory.

- **Setup.exe /AddUmLanguagePack:ko-KR /IAcceptExchangeServerLicenseTerms**

This command installs the Korean Unified Messaging language pack from the %ExchangeSourceDir%\ServerRoles\UnifiedMessaging directory.

How do you know this worked?

To verify that you've successfully installed Exchange 2013, see Verify an Exchange 2013 installation.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Install the Exchange 2013 Edge Transport role using the Setup wizard

Exchange Server 2013 > Planning and deployment > Deploy a new installation of Exchange 2013 >

Applies to: *Exchange Server*

Topic Last Modified: *2014-06-19*

This topic explains how to use the Microsoft Exchange Server 2013 Setup wizard to install the Exchange 2013 Edge Transport server role on a computer. The Edge Transport role is available with Exchange 2013 Service Pack 1 (SP1) or later. For more information about planning and deploying Exchange 2013, see Planning and deployment.

We recommend that the Edge Transport role be installed in a perimeter network outside of your

organization's internal Active Directory forest. While you can install the Edge Transport server role on a domain-joined computer, doing so will only enable domain management of Windows features and settings. The Edge Transport role itself doesn't use Active Directory. Instead, it uses the Active Directory Lightweight Directory Services (AD LDS) Windows feature to store configuration and recipient information. For more information about the Edge Transport role, see Edge Transport servers.

If you want to install the Exchange 2013 Mailbox or Client Access roles on a computer, see Install Exchange 2013 using the Setup wizard. The Edge Transport role can't be installed on the same computer as the Mailbox or Client Access server roles.

Tip:

Have you heard about the Exchange Server Deployment Assistant? It's a free online tool that helps you quickly deploy Exchange 2013 in your organization by asking you a few questions and creating a customized deployment checklist just for you. If you want to learn more about it, go to Exchange Server Deployment Assistant.

For information about tasks to complete after installation, see Exchange 2013 post-Installation tasks.

What do you need to know before you begin?

- Estimated time to complete: 40 minutes
- Make sure you've read the release notes prior to installing Exchange 2013. For more information, see Release notes for Exchange 2013.
- The computer you install Exchange 2013 on must have a supported operating system (such as Windows Server 2008 R2 with SP1, Windows Server 2012 R2, or Windows Server 2012), have enough disk space, and satisfy other requirements. For information about system requirements, see Exchange 2013 system requirements.
- To run Exchange 2013 setup, you must install Microsoft .NET Framework 4.5, Windows Management Framework, and other required software. To understand the prerequisites for all server roles, see Exchange 2013 prerequisites.
- You need to configure the primary DNS suffix on the computer. For example, if the fully qualified domain name of your computer is edge.contoso.com, the DNS suffix for the computer is contoso.com. For more information, see Primary DNS Suffix is missing.
- Exchange 2007 and Exchange 2010 Hub Transport servers need an update before you can create an EdgeSync Subscription between them and an Exchange 2013 Edge Transport server. If you don't install this update, the EdgeSync Subscription won't work correctly. For more information, see the "Supported coexistence scenarios" section in Exchange 2013 system requirements.
- Make sure the account you use is a member of the local Administrators group on the computer you're installing the Edge Transport role.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Caution:

After you install Exchange 2013 on a server, you must not change the server name. Renaming a server after you have installed an Exchange 2013 server role is not supported.

Install Exchange Server 2013

Note:

To download the latest version of Exchange 2013, see Updates for Exchange 2013.

1. Log on to the computer on which you want to install Exchange 2013.
2. Navigate to the network location of the Exchange 2013 installation files.
3. Start Exchange 2013 Setup by double-clicking `Setup.exe`

Important:

If you have User Access Control (UAC) enabled, you must right-click `Setup.exe` and select **Run as administrator**.

4. On the **Check for Updates?** page, choose whether you want Setup to connect to the Internet and download product and security updates for Exchange 2013. If you select **Connect to the Internet and check for updates**, Setup will download updates and apply them prior to continuing. If you select **Don't check for updates right now**, you can download and install updates manually later. We recommend that you download and install updates now. Click **Next** to continue.
5. The **Introduction** page begins the process of installing Exchange into your organization. It will guide you through the installation. Several links to helpful deployment content are listed. We recommend that you visit these links prior to continuing setup. Click **Next** to continue.
6. On the **License Agreement** page, review the software license terms. If you agree to the terms, select **I accept the terms in the license agreement**, and then click **Next**.
7. On the **Recommended settings** page, select whether you want to use the recommended settings. If you select **Use recommended settings**, Exchange will automatically send error reports and information about your computer hardware and how you use Exchange to Microsoft. If you select **Don't use recommended settings**, these settings remain disabled but you can enable them at any time after Setup completes. For more information about these settings and how information sent to Microsoft is used, click **?**.
8. On the **Server Role Selection** page, select **Edge Transport**. Remember that you can't add the Mailbox or Client Access server roles to a computer that has the Edge Transport role installed. The management tools are installed automatically if you install any server role.

Select **Automatically install Windows Server roles and features that are required to install Exchange Server** to have the Setup wizard install required Windows prerequisites. You may need to reboot the computer to complete the installation of some Windows features. If you don't select this option, you must install the Windows features manually.

Note:

This option installs only the Windows features required by Exchange. You must manually install other prerequisites manually. For more information, see Exchange 2013 prerequisites.

Click **Next** to continue.

9. On the **Installation Space and Location** page, either accept the default installation location or click **Browse** to choose a new location. Make sure that you have enough disk space available in the location where you want to install Exchange. Click **Next** to continue.
10. On the **Readiness Checks** page, view the status to determine if the organization and server role prerequisite checks completed successfully. If they haven't completed successfully, you must resolve any reported errors before you can install Exchange 2013. You don't need to exit Setup when resolving some of the prerequisite errors. After resolving a reported error, click **back** and then click **Next** to run the prerequisite check again. Be sure to also review any warnings that are reported. If all readiness checks have completed successfully, click **Next** to install Exchange 2013.
11. On the **Completion** page, click **Finish**.
12. Restart the computer after Exchange 2013 has completed.
13. Complete your deployment by performing the tasks provided in Exchange 2013 post-Installation tasks.

How do you know this worked?

To verify that you've successfully installed Exchange 2013, see Verify an Exchange 2013 installation.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Delegate the installation of an Exchange 2013 server

Exchange Server 2013 > Planning and deployment > Deploy a new installation of Exchange 2013 >

Applies to: *Exchange Server 2013, Exchange Server, Exchange Online*

Topic Last Modified: *2014-07-31*

Exchange Server 2013 lets you delegate the installation of Exchange servers to people who aren't members of the Exchange 2013 Organization Management role group. This is often helpful in large companies where the people who install and set up servers aren't the same people who manage services, like Exchange. If this sounds like something you want to do, this topic is for you.

Normally, when Exchange is installed, the people installing it need to be members of the Organization Management role group. This is because when Exchange is installed, changes are made to Active Directory, and only Exchange administrators, who are members of the Organization Management role group, can make those changes. The following list shows the changes that are

made:

- A server object is created in the **CN=Servers,CN=Exchange Administrative Group (FYDIBOHF23SPDLT),CN=Administrative Groups,CN=<Organization Name>,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<Root Domain>** configuration partition.
- The following access control entries (ACEs) are added to the server object within the configuration partition for the Delegated Setup role group:
  - Full Control on the server object and its child objects
  - Deny access control entry for the Send As extended right
  - Deny access control entry for the Receive As extended right
  - Deny CreateChild and DeleteChild permissions for Exchange Public Folder Store objects

Note:

Public folders are administered at an organizational level; therefore, the creation and deletion of public folder stores is restricted to Exchange administrators.

- The Active Directory computer account for the server is added to the Exchange Servers group.
- The server is added as a provisioned server in the Exchange Admin Center.

In large companies, the people who install and set up new servers often aren't Exchange administrators. To enable them to install Exchange, an Exchange administrator can *provision* the server in Active Directory. When a server is provisioned, all of the changes needed for the new Exchange server to function are made to Active Directory separately from the actual installation of Exchange on a computer. An Exchange administrator can provision a new server in Active Directory hours or even days before Exchange is installed on the new computer. After a server has been provisioned, the person doing the installation needs only to be a member of the Delegated Setup role group to install Exchange. The Delegated Setup role group only allows members to install provisioned servers.

Keep the following in mind when thinking about using delegated setup:

- At least one Exchange 2013 server has to already be installed before you can delegate the installation of additional servers. The person who installs the first server needs to be an Exchange administrator. For more information, check out Checklist: Perform a new installation of Exchange 2013.
- A delegated user can't uninstall an Exchange server. To uninstall an Exchange server, you need to be an Exchange administrator.

How do I provision an Exchange 2013 server?

To provision a server for Exchange, you need to use Exchange 2013 command-line Setup. If you're not very familiar with the Windows Command Prompt, don't worry. This topic steps you through exactly what you need to do. Before we start, here are a couple of things to keep in mind:

- You need to be a member of the Organization Management role group to provision a server.
- You should have the latest release of Exchange 2013. You can get the download link from Updates for Exchange 2013.

The command that you need to use to provision the server depends on whether you're running

Setup from the computer you're provisioning or whether you're running it from another computer. Choose the command in the following steps that matches where you're running Setup:

1. Press the Windows key + 'R' to open the **Run** window.
2. In **Open**, type**cmd.exe**, and then press Enter to open a **Windows Command Prompt**.
3. Change directories to where you downloaded and expanded the Exchange 2013 install files. If the install files are located in `C:\Downloads\Exchange 2013`, use the following command.

```
CD "C:\Downloads\Exchange 2013"
```

4. Choose the command that matches where you're running Setup:
   - **If you're running Setup on the computer that's being provisioned**, run the following command:

```
Setup.exe /NewProvisionedServer /
IAcceptExchangeServerLicenseTerms
```

   - **If you're running Setup on another computer**, run the following command:

```
Setup.exe /NewProvisionedServer:<ComputerName> /
IAcceptExchangeServerLicenseTerms
```

5. After you provision the server, you need to make sure that you've added the users who should be able to install Exchange on provisioned servers to the Delegated Setup role group. To see how to add users to a role group, see Manage Role Group Members.

When you're done with these steps, the computer will be ready for Exchange to be installed. Exchange 2013 can be installed on a provisioned server by using the steps in Install Exchange 2013 using the Setup wizard.

How do I know this worked?

To make sure the server was properly provisioned for Exchange, you can do the following:

1. Go to **Start** > **Administrative Tools**, and then open **Active Directory Users and Computers**.
2. Select **Microsoft Exchange Security Groups**, double-click **Exchange Servers**, and then select the **Members** tab.
3. On the **Members** tab, check to see if the server you just provisioned is listed as a member of the security group.

If your server is listed as a member of the Exchange Servers security group, it was properly provisioned. Someone who's a member of the Delegated Setup role group can now install Exchange on that server.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

information you were hoping to find.

Upgrade Exchange 2013 to the latest cumulative update or service pack

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013, Exchange Server, Exchange Online*

Topic Last Modified: *2014-06-12*

If you have Microsoft Exchange Server 2013 installed, you can upgrade it to the latest Exchange 2013 cumulative update or service pack. You can use the Exchange 2013 Setup wizard to upgrade your current version of Exchange 2013. For more information about the latest Exchange 2013 cumulative update or service pack, see Updates for Exchange 2013. To learn more about Exchange 2013, see What's new in Exchange 2013.

Warning:

After you upgrade Exchange 2013 to a newer cumulative update or service pack, you can't uninstall the new version to revert to the previous version. If you uninstall the new version, you remove Exchange from the server.

What do you need to know before you begin?

- Estimated time to complete: 60 minutes
- Make sure you read the release notes before you install Exchange 2013. For more information, see Release notes for Exchange 2013.
- Make sure that any server on which you plan to install the cumulative update or service pack meets the system requirements and prerequisites. For more information, see Exchange 2013 system requirements and Exchange 2013 prerequisites.

Warning:

Any customized per-server settings you make in Exchange XML application configuration files, for example, web.config files on Client Access servers or the EdgeTransport.exe.config file on Mailbox servers, will be overwritten when you install an Exchange Cumulative Update (CU). Make sure that you save this information so you can easily re-configure your server after the install. You must re-configure these settings after you install an Exchange CU.

- After you install a cumulative update or service pack, you must restart the computer so that changes can be made to the registry and operating system.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Install the Exchange 2013 cumulative update or service pack

You can install the cumulative update or service pack for Exchange 2013 by using either the Setup wizard or via unattended mode. For specific instructions, see the following topics:

- Install Exchange 2013 using the Setup wizard
- Install Exchange 2013 using unattended mode

Upgrade from Exchange 2010 to Exchange 2013

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013, Exchange Server, Exchange Online*

Topic Last Modified: *2014-06-19*

Microsoft Exchange Server 2010 and Exchange Server 2007 have multiple server roles: Client Access, Mailbox, Hub Transport, Unified Messaging, and Edge Transport. With Exchange Server 2013, we reduced the number of server roles from five to three: Client Access, Mailbox, and Edge Transport. Unified Messaging is now considered a component or sub-feature of the voice-related features that are offered in Exchange 2013. (For more details about the changes, see “Exchange 2013 architecture” in What's new in Exchange 2013.)

When you're upgrading your existing Exchange 2010 organization to Exchange 2013, there's a period of time when Exchange 2010 and Exchange 2013 servers will coexist within your organization. You can maintain this mode for an indefinite period of time, or you can immediately complete the upgrade to Exchange 2013 by moving all resources from Exchange 2010 to Exchange 2013, and then decommissioning the Exchange 2010 servers. You have a coexistence scenario if the following conditions are true:

- Exchange 2013 is deployed in an existing Exchange organization.
- More than one version of Microsoft Exchange provides messaging services to the organization.

You can't upgrade an existing Exchange 2003 organization directly to Exchange 2013. You must first upgrade the Exchange 2003 organization to either an Exchange 2007 or Exchange 2010 organization, and then you can upgrade the Exchange 2007 or Exchange 2010 organization to Exchange 2013. We recommend that you upgrade your organization from Exchange 2003 to Exchange 2010, and then upgrade from Exchange 2010 to Exchange 2013.

⚠Warning:

You need to remove all instances of Exchange 2003 from your organization before you can upgrade to Exchange 2013.

You can migrate all your Exchange 2003 mailboxes to Exchange Online. For more information about this approach, see **Mailbox Migration to Exchange Online**.

The following table lists the scenarios in which coexistence between Exchange 2013 and earlier versions of Exchange is supported.

Coexistence of Exchange 2013 and earlier versions of Exchange Server

Exchange version	Exchange organization coexistence
Exchange Server 2003 and earlier versions	Not supported
Exchange 2007	Supported with the following minimum versions of Exchange: • [1]Update Rollup 10 for Exchange 2007 Service Pack 3 (SP3) on all Exchange 2007 servers in the organization, including Edge Transport servers. • Exchange 2013 Cumulative Update 2 (CU2) or later on all Exchange 2013 servers in the organization.
Exchange 2010	Supported with the following minimum versions of Exchange: • [2]Exchange 2010 SP3 on all Exchange 2010 servers in the organization, including Edge Transport servers. • Exchange 2013 CU2 or later on all Exchange 2013 servers in the organization.
Mixed Exchange 2010 and Exchange 2007 organization	Supported with the following minimum versions of Exchange: • [1]Update Rollup 10 for Exchange 2007 SP3 on all Exchange 2007 servers in the organization, including Edge Transport servers. • [2]Exchange 2010 SP3 on all Exchange 2010 servers in the organization, including Edge

	Transport servers. • Exchange 2013 CU2 or later on all Exchange 2013 servers in the organization.

[1] If you want to create an EdgeSync Subscription between an Exchange 2007 Hub Transport server and an Exchange 2013 SP1 Edge Transport server, you need to install Exchange 2007 SP3 Update Rollup 13 or later on the Exchange 2007 Hub Transport server.

[2] If you want to create an EdgeSync Subscription between an Exchange 2010 Hub Transport server and an Exchange 2013 SP1 Edge Transport server, you need to install Exchange 2010 SP3 Update Rollup 5 or later on the Exchange 2010 Hub Transport server.

Mixed mode coexistence of Exchange 2013 and Exchange 2007 with Exchange 2010

If you have Active Directory sites with both Exchange 2010and Exchange 2007 installed, follow the upgrade instructions from both Exchange 2010 and Exchange 2007, and perform the upgrade steps required by both.

Overview of the upgrade process

To help you get an overview of the Exchange 2010 to Exchange 2013 upgrade process, we've gathered resources related to each key task in the following table. For specific step-by-step guidance, see Checklist: Upgrade from Exchange 2010.

Task	Topic
Learn about Exchange 2013 roles and components	What's new in Exchange 2013 Client Access server Mailbox server Mail flow Unified Messaging

Add digital certificates on the Client Access server	Exchange 2013 Client Access server configuration Digital certificates and SSL Create a digital certificate request
Configure Exchange-related virtual directories	Default settings for Exchange virtual directories
Move mailboxes from Exchange 2010	Mailbox moves in Exchange 2013
Configure transport components	Edge Subscriptions (only necessary if you've installed an Edge Transport server) Mail routing Shadow redundancy Delivery reports for administrators
Configure and deploy UM	Planning for Unified Messaging Deploying voice mail and UM

Checklist: Upgrade from Exchange 2010

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-28*

Use this checklist to upgrade from Microsoft Exchange 2010 to Exchange 2013. Before you start working with this checklist, make sure you're familiar with the concepts discussed in:

- Planning and deployment
- What's new in Exchange 2013

This checklist is generic in that it provides guidance for a typical upgrade scenario.

Note:

The Exchange Server Deployment Assistant provides you with customized step-by-step guidance about how to deploy Exchange Server. The Deployment Assistant can help you deploy a new installation of Exchange Server 2013, upgrade a previous version to Exchange 2013, or configure a hybrid deployment of Exchange 2013 and Exchange Online. To learn

more, see Exchange Server Deployment Assistant.

Checklist for upgrading from Exchange 2010 to Exchange 2013

Done?		Task	Topic(s)
	1. Read the release notes.	Release notes for Exchange 2013	
		2. Verify system requirements	Exchange 2013 system requirements
		3. Confirm prerequisite steps are done	Exchange 2013 prerequisites Deployment security checklist
		4. Configure disjoint namespace **Note:** This step is optional. It's only necessary if your organization is running a disjoint namespace.	Configure the DNS suffix search list for a disjoint namespace
	5. Select an offline address book for all Exchange 2010 mailbox databases	Set mailbox database properties in Manage mailbox databases in Exchange 2013	
		6. Install Exchange 2013	Install Exchange 2013 using the Setup wizard Install the Exchange 2013 Edge Transport role using the Setup wizard

			Verify an Exchange 2013 installation
	7. Create an Exchange 2013 mailbox	Create user mailboxes	
		8. Configure Exchange-related virtual directories **Note:** This step is necessary if you want to use Exchange Web Services, Outlook Anywhere, or the offline address book. It also may be required if you need to change any of the default settings for Exchange Control Panel, Microsoft Office Outlook Web App, or Exchange ActiveSync.	Exchange 2013 Client Access server configuration
		9. Add digital certificates on the Client Access server	Digital certificates and SSL
	10. Move arbitration mailbox	Move the Exchange 2010 system mailbox to Exchange 2013	
		11. Configure Unified Messaging **Note:** This step is optional. It's only necessary if you want to use Unified Messaging in your organization.	Upgrade Exchange 2010 UM to Exchange 2013 UM
		12. Configure Edge Transport server **Note:** This step is optional. It's only	Configure Internet mail flow through a subscribed Edge Transport server

		necessary if your organization is uses an Edge Transport server.		
	13. Enable and configure Outlook Anywhere	Outlook Anywhere		
	14. Configure service connection point	Exchange 2013 Client Access server configuration		
	15. Configure DNS records	**Configure DNS records for Exchange 2010 multiple-server install**		
		16. Move mailboxes from Exchange 2010 to Exchange 2013	Mailbox moves in Exchange 2013	
		17. Move public folder data from Exchange 2013 to Exchange 2013	Public folders Migrate public folders to Exchange 2013 from previous versions	
		18. Post-installation tasks	Exchange 2013 post-Installation tasks	

Upgrade from Exchange 2007 to Exchange 2013

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013, Exchange Server, Exchange Online*

Topic Last Modified: *2014-06-19*

Microsoft Exchange Server 2010 and Exchange Server 2007 have multiple server roles: Client Access, Mailbox, Hub Transport, Unified Messaging, and Edge Transport. With Exchange Server 2013, we reduced the number of server roles from five to three: Client Access, Mailbox, and Edge Transport. Unified Messaging is now considered a component or sub feature of the voice-related features that are offered in Exchange 2013. (For more details about the changes, see "Exchange 2013 architecture" in What's new in Exchange 2013.)

When you're upgrading your existing Exchange 2007 organization to Exchange 2013, there's a period of time when Exchange 2007 and Exchange 2013 servers will coexist within your organization. You can maintain this mode for an indefinite period of time, or you can immediately complete the upgrade to Exchange 2013 by moving all resources from Exchange 2007 to Exchange 2013, and then decommissioning the Exchange 2007 servers. You have a coexistence scenario if the following conditions are true:

- Exchange 2013 is deployed in an existing Exchange organization.
- More than one version of Microsoft Exchange provides messaging services to the organization.

You can't upgrade an existing Exchange 2003 organization directly to Exchange 2013. You must first upgrade the Exchange 2003 organization to either an Exchange 2007 or Exchange 2010 organization, and then you can upgrade the Exchange 2007 or Exchange 2010 organization to Exchange 2013. We recommend that you upgrade your organization from Exchange 2003 to Exchange 2010, and then upgrade from Exchange 2010 to Exchange 2013.

Warning:
You need to remove all instances of Exchange 2003 from your organization before you can upgrade to Exchange 2013.

You can migrate all your Exchange 2003 mailboxes to Exchange Online. For more information about this approach, see **Mailbox Migration to Exchange Online**.

The following table lists the scenarios in which coexistence between Exchange 2013 and earlier versions of Exchange is supported.

Coexistence of Exchange 2013 and earlier versions of Exchange Server

Exchange version	Exchange organization coexistence
Exchange Server 2003 and earlier versions	Not supported
Exchange 2007	Supported with the following minimum versions of Exchange: • [1]Update Rollup 10 for Exchange 2007 Service Pack 3 (SP3) on all Exchange 2007 servers in the organization, including Edge Transport servers.

	• Exchange 2013 Cumulative Update 2 (CU2) or later on all Exchange 2013 servers in the organization.
Exchange 2010	Supported with the following minimum versions of Exchange: • [2]Exchange 2010 SP3 on all Exchange 2010 servers in the organization, including Edge Transport servers. • Exchange 2013 CU2 or later on all Exchange 2013 servers in the organization.
Mixed Exchange 2010 and Exchange 2007 organization	Supported with the following minimum versions of Exchange: • [1]Update Rollup 10 for Exchange 2007 SP3 on all Exchange 2007 servers in the organization, including Edge Transport servers. • [2]Exchange 2010 SP3 on all Exchange 2010 servers in the organization, including Edge Transport servers. • Exchange 2013 CU2 or later on all Exchange 2013 servers in the organization.

[1] If you want to create an EdgeSync Subscription between an Exchange 2007 Hub Transport server and an Exchange 2013 SP1 Edge Transport server, you need to install Exchange 2007 SP3 Update Rollup 13 or later on the Exchange 2007 Hub Transport server.

[2] If you want to create an EdgeSync Subscription between an Exchange 2010 Hub Transport server and an Exchange 2013 SP1 Edge Transport server, you need to install Exchange 2010 SP3 Update Rollup 5 or later on the Exchange 2010 Hub Transport server.

Mixed mode coexistence of Exchange 2013 and Exchange 2007 with Exchange 2010

If you have Active Directory sites with both Exchange 2010 and Exchange 2007 installed, follow the upgrade instructions from both Exchange 2010 and Exchange 2007, and perform the upgrade steps required by both.

Overview of the upgrade process

To help you get an overview of the Exchange 2007 to Exchange 2013 upgrade process, we've gathered resources related to each key task in the following table. For specific step-by-step guidance, see Checklist: Upgrade from Exchange 2007.

Task	Topic
Learn about Exchange 2013 roles and components	What's new in Exchange 2013 Client Access server Mailbox server Mail flow Unified Messaging
Install Exchange 2013	Install Exchange 2013 using the Setup wizard Install the Exchange 2013 Edge Transport role using the Setup wizard (optional) Verify an Exchange 2013 installation
Add digital certificates on the Client Access server	Exchange 2013 Client Access server configuration Digital certificates and SSL Create a digital certificate request
Configure Exchange-related virtual directories	Default settings for Exchange virtual directories
Move mailboxes from Exchange 2010	Mailbox moves in Exchange 2013
Configure transport components	Edge Subscriptions (only necessary if you've installed an Edge Transport server) Mail routing Shadow redundancy Delivery reports for administrators
Configure and deploy UM	Planning for Unified Messaging

	Deploying voice mail and UM

Checklist: Upgrade from Exchange 2007

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-28*

Use this checklist to upgrade from Microsoft Exchange Server 2007 to Exchange Server 2013. Before you start working with this checklist, make sure you're familiar with the concepts discussed in:

- Planning and deployment
- What's new in Exchange 2013

This checklist is generic in that it provides guidance for a typical upgrade scenario.

Note:

The Exchange Server Deployment Assistant provides you with customized step-by-step guidance about how to deploy Exchange Server. The Deployment Assistant can help you deploy a new installation of Exchange Server 2013, upgrade a previous version to Exchange 2013, or configure a hybrid deployment of Exchange 2013 and Exchange Online. To learn more, see Exchange Server Deployment Assistant.

Deploy multiple forest topologies for Exchange 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-20*

This topic provides an overview of deploying Microsoft Exchange Server 2013 in multiple forest topologies. You'll find information about the following subjects:

- **Supported multiple forest topologies** Exchange 2013 supports two types of multiple forest topologies: cross-forest and resource forest.
- **GAL synchronization** If you have a cross-forest environment, you need to ensure that the GAL in any given forest contains mail recipients from other forests.
- **Moving mailboxes across forests** The **New-MoveRequest** and **New-MigrationBatch** cmdlets in the Exchange Management Shell can help move mailboxes from one forest to another.
- **Understanding multiple forest administration** Learn about the permissions model to configure and manage the permissions between your forests.

Supported multiple forest topologies

Exchange 2013 supports the following types of multiple forest topologies:

- **Cross-forest** A cross-forest topology is one with multiple Exchange forests. Here is an overview of what you need to do to deploy Exchange 2013 in a topology with a multiple forest:
  1. You must first install Exchange 2013 in each forest. For more information, see Deploy a new installation of Exchange 2013.
  2. Next, you must synchronize the recipients in each of the forests, so that the Global Address List (GAL) in each forest contains users from all the synchronized forests. See the "GAL Synchronization" section below for more details.
  3. Finally, you must configure the Availability service so that users in one forest can view availability data for users in another forest. For more information, see Configure the Availability service for cross-forest topologies.

For details about deploying Exchange 2013 in a cross-forest topology, see Deploy Exchange 2013 in a cross-forest topology.

- **Resource forest** A resource forest topology is one with an Exchange forest and one or more user accounts forests. Here is an overview of what you need to do to deploy Exchange 2013 in a topology with a resource forest:
  1. You must have a forest with Exchange installed. In the Exchange forest, you must have disabled the user accounts that have Exchange mailboxes.

2. You must have at least one forest that contains user accounts. This forest should *not* have Exchange installed.
3. Then, you must associate the disabled user accounts in the Exchange forest with the user accounts in the accounts forest.

For details about deploying Exchange 2013 in a resource forest topology, see Deploy Exchange 2013 in an Exchange resource forest topology.

GAL synchronization

By default, a GAL contains mail recipients from a single forest. If you have a cross-forest environment, we recommend using Microsoft Identity Lifecycle Manager (ILM) 2007 Feature Pack 1 (FP1) to ensure that the GAL in any given forest contains mail recipients from other forests. ILM 2007 FP1 creates mail users that represent recipients from other forests, thereby allowing users to view them in the GAL and send mail. For example, users in Forest A appear as a mail user in Forest B and vice versa. Users in the target forest can then select the mail user object that represents a recipient in another forest to send mail.

To enable GAL synchronization, you create management agents that import mail-enabled users, contacts, and groups from designated Active Directory services into a centralized metadirectory. In the metadirectory, mail-enabled objects are represented as mail users. Groups are represented as contacts without any associated membership. The management agents then export these mail users to an organizational unit in the specified target forest.

For more information about Forefront Identity Manager (FIM), see Forefront Identity Manager 2010.

Moving mailboxes across forests

In a cross-forest topology, you may want to move mailboxes from one forest to another. To do this you must use the **New-MoveRequest** or **New-MigrationBatch** cmdlet in the Exchange Management Shell. For more information about moving mailboxes across forests, see the following topics:

- Prepare mailboxes for cross-forest move requests
- Prepare mailboxes for cross-forest moves using the Prepare-MoveRequest.ps1 script in the Shell
- Prepare mailboxes for cross-forest moves using sample code

Understanding multiple forest administration

Exchange 2013 uses new permissions functionality to manage your multiple forest environments.

Exchange 2013 uses a Role Based Access Control (RBAC) permissions model. The management role groups that administrators are members of, and the management role assignment policies that end-users are assigned, determine what each administrator and end-user can do. To understand multiple forest permissions, you need to be familiar with RBAC. For more information about RBAC and role groups and role assignment policies in particular, see Understanding Role Based Access

Control.

You can use the RBAC permissions model to configure and manage the permissions between your forests. For more information about multiple forest permissions, see the following topics:

- Understanding multiple-forest permissions
- Manage linked role groups
- Create linked role groups that mirror built-in role groups

Deploy Exchange 2013 in a cross-forest topology

Exchange Server 2013 > Planning and deployment > Deploy multiple forest topologies for Exchange 2013 >

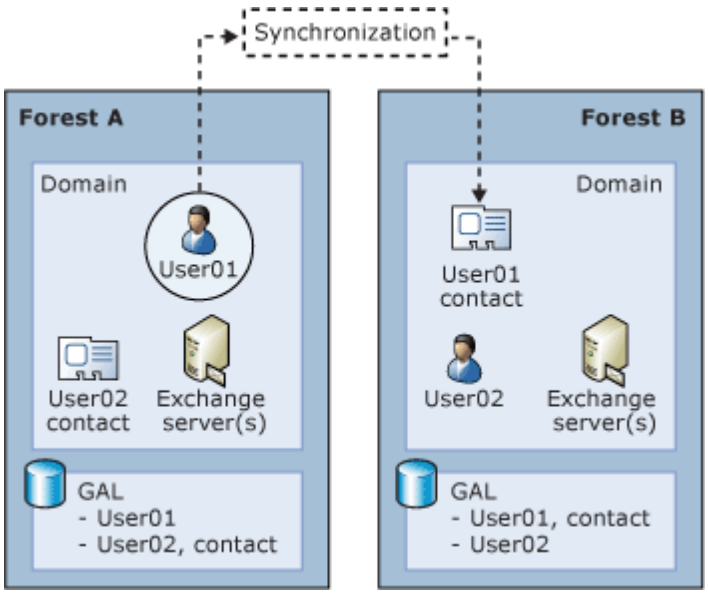
Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-13*

This topic explains how to deploy Exchange 2013 in a cross-forest topology using Microsoft Forefront Identity Manager 2010 R2 SP1. To deploy Exchange 2013 in a cross-forest topology, you must first install Exchange 2013 in each forest, and then connect the forests so that users can see address and availability data across the forests.

The following figure illustrates user synchronization between two Exchange 2013 forests.

Example of Exchange 2013 cross-forest synchronization



This topic does *not* describe how to deploy Exchange 2013 in a dedicated Exchange forest (or resource forest) topology. For more information about how to deploy Exchange 2013 in a resource forest topology, see Deploy Exchange 2013 in an Exchange resource forest topology.

What do you need to know before you begin?

To perform the following procedure in Exchange 2013, confirm the following:

- You have correctly configured Domain Name System (DNS) for name resolution across forests in your organization. To verify that DNS is configured correctly, use the Ping tool to test connectivity to each forest from the other forests in your organization and from the server on which you will run the GALSync agent.
- The GALSync management agent (MA) communicates with the Exchange 2013 forest using Windows PowerShell V2.0 RTM. Make sure Windows PowerShell v1.0 isn't installed on this computer by going to Control Panel, and then clicking Programs and Features.
- Ensure that Windows Remote Management has not been installed by Windows Update.
- Install Windows PowerShell and Windows Remote Management. For details, see Microsoft Knowledge Base article 968930, Windows Management Framework Core package (Windows PowerShell 2.0 and WinRM 2.0).
- Download Forefront Identity Manager 2010 R2 SP1. See Download of Microsoft Forefront Identity Manager 2010 R2 SP1.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Deploy Exchange 2013 in a cross-forest topology with Forefront Identity Manager 2010 R2 SP1

1. In each forest, install Exchange 2013 separately. To install Exchange 2013, perform the same steps that you would if you were installing Exchange 2013 in a single forest topology. For detailed steps, see one of the following topics:
   - Deploy a new installation of Exchange 2013
   - Install Exchange 2013 using the Setup wizard

Note:

This topic assumes that you don't have an existing Exchange 2007 or Exchange 2010 topology. If you do have an existing Exchange topology and you want to upgrade, see Upgrade from Exchange 2010 to Exchange 2013 or Upgrade from Exchange 2007 to Exchange 2013.

2. In each forest, use Active Directory Users and Computers to create a container in which FIM 2010 R2 SP1 will create contacts for each mailbox from the other forest. We recommend that you name this container **FromFIM**. To create the container, select the domain in which you want to create the container, right-click the domain, select **New** > **Organizational Unit**. In **New Object - Organizational Unit**, type **FromFIM**, and then click **OK**.
3. Create a GALSync management agent for each forest by using Forefront Identify Manager. This

allows you to synchronize the users in each forest and create a common GAL. For detailed steps, see the following resources:

- Configuring Global Address List (GAL) Synchronization with Forefront Identity Manager (FIM) 2010
- Work with Management Agents
- Forefront Identity Manager 2010 R2 Documentation Roadmap

Important:

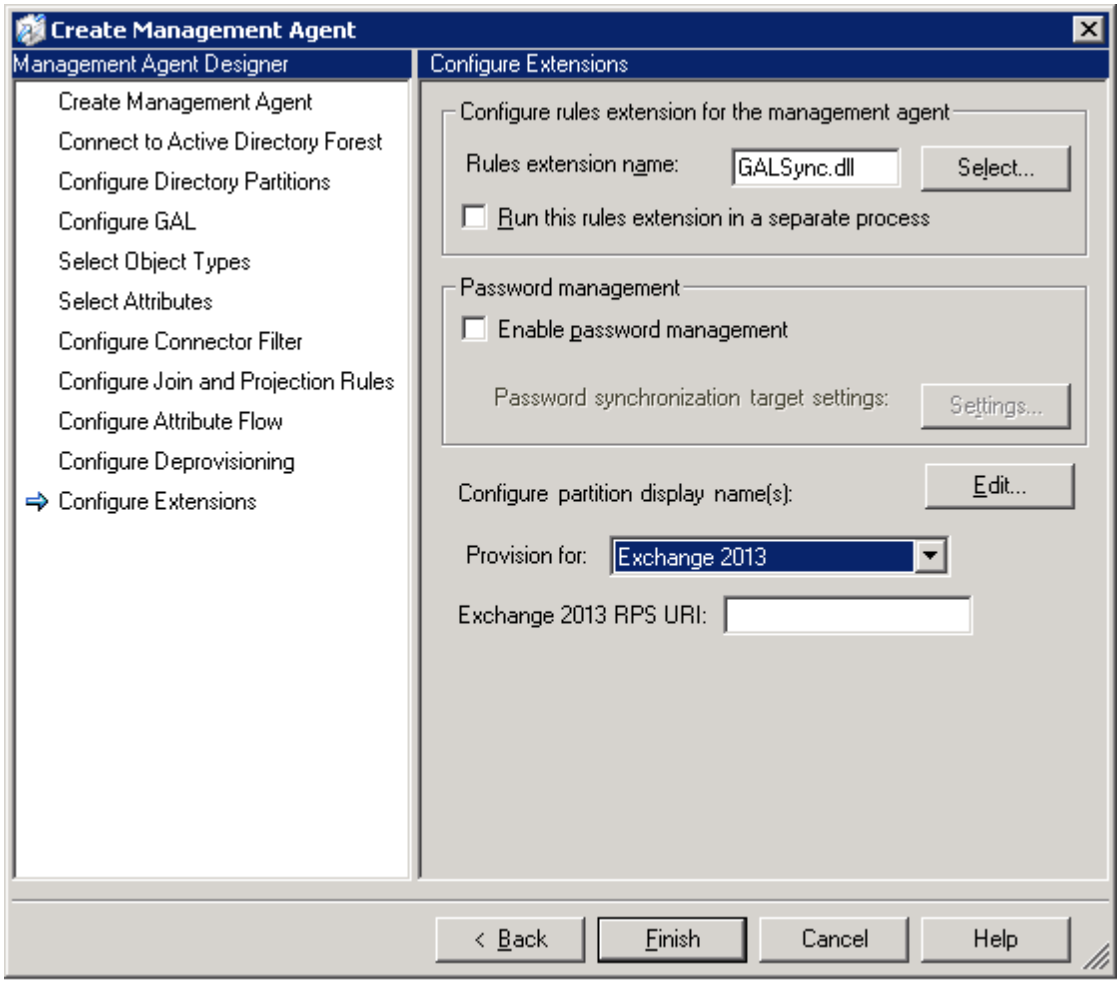
While the resources discuss Exchange 2010, Exchange 2013 is supported for FIM 2010 R2 SP1. Make sure that you configure **Extensions** in FIM 2010 R2 SP1 for Exchange 2013.

- On the **Configure Extensions** page, under **Configure partition display name(s)**, next to **Provision for**, select **Exchange 2013**. You will see the **Exchange 2013 RPS URI** field. Enter the URI of an Exchange 2013 Client Access server to make sure the remote PowerShell connection is functioning. The **Exchange 2013 RPS URI** should be in the following format: http://CAS_Server_FQDN/Powershell. Click **OK**.

Note:

Make sure that the administrator credentials used to connect to the Exchange 2013 forest can also make remote PowerShell connections to that forest.
The following figure shows how to select provisioning for Exchange 2013.

Provision GalSync Management Agent for Exchange 2013



4. Create an SMTP Send connector in each of the forests. For detailed steps, see Configure a cross-forest Send connector.

5. In each forest, enable the Availability service so that users in each forest can view free/busy data about users in the other forest. For more information, see Availability service in Exchange 2013.
6. If you want mail relayed through any forest in your organization, you must configure a domain in that forest as an authoritative domain. For detailed steps, see Configure Exchange to accept mail for multiple authoritative domains.

Deploy Exchange 2013 in an Exchange resource forest topology

Exchange Server 2013 > Planning and deployment > Deploy multiple forest topologies for Exchange 2013 >

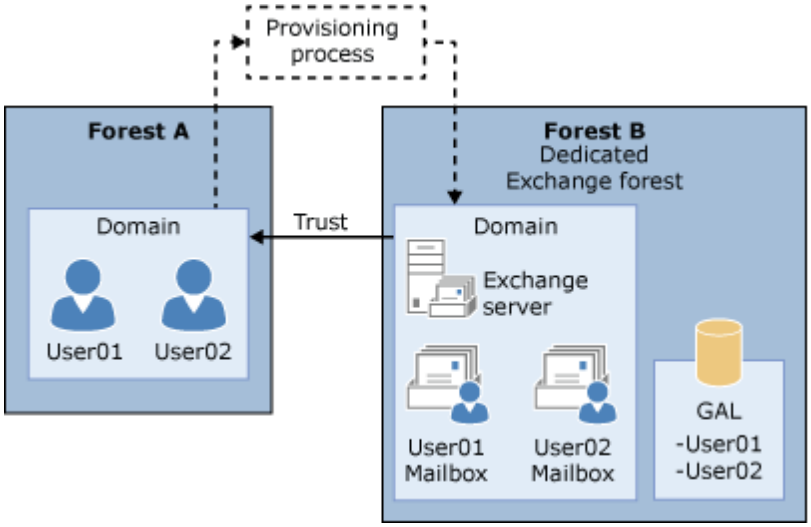
Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-05-08*

This topic explains how to deploy Microsoft Exchange 2013 in an Exchange resource forest topology. An Exchange resource forest is also called a dedicated Exchange forest. This topic assumes that you don't have an existing Exchange 2013 topology.

The following figure shows an Exchange organization with a resource forest.

Example of an Exchange organization with an Exchange resource forest



What do you need to know before you begin?

To perform the following procedure in Exchange 2013, confirm you have the following:

- You have the following two Active Directory forests:
  - One forest contains the user accounts for your organization. In this procedure, this forest is called the *accounts forest*.
  - One forest does not contain user accounts and does not yet have Exchange installed. In this

procedure, this forest is called the *Exchange forest*. You will use the procedure to install Exchange 2013 in this forest.

- You have correctly configured Domain Name System (DNS) for name resolution across forests in your organization. To check that you have DNS configured correctly, ping each forest from the other forest or forests in your organization. For more information about configuring DNS, see the DNS Servers Operations Guide.

Deploy Exchange 2013 in an Exchange resource forest topology

1. From a domain controller in the Exchange forest, create a one-way outgoing trust so that the Exchange forest trusts the accounts forest. For detailed steps, see Create a one-way, outgoing, forest trust for both sides of the trust.

Note:
Although we recommend that you create a forest trust, you can create either a forest trust or an external trust. If you create an external trust, when you create linked mailboxes in Step 3, on the **Master Account** page of the New Mailbox wizard, you must specify a user account that can access the domain controller in the trusted forest. You can't use the credentials with which you are currently logged on. If you create linked mailboxes by using the **New-Mailbox** cmdlet, you must specify a user account that can access the domain controller in the trusted forest by using the *LinkedCredential* parameter.

2. In the Exchange forest, install Exchange 2013. Install Exchange the same way that you would in a single forest scenario. For detailed steps about how to install Exchange 2013, see one of the following topics:
   - Deploy a new installation of Exchange 2013
   - Install Exchange 2013 using the Setup wizard
3. In the Exchange forest, for each user in the accounts forest that will have a mailbox in the Exchange forest, create a mailbox that is associated with an external account. For detailed steps, see Manage linked mailboxes.

Exchange 2013 post-Installation tasks

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-30*

After you've completed the installation of Microsoft Exchange Server 2013, read the following topics to help you configure your new Exchange 2013 organization.

Topic	Description

Enter your Exchange 2013 product key	Read this topic to license an Microsoft Exchange server.
Configure mail flow and client access	Read this topic to configure mail flow to and from the Internet and configure Microsoft Exchange to accept client connections from the Internet.
Configure Internet mail flow through a subscribed Edge Transport server	Read this topic if you're installing an Edge Transport server and you want to configure an EdgeSync Subscription between that server and a Hub Transport server.
Verify an Exchange 2013 installation	Read this topic to verify that Exchange 2013 was installed successfully in your organization.
Install the Exchange 2013 management tools	Read this topic to install the Exchange Management Shell and Exchange Toolbox on client workstations or other non-Exchange servers in your organization.

If you want to configure additional features, such as permissions, compliance, high availability, and more, see Exchange Server 2013.

Enter your Exchange 2013 product key

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-14*

A product key tells Exchange Server 2013 that you've purchased a Standard or Enterprise Edition license. If the product key you purchased is for an Enterprise Edition license, it lets you mount more than five databases per server in addition to everything that's available with a Standard Edition license. If you want to read more about Exchange licensing, see Exchange 2013: editions and versions.

If you don't enter a product key, your server is automatically licensed as a trial edition. The trial edition functions just like an Exchange Standard Edition server and is helpful if you want to try out

Exchange before you buy it, or to run tests in a lab. The only difference is that you can only use an Exchange server licensed as a trial edition for up to 180 days. If you want to keep using the server beyond 180 days, you'll need to enter a product key or the Exchange Admin Center (EAC) will start to show reminders that you need to enter a product key to license the server.

Tip:

We've noticed some visitors to this page are looking for information on how to install or activate Office. If that's you, check out these pages:

- Install Office
- Need help with your Office product key?

If you want to enter a product key on an Exchange 2010 server, go to Enter an Exchange 2010 product key.
If you want to enter a product key on an Exchange 2013 server, you're in the right place! Read on.

What do you need to know before you begin?

- Estimated time to complete this procedure: less than 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Product key" entry in the Exchange and Shell infrastructure permissions topic.
- If you're licensing an Exchange server that's running the Mailbox server role, you'll need to restart the Microsoft Exchange Information Store service on the server after you enter the product key.
- If you want to upgrade an Exchange server from a Standard Edition license to an Enterprise Edition license, follow the steps in this topic.
- If you want to downgrade an Exchange server from an Enterprise Edition license to a Standard Edition license, you need to reinstall Exchange.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Use the EAC to enter the product key

1. Open the EAC by browsing to https://<*Client Access server name*>/ecp.
2. Enter your user name and password in **Domain\user name** and **Password**, and then click **Sign in**.
3. Go to **Servers** > **Servers**. Select the server you want to license, and then click **Edit** ✎.
4. (Optional) If you want to upgrade the server from a Standard Edition license to an Enterprise Edition license, on the **General** page, select **Change product key**. You'll only see this option if the server is already licensed.

5. On the **General** page, enter your product key in the **Enter a valid product key** text boxes.
6. Click **Save**.
7. If you licensed an Exchange server running the Mailbox server role, do the following to restart the Microsoft Exchange Information Store service:
   a. Open **Control Panel**, go to **Administrative Tools**, and then open **Services**.
   b. Right-click on **Microsoft Exchange Information Store** and click **Restart**.

Use the Shell to enter the product key

This example uses the **set-ExchangeServer** cmdlet to enter the product key.

Note:
You can run this command again on the same server to upgrade it from a Standard Edition license to an Enterprise Edition license.

```
Set-ExchangeServer ExServer01 -ProductKey aaaaa-aaaaa-aaaaa-aaaaa-aaaaa
```

For detailed syntax and parameter information, see Set-ExchangeServer.

If you licensed an Exchange server running the Mailbox server role, do the following to restart the Microsoft Exchange Information Store service:

1. Open **Control Panel**, go to **Administrative Tools**, and then open **Services**.
2. Right-click **Microsoft Exchange Information Store** and click **Restart**.

How do you know this worked?

To use the EAC to verify that you've successfully licensed the server as Standard Edition or Enterprise Edition, do the following:

1. Enter your user name and password in **Domain\user name** and **Password**, and then click **Sign in**.
2. Go to **Servers** > **Servers**.
3. Select the server you want to view, and then look in the server details pane. If the product key has been accepted, **Licensed** will appear along with the Exchange 2013 edition.

To use the Shell to verify that you've successfully licensed the server as Standard Edition or Enterprise Edition, do the following:

1. Open the Shell.
2. Run the following command to view the licensing status of a specific Exchange server.

```
Get-ExchangeServer ExServer01 | Format-Table Edition,*Trial*
```

3. (Optional) Run the following command to view the licensing status of all Exchange servers in your organization.

```
Get-ExchangeServer | Format-Table Name, Edition, *Trial* -
Auto
```

Configure mail flow and client access

Exchange Server 2013 > Planning and deployment > Exchange 2013 post-Installation tasks >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-03-20*

After you've installed Microsoft Exchange Server 2013 in your organization, you need to configure Exchange Server 2013 for mail flow and client access. Without these additional steps, you won't be able to send mail to the Internet and external clients such as Microsoft Office Outlook and Exchange ActiveSync devices won't be able to connect to your Exchange organization.

The steps in this topic assume a basic Exchange deployment with a single Active Directory site and a single simple mail transport protocol (SMTP) namespace.

Important:

This topic uses example values such as Ex2013CAS, contoso.com, mail.contoso.com, and 172.16.10.11. Replace the example values with the server names, FQDNs, and IP addresses for your organization.

For additional management tasks related to mail flow and clients and devices, see Mail flow and Clients and mobile.

What do you need to know before you begin?

- Estimated time to complete this task: 50 minutes
- Procedures in this topic require specific permissions. See each procedure for its permissions information.
- You might receive certificate warnings when you connect to the Exchange admin center (EAC) website until you configure a secure sockets layer (SSL) certificate on the Client Access server. You'll be shown how to do this later in this topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Important:

Each organization requires at a minimum one Client Access server and one Mailbox server in the Active Directory forest. Additionally, each Active Directory site that contains a Mailbox server must also contain at least one Client Access server. If you're separating your server roles, we recommend installing the Mailbox server role first.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

How do you do this?

Step 1: Create a Send connector

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Send connectors" entry in the Mail flow permissions topic.

Before you can send mail to the Internet, you need to create a Send connector on the Mailbox server. Do the following.

1. Open the EAC by browsing to the URL of your Client Access server. For example, https://Ex2013CAS/ECP.
2. Enter your user name and password in **Domain\user name** and **Password** and then click **Sign in**.
3. Go to **Mail flow** > **Send connectors**. On the **Send connectors** page, click **New +**.
4. In the **New send connector** wizard, specify a name for the Send connector and then select **Internet**. Click **Next**.
5. Verify that **MX record associated with recipient domain** is selected. Click **Next**.
6. Under **Address space**, click **Add +**. In the **Add domain** window, make sure **SMTP** is selected in the **Type** field. In the **Fully Qualified Domain Name (FQDN)** field, enter ***. Click **Save**.
7. Make sure **Scoped send connector** isn't selected and then click **Next**.
8. Under **Source server**, click **Add +**. In the **Select a Server** window, select a Mailbox server. After you've selected the server, click **Add** and then click **OK**.
9. Click **Finish**.

Note:

A default inbound Receive connector is created when Exchange 2013 is installed. This Receive connector accepts anonymous SMTP connections from external servers. You don't need to do any additional configuration if this is the functionality you want. If you want to restrict inbound connections from external servers, modify the **Default Frontend <Client Access server>** Receive connector on the Client Access server.

How do you know this step worked?

To verify that you have successfully created an outbound Send connector, do the following:

1. In the EAC, verify the new Send connector appears in **Mail flow** > **Send connectors**.
2. Open Outlook Web App and send an email message to an external recipient. If the recipient receives the message, you've successfully configured the Send connector.

Step 2: Add additional accepted domains

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Accepted domains" entry in the Mail flow permissions topic.

By default, when you deploy a new Exchange 2013 organization in an Active Directory forest, Exchange uses the domain name of the Active Directory domain where Setup /PrepareAD was run. If you want recipients to receive and send messages to and from another domain, you must add the domain as an accepted domain. This domain is also added as the primary SMTP address on the default email address policy in the next step.

Important:
A public Domain Name System (DNS) MX resource record is required for each SMTP domain for which you accept email from the Internet. Each MX record should resolve to the Internet-facing server that receives email for your organization.

1. Open the EAC by browsing to the URL of your Client Access server. For example, https://Ex2013CAS/ECP.
2. Enter your user name and password in **Domain\user name** and **Password** and then click **Sign in**.
3. Go to **Mail flow** > **Accepted domains**. On the **Accepted domains** page, click **New +**.
4. In the **New accepted domain** wizard, specify a name for the accepted domain.
5. In the **Accepted domain** field, specify the SMTP recipient domain you want to add. For example, contoso.com.
6. Select **Authoritative domain** and then click **Save**.

How do you know this step worked?

To verify that you have successfully created an accepted domain, do the following:

- In the EAC, verify the new accepted domain appears in **Mail flow** > **Accepted domains**.

Step 3: Configure the default email address policy

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Email address policies" entry in the Email address and address book permissions topic.

If you added an accepted domain in the previous step and you want that domain to be added to every recipient in the organization, you need to update the default email address policy.

1. Open the EAC by browsing to the URL of your Client Access server. For example, https://Ex2013CAS/ECP.
2. Enter your user name and password in **Domain\user name** and **Password** and then click **Sign in**.
3. Go to **Mail flow** > **Email address policies**. On the **Email address policies** page, select **Default Policy** and then click **Edit** ✎.
4. On the **Default Policy Email Address Policy** page, click **Email Address Format**.
5. Under **Email address format**, click the SMTP address you want to change and then click **Edit** ✎.
6. On the **Email address format** page in the **Email address parameters** field, specify the SMTP recipient domain you want to apply to all recipients in the Exchange organization. This domain must match the accepted domain you added in the previous step. For example, @contoso.com. Click **Save**.
7. Click **Save**

8. In the **Default Policy** details pane, click **Apply**.

Note:

We recommend that you configure a user principal name (UPN) that matches the primary email address of each user. If you don't provide a UPN that matches the email address of a user, the user will be required to manually provide their domain\user name or UPN in addition to their email address. If their UPN matches their email address, Outlook Web App, ActiveSync, and Outlook will automatically match their email address to their UPN.

How do you know this step worked?

To verify that you have successfully configured the default email address policy, do the following:

1. In the EAC, go to **Recipients** > **Mailboxes**.
2. Select a mailbox and then, in the recipient details pane, verify that the **User mailbox** field has been set to <*alias*>@<*new accepted domain*>. For example, david@contoso.com.
3. Optionally, create a new mailbox and verify the mailbox is given an email address with the new accepted domain by doing the following:
   a. Go to **Recipients** > **Mailboxes**, click **New +** and then select **User mailbox**.
   b. On the new user mailbox page, provide the information required to create a new mailbox. Click **Save**.
   c. Select the new mailbox and then, in the recipient details pane, verify that the **User mailbox** field has been set to <*alias*>@<*new accepted domain*>. For example, david@contoso.com.

Step 4: Configure external URLs

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "<*Service*> virtual directory settings" entry in the Clients and mobile devices permissions topic.

Before clients can connect to your new server from the Internet, you need to configure the external domains, or URLs, on the Client Access server's virtual directories and then configure your public domain name service (DNS) records. The steps below configure the same external domain on the external URL of each virtual directory. If you want to configure different external domains on one or more virtual directory external URLs, you need to configure the external URLs manually. For more information, see Virtual directory management.

1. Open the EAC by browsing to the URL of your Client Access server. For example, https://Ex2013CAS/ECP.
2. Enter your user name and password in **Domain\user name** and **Password** and then click **Sign in**.
3. Go to **Servers** > **Servers**, select the name of the Internet-facing Client Access server and then click **Edit** ✎.
4. Click **Outlook Anywhere**.
5. In the **Specify the external hostname** field, specify the externally accessible FQDN of the Client Access server. For example, mail.contoso.com.
6. While you're here, let's also set the internally accessible FQDN of the Client Access server. In the **Specify the internal hostname** field, insert the FQDN you used in the previous step. For

example, mail.contoso.com.

7. Click **Save**.
8. Go to **Servers** > **Virtual directories** and then click **Configure external access domain**.
9. Under **Select the Client Access servers to use with the external URL**, click **Add +**
10. Select the Client Access servers you want to configure and then click **Add**. After you've added all of the Client Access servers you want to configure, click **OK**.
11. In **Enter the domain name you will use with your external Client Access servers**, type the external domain you want to apply. For example, mail.contoso.com. Click **Save**.

Note:

Some organizations make the Outlook Web App FQDN unique to protect users against changes to underlying server FQDN changes. Many organizations use owa.contoso.com for their Outlook Web App FQDN instead of mail.contoso.com. If you want to configure a unique Outlook Web App FQDN, do the following after you completed the previous step. This checklist assumes you have configured a unique Outlook Web App FQDN.

a. Select **owa (Default Web Site)** and click **Edit**.
b. In **External URL**, type **https://**, then the unique Outlook Web App FQDN you want to use, and then append **/owa**. For example, https://owa.contoso.com/owa.
c. Click **Save**.
d. Select **ecp (Default Web Site)** and click **Edit**.
e. In **External URL**, type **https://**, then the same Outlook Web App FQDN that you specified in the previous step, and then append **/ecp**. For example, https://owa.contoso.com/ecp.
f. Click **Save**.

After you've configured the external URL on the Client Access server virtual directories, you need to configure your public DNS records for Autodiscover, Outlook Web App, and mail flow. The public DNS records should point to the external IP address or FQDN of your Internet-facing Client Access server and use the externally accessible FQDNs that you've configured on your Client Access server. The following are examples of recommended DNS records that you should create to enable mail flow and external client connectivity.

FQDN	DNS record type	Value
Contoso.com	MX	Mail.contoso.com
Mail.contoso.com	A	172.16.10.11
Owa.contoso.com	CNAME	Mail.contoso.com
Autodiscover.contoso.com	CNAME	Mail.contoso.com

How do you know this step worked?

To verify that you have successfully configured the external URL on the Client Access server virtual directories, do the following:

1. In the EAC, go to **Servers** > **Virtual directories**.
2. In the **Select server** field, select the Internet-facing Client Access server.
3. Select a virtual directory and then, in the virtual directory details pane, verify that the **External URL** field is populated with the correct FQDN and service as shown below:

Virtual directory	External URL value
Autodiscover	No external URL displayed
ECP	https://owa.contoso.com/ecp
EWS	https://mail.contoso.com/EWS/Exchange.asmx
Microsoft-Server-ActiveSync	https://mail.contoso.com/Microsoft-Server-ActiveSync
OAB	https://mail.contoso.com/OAB
OWA	https://owa.contoso.com/owa
PowerShell	http://mail.contoso.com/PowerShell

To verify that you have successfully configured your public DNS records, do the following:

1. Open a command prompt and run `nslookup.exe`.
2. Change to a DNS server that can query your public DNS zone.
3. In `nslookup`, look up the record of each FQDN you created. Verify that the value that's returned for each FQDN is correct.
4. In `nslookup`, type `set type=mx` and then look up the accepted domain you added in Step 1. Verify that the value returned matches the FQDN of the Client Access server.

Step 5: Configure internal URLs

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "<*Service*> virtual directory settings" entry in the Clients and mobile devices permissions topic.

Before clients can connect to your new server from yourintranet, you need to configure the internal domains, or URLs, on the Client Access server's virtual directories and then configure your private domain name service (DNS) records.

The procedure below lets you choose whether you want users to use the same URL on your intranet and on the Internet to access your Exchange server or whether they should use a different URL. What you choose depends on the addressing scheme you have in place already or that you want to implement. If you're implementing a new addressing scheme, we recommend that you use the same URL for both internal and external URLs. Using the same URL makes it easier for users to access your Exchange server because they only have to remember one address. Regardless of the choice you make, you need to make sure you configure a private DNS zone for the address space you configure. For more information about administering DNS zones, see Administering DNS Server.

For more information about internal and external URLs on virtual directories, see Virtual directory management.

Configure internal and external URLs to be the same

1. Open the Exchange Management Shell on your Client Access server.
2. Store the host name of your Client Access server in a variable that will be used in the next step. For example, Ex2013CAS.

```
$HostName = "Ex2013CAS"
```

3. Run each of the following commands in the Shell to configure each internal URL to match the virtual directory's external URL.

```
Set-EcpVirtualDirectory "$HostName\ECP (Default Web Site)"
-InternalUrl ((Get-EcpVirtualDirectory "$HostName\ECP
(Default Web Site)").ExternalUrl)
Set-WebServicesVirtualDirectory "$HostName\EWS (Default Web
Site)" -InternalUrl ((get-WebServicesVirtualDirectory
"$HostName\EWS (Default Web Site)").ExternalUrl)
Set-ActiveSyncVirtualDirectory "$HostName\Microsoft-Server-
ActiveSync (Default Web Site)" -InternalUrl ((Get-
ActiveSyncVirtualDirectory "$HostName\Microsoft-Server-
ActiveSync (Default Web Site)").ExternalUrl)
Set-OabVirtualDirectory "$HostName\OAB (Default Web Site)"
-InternalUrl ((Get-OabVirtualDirectory "$HostName\OAB
(Default Web Site)").ExternalUrl)
Set-OwaVirtualDirectory "$HostName\OWA (Default Web Site)"
-InternalUrl ((Get-OwaVirtualDirectory "$HostName\OWA
(Default Web Site)").ExternalUrl)
Set-PowerShellVirtualDirectory "$HostName\PowerShell
(Default Web Site)" -InternalUrl ((Get-
PowerShellVirtualDirectory "$HostName\PowerShell (Default
Web Site)").ExternalUrl)
```

After you've configured the internal URL on the Client Access server virtual directories, you need to configure your private DNS records for Outlook Web App, and other connectivity. Depending on your configuration, you'll need to configure your private DNS records to point to the internal or external IP address or fully qualified domain name (FQDN) of your Client Access server. The following are examples of recommended DNS records that you should create to enable internal client connectivity.

FQDN	DNS record type	Value

Mail.contoso.com	CNAME	Ex2013CAS.corp.contoso.com
Owa.contoso.com	CNAME	Ex2013CAS.corp.contoso.com

How do you know this step worked?

To verify that you have successfully configured the internal URL on the Client Access server virtual directories, do the following:

1. In the EAC, go to **Servers** > **Virtual directories**.
2. In the **Select server** field, select the Internet-facing Client Access server.
3. Select a virtual directory and then click **Edit** .
4. Verify that the **Internal URL** field is populated with the correct FQDN and service as shown below:

Virtual directory	Internal URL value
Autodiscover	No internal URL displayed
ECP	https://owa.contoso.com/ecp
EWS	https://mail.contoso.com/EWS/Exchange.asmx
Microsoft-Server-ActiveSync	https://mail.contoso.com/Microsoft-Server-ActiveSync
OAB	https://mail.contoso.com/OAB
OWA	https://owa.contoso.com/owa
PowerShell	http://mail.contoso.com/PowerShell

To verify that you have successfully configured your private DNS records, do the following:

1. Open a command prompt and run `nslookup.exe`.
2. Change to a DNS server that can query your private DNS zone.
3. In `nslookup`, look up the record of each FQDN you created. Verify that the value that's returned for each FQDN is correct.

Configure different internal and external URLs

1. Open the EAC by browsing to the URL of your Client Access server. For example, https://Ex2013CAS/ECP.
2. Go to **Servers** > **Virtual directories**.
3. In the **Select server** field, select the Internet-facing Client Access server.
4. Select the virtual directory you want to change and click **Edit** .
5. In **Internal URL**, replace the host name between **https://** and the first forward slash (**/**) with the new FQDN you want to use. For example, if you want to change the EWS virtual directory FQDN from Ex2013CAS.corp.contoso.com to internal.contoso.com, change the internal URL from https://Ex2013CAS.corp.contoso.com/ews/exchange.asmx to https://internal.contoso.com/ews/exchange.asmx.

6. Click **Save**.
7. Repeat steps 5 and 6 for each virtual directory you want to change.

Note:
The ECP and OWA virtual directory internal URLs must be the same. You can't set an internal URL on the Autodiscover virtual directory.

After you've configured the internal URL on the Client Access server virtual directories, you need to configure your private DNS records for Outlook Web App, and other connectivity. Depending on your configuration, you'll need to configure your private DNS records to point to the internal or external IP address or FQDN of your Client Access server. The following is an example of recommended DNS record that you should create to enable internal client connectivity if you've configured your virtual directory internal URLs to use internal.contoso.com.

FQDN	DNS record type	Value
internal.contoso.com	CNAME	Ex2013CAS.corp.contoso.com

How do you know this step worked?

To verify that you have successfully configured the internal URL on the Client Access server virtual directories, do the following:

1. In the EAC, go to **Servers** > **Virtual directories**.
2. In the **Select server** field, select the Internet-facing Client Access server.
3. Select a virtual directory and then click **Edit** .
4. Verify that the **Internal URL** field is populated with the correct FQDN. For example, you may have set the internal URLs to use internal.contoso.com.

Virtual directory	Internal URL value
Autodiscover	No internal URL displayed
ECP	https://internal.contoso.com/ecp
EWS	https://internal.contoso.com/EWS/Exchange.asmx
Microsoft-Server-ActiveSync	https://internal.contoso.com/Microsoft-Server-ActiveSync
OAB	https://internal.contoso.com/OAB
OWA	https://internal.contoso.com/owa
PowerShell	http://internal.contoso.com/PowerShell

To verify that you have successfully configured your private DNS records, do the following:

1. Open a command prompt and run `nslookup.exe`.
2. Change to a DNS server that can query your private DNS zone.
3. In `nslookup`, look up the record of each FQDN you created. Verify that the value that's returned for

each FQDN is correct.

Step 6: Configure an SSL certificate

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Certificate management" entry in the Mail flow permissions topic.

Some services, such as Outlook Anywhere and Exchange ActiveSync, require certificates to be configured on your Exchange 2013 server. The following steps show you how to configure an SSL certificate from a third-party certificate authority (CA):

1. Open the EAC by browsing to the URL of your Client Access server. For example, https://Ex2013CAS/ECP.
2. Enter your user name and password in **Domain\user name** and **Password** and then click **Sign in**.
3. Go to **Servers** > **Certificates**. On the **Certificates** page, make sure your Client Access server is selected in the **Select server** field, and then click **New +**.
4. In the **New Exchange certificate** wizard, select **Create a request for a certificate from a certification authority** and then click **Next**.
5. Specify a name for this certificate and then click **Next**.
6. If you want to request a wildcard certificate, select **Request a wild-card certificate** and then specify the root domain of all subdomains in the **Root domain** field. If you don't want to request a wildcard certificate and instead want to specify each domain you want to add to the certificate, leave this page blank. Click **Next**.
7. Click **Browse** and specify an Exchange server to store the certificate on. The server you select should be the Internet-facing Client Access server. Click **Next**.
8. For each service in the list shown, verify that the external or internal server names that users will use to connect to the Exchange server are correct. For example:
   - If you configured your internal and external URLs to be the same, **Outlook Web App (when accessed from the Internet)** and **Outlook Web App (when accessed from the Intranet)** should show owa.contoso.com. **OAB (when accessed from the Internet)** and **OAB (when accessed from the Intranet)** should show mail.contoso.com.
   - If you configured the internal URLs to be internal.contoso.com, **Outlook Web App (when accessed from the Internet)** should show owa.contoso.com and **Outlook Web App (when accessed from the Intranet)** should show internal.contoso.com.

These domains will be used to create the SSL certificate request. Click **Next**.

9. Add any additional domains you want included on the SSL certificate.
10. Select the domain that you want to be the common name for the certificate, and then click **Set as common name**. For example, contoso.com. Click **Next**.
11. Provide information about your organization. This information will be included with the SSL certificate. Click **Next**.
12. Specify the network location where you want this certificate request to be saved. Click **Finish**.

After you've saved the certificate request, submit the request to your certificate authority (CA). This can be an internal CA or a third-party CA, depending on your organization. Clients that connect to

the Client Access server must trust the CA that you use. After you receive the certificate from the CA, complete the following steps:

1. On the **Server** > **Certificates** page in the EAC, select the certificate request you created in the previous steps.
2. In the certificate request details pane, click **Complete** under **Status**.
3. On the complete pending request page, specify the path to the SSL certificate file and then click **OK**.
4. Select the new certificate you just added, and then click **Edit** .
5. On the certificate page, click **Services**.
6. Select the services you want to assign to this certificate. At minimum, you should select **SMTP** and **IIS**. Click **Save**.
7. If you receive the warning **Overwrite the existing default SMTP certificate?**, click **Yes**.

How do you know this step worked?

To verify that you have successfully added a new certificate, do the following:

1. In the EAC, go to **Servers** > **Certificates**.
2. Select the new certificate and then, in the certificate details pane, verify that the following are true:
   - **Status** shows **Valid**
   - **Assigned to services** shows, at minimum, **IIS** and **SMTP**.

How do you know this task worked?

To verify that you have configured mail flow and external client access, do the following:

1. In Outlook, on an Exchange ActiveSync device, or on both, create a new profile. Verify that Outlook or the mobile device successfully creates the new profile.
2. In Outlook, or on the mobile device, send a new message to an external recipient. Verify the external recipient receives the message.
3. In the external recipient's mailbox, reply to the message you just sent from the Exchange mailbox. Verify the Exchange mailbox receives the message.
4. Go to https://owa.contoso.com/owa and verify that there are no certificate warnings.

Verify an Exchange 2013 installation

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-09-10*

After you install Microsoft Exchange Server 2013, we recommend that you verify the installation by running the **Get-ExchangeServer** cmdlet and by reviewing the setup log file. If the setup process

fails or errors occur during installation, you can use the setup log file to track down the source of the problem.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Run Get-ExchangeServer

To verify that Exchange 2013 installed successfully, run the **Get-ExchangeServer** cmdlet in the Exchange Management Shell. A list is displayed of all Exchange 2013 server roles that are installed on the specified server when this cmdlet is run.

For detailed syntax and parameter information, see Get-ExchangeServer.

Review the setup log file

You can also learn more about the installation and configuration of Exchange 2013 by reviewing the setup log file created during the setup process.

During installation, Exchange Setup logs events in the **Application** log of **Event Viewer** on computers that are running Windows Server 2008 R2 with Service Pack 1 (SP1) and Windows Server 2012. Review the **Application** log, and make sure there are no warning or error messages related to Exchange setup. These log files contain a history of each action that the system takes during Exchange 2013 setup and any errors that may have occurred. By default, the logging method is set to verbose. Information is available for each installed server role.

You can find the setup log file at <*system drive*>\ExchangeSetupLogs\ExchangeSetup.log. The <*system drive*> variable represents the root directory of the drive where the operating system is installed.

The setup log file tracks the progress of every task that is performed during the Exchange 2013 installation and configuration. The file contains information about the status of the prerequisite and system readiness checks that are performed before installation starts, the application installation progress, and the configuration changes that are made to the system. Check this log file to verify that the server roles were installed as expected.

We recommend that you start your review of the setup log file by searching for any errors. If you find an entry that indicates that an error occurred, read the associated text to determine the cause of the error.

Install the Exchange 2013 management

tools

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-01-28*

With the Microsoft Exchange Server 2013 management tools, you can configure and manage your Exchange organization remotely. Exchange 2013 management tools include the Exchange Management Shell and the Exchange Toolbox. This topic explains how you can either use Setup.exe or unattended setup mode to install the Exchange 2013 management tools.

Note:
You don't need to perform this procedure to use the Exchange Administration Center (EAC) remotely. The EAC is a web-based console that's hosted on computers running the Exchange 2013 Client Access server role. For more information about accessing the EAC remotely, see Exchange admin center in Exchange 2013.

For more information about managing Exchange 2013, see Exchange admin center in Exchange 2013 and Exchange Management Shell.

What do you need to know before you begin?

- Estimated time to complete: 10 minutes
- Make sure you've read the release notes prior to installing Exchange 2013. For more information, see Release notes for Exchange 2013.
- The computer you install the management tools on must have a supported operating system (such as Windows Server 2012 or Windows 8), have enough disk space, be a member of an Active Directory domain, and satisfy other requirements. For information about system requirements, see Exchange 2013 system requirements.
- To run Exchange 2013 Setup, you must install Microsoft .NET Framework 4.5, Windows Management Framework 3.0, and other required software. To understand the prerequisites for all server roles, see Exchange 2013 prerequisites.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use Setup to install the Exchange 2013 management tools

1. Log on to the computer on which you want to install Exchange 2013.
2. Navigate to the network location of the Exchange 2013 installation files.
3. Start Exchange 2013 Setup by double-clicking `setup.exe`

Important:

If you have User Access Control (UAC) enabled, you must right-click `Setup.exe` and select **Run as administrator**.

4. On the **Check for Updates** page, choose whether you want Setup to connect to the Internet and download product and security updates for Exchange 2013. If you select **Connect to the Internet and check for updates**, Setup will download updates and apply them prior to continuing. If you select **Don't check for updates right now**, you can download and install updates manually later. We recommend that you download and install updates now. Click **Next** to continue.
5. The **Introduction** page begins the process of installing Exchange into your organization. It will guide you through the installation. Several links to helpful deployment content are listed. We recommend that you visit these links prior to continuing setup. Click **Next** to continue.
6. On the **License Agreement** page, review the software license terms. If you agree to the terms, select **I accept the terms in the license agreement**, and then click **Next**.
7. On the **Recommended settings** page, select whether you want to use the recommended settings. If you select **Use recommended settings**, Exchange will automatically send error reports and information about your computer hardware and how you use Exchange to Microsoft. If you select **Don't use recommended settings**, these settings remain disabled but you can enable them at any time after Setup completes. For more information about these settings and how information sent to Microsoft is used, click **?**.
8. On the **Server Role Selection** page, verify that **Management Tools** is selected.

Select **Automatically install Windows Server roles and features that are required to install Exchange Server** to have the Setup wizard install required Windows prerequisites. You may need to reboot the computer to complete the installation of some Windows features. If you don't select this option, you must install the Windows features manually.

Note:

This option installs only the Windows features required by Exchange. You must manually install other prerequisites manually. For more information, see Exchange 2013 prerequisites.

Click **Next** to continue.

9. On the **Installation Space and Location** page, either accept the default installation location or click **Browse** to choose a new location. Make sure that you have enough disk space available in the location where you want to install Exchange. Click **Next** to continue.
10. If this is the first time you've run Exchange 2013 Setup in your organization, on the **Exchange Organization** page, type a name for your Exchange organization. The Exchange organization name can contain only the following characters:
    - A through Z
    - a through z
    - 0 through 9
    - Space (not leading or trailing)
    - Hyphen or dash

Note:

The organization name can't contain more than 64 characters. The organization name can't be blank.

If you want to use the Active Directory split permissions model, select **Apply Active Directory split permission security model to the Exchange organization**.

Caution:
Most organizations don't need to apply the Active Directory split permissions model. If you need to separate management of Active Directory security principals and Exchange configuration, Role Based Access Control (RBAC) split permissions might work for you. For more information, click **?**.

Click **Next** to continue.

11. On the **Readiness Checks** page, view the status to determine if the organization and server role prerequisite checks completed successfully. If they haven't completed successfully, you must resolve any reported errors before you can install Exchange 2013. You don't need to exit Setup when resolving some of the prerequisite errors. After resolving a reported error, click **back** and then click **Next** to run the prerequisite check again. Be sure to also review any warnings that are reported. If all readiness checks have completed successfully, click **Next** to install Exchange 2013.
12. On the **Completion** page, click **Finish**.
13. Restart the computer after Exchange 2013 has completed.

Use unattended Setup mode to install the Exchange 2013 management tools

1. Log on to the computer on which you want to install the Exchange 2013 management tools.
2. Navigate to the network location of the Exchange 2013 installation files.
3. At the command prompt, run the following command.

Important:
If you have User Access Control (UAC) enabled, you must run `Setup.exe` from an elevated command prompt.

```
Setup.exe /Role:ManagementTools /
IAcceptExchangeServerLicenseTerms
```

For more information, see Install Exchange 2013 using unattended mode.

Exchange 2013 virtualization

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-23*

You can deploy Microsoft Exchange Server 2013 in a virtualized environment. This topic provides an overview of the scenarios that are supported for deploying Exchange 2013 on hardware virtualization software.

Contents

The following terms are used in this discussion of Exchange virtualization:

- **Cold boot** When bringing a system from a power-off state into a clean start of the operating system, the action is a *cold boot*. No operating system state has been persisted in this case.
- **Saved state** When a virtual machine is powered off, hypervisors typically have the ability to save the state of the virtual machine, so when the machine is powered back on, it returns to that *saved state* rather than going through a cold boot startup.
- **Planned migration** When a system administrator initiates the move of a virtual machine from one hypervisor host to another, the action is a *planned migration*. The action could be a single migration, or a system administrator could configure automation to move the virtual machine on a timed basis. A planned migration could also be the result of some other event that occurs in the system, other than hardware or software failure. The key point is the Exchange virtual machine is operating normally and needs to be relocated for some reason. This relocation can be done via technology, like Live Migration or vMotion. However, if the Exchange virtual machine or the hypervisor host where the virtual machine is located experiences some sort of failure condition, the outcome isn't characterized as a planned migration.

Requirements for hardware virtualization

Microsoft supports Exchange 2013 in production on hardware virtualization software only when all the following conditions are true:

- The hardware virtualization software is running one of the following:
  - Any version of Windows Server with Hyper-V technology or Microsoft Hyper-V Server
  - Any third-party hypervisor that has been validated under the Windows Server Virtualization Validation Program.

Note:
Deployment of production Exchange servers on Windows Azure virtual machines isn't supported.

- The Exchange guest virtual machine has the following conditions:
  - It's running Exchange 2013.

- It's deployed on Windows Server 2008 R2 SP1 (or later versions), Windows Server 2012, or on Windows Server 2012 R2.

For deployments of Exchange 2013:

- All Exchange 2013 server roles are supported in a virtual machine.
- Exchange server virtual machines (including Exchange Mailbox virtual machines that are part of a database availability group, or DAG), may be combined with host-based failover clustering and migration technology, as long as the virtual machines are configured such that they won't save and restore state on disk when moved or taken offline. All failover activity occurring at the hypervisor level must result in a cold boot when the virtual machine is activated on the target node. All planned migration must either result in shutdown and cold boot, or an online migration that makes use of a technology like Hyper-V Live Migration. Hypervisor migration of virtual machines is supported by the hypervisor vendor; therefore, you must ensure that your hypervisor vendor has tested and supports migration of Exchange virtual machines. Microsoft supports Hyper-V Live Migration of these virtual machines.
- Only management software (for example, antivirus software, backup software, or virtual machine management software) can be deployed on the physical host machine. No other server-based applications (for example, Exchange, SQL Server, Active Directory, or SAP) should be installed on the host machine. The host machine should be dedicated to running guest virtual machines.
- Some hypervisors include features for taking snapshots of virtual machines. Virtual machine snapshots capture the state of a virtual machine while it's running. This feature enables you to take multiple snapshots of a virtual machine and then revert the virtual machine to any of the previous states by applying a snapshot to the virtual machine. However, virtual machine snapshots aren't application aware, and using them can have unintended and unexpected consequences for a server application that maintains state data, such as Exchange. As a result, making virtual machine snapshots of an Exchange guest virtual machine isn't supported.
- Many hardware virtualization products allow you to specify the number of virtual processors that should be allocated to each guest virtual machine. The virtual processors located in the guest virtual machine share a fixed number of logical processors in the physical system. Exchange supports a virtual processor-to-logical processor ratio no greater than 2:1, although we recommend a ratio of 1:1. For example, a dual processor system using quad core processors contains a total of 8 logical processors in the host system. On a system with this configuration, don't allocate more than a total of 16 virtual processors to all guest virtual machines combined.
- When calculating the total number of virtual processors required by the host machine, you must also account for both I/O and operating system requirements. In most cases, the equivalent number of virtual processors required in the host operating system for a system hosting Exchange virtual machines is 2. This value should be used as a baseline for the host operating system virtual processor when calculating the overall ratio of physical cores to virtual processors. If performance monitoring of the host operating system indicates you're consuming more processor utilization than the equivalent of 2 processors, you should reduce the count of virtual processors assigned to guest virtual machines accordingly and verify that the overall virtual processor-to-physical core ratio is no greater than 2:1.
- The operating system for an Exchange guest machine must use a disk that has a size equal to at

least 15 gigabytes (GB) plus the size of the virtual memory that's allocated to the guest machine. This requirement is necessary to account for the operating system and paging file disk requirements. For example, if the guest machine is allocated 16 GB of memory, the minimum disk space needed for the guest operating system disk is 31 GB.

In addition, it's possible that guest virtual machines may be prevented from directly communicating with Fibre Channel or SCSI host bus adapters (HBAs) installed in the host machine. In this event, you must configure the adapters in the host machine's operating system and present the logical unit numbers (LUNs) to guest virtual machines as either a virtual disk or a pass-through disk.

Return to top

Host machine storage requirements

The minimum disk space requirements for each host machine are as follows:

- Host machines in some hardware virtualization applications may require storage space for an operating system and its components. For example, when running Windows Server 2008 R2 with Hyper-V, you will need a minimum of 10 GB to meet the requirements for Windows Server 2008. For more details, see Windows Server 2008 R2 System Requirements. Additional storage space is also required to support the operating system's paging file, management software, and crash recovery (dump) files.
- Some hypervisors maintain files on the host machine that are unique to each guest virtual machine. For example, in a Hyper-V environment, a temporary memory storage file (BIN file) is created and maintained for each guest machine. The size of each BIN file is equal to the amount of memory allocated to the guest machine. In addition, other files may also be created and maintained on the host machine for each guest machine.
- If your host machine is running Windows Server 2012 Hyper-V or Hyper-V 2012, and you are configuring a host-based failover cluster that will host Exchange Mailbox servers in a database availability group, then we recommend following the guidance documented in Microsoft Knowledge Base article, 2872325, Guest Cluster nodes in Hyper-V may not be able to create or join.

Return to top

Exchange storage requirements

Requirements for storage connected to a virtualized Exchange server are as follows:

- Each Exchange guest machine must be allocated sufficient storage space on the host machine for the fixed disk that contains the guest's operating system, any temporary memory storage files in use, and related virtual machine files that are hosted on the host machine. In addition, for each Exchange guest machine, you must also allocate sufficient storage for the message queues and sufficient storage for the databases and log files on Mailbox servers.
- The storage used by the Exchange guest machine for storage of Exchange data (for example, mailbox databases and transport queues) can be virtual storage of a fixed size (for example,

fixed virtual hard disks (VHDs) in a Hyper-V environment), SCSI pass-through storage, or Internet SCSI (iSCSI) storage. Pass-through storage is storage that's configured at the host level and dedicated to one guest machine. All storage used by an Exchange guest machine for storage of Exchange data must be block-level storage because Exchange 2013 doesn't support the use of network attached storage (NAS) volumes, other than in the SMB 3.0 scenario outlined later in this topic. Also, NAS storage that's presented to the guest as block-level storage via the hypervisor isn't supported.

- Fixed VHDs may be stored on SMB 3.0 files that are backed by block-level storage if the guest machine is running on Windows Server 2012 Hyper-V (or a later version of Hyper-V). The only supported usage of SMB 3.0 file shares is for storage of fixed VHDs. Such file shares can't be used for direct storage of Exchange data. When using SMB 3.0 file shares to store fixed VHDs, the storage backing the file share should be configured for high availability to ensure the best possible availability of the Exchange service.
- Storage used by Exchange should be hosted in disk spindles that are separate from the storage that's hosting the guest virtual machine's operating system.
- Configuring iSCSI storage to use an iSCSI initiator inside an Exchange guest virtual machine is supported. However, there is reduced performance in this configuration if the network stack inside a virtual machine isn't full-featured (for example, not all virtual network stacks support jumbo frames).

Return to top

Exchange memory requirements and recommendations

Some hypervisors have the ability to oversubscribe or dynamically adjust the amount of memory available to a specific guest machine based on the perceived usage of memory in the guest machine as compared to the needs of other guest machines managed by the same hypervisor. This technology makes sense for workloads in which memory is needed for brief periods of time and then can be surrendered for other uses. However, it doesn't make sense for workloads that are designed to use memory on an ongoing basis. Exchange, like many server applications with optimizations for performance that involve caching of data in memory, is susceptible to poor system performance and an unacceptable client experience if it doesn't have full control over the memory allocated to the physical or virtual machine on which it's running. As a result, using dynamic memory features for Exchange isn't supported.

Return to top

Host-based failover clustering and migration for Exchange

The following are answers to some frequently asked questions about host-based failover clustering and migration technology with Exchange 2013 DAGs:

- **Does Microsoft support third-party migration technology?**

Microsoft can't make support statements for the integration of third party hypervisor products using

these technologies with Exchange, because these technologies aren't part of the Server Virtualization Validation Program (SVVP). The SVVP covers the other aspects of Microsoft support for third-party hypervisors. You need to ensure that your hypervisor vendor supports the combination of their migration and clustering technology with Exchange. If your hypervisor vendor supports their migration technology with Exchange, Microsoft supports Exchange with their migration technology.

- **How does Microsoft define host-based failover clustering?**

Host-based failover clustering refers to any technology that provides the automatic ability to react to host-level failures and start affected virtual machines on alternate servers. Use of this technology is supported given that, in a failure scenario, the virtual machine is coming up from a cold boot on the alternate host. This technology helps to make sure that the virtual machine never comes up from a saved state that's persisted on disk because it will be stale relative to the rest of the DAG members.

- **What does Microsoft mean by migration support?**

Migration technology refers to any technology that allows a planned move of a virtual machine from one host machine to another host machine. This move could also be an automated move that occurs as part of resource load balancing, but it isn't related to a failure in the system. Migrations are supported as long as the virtual machines never come up from a saved state that's persisted on disk. This means that technology that moves a virtual machine by transporting the state and virtual machine memory over the network with no perceived downtime is supported for use with Exchange. A third-party hypervisor vendor must provide support for the migration technology, while Microsoft provides support for Exchange when used in this configuration.

Return to top

Integration with SharePoint and Lync

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-12-11*

Microsoft Exchange Server 2013 includes many features that integrate with Microsoft SharePoint 2013 and Microsoft Lync 2013. Together, these products offer a suite of features that make scenarios such as enterprise eDiscovery and collaboration using site mailboxes possible.

Archiving, hold, and eDiscovery

Archiving of email and documents, preserving them for the duration required to meet regulatory compliance and business requirements, and ability to search them quickly to fulfill eDiscovery requests is critical in most organizations. Exchange 2013, SharePoint 2013 and Lync Server 2013

together provide integrated archiving, hold and eDiscovery functionality, allowing you to preserve important data in-place across Exchange mailboxes, SharePoint documents and web sites, and archived Lync content. The eDiscovery Center in SharePoint 2013 allows authorized discovery managers to perform an eDiscovery search for content across these stores, preview search results, and export the data for legal review.

Archive Lync Server 2013 content in Exchange 2013

With Lync Server 2013 deployed in an organization with Exchange 2013, you can configure Lync to archive instant messaging and on-line meeting content such as shared presentations or documents in the user's Exchange 2013 mailbox. Archiving Lync data in Exchange 2013 allows you to apply retention policies to it. Archived Lync content also surfaces in any eDiscovery searches. For more details about Lync Archiving and how to deploy it, see the following topics:

- Planning for Archiving
- Deploying Archiving

Search Exchange, SharePoint and Lync data using the SharePoint 2013 eDiscovery Center

Exchange 2013 allows SharePoint 2013 to search Exchange mailbox content using Federated search API. SharePoint 2013 provides an eDiscovery Center to allow authorized personnel to perform eDiscovery. Microsoft Search Foundation provides a common indexing and search infrastructure to both Exchange 2013 and SharePoint 2013 and allows you to use the same query syntax across both applications. This ensures an eDiscovery search performed in SharePoint 2013 will return the same Exchange 2013 content as the same search performed using In-Place eDiscovery in Exchange 2013. SharePoint 2013 eDiscovery Center also allows you to export content returned in an eDiscovery search, including export of Exchange 2013 content to a PST file.

For more details, see the following topics:

- In-Place eDiscovery
- In-Place Hold
- Configure eDiscovery in SharePoint 2013
- What's new in eDiscovery in SharePoint Server 2013
- Configure Exchange for SharePoint eDiscovery Center

Site mailboxes

In many organizations, information resides in two different stores - email in Microsoft Exchange and documents in SharePoint, with two different interfaces to access them. This causes a disjointed user experience and impedes effective collaboration. Site mailboxes allow users to collaborate effectively by bringing together Exchange emails and SharePoint documents. For users, a site mailbox serves as a central filing cabinet, providing a place to file project emails and documents

that can only be accessed and edited by site members. Site mailboxes are surfaced in Outlook 2013 and give users easy access to the email and documents for the projects they care about. Additionally, the same set of content can be accessed directly from the SharePoint site itself.

Under the covers of a site mailbox, the content is kept where it belongs. Exchange stores the email, providing users with the same message view for email conversations that they use every day for their own mailboxes. SharePoint stores the documents, bringing document coauthoring and versioning to the table. Exchange synchronizes just enough metadata from SharePoint to create the document view in Outlook (e.g. document title, last modified date, last modified author, size).

Site mailboxes are provisioned and managed from SharePoint 2013. For more details, see the following topics:.

- Site mailboxes
- Configure site mailboxes in SharePoint Server 2013

Unified contact store

Unified contact store (UCS) is a feature that provides a consistent contact experience across Microsoft Office products. This feature enables users to store all contact information in their Exchange 2013 mailbox so that the same contact information is available globally across Lync, Exchange, Outlook and Outlook Web App.

After Lync Server 2013 is installed in an environment with Exchange 2013 and you have configured server-to-server authentication between the two, users can initiate the migration of existing contacts from Lync Server 2013 to Exchange 2013. For details, see Planning and Deploying Unified Contact Store.

User photos

User photos is a feature that allows you to store high resolution user photos in Exchange 2013 that can be accessed by client applications, including Outlook, Outlook Web App, SharePoint 2013, Lync 2013, and mobile email clients. A low-resolution photo is also stored in Active Directory. As with Unified contact stores, user photos allow your organization to maintain a consistent user profile photo that can be consumed by client applications without requiring each application to have its own user photos and different ways to add and manage them. Users can manage their own photos using Outlook Web App, SharePoint 2013 or Lync 2013. For detail about managing photos on Outlook Web App, see My account.

Lync presence in Outlook Web App

In Exchange 2013 environments with Lync Server 2013 installed, you can configure them to enable users to see presence information in Outlook Web App. Users can see their instant messaging contacts and groups in the Navigation Pane of Outlook Web App, respond to or initiate instant

messaging sessions from Outlook Web App and manage their instant messaging contacts and groups.

OAuth authentication

Exchange 2013, SharePoint 2013 and Lync Server 2013 provide the rich cross-product functionality described above using OAuth authorization protocol for server-to-server authentication. Using the same authentication protocol allows these applications to seamlessly and securely authenticate to each other. The authentication mechanism supports authentication as an application using the context of a linked account and user impersonation where the access request is made in the user context.

OAuth is a standard authorization protocol used by many web sites and web services. It allows clients to access resources provided by a resource server without having to provide a username and password. Authentication is performed by an authorization server trusted by the resource owner, which provides the client with an access token. The token grants access to a specific set of resources for a specified period. For more details about Exchange 2013's implementation of OAuth, see [MS-XOAUTH]: OAuth 2.0 Authorization Protocol Extensions.

OAuth in on-premises deployments

Within an on-premises deployment, Exchange 2013, SharePoint 2013 and Lync Server 2013 do not require an authorization server to issue tokens. Each of these applications issue self-signed tokens to access resources provided by other application. The application that provides access to resources, for example Exchange 2013, must trust the self-signed tokens presented by the calling application. Trust is established by creating a *partner application* configuration for the calling application, which includes the calling application's ApplicationID, certificate, and AuthMetadataUrl. Exchange 2013, SharePoint 2013 and Lync Server 2013 publish their auth metadata document in a well-known URL.

Server	**AuthMetadataUrl**
Exchange 2013	`https://<serverfqdn>/autodiscover/metadata/json/1`
Lync Server 2013	`https://<serverfqdn>/metadata/json/1`
SharePoint 2013	`https://<serverfqdn>/_layouts/15/metadata/json/1`

Exchange 2013 Server Auth Certificate

Exchange 2013 Setup creates a self-signed certificate with the friendly name Microsoft Exchange Server Auth Certificate. The certificate is replicated to all front-end servers in the Exchange 2013 organization. The certificate's thumbprint is specified in Exchange 2013's authorization configuration, along with its service name, a well-known GUID that represents on-premises Exchange 2013. Exchange uses the authorization configuration to publish its auth metadata

document.

Important:
The default Server Auth Certificate created by Exchange 2013 is valid for five years. You must ensure the authorization configuration includes a current certificate.

When Exchange 2013 receives an access request from a partner application via Exchange Web Services (EWS), it parses the `www-authenticate` header of the https request, which contains the access token signed by the calling server using its private key. The auth module validates the access token using the partner application configuration. It then grants access to resources based on the RBAC permissions granted to the application. If the access token is on behalf of a user, the RBAC permissions granted to the user are checked. For example, if a user performs an eDiscovery search using the eDiscovery Center in SharePoint 2013, Exchange checks whether the user is a member of the Discovery Management role group or has the Mailbox Search role assigned and the mailboxes being searched are within the scope of the RBAC role assignment. For more details, see Permissions.

Managing OAuth Authentication

In Exchange 2013, there are two configuration objects you must manage for OAuth authentication with partner applications:

- **AuthConfig** The AuthConfig is created by Exchange 2013 Setup and is used to publish the auth metadata. You don't need to manage the auth config except to provision a new certificate when the existing certificate is close to expiration. When this happens, you can renew the existing certificate and configure the new certificate as the next certificate in the AuthConfig along with its effective date. The new certificate is automatically replicated to other Exchange 2013 in the organization, the auth metadata document is refreshed with details of the new certificate, and the AuthConfig rolls over to the new certificate on the effective date.
- **Partner applications** To enable partner applications to request access tokens from Exchange 2013, you must create a partner application configuration. Exchange 2013 provides the `Configure-EnterprisePartnerApplication.ps1` script, which allows you to quickly and easily create partner application configurations and minimize configuration errors. For details, see Configure OAuth authentication with SharePoint 2013 and Lync 2013.

Configure OAuth authentication with SharePoint 2013 and Lync 2013

Exchange Server 2013 > Planning and deployment > Integration with SharePoint and Lync >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-03*

Exchange Server 2013 allows other applications to use OAuth to authenticate to Exchange. The applications must be configured as partner applications in Exchange 2013.

In Exchange 2013, OAuth configuration with partner applications such as SharePoint 2013 and Lync Server 2013 is supported only by using the `Configure-EnterpriseApplication.ps1` script. By automating the task, the script makes it easier to configure authentication with partner applications and reduces configuration errors. The script performs the following tasks:

1. Configures an Enterprise partner application that self-issues OAuth tokens to successfully authenticate to Exchange.
2. Assigns Role Based Access Control (RBAC) roles to the partner application to authorize it for calling specific Exchange Web Services APIs.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- The partner application must publish an auth metadata document for Exchange 2013 to establish a direct trust to this application and accept authentication requests.
- Examples in this topic use the following default location of the `\Scripts` directory: `C:\Program Files\Microsoft\Exchange Server\V15\Scripts`.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Configure OAuth authentication with a partner application

This procedure uses the `Configure-EntepririseApplication.ps1` script to configure OAuth authentication with partner applications. Access to resources depends on the permissions assigned to the partner application and/or the user it impersonates by using RBAC.

After configuring OAuth authentication from Exchange, the partner application can use Exchange 2013 resources. If Exchange 2013 also needs to access resources offered by the partner application, you must also configure OAuth authentication in the partner application.

This example configures OAuth authentication for SharePoint 2013.

```
Cd C:\Program Files\Microsoft\Exchange Server\V15\Scripts
Configure-EnterprisePartnerApplication.ps1 -AuthMetaDataUrl
```

```
https://sharepoint.contoso.com/_layouts/15/metadata/json/1
-ApplicationType SharePoint
```

This example configures OAuth authentication for Lync Server 2013.

```
Cd C:\Program Files\Microsoft\Exchange Server\V15\Scripts
Configure-EnterprisePartnerApplication.ps1 -AuthMetaDataUrl
https://lync.contoso.com/metadata/json/1 -ApplicationType
Lync
```

How do you know this worked?

To verify that you have successfully configured an enterprise partner application to authenticate to Exchange 2013 , run the Get-PartnerApplication cmdlet in the Shell to retrieve the configuration. You can also run the Test-OAuthConnectivity cmdlet to test OAuth connectivity with a partner application for a user.

More information

- In hybrid deployments, you can use OAuth authentication between your on-premises Exchange 2013 organization and the Exchange Online organization. For more information, see Using OAuth authentication to support eDiscovery in an Exchange hybrid deployment.
- In on-premises deployments, you can configure server-to-server authentication between Exchange 2013 and SharePoint 2013 so administrators and compliance officers can use the eDiscovery Center in SharePoint 2013 to search Exchange 2013 mailboxes. For more information, see Configure Exchange for SharePoint eDiscovery Center.

What changes in Active Directory when Exchange 2013 is installed?

Applies to: *Exchange Server*

Topic Last Modified: *2014-05-26*

When you install Exchange 2013, changes are made to your Active Directory forest and domains. Exchange does this so that it can store information about the Exchange servers, mailboxes, and other objects related to Exchange in your organization. These changes are made for you when you run the Exchange 2013 Setup wizard or when you run the *PrepareSchema*, *PrepareAD*, and *PrepareDomains* commands (see how to use these commands in Prepare Active Directory and domains) during Exchange 2013 command-line Setup. If you're curious about the changes that Exchange makes to Active Directory, this topic is for you. It explains what Exchange does at each step of Active Directory preparation.

There are three steps that need to be done to prepare Active Directory for Exchange:

- Extend the Active Directory schema
- Prepare Active Directory containers, objects, and other items
- Prepare Active Directory domains

After all three steps are done, your Active Directory forest is ready for Exchange 2013. You can find out more about how to install Exchange 2013 by reading Install Exchange 2013 using the Setup wizard.

Extend the Active Directory schema

Extending the Active Directory schema adds and updates classes, attributes, and other items. These changes are needed so that Exchange can create containers and objects to store information about the Exchange organization. Because Exchange makes a lot of changes to the Active Directory schema, there's a topic dedicated to this step. To see all of the changes made to the schema, see Exchange 2013 Active Directory schema changes.

This step is done automatically when you run the Exchange 2013 Setup wizard on the first Exchange 2013 server in the Active Directory forest. It's also done when you run Exchange 2013 command line Setup with the *PrepareSchema* command (or optionally with the *PrepareAD* command) on the first Exchange 2013 server in the forest. If you want to find out more information about how to extend the schema, see Extend the Active Directory schema in Prepare Active Directory and domains.

After Exchange is finished extending the schema, it sets the schema version, which is stored in the **ms-Exch-Schema-Version-Pt** attribute. If you want to make sure that the Active Directory schema was extended successfully, you can check the value stored in this attribute. If the value in the attribute matches the schema version listed for the release of Exchange 2013 you installed, extending the schema was successful. For a list of Exchange releases and how to check the value of this attribute, check out the How do you know this worked? section in Prepare Active Directory and domains.

Prepare Active Directory containers, objects, and other items

With the schema extended, the next step is to add all of the containers, objects, attributes, and other items that Exchange uses to store information in Active Directory. Most of the changes made in this step are applied to the entire Active Directory forest. A smaller set of changes are made to the local Active Directory domain where the *PrepareAD* command was run during Setup.

These are the changes that are made to the Active Directory forest:

- The Microsoft Exchange container is created under CN=Services,CN=Configuration,DC=<*root domain*> if it doesn't already exist.
- The following containers and objects are created under CN=<*organization name*>,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<*root domain*> if they don't already exist:
  - CN=Address Lists Container
  - CN=AddressBook Mailbox Policies
  - CN=Addressing
  - CN=Administrative Groups
  - CN=Approval Applications
  - CN=Auth Configuration
  - CN=Availability Configuration
  - CN=Client Access
  - CN=Connections
  - CN=ELC Folders Container
  - CN=ELC Mailbox Policies
  - CN=ExchangeAssistance
  - CN=Federation
  - CN=Federation Trusts
  - CN=Global Settings

    - CN=Hybrid Configuration
    - CN=Mobile Mailbox Policies
    - CN=Mobile Mailbox Settings
    - CN=Monitoring Settings
    - CN=OWA Mailbox Policies

    - CN=Push Notification Settings
    - CN=RBAC
    - CN=Recipient Policies
    - CN=Remote Accounts Policies Container
    - CN=Retention Policies Container
    - CN=Retention Policy Tag Container
    - CN=ServiceEndpoints
    - CN=System Policies
    - CN=Team Mailbox Provisioning Policies
    - CN=Transport Settings
    - CN=UM AutoAttendant Container
    - CN=UM DialPlan Container
    - CN=UM IPGateway Container
    - CN=UM Mailbox Policies
    - CN=Workload Management Settings
- The following containers and objects are created under CN=Transport Settings,CN=<*Organization Name*>,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<*root domain*> if they don't already exist:
    - CN=Accepted Domains
    - CN=ControlPoint Config
    - CN=DNS Customization
    - CN=Interceptor Rules
    - CN=Malware Filter
    - CN=Message Classifications
    - CN=Message Hygiene
    - CN=Rules
    - CN=MicrosoftExchange329e71ec88ae4615bbc36ab6ce41109e
- Permissions are set throughout the configuration partition in Active Directory.
- The Rights.ldf file is imported. This file adds permissions that are needed to install Exchange and configure Active Directory.
- The Microsoft Exchange Security Groups organizational unit (OU) is created in the root domain of the forest, and permissions are assigned to it.
- The following management role groups are created within the Microsoft Exchange Security Groups OU if they don't already exist:
    - Compliance Management
    - Delegated Setup

    - Discovery Management
    - Help Desk
    - Hygiene Management
    - Organization Management
    - Public Folder Management
    - Recipient Management
    - Records Management
    - Server Management
    - UM Management
    - View-Only Organization Management
- The new management role groups (which appear as universal security groups (USGs) in Active Directory) that were created in the Microsoft Exchange Security Groups OU are added to the **otherWellKnownObjects** attribute stored on the CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<*root domain*> container.
- The Unified Messaging Voice Originator contact is created in the Microsoft Exchange System Objects container of the root domain.
- The domain where the *PrepareAD* command was run is prepared for Exchange 2013. For information about what's done to prepare the Active Directory domain for Exchange, check out Preparing Active Directory domains.
- The **msExchProductId** property on the Exchange organization object is set. If you want to make sure that the Active Directory schema was extended successfully, you can check the value stored in this property. If the value in the property matches the schema version listed for the release of Exchange 2013 you installed, extending the schema was successful. For a list of Exchange releases and how to check the value of this property, check out the How do you know this worked? section in Prepare Active Directory and domains.

Prepare Active Directory domains

The final step of preparing Active Directory for Exchange is to prepare all of the Active Directory domains where Exchange servers will be installed or where mailbox-enabled users will be located. This step is done automatically in the domain where the *PrepareAD* command was run.

These are the changes that are made to the Active Directory domains:

- The Microsoft Exchange System Objects container is created in the root domain partition in Active Directory if it doesn't already exist.
- Permissions are set on the Microsoft Exchange System Objects container for the Exchange Servers, Organization Management, and Authenticated Users security groups.
- The Exchange Install Domain Servers domain global group is created in the current domain and placed in the Microsoft Exchange System Objects container.
- The Exchange Install Domain Servers group is added to the Exchange Servers USG in the root domain.
- Permissions are assigned at the domain level for the Exchange Servers USG and the Organization Management USG.

- The **objectVersion** property in the Microsoft Exchange System Objects container under DC=<*root domain*> is set. If you want to make sure that the Active Directory schema was extended successfully, you can check the value stored in this property. If the value in the property matches the schema version listed for the release of Exchange 2013 you installed, extending the schema was successful. For a list of Exchange releases and how to check the value of this property, check out the How do you know this worked? section in Prepare Active Directory and domains.

Exchange 2013: editions and versions

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-24*

Microsoft Exchange Server 2013 is available in two server editions: Standard Edition and Enterprise Edition. Enterprise Edition can scale to 50 mounted databases per server in the Release to Manufacturing (RTM) and Cumulative Update 1 (CU1) versions, and 100 mounted databases per server in Cumulative Update 2 (CU2) and later versions; Standard Edition is limited to 5 mounted databases per server. A mounted database is a database that is in use. A mounted database can be an active mailbox database that is mounted for use by clients, or a passive mailbox database that is mounted in recovery for log replication and replay. While you can create more databases than the limits described above, you can only mount the maximum number specified above. The recovery database does not count towards this limit.

These licensing editions are defined by a product key. When you enter a valid license product key, the supported edition for the server is established. Product keys can be used for the same edition key swaps and upgrades only; they can't be used for downgrades. You can use a valid product key to move from the evaluation version (Trial Edition) of Exchange 2013 to either Standard Edition or Enterprise Edition. You can also use a valid product key to move from Standard Edition to Enterprise Edition.

You can also license the server again using the same edition product key. For example, if you had two Standard Edition servers with two keys, but you accidentally used the same key on both servers, you can change the key for one of them to the other key that you were issued. You can take these actions without having to reinstall or reconfigure anything. After you enter the product key and restart the Microsoft Exchange Information Store service, the edition corresponding to that product key will be reflected.

No loss of functionality will occur when the Trial Edition expires, so you can maintain lab, demo, training, and other non-production environments beyond 120 days without having to reinstall the Trial Edition of Exchange 2013.

As mentioned earlier, you can't use product keys to downgrade from Enterprise Edition to Standard Edition, nor can you use them to revert to the Trial Edition. These types of downgrades can only be

done by uninstalling Exchange 2013, reinstalling Exchange 2013, and entering the correct product key.

Exchange 2013 versions

For a list of Exchange 2013 versions and information on how to download and upgrade to the latest version of Exchange 2013, see the following topics:

- Exchange Server Updates: build numbers and release dates
- Upgrade Exchange 2013 to the latest cumulative update or service pack

To view the build number for the version of Exchange 2013 that you're running, run the following command in the Exchange Management Shell.

```
Get-ExchangeServer | fl name,edition,admindisplayversion
```

Exchange 2013 license types

Exchange 2013 is licensed in the Server/Client Access License (CAL) model similar to how Exchange 2010 was licensed. Following are the types of licenses:

- **Server licenses** A license must be assigned for each instance of the server software that is being run. The Server license is sold in two server editions: Standard Edition and Enterprise Edition.
- **Client Access licenses (CALs)** Exchange 2013 also comes in two client access license (CAL) editions, which are referred to as a Standard CAL and an Enterprise CAL. You can mix and match the server editions with the CAL types. For example, you can use Enterprise CALs with Exchange 2013 Standard Edition. Similarly, you can use Standard CALs with Exchange 2013 Enterprise Edition.

For more information about Exchange license types, see Licensing.

Exchange Server Supportability Matrix

Applies to: *Exchange Server 2013, Exchange Server 2010, Exchange Server 2007*

Topic Last Modified: *2014-08-26*

The Exchange Server Supportability Matrix provides a central source for Microsoft Exchange administrators to easily locate information about the level of support available for any configuration or required component for supported versions of Microsoft Exchange.

Support lifecycle

For more information about the support lifecycle for a specific version of Exchange, or of the Microsoft Windows server or client operating systems, see the Microsoft Support Lifecycle page. For more information about the Microsoft Support Lifecycle, see the Microsoft Support Lifecycle Policy FAQ.

Exchange Server 2003 End-of-life

As of April 8, 2014, Microsoft no longer provides security updates, offers free or paid support options, or updated online content such as KB articles for Exchange 2003. Online content may remain available as long as Exchange 2003 remains in the Self-Help online support phase.

Companies running Exchange 2003 after April 8, 2014 will be responsible for their own for support. More importantly, because Microsoft will no longer provide security updates, companies that choose to continue running Exchange 2003 accept the risk associated with that.

Release model

The following table identifies the release model for each supported version of Exchange. The release model is identified by an X character.

For versions of Exchange prior to Exchange 2013, each update rollup package is cumulative with regard to the whole product. Therefore, if you apply an update rollup package to Exchange Server 2010, you apply all the fixes contained in that update rollup package. This includes all the fixes contained in each earlier update rollup package. When an update or a hotfix for earlier versions of Exchange is created, one or more of the binary files included in the update or included in the hotfix are cumulative. They are cumulative with regard to the contents of the files. However, they aren't cumulative with regard to the whole Exchange product. For more information, see Exchange 2010 Servicing.

With Exchange 2013, we changed the way we deliver hotfixes and service packs. Instead of the priority-driven hotfix release and update rollup model used by previous versions of Exchange, Exchange 2013 now adheres to a scheduled delivery model. In this model, cumulative updates are released every three months. A cumulative update (CU) for Exchange 2013 is released as a full refresh of Exchange 2013, similar to a product upgrade or a service pack release. For more information about the new servicing model, see Updates for Exchange 2013.

Servicing release model	Exchange 2013	Exchange 2010	Exchange 2007	
Cumulative updates	X			
Update rollups		X	X	
Security Hotfixes	X			

delivered separately				

Supported operating system platforms

The following table identifies the operating system platforms on which each version of Exchange can run. Supported platforms are identified by an X character.

Operating system platform	Exchange 2013 SP1 and later	Exchange 2013 CU3	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3
Windows Vista SP2			X[1]	X[1]	X[1]
Windows Server 2003 SP2					X
Windows Server 2003 R2 SP2					X
Windows Server 2008 SP2			X	X	X
Windows Server 2008 R2 SP1	X	X	X	X	X
Windows 7 SP1	X[1]	X[1]	X[1]	X[1]	X[1]

Windows 8.1	X[1]				
Windows Server 2012	X	X	X		

Windows Server 2012 R2	X				

[1]Only for Exchange management tools

Supported Active Directory environments

The following table identifies the Active Directory environments with which each version of Exchange can communicate. Supported environments are identified by an X character. An Active Directory server refers to both writable global catalog servers and to writable domain controllers. Read-only global catalog servers and read-only domain controllers aren't supported.

Operating system environment	Exchange 2013 SP1 and later	Exchange 2013 CU3	Exchange 2010 SP3 RU5 or later	Exchange 2010 SP2	Exchange 2007 SP3 RU13 or later	
Windows Server 2003 SP1 Active Directory servers					X	
Windows Server 2003 SP2 Active Directory servers	X	X	X	X	X	
Windows Server 2008 SP2 Active Directory servers	X	X	X	X	X	
Windows Server 2008 R2 SP1 Active	X	X	X	X	X	

Directory servers						
Windows Server 2012 Active Directory servers	X	X	X	X	X	
Windows Server 2012 R2 Active Directory servers	X	X	X		X	

Domain and forest functional level	**Exchange 2013 SP1 and later**	**Exchange 2013 CU3**	**Exchange 2010 SP3 RU5 or later**	**Exchange 2010 SP2**	**Exchange 2007 SP3 RU13 or later**	
Windows Server 2003 domain functional level	X	X	X	X	X	
Windows Server 2008 R2 SP1 domain functional level	X	X	X	X	X	
Windows Server 2012 domain functional	X	X	X	X	X	

level						
Windows Server 2012 R2 domain functional level	X		X			
Windows Server 2003 forest functional level	X	X	X	X	X	
Windows Server 2008 R2 SP1 forest functional level	X	X	X	X	X	
Windows Server 2012 forest functional level	X	X	X	X	X	
Windows Server 2012 R2 forest functional level	X		X			

Web browsers supported for use with the premium version of Outlook Web App or Outlook Web Access

The following table identifies the Web browsers supported for use together with the premium version of Microsoft Office Outlook Web App for Exchange 2013, Microsoft Exchange Server 2010 and Office Outlook Web Access for Exchange 2007. Supported browsers are identified by an X character.

Browser	Exchange 2013 CU3 or later	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3	
Internet Explorer 11	X	X			
Internet Explorer 10	X	X			
Internet Explorer 9	X	X	X	X	
Internet Explorer 8	X	X	X	X	
Internet Explorer 7		X	X	X	
Firefox 3.0.1 or later		X	X		
Firefox 12 or later	X	X	X		
Safari 3.1 or later		X	X		
Safari 5.0 or later	X	X	X		
Chrome 3.0.195 or later		X	X		
Chrome 18 or later	X	X	X		

Web browsers supported for use with the basic version of Outlook Web App or Outlook Web Access

The following table identifies the Web browsers that are supported for use together with the light (basic) version of Outlook Web App for Exchange 2013, Exchange 2010 or Microsoft Outlook Web Access for Microsoft Exchange Server 2007. Supported browsers are identified by an X character.

Note:

Outlook Web App Basic (Outlook Web App Light) is supported for use in mobile browsers. However, if rendering or authentication issues occur in a mobile browser, determine whether the issue can be reproduced by using Outlook Web App Light in the full client of a supported browser. For example, test the use of Outlook Web App Light in Safari, Chrome, or Internet Explorer. If the issue can't be reproduced in the full client, we recommend that you contact the mobile device vendor for help. In these cases, we collaborate with the vendor as appropriate.

Browser	Exchange 2013 CU3 or later	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3	
Internet Explorer 11	X	X			
Internet Explorer 10	X	X			
Internet Explorer 9	X	X[1]	X[1]	X	
Internet Explorer 8	X	X	X	X	
Internet Explorer 7	X	X	X	X	
Safari	X	X	X	X	
Firefox	X	X	X	X	
Netscape				X	
Opera	X	X	X	X	

[1]Requires Exchange 2010 SP2 RU5-v2, described in Microsoft Knowledge Base article 2785908, Description of Update Rollup 5 version 2 for Exchange Server 2010 Service Pack 2.

Web browsers supported for use of S/MIME with Outlook Web App or Outlook Web Access

The following table identifies the Web browsers that are supported for the use of S/MIME together with Outlook Web App for Exchange 2013, Exchange 2010 or Outlook Web Access for Exchange 2007. Supported browsers are identified by an X character.

Browser	Exchange 2013 CU3 and later	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3	
Internet Explorer 11	X	X			
Internet Explorer 10	X	X			
Internet Explorer 9	X	X	X	X	
Internet Explorer 8		X	X	X	
Internet Explorer 7		X	X	X	

Clients

The following table identifies the mailbox clients that are supported for use together with each version of Exchange. Supported clients are identified by an X character.

Client	Exchange 2013 CU3 or later	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3
Outlook 2003		X	X	X
Outlook 2007	X[2]	X	X	X

Outlook 2010	X[3]	X	X	X
Outlook 2013	X	X	X	X
Windows Mobile 5.0	X	X	X	X
Windows Mobile 6.0	X	X	X	X
Windows Mobile 6.1	X	X	X	X
Windows Mobile 6.5	X	X	X	X
Windows Phone 7	X	X	X	X
Windows Phone 7.5	X	X	X	X
Windows Phone 8	X	X	X	X
Entourage X				X[1]
Entourage 2004 (DAV)				X[2]
Entourage 2008 (DAV)				X[2]
Entourage 2008 (EWS)	X[4]	X[4]	X[4]	X

[1]WebDav: Contacts, Events, IMAP: Mail

[2]Requires Outlook 2007 Service Pack 3 and the November 2012 Public Update or later.

[3]Requires Outlook 2010 Service Pack 1 and the November 2012 Public Update or later.

[4]EWS only. There is no DAV support for Exchange 2010.

Tools

The following table identifies the version of Microsoft Exchange that can be used together with the Microsoft Exchange Inter-Organization Replication tool (Exscfg.exe; Exssrv.exe). The tool is used to replicate public folder information (including free/busy information) between Exchange organizations. For more information, see Microsoft Exchange Server Inter-Organization Replication. Supported versions are identified by an X character.

Tool	Exchange 2013 CU3 or later	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3	
Inter-Organization Replication tool		X	X	X	

Microsoft .NET Framework

The following table identifies the version of the Microsoft .NET Framework that can be used together with each version of Exchange. Supported versions are identified by an X character.

.NET Framework	Exchange 2013 SP1 or later	Exchange 2013 CU3	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3
.NET Framework 2.0 SP1					X
.NET Framework 3.0					X
.NET Framework 3.5			X[5]		X[3]
.NET Framework 3.5 SP1			X	X	X
.NET Framework 4.0			X[5]	X[4]	

.NET Framework 4.5	X	X	X[5]	X[4]	
.NET Framework 4.5.1	X				

[3]Supported versions of the .NET Framework are included in the .NET Framework 3.5 and in the .NET Framework 3.5 SP1.

[4]Applies only when upgrading the system from the .NET Framework 3.5 and the .NET Framework 3.5 SP1. Uninstalling the .NET Framework 3.5 and the .NET Framework 3.5 SP1 isn't supported.

[5] If you are using Windows Server 2012, the .NET Framework 3.5 must be installed before you can use Exchange 2010 SP3.

Windows Management Framework

The following table identifies the version of the Windows Management Framework, which contains the Windows PowerShell command-line interface, that can be used together with each version of Exchange. Supported versions are identified by an X character.

Windows PowerShell	Exchange 2013 SP1 and later	Exchange 2013 CU3	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3	
Windows PowerShell 1.0					X	
Windows PowerShell 2.0			X	X	X	
Windows Management Framework 3.0	X	X				
Windows Management	X		X[6]			

Framework 4.0						

[6] Requires Exchange Server 2010 SP3 RU5 or later.

Microsoft Management Console

The following table identifies the version of Microsoft Management Console (MMC) that can be used together with each version of Exchange. Supported versions are identified by an X character.

MMC	Exchange 2013 CU3 or later	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3		
MMC 3.0	X		X	X	X	

Windows Installer

The following table identifies the version of Windows Installer that is used together with each version of Exchange. Supported versions are identified by an X character.

Windows Installer	Exchange 2013 CU3 or later	Exchange 2010 SP3	Exchange 2010 SP2	Exchange 2007 SP3
Windows Installer 4.5	X	X	X	X
Windows Installer 5.0	X			

Exchange 2013 deployment permissions reference

Exchange Server 2013 > Planning and deployment > Deployment reference >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-19*

This topic describes the permissions that are required to set up a Microsoft Exchange Server 2013 organization. The universal security groups (USGs) that are associated with management role groups, and other Windows security groups and security principals, are added to the access control

lists (ACLs) of various Active Directory objects. ACLs control what operations can be performed on each object. By understanding what permissions are granted to each role group, security group, or security principal, you can determine what minimum permissions are required to install Exchange 2013.

In some cases, the ACL isn't applied on the usual property, **ntSecurityDescriptor**, but on another property, such as **msExchMailboxSecurityDescriptor**. The directory service can't enforce security that isn't specified in the Windows security descriptor. In most cases, these ACLs are replicated to store ACLs on appropriate objects by the store service. Unfortunately, there is no tool to view these ACLs as anything other than raw binary data.

The columns of each permissions table include the following information:

- **Account** The security principal granted or denied the permissions.
- **ACE type** Access control entry (ACE) type
  - **Allow ACE** An allow ACE allows the user or group associated with the ACE to access an item.
  - **Deny ACE** A deny ACE prevents the user or group associated with the ACE from accessing an item.
- **Inheritance** The type of inheritance used for child objects.
  - **All** indicates that the permissions apply to the object and all sub-objects.
  - **Desc** indicates the permissions apply to the object class listed in the On Property/Applies To row.
  - **None** indicates those permissions only apply the object.
- **Permissions** The permissions granted to the account.
- **On Property/Applies To** In some cases, permissions apply only to a given property, property set, or object class. These limited permissions are specified here.
- **Comments** When applicable, this column explains why the permissions are required or provides other information about the permissions.

The permissions are generally listed in the table by the names that are used on the Active Directory Service Interfaces (ADSI) Edit (AdsiEdit.msc) **Security** property page in the **Advanced** view on the **View/Edit** tab. The ADSI Edit **Security** property page lists a much more condensed view of the permissions. The LDP tool (Ldp.exe) displays the access mask directly as a numeric value. The setup code refers to the permissions by predefined constants.

The following table shows the relationships between these values.

ADSI Edit Summary page	ADSI Edit Advanced view, View/Edit tab	ACL entries applied to a given object	Binary value (access mask in LDP)
Full Control	Full Control	`WRITE_OWNER | WRITE_DAC | READ_CONTROL | DELETE | ACTRL_DS_CONTROL_ACCESS | ACTRL_DS_LIST_OBJECT | ACTRL_DS_DELETE_TREE | ACTRL_DS_WRITE_PROP | ACTRL_DS_READ_PROP`	0x000F01FF

		| ACTRL_DS_SELF | ACTRL_DS_LIST | ACTRL_DS_DELETE_CHILD | ACTRL_DS_CREATE_CHILD	
Read	List Contents + Read All Properties + Read Permissions	ACTRL_DS_LIST | ACTRL_DS_READ_PROP | READ_CONTROL	0x00020014
Write	Write All Properties + All Validated Writes	ACTRL_DS_WRITE_PROP | ACTRL_DS_SELF	0x00000028
	List Contents	ACTRL_DS_LIST	0x00000004
	Read All Properties	ACTRL_DS_READ_PROP	0x00000010
	Write All Properties	ACTRL_DS_WRITE_PROP	0x00000020
	Delete	DELETE	0x00010000
	Delete Subtree	ACTRL_DS_DELETE_TREE	0x00000040
	Read Permissions	READ_CONTROL	0x00020000
	Modify Permissions	WRITE_DAC	0x00040000
	Modify Owner	WRITE_OWNER	0x00080000
	All Validated Writes	ACTRL_DS_SELF	0x00000008
	All Extended Rights	ACTRL_DS_CONTROL_ACCESS	0x00000100
Create All Child Objects	Create All Child Objects	ACTRL_DS_CREATE_CHILD	0x00000001
Delete All Child Objects	Delete All Child Objects	ACTRL_DS_DELETE_CHILD	0x00000002
		ACTRL_DS_LIST_OBJECT	0x00000080

Extended rights are custom rights specified by individual applications. They are specified in the ACL. However, they are meaningless to Active Directory. The specific application enforces any extended rights. Examples of Exchange extended rights are "Create public folder" or "Create named properties in the information store."

For information about permissions that are set during a Microsoft Exchange Server 2010

installation, see Exchange 2010 Deployment Permissions Reference.

Prepare Active Directory Permissions

The permissions tables in this section show the permissions set when you execute the `Setup /PrepareAD` command.

Note:

The permissions described in this section are the default permissions that are configured when you deploy Exchange 2013 using the shared permissions model. If you've deployed Exchange 2013 using the Active Directory split permissions model, the default permission are different. For more information on the changes to the default permissions when using Active Directory split permissions and the shared and split permissions models in general, see Active Directory split permissions in Understanding split permissions. If you don't choose to use Active Directory split permissions when you install Exchange, Exchange will use shared permissions.

Microsoft Exchange Container Permissions

The following table shows the permissions that are set on the Microsoft Exchange container within the configuration partition.

Distinguished name of the object: CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<domain>

Account	ACE type	Inheritance	Permissions	On property/ Applies to	Comments
Installation Account	Allow ACE	All	Full Control		This is the account that is used to run `/PrepareAD`.
Organization Management	Allow ACE	All	Full Control		
Exchange Trusted Subsystem	Allow ACE	All	Full Control		
Exchange Servers	Allow ACE	All	Read		
Authenticated	Allow ACE	None	Read Property		

Users			List Contents		
Exchange Trusted Subsystem	Allow ACE	All	Modify Permissions	msExchSmtpReceiveConnector	
Public Folder Management	Allow ACE	All	Read List Object		
Delegated Setup	Allow ACE	All	Read List Object		

Microsoft Exchange Autodiscover Container Permissions

The following table shows the permissions set on the Microsoft Exchange Autodiscover container within the configuration partition.

Distinguished name of the object: CN=Microsoft Exchange Autodiscover,CN=Services,CN=Configuration,DC=<domain>

Account	ACE type	Inheritance	Permissions	On property/ Applies to
Exchange Servers	Allow ACE	All	Read	

Microsoft Exchange Organization Container Permissions

The permissions tables in this section show the permissions set on the Microsoft Exchange Organization and sub-containers within the configuration partition.

Distinguished name of the object: CN=<organization>,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<domain>

Account(s)	ACE type	Inheritance	Permissions	On property/ Applies to	Comments
Enterprise Admins Root Domain Admins Installation	Deny ACE	All	Send As Receive As		Windows administrators aren't allowed to open mailboxes.

Account Organization Management					
Enterprise Admins Schema Admins Root Domain Admins Installation Account Organization Management	Deny ACE	All	Exchange Web Services Impersonation Exchange Web Services Token Serialization		Extended right
Enterprise Admins Schema Admins Root Domain Admins Installation Account	Deny ACE	All	Store Transport Access Store Constrained Delegation Store Read Access Store Read Write Access

Organization Management	Allow ACE	All	Full Control	
Root Domain Administrators	Allow ACE	All	Read Members Write Members	
Child Domain Administrators	Allow ACE	All	Read Members Write Members	

Prepare Domain

The following tables show the permissions set when you execute the `Setup /PrepareDomain` command.

Note:

The permissions described in this section are the default permissions that are configured when you deploy Exchange 2013 using the shared permissions model. If you've deployed Exchange 2013 using the Active Directory split permissions model, the default permission are different. For more information on the changes to the default permissions when using Active Directory split permissions and the shared and split permissions models in general, see Active Directory split permissions in Understanding split permissions. If you don't choose to use Active Directory split permissions when you install Exchange, Exchange will use shared permissions.

Deployment security checklist

Exchange Server 2013 > Planning and deployment > Deployment reference >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-01*

Microsoft Exchange Server 2013 features are designed to help improve the security of your messaging environment. Generally, for Exchange 2013, the following conditions are true:

- Accounts that are used by Exchange 2013 have the minimum rights that are required to perform the given task sets.
- By default, services are started only when they are required.

- Access control list (ACL) rights for Exchange objects are minimized.
- Administrative permissions are set according to the scope of change on the object that a given modification requires.
- By default, all internal default message paths are encrypted.

This topic lists steps that we recommend you take to harden the messaging environment before you install Microsoft Exchange. We recommend that you refer to this checklist every time that you install a new Exchange server role.

Before installing Exchange 2013, perform the following procedures.

Procedure	Done?
Run Microsoft Update.	
Run the Microsoft Windows Malicious Software Removal Tool. The Malicious Software Removal Tool is included with Microsoft Update. More information about the tool can be found at Malicious Software Removal Tool.	
Run the Microsoft Baseline Security Analyzer.	

Exchange 2013 sizing and capacity planning

Exchange Server 2013 > Planning and deployment > Deployment reference >

Topic Last Modified: *2013-05-16*

Sizing and capacity planning for Exchange Server 2013 is an important part of your Exchange 2013 deployment. Configuring a system for optimum performance is an iterative process. Take the time to understand all the variables that affect your system, including user profile, architecture, and hardware. With this knowledge, you can establish baseline metrics for your systems and make adjustments to improve system performance. For more information and guidance about sizing and capacity planning for your Exchange organization, see the Exchange Team blog article Ask the Perf Guy: Sizing Exchange 2013 Deployments.

Exchange 2013 storage configuration options

Applies to: *Exchange Server 2013, Exchange Server, Exchange Online*

Topic Last Modified: *2014-07-10*

Understanding storage options and requirements for the Mailbox server role in Microsoft Exchange Server 2013 is an important part of your Mailbox server storage design solution.

Contents

Storage architectures

The following table describes supported storage architectures and provides best practice guidance for each type of storage architecture where appropriate.

Supported storage architectures

Storage architecture	Description	Best practice
Direct-attached storage (DAS)	DAS is a digital storage system directly attached to a server or workstation, without a storage network in between. For example, DAS transports include Serial Attached Small Computer System Interface (SCSI) and Serial Attached Advanced Technology Attachment (ATA).	Not available.
Storage area network (SAN): Internet Small Computer	SAN is an architecture to attach remote computer storage	Don't share physical disks backing up Exchange data with

System Interface (iSCSI)	devices (such as disk arrays and tape libraries) to servers in such a way that the devices appear as locally attached to the operating system (for example, block storage). iSCSI SANs encapsulate SCSI commands within IP packets and use standard networking infrastructure as the storage transport (for example, Ethernet).	other applications. Use dedicated storage networks. Use multiple network paths for stand-alone configurations.
SAN: Fibre Channel	Fibre Channel SANs encapsulate SCSI commands within Fibre Channel packets and generally utilize specialized Fibre Channel networks as the storage transport.	Don't share physical disks backing up Exchange data with other applications. Use multiple Fibre Channel network paths for stand-alone configurations. Follow storage vendor's best practices for tuning Fibre Channel host bus adapters (HBAs), for example, Queue Depth and Queue Target.

A network-attached storage (NAS) unit is a self-contained computer connected to a network, with the sole purpose of supplying file-based data storage services to other devices on the network. The operating system and other software on the NAS unit provide the functionality of data storage, file systems, and access to files, and the management of these functionalities (for example, file storage).

All storage used by Exchange for storage of Exchange data must be block-level storage because Exchange 2013 doesn't support the use of NAS volumes, other than in the SMB 3.0 scenario outlined in the topic Exchange 2013 virtualization. Also, in a virtualized environment, NAS storage that's presented to the guest as block-level storage via the hypervisor isn't supported.

Return to top

Physical disk types

The following table provides a list of supported physical disk types and provides best practice guidance for each physical disk type where appropriate.

Supported physical disk types

Physical disk type	Description	Supported or best practice
Serial ATA (SATA)	SATA is a serial interface for ATA and integrated device electronics (IDE) disks. SATA disks are available in a variety of form factors, speeds, and capacities. In general, choose SATA disks for Exchange 2013 mailbox storage when you have the following design requirements: • High capacity • Moderate performance • Moderate power utilization	Supported: 512-byte sector disks for Windows Server 2008 and Windows Server 2008 R2. In addition, 512e disks are supported for Windows Server 2008 R2 with the following: • The hotfix described in Microsoft Knowledge Base article 982018, An update that improves the compatibility of Windows 7 and Windows Server 2008 R2 with Advanced Format Disks is available. • Windows Server 2008 R2 with Service Pack 1 (SP1) and Exchange Server 2010 SP1. Support requires that all copies of a database reside on the same physical disk type. For example, it is not a supported configuration to host one copy of a given database on a 512-byte sector disk and another copy of that same database on a 512e disk. Also be aware that 4-kilobyte (KB) sector disks are not supported for any version of

		Microsoft Exchange and 512e disks are not supported for any version of Exchange prior to Exchange Server 2010 SP1. Best practice: Consider enterprise class SATA disks, which generally have better heat, vibration, and reliability characteristics.
Serial Attached SCSI	Serial Attached SCSI is a serial interface for SCSI disks. Serial Attached SCSI disks are available in a variety of form factors, speeds, and capacities. In general, choose Serial Attached SCSI disks for Exchange 2013 mailbox storage when you have the following design requirements: • Moderate capacity • High performance • Moderate power utilization	Supported: 512-byte sector disks for Windows Server 2008 and Windows Server 2008 R2. In addition, 512e disks are supported for Windows Server 2008 R2 with the following: • The hotfix described in Microsoft Knowledge Base article 982018, An update that improves the compatibility of Windows 7 and Windows Server 2008 R2 with Advanced Format Disks is available. • Windows Server 2008 R2 with Service Pack 1 (SP1) and Exchange Server 2010 SP1. Support requires that all copies of a database reside on the same physical disk type. For example, it is not a supported configuration to host one copy of a given database on a 512-byte sector disk and another

		copy of that same database on a 512e disk. Also be aware that 4-kilobyte (KB) sector disks are not supported for any version of Microsoft Exchange and 512e disks are not supported for any version of Exchange prior to Exchange Server 2010 SP1. Best practice: Physical disk-write caching must be disabled when used without a UPS.
Fibre Channel	Fibre Channel is an electrical interface used to connect disks to Fibre Channel-based SANs. Fibre Channel disks are available in a variety of speeds and capacities. In general, choose Fibre Channel disks for Exchange 2013 mailbox storage when you have the following design requirements: • Moderate capacity • High performance • SAN connectivity	Supported: 512-byte sector disks for Windows Server 2008 and Windows Server 2008 R2. In addition, 512e disks are supported for Windows Server 2008 R2 with the following: • The hotfix described in Microsoft Knowledge Base article 982018, An update that improves the compatibility of Windows 7 and Windows Server 2008 R2 with Advanced Format Disks is available. • Windows Server 2008 R2 with Service Pack 1 (SP1) and Exchange Server 2010 SP1. Support requires that all copies of a database reside on the same physical disk type. For example, it is not a supported configuration to host one copy

		of a given database on a 512-byte sector disk and another copy of that same database on a 512e disk. Also be aware that 4-kilobyte (KB) sector disks are not supported for any version of Microsoft Exchange and 512e disks are not supported for any version of Exchange prior to Exchange Server 2010 SP1. Best practice: Physical disk-write caching must be disabled when used without a UPS.
Solid-state drive (SSD) (flash disk)	An SSD is a data storage device that uses solid-state memory to store persistent data. An SSD emulates a hard disk drive interface. SSD disks are available in a variety of speeds (different I/O performance capabilities) and capacities. In general, choose SSD disks for Exchange 2013 mailbox storage when you have the following design requirements: • Low capacity • Extremely high performance	Supported: 512-byte sector disks for Windows Server 2008 and Windows Server 2008 R2. In addition, 512e disks are supported for Windows Server 2008 R2 with the following: • The hotfix described in Microsoft Knowledge Base article 982018, An update that improves the compatibility of Windows 7 and Windows Server 2008 R2 with Advanced Format Disks is available. • Windows Server 2008 R2 with Service Pack 1 (SP1) and Exchange Server 2010 SP1. Support requires that all copies of a database reside on the same physical disk type. For example,

		it is not a supported configuration to host one copy of a given database on a 512-byte sector disk and another copy of that same database on a 512e disk. Also be aware that 4-kilobyte (KB) sector disks are not supported for any version of Microsoft Exchange and 512e disks are not supported for any version of Exchange prior to Exchange Server 2010 SP1. Best practice: Physical disk-write caching must be disabled when used without a UPS. In general, Exchange 2013 Mailbox servers don't require the performance characteristics of SSD storage.

Factors to consider when choosing disk types

There are several trade-offs when choosing disk types for Exchange 2013 storage. The correct disk is one that balances performance (both sequential and random) with capacity, reliability, power utilization, and capital cost. The following table of supported physical disk types provides information to help you when considering these factors.

Factors in disk type choice

Disk speed (RPM)	Disk form factor	Interface or transport	Capacity	Random I/O performance	Sequential I/O performance	Power utilization
5,400	2.5-inch	SATA	Average	Poor	Poor	Excellent
5,400	3.5-inch	SATA	Excellent	Poor	Poor	Above average

7,200	2.5-inch	SATA	Average	Average	Average	Excellent
7,200	2.5-inch	Serial Attached SCSI	Average	Average	Above average	Excellent
7,200	3.5-inch	SATA	Excellent	Average	Above average	Above average
7,200	3.5-inch	Serial Attached SCSI	Excellent	Average	Above average	Above average
7,200	3.5-inch	Fibre Channel	Excellent	Average	Above average	Average
10,000	2.5-inch	Serial Attached SCSI	Below average	Excellent	Above average	Above average
10,000	3.5-inch	SATA	Average	Average	Above average	Above average
10,000	3.5-inch	Serial Attached SCSI	Average	Above average	Above average	Below average
10,000	3.5-inch	Fibre Channel	Average	Above average	Above average	Below average
15,000	2.5-inch	Serial Attached SCSI	Poor	Excellent	Excellent	Average
15,000	3.5-inch	Serial Attached SCSI	Average	Excellent	Excellent	Below average

15,000	3.5-inch	Fibre Channel	Average	Excellent	Excellent	Poor
SSD: enterprise class	Not applicable	SATA, Serial Attached SCSI, Fibre Channel	Poor	Excellent	Excellent	Excellent

Return to top

Best practices for supported storage configurations

This section provides best practice information about supported disk and array controller configurations.

Redundant Array of Independent Disks (RAID) is often used to both improve the performance characteristics of individual disks (by striping data across several disks) as well as to provide protection from individual disk failures. With the advancements in Exchange 2013 high availability, RAID is not a required component for Exchange 2013 storage design. However, RAID is still an essential component of Exchange 2013 storage design for standalone servers as well as solutions that require storage fault tolerance.

Operating System, System, or Pagefile Volume

The recommended configuration for an operating system, system or pagefile volume is to utilize RAID technology to protect this data type. The recommended RAID configuration is either RAID-1 or RAID-1/0, however all RAID types are supported.

Separated Mailbox Database and Log Volumes

If you are deploying a standalone Mailbox server role architecture, RAID technology is required for the mailbox database and log volumes. The recommended RAID configuration for mailbox volumes is RAID-1/0 (especially if you are using 5.4K or 7.2K disks); however all RAID types are supported. For log volumes, RAID-1 or RAID-1/0 is the recommended RAID configuration.

When using RAID-5 or RAID-6 configurations for the operating system, pagefile, or Exchange data volumes, note the following:

- RAID-5 configurations, including variations such as RAID-50 and RAID-51, should have no more than 7 disks per array group and array controller high-priority scrubbing and surface scanning enabled.
- RAID-6 configurations should have array controller high-priority scrubbing and surface scanning enabled.

While JBOD is supported in high availability architectures that have 3 or more highly available database copies, because the log and mailbox database volumes are separated, JBOD is not

recommended.

Mailbox Database and Log Volume Co-Location

Mailbox database and log volume co-location is not recommended in standalone architectures. In high availability architectures, there are two possibilities for this scenario:
1. Single database per volume
2. Multiple databases per volume

Single Database Per Volume

From an Exchange perspective, JBOD means having both the database and its associated logs stored on a single disk. To deploy on JBOD, you must deploy a minimum of three highly available database copies. Utilizing a single disk is a single point of failure, because when the disk fails, the database copy residing on that disk is lost. Having a minimum of three database copies ensures fault tolerance by having two additional copies in the event that one copy (or one disk) fails. However, placement of three highly available database copies, as well as the use of lagged database copies, can affect storage design. The following table shows guidelines for RAID or JBOD considerations.

RAID or JBOD Considerations

Datacenter servers	Two highly available copies (total)	Three highly available copies (total)	Two or more highly available copies per datacenter	One lagged copy	Two or more lagged copies per datacenter
Primary datacenter servers	RAID	RAID or JBOD (2 copies)	RAID or JBOD	RAID	RAID or JBOD
Secondary datacenter servers	RAID	RAID (1 copy)	RAID or JBOD	RAID	RAID or JBOD

To deploy on JBOD with the primary datacenter servers, you need three or more highly available database copies within the DAG. If mixing lagged copies on the same server hosting highly available database copies (for example, not using dedicated lagged database copy servers), you need at least two lagged database copies.

For the secondary datacenter servers to use JBOD, you should have at least two highly available database copies in the secondary datacenter. The loss of a copy in the secondary datacenter won't result in requiring a reseed across the WAN or having a single point of failure in the event the secondary datacenter is activated. If mixing lagged database copies on the same server hosting highly available database copies (for example, not using dedicated lagged database copy servers), you need at least two lagged database copies.

For dedicated lagged database copy servers, you should have at least two lagged database copies within a datacenter to use JBOD. Otherwise, the loss of disk results in the loss of the lagged database copy, as well as the loss of the protection mechanism.

Multiple Databases Per Volume

Multiple databases per volume is a new JBOD scenario available in Exchange 2013 that allows for active and passive copies (including lagged copies) to be mixed on a single disk, enabling better disk utilization. However, to deploy lagged copies in this manner, automatic lagged copy log file play down must be enabled. The following table shows guidelines for JBOD considerations for multiple databases per volume.

JBOD Considerations

Datacenter Servers	3 or more copies (total)	Two or more copies per datacenter
Primary datacenter servers	JBOD	JBOD
Secondary datacenter servers	N/A	JBOD

The following table provides guidance about storage array configurations for Exchange 2013.

Supported RAID types for the Exchange 2013 Mailbox server role

RAID type	Description	Supported or best practice
Disk array RAID stripe size (KB)	The stripe size is the per disk unit of data distribution within a RAID set. Stripe size is also referred to as *block size*.	Best practice: 256 KB or greater. Follow storage vendor best practices.
Storage array cache settings	The cache settings are provided by a battery-backed caching array controller.	Best practice: 75 percent write cache and 25 percent read cache (battery-backed cache). Follow storage vendor best practices. This guidance also applies to JBOD configurations.
Physical disk write caching	The settings for the cache are on each individual disk.	Supported: Physical disk write caching must be disabled when used without a UPS.

The following table provides guidance about database and log file choices.

Database and log file choices for the Exchange 2013 Mailbox server role

Database and log file options	Description	Stand-alone: supported or best practice	High availability: supported or best practice
File placement: database per log isolation	Database per log isolation refers to placing the database file and logs from the same mailbox database onto different volumes backed by different physical disks.	Best practice: For recoverability, move database (.edb) file and logs from the same database to different volumes backed by different physical disks.	Supported: Isolation of logs and databases isn't required.
File placement: database files per volume	Database files per volume refers to how you distribute database files within or across disk volumes.	Best practice: Based on your backup methodology.	Supported: When using JBOD, create a single volume with separate directories for database(s) and for log files.
File placement: log streams per volume	Log streams per volume refers to how you distribute database log files within or across disk volumes.	Best practice: Based on your backup methodology.	Supported: When using JBOD, create a single volume with separate directories for database(s) and for log files. Best practice: When using JBOD, leverage multiple databases per volume.
Database size	Database size refers to the disk database (.edb) file size.	Supported: Approximately 16 terabytes. Best practice:	Supported: Approximately 16 terabytes. Best practice:

		• 200 gigabytes (GB) or less. • Provision for 120 percent of calculated maximum database size.	• 2 terabytes or less. • Provision for 120 percent of calculated maximum database size.
Log truncation method	Log truncation method is the process for truncating and deleting old database log files. There are two mechanisms: • Circular logging, in which Exchange deletes the logs. • Log truncation, which occurs after a successful full or incremental Volume Shadow Copy Service (VSS) backup.	Best practice: • Use backups for log truncation (for example, circular logging disabled). • Provision for three days of log generation capacity.	Best practice: • Enable circular logging for deployments that use Exchange native data protection features. • Provision for three days beyond replay lag setting of log generation capacity.

The following table provides guidance about Windows disk types.

Windows disk types for the Exchange 2013 Mailbox server role

Windows disk type	Description	Stand-alone: supported or best practice	High availability: supported or best practice
Basic disk	A disk initialized for basic storage is called a basic disk. A basic disk contains basic volumes, such as primary partitions, extended partitions, and logical	Supported. Best practice: Use basic disks.	Supported. Best practice: Use basic disks.

	drives.		
Dynamic disk	A disk initialized for dynamic storage is called a dynamic disk. A dynamic disk contains dynamic volumes, such as simple volumes, spanned volumes, striped volumes, mirrored volumes, and RAID-5 volumes.	Supported.	Supported.

The following table provides guidance on volume configurations.

Volume configurations for the Exchange 2013 Mailbox server role

Volume configuration	Description	Stand-alone: supported or best practice	High availability: supported or best practice
GUID partition table (GPT)	GPT is a disk architecture that expands on the older master boot record (MBR) partitioning scheme. The maximum NTFS formatted partition size is 256 terabytes.	Supported. Best practice: Use GPT partitions.	Supported. Best practice: Use GPT partitions.
MBR	An MBR, or partition sector, is the 512-byte boot sector that is the first sector (LBA Sector 0) of a partitioned data storage device such as a hard disk. The maximum NTFS formatted partition size is	Supported.	Supported.

	2 terabytes.		
Partition alignment	Partition alignment refers to aligning partitions on sector boundaries for optimal performance.	Supported: The Windows Server 2008 R2 and Windows Server 2012 default is 1 megabyte (MB).	Supported: The Windows Server 2008 R2 and Windows Server 2012 default is 1 MB.
Volume path	Volume path refers to how a volume is accessed.	Supported: Drive letter or mount point. Best practice: Mount point host volume must be RAID enabled.	Supported: Drive letter or mount point. Best practice: Mount point host volume must be RAID-enabled.
File system	File system is a method for storing and organizing computer files and the data they contain to make it easy to find and access the files.	Supported: NTFS and ReFS.	Supported: NTFS and ReFS.
NTFS defragmentation	NTFS defragmentation is a process that reduces the amount of fragmentation in Windows file systems. It does this by physically organizing the contents of the disk to store the pieces of each file close together and contiguously.	Supported. Best practice: Not required and not recommended. On Windows Server 2012, we also recommend disabling the automatic disk optimization and defragmentation feature.	Supported. Best practice: Not required and not recommended. On Windows Server 2012, we also recommend disabling the automatic disk optimization and defragmentation feature.
NTFS allocation unit	NTFS allocation unit size	Supported: All	Supported: All

size	represents the smallest amount of disk space that can be allocated to hold a file.	allocation unit sizes. Best practice: 64 KB for both .edb and log file volumes.	allocation unit sizes. Best practice: 64 KB for both .edb and log file volumes.
NTFS compression	NTFS compression is the process of reducing the actual size of a file stored on the hard disk.	Supported: Not supported for Exchange database or log files.	Supported: Not supported for Exchange database or log files.
NTFS Encrypting File System (EFS)	EFS enables users to encrypt individual files, folders, or entire data drives. Because EFS provides strong encryption through industry-standard algorithms and public key cryptography, encrypted files are confidential even if an attacker bypasses system security.	Supported: Not supported for Exchange database or log files.	Not supported for Exchange database or log files.
Windows BitLocker (volume encryption)	Windows BitLocker is a data protection feature in Windows Server 2008. BitLocker protects against data theft or exposure on computers that are lost or stolen, and it offers more secure data deletion when computers are decommissioned.	Supported: All Exchange database and log files.	Supported: All Exchange database and log files. Windows failover clusters require Windows Server 2008 R2 or Windows Server 2008 R2 SP1 and the following hotfix: You cannot enable BitLocker on a disk

			volume in Windows Server 2008 R2 if the computer is a failover cluster node. Exchange volumes with Bitlocker enabled are not supported on Windows failover clusters running earlier versions of Windows. For more information about Windows 7 BitLocker encryption, see BitLocker Drive Encryption in Windows 7: Frequently Asked Questions.
Server Message Block (SMB) 3.0	The Server Message Block (SMB) protocol is a network file sharing protocol (on top of TCP/IP or other network protocols) that allows applications on a computer to access files and resources on a remote server. It also allows applications to communicate with any server program that is set	Limited Support. Supported scenario is a hardware virtualized deployment where the disks are hosted on VHDs on an SMB 3.0 share. These VHDs are presented to the host via a hypervisor. For more information, see Exchange 2013 virtualization.	Limited Support. Supported scenario is a hardware virtualized deployment where the disks are hosted on VHDs on an SMB 3.0 share. These VHDs are presented to the host via a hypervisor. For more information, see Exchange 2013 virtualization.

	up to receive an SMB client request. Windows Server 2012 introduces the new 3.0 version of the SMB protocol with the following features: • SMB Transparent failover • SMB Scaleout • SMB Multichannel • SMB Direct • SMB Encryption • VSS for SMB file shares • SMB Directory Leasing • SMB PowerShell		
Storage Spaces	Storage Spaces is a new storage solution that delivers virtualization capabilities for Windows Server 2012. Storage Spaces allow you to organize physical disks into storage pools, which can be easily expanded by simply adding disks. These disks can be connected either through USB, SATA or SAS. It also utilizes virtual disks (spaces), which behave just like physical disks, with associated powerful capabilities such as thin	Supported. Same restrictions as for physical disk types outlined in this topic.	Supported. Same restrictions as for physical disk types outlined in this topic.

	provisioning, as well as resiliency to failures of underlying physical media. For more information on Storage Spaces, see Storage Spaces Overview.		
Resilient File System (ReFS)	ReFS is a newly engineered file system for Windows Server 2012 that is built on the foundations of NTFS. ReFS maintains high degree of compatibility with NTFS while providing enhanced data verification and auto-correction techniques as well as an integrated end-to-end resiliency to corruptions especially when used in conjunction with the storage spaces feature. For more information on ReFS, see Resilient File System Overview.	Supported for volumes containing Exchange database files, log files and content indexing files, provided that the following hotfix is installed: Exchange Server 2013 databases become fragmented in Windows Server 2012. Not supported for volumes containing Exchange binaries. Best practice: Data integrity features must be disabled for the Exchange database (.edb) files or the volume that hosts these files. Integrity features can be enabled for volumes containing the content	Supported for volumes containing Exchange database files, log files and content indexing files, provided that the following hotfix is installed: Exchange Server 2013 databases become fragmented in Windows Server 2012. Not supported for volumes containing Exchange binaries. Best practice: Data integrity features must be disabled for the Exchange database (.edb) files or the volume that hosts these files. Integrity features can be enabled for volumes containing the content

		index catalog, provided that the volume does not contain any databases or log files.	index catalog, provided that the volume does not contain any databases or log files.
Data De-Duplication	Data deduplication is a new technique to optimize storage utilization for Windows Server 2012. It is a method of finding and removing duplication within data without compromising its fidelity or integrity. The goal is to store more data in less space by segmenting files into small variable-sized chunks, identifying duplicate chunks, and maintaining a single copy of each chunk. Redundant copies of the chunk are replaced by a reference to the single copy, the chunks are organized into container files, and the containers are compressed for further space optimization.	Not Supported for Exchange database files. Note: Can be used for Exchange database files that are completely offline (used as backups or archives).	Not Supported for Exchange database files. Note: Can be used for Exchange database files that are completely offline (used as backups or archives).

IPv6 support in Exchange 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-04-11*

Internet Protocol version 6 (IPv6) is the most recent version of the Internet Protocol (IP). IPv6 is intended to correct many of the shortcomings of IPv4, which was the previous version of the IP.

In Microsoft Exchange Server 2013, IPv6 is supported only when IPv4 is also installed and enabled. If Exchange 2013 is deployed in this configuration, and the network supports IPv4 and IPv6, all Exchange servers can send data to and receive data from devices, servers, and clients that use IPv6 addresses.

This topic discusses IPv6 addressing in Exchange 2013. For additional background information about IPv6, see IPv6.

Contents

IPv6 support in Exchange 2013 components

The following table describes the components in Exchange 2013 that are affected by IPv6.

Exchange 2013 features and IPv6

Feature	IPv6 supported	Comments
IP Allow list and IP Block list in the Connection Filtering agent	Yes	
IP Allow List providers and IP Block List providers in the Connection Filtering agent.	No	Currently, there is no widely accepted industry standard protocol for looking up IPv6 addresses. Most IP Block List providers don't support IPv6 addresses. If you allow anonymous connections from

		unknown IPv6 addresses on a Receive connector, you increase the risk that spammers will bypass IP Block List providers and successfully deliver spam into your organization.
Sender reputation in the Protocol Analysis agent	No	The Protocol Analysis agent doesn't compute the sender reputation level (SRL) for messages that originate from IPv6 senders. For more information about sender reputation, see Sender reputation and the Protocol Analysis agent.
Sender ID	Yes	For more information, see Sender ID.
Receive connectors	Yes	IPv6 addresses are accepted for the following components: • Local IP address bindings • Remote IP addresses • IP address ranges We strongly recommend against configuring Receive connectors to accept anonymous connections from unknown IPv6 addresses. If your organization must receive mail from senders who use IPv6 addresses, create a dedicated Receive connector that restricts the remote IP addresses to the specific IPv6 addresses that those

		senders use. For more information, see Receive connectors.
Send connectors	Yes	IPv6 addresses are accepted for the following components: • Smart host IP addresses • The *SourceIPAddress* parameter for Send connectors configured on Edge Transport servers **Note:** If you want to specify an IPv6 address for the *SourceIPAddress* parameter, make sure that the appropriate DNS AAAA and mail exchange (MX) records are configured correctly. This helps ensure message delivery if a remote messaging server tries any kind of reverse lookup test on the specified IPv6 address. For more information, see Send connectors.
Incoming message rate limits	Partial	Incoming message rate limits that you can set on a Receive connector, such as the *MaxInboundConnectionPercentagePerSource* parameter, the *MaxInboundConnectionPerSource* parameter, and the *TarpitInterval* parameter, only apply to a global IPv6 address. Link local IPv6 addresses and site local IPv6 addresses aren't affected by any specified incoming message rate

		limits.
Unified Messaging	Yes	For more information, see IPv6 support in Unified Messaging.
Database availability group (DAG) member	Yes	Static IPv6 addresses are supported by Windows Server and the Cluster service. However, using static IPv6 addresses goes against best practices. Exchange 2013 doesn't support the configuration of static IPv6 addresses during setup. Failover clusters support Intra-site Automatic Tunnel Addressing Protocol (ISATAP). They support only IPv6 addresses that allow for dynamic registration in DNS. Link local addresses can't be used in a cluster. For more information about DAG network requirements, see the "Network requirements" section in Planning for high availability and site resilience.

Return to top

Enable or disable protocols in the operating system

Exchange 2013 servers fully support IPv6 networks. Therefore, even if you aren't using IPv6, you don't need to disable IPv6 on your Exchange servers.

IPv6 support in Exchange 2013 requires IPv4 to be installed and enabled on all Exchange 2013 servers. Uninstalling IPv4 from your Exchange 2013 servers isn't supported.

To learn more about IPv6 support in Microsoft Windows, see IPv6 for Microsoft Windows:

Frequently Asked Questions.

IPv6 address basics

An IPv6 address is 128-bits long. The address is described by using colon-hexadecimal notation. Colon-hexadecimal notation describes the 128-bit address by using eight 16-bit, 4-digit hexadecimal numbers separated by the colon character (:). An example of an IPv6 address in colon-hexadecimal notation is 2001:0DB8:0000:0000:02AA:00FF:C0A8:640A.

You can express an IPv6 address by using the following methods:

- **Suppress leading zeros** You can omit the leading zeros in any of the eight 4-digit hexadecimal numbers in an IPv6 address.
- **Double-colon compression** You can use two colons (::) to represent contiguous 16-bit hexadecimal digits that contain all zeros. These all-zero digits may exist at the beginning, middle, or end of the IPv6 address. You can only use double-colon compression one time in an IPv6 address.
- **Trailing dotted-decimal notation** You may express the last 32 bits at the end of an IPv6 address in dotted-decimal notation by separating the 8-bit digits with a period (.). Trailing dotted-decimal notation is frequently used with IPv4-compatible addresses.

The following table provides examples of the IPv6 address notation and the equivalent IPv6 address syntax.

IPv6 address notation and syntax

IPv6 address notation	IPv6 address syntax
Full IPv6 address	2001:0DB8:0000:0000:02AA:00FF:C0A8:640A
IPv6 address that uses suppressed leading zeros	2001:DB8:0:0:2AA:FF:C0A8:640A
IPv6 address that uses double-colon compression	2001:DB8::2AA:FF:C0A8:640A
IPv6 address that uses trailing dotted-decimal notation	2001:DB8::2AA:FF:192.168.100.10

IPv6 addresses are categorized into the following types:

- **Unicast address** A packet is delivered to one interface.
- **Multicast address** A packet is delivered to multiple interfaces.
- **Anycast address** A packet is delivered to the nearest of multiple interfaces. The distance between interfaces is defined by the routing cost.

IPv6 unicast addresses have the following possible scopes:

- **Link local** The scope of the IPv6 address is the local subnet. IPv6 link local addresses are comparable to IPv4 link local addresses used in Automatic Private IP Addressing (APIPA).
- **Site local** The scope of the IPv6 address is the local organization. Site local addresses were deprecated by RFC 3879 and replaced by unique local addresses as defined in RFC 4193. IPv6 site local addresses and IPv6 unique local addresses are comparable to IPv4 private IP addresses.
- **Global** The scope of the IPv6 address is the whole world. IPv6 global addresses are comparable to IPv4 public IP addresses.

The following table provides a comparison of IPv4 elements and IPv6 elements.

IPv4 vs. IPv6 elements

Item	IPv4	IPv6
Private IP address	10.0.0.0/8 172.16.0.0/12 192.168.0.0/16	FD00::/8
Link local address	169.254.0.0/16	FE80::/64
Loopback address	127.0.0.1	::1
Unspecified address	0.0.0.0	::
Address resolution	Address Resolution Protocol (ARP)	Neighbor Discovery (ND)
Domain Name System (DNS) host name resolution	Address record (A record)	AAAA record or A6 record

For more information about IPv6 addressing, see IPv6 Address Types.

Supported IPv6 Address Input Formats

The following types of IPv6 address input formats are supported in Exchange 2013:

- A single IPv6 address
- An IPv6 address range
- An IPv6 address together with a subnet mask
- An IPv6 address together with a subnet mask that uses Classless Interdomain Routing (CIDR) notation

The following table provides examples of the acceptable IPv6 address input formats in Exchange 2013.

IPv6 address examples

Type	Example of an IPv6 address
Single address	2001:DB8::2AA:FF:C0A8:640A
Address range	2001:DB8::2AA:FF:C0A8:640A-2001:DB8::2AA:FF:C0A8:6414
Address together with subnet mask	2001:DB8::2AA:FF:C0A8:640A(FFFF:FFFF:FFFF:FFFF::)
Address together with subnet mask that uses CIDR notation	2001:DB8::2AA:FF:C0A8:640A/64

In Exchange 2013, the following input formats are supported:

- Suppression of leading zeros
- Double-colon compression
- Trailing dotted-decimal notation

Exchange 2013 language support

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-08*

Microsoft Exchange Server 2013 has enhanced language support for both servers and clients. This topic lists the languages that are available for both servers and clients in Exchange 2013.

Supported server languages for Exchange 2013

The following server languages are supported and available for Exchange 2013:

- Chinese (Simplified)
- Chinese (Traditional)
- English
- French
- German
- Italian
- Japanese

- Korean
- Portuguese
- Russian
- Spanish

Supported client languages for Exchange 2013

The following client languages are supported and available for Exchange 2013:

- Amharic
- Arabic
- Basque (Basque)
- Bengali (India)
- Bulgarian
- Catalan
- Chinese (Simplified)
- Chinese (Traditional)
- Croatian
- Czech
- Danish
- Dutch
- English
- Estonian
- Filipino (Philippines)
- Finnish
- French
- Galician
- German
- Greek
- Gujarati
- Hebrew
- Hindi
- Hungarian
- Icelandic
- Indonesian
- Italian
- Japanese
- Kannada
- Kazakh
- Kiswahili
- Korean
- Latvian
- Lithuanian

- Malay (Brunei Darussalam)
- Malay (Malaysia)
- Malayalam
- Marathi
- Norwegian (Bokmål)
- Norwegian (Nynorsk)
- Oriya
- Persian
- Polish
- Portuguese (Brazil)
- Portuguese (Portugal)
- Romanian
- Russian
- Serbian (Cyrillic, Serbia)
- Serbian (Latin)
- Slovak
- Slovenian
- Spanish
- Swedish
- Tamil
- Telugu
- Thai
- Turkish
- Ukrainian
- Urdu
- Vietnamese
- Welsh

Exchange 2013 readiness checks

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-09-10*

The topics in this section provide details about the readiness checks Microsoft Exchange Server 2013 is performing when Exchange is installed. Readiness checks ensure that your Active Directory forest and Exchange servers are ready for Exchange 2013. Each readiness check topic describes the actions that you can take to resolve issues that are found when the readiness checks are run. You should only perform the steps outlined in a readiness check topic if that readiness check was displayed during setup.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

AD LDS directory exists in default location

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-12*

Microsoft Exchange Server 2013 Setup can't continue because the attempt to install Active Directory Lightweight Directory Services (AD LDS) failed.

An older installation of AD LDS exists in the default location. Setup can't perform a new AD LDS install in an existing AD LDS directory structure.

To resolve this issue, remove the existing AD LDS directory and then run Setup again.

For more information about AD LDS directory management, see Administering AD LDS Directory Partitions.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Duplicate Microsoft Exchange System Objects container exists in Active Directory

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-02-18*

Microsoft Exchange Server 2013 Setup can't continue because it found a duplicate Microsoft Exchange System Objects container in Active Directory Domain Naming context. When Setup finds a duplicate Microsoft Exchange System Objects container, you must delete the duplicate container before Setup can continue. When a duplicate Microsoft Exchange System Objects container exists, you can't solve the problem by running **DomainPrep** again. You must identify and delete the duplicate Microsoft Exchange System Objects container.

To resolve this issue, do the following:

1. Log on to the domain controller with administrative credentials.
2. In **Administrative Tools**, click **Active Directory Users and Computers**.
3. In the **Active Directory Users and Computers** management console pane, click **View** from the toolbar menu and then select **Advanced Features**.
4. Locate the duplicate Microsoft Exchange System Objects container.
5. Verify the duplicate Microsoft Exchange System Objects container doesn't contain valid Active Directory objects.
6. Right-click the duplicate Microsoft Exchange System Objects container, and then click **Delete**.
7. Confirm the deletion by clicking **Yes** in the Active Directory dialog box.

Note:
If you want the change to be replicated immediately, you must manually initiate replication between domain controllers.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Client Access server role is already installed

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-13*

Microsoft Exchange Server 2013 Setup has detected that you're attempting to install the Client Access server role; however, the role is already installed on the computer.

If you want to reinstall the Client Access server role, you must first uninstall Exchange and then install the Client Access server role.

You may also receive this message if a previous installation of Exchange didn't complete

successfully. If this happens, uninstall Exchange and then reinstall the Client Access server role. If the installation continues to fail, do the following:

- Make sure that your organization and the computer you're installing Exchange on meet the Exchange 2013 system requirements.
- Make sure that you've installed all the prerequisites required by Exchange, as described in Exchange 2013 prerequisites.
- Read the Release notes for Exchange 2013.
- View the Exchange Setup log located in <*installation drive*>:\ExchangeSetupLogs \ExchangeSetup.log, and look for errors or warnings that may have occurred during Setup.
- Search the Exchange Server forums. In your search query, specify the title of this topic.
- Search the Internet using your favorite search engine. Be sure to include the title of this topic in your search.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Active Directory does not exist or cannot be contacted

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-08*

Microsoft Exchange Server 2013 Setup can't continue because it can't contact a valid Active Directory directory service site. Setup requires that the server you're installing Exchange on is able to locate the configuration naming context in Active Directory.

To resolve this issue, verify that the user account running Exchange Setup is an Active Directory user and then run Setup again. If this doesn't resolve the issue, follow the guidance about using the dcdiag.exe and repadmin.exe support tools from the topics below to further diagnose the problem.

For more information about Active Directory troubleshooting and configuration for Exchange, see the following topics:

- Prepare Active Directory and domains
- Troubleshooting Active Directory Domain Services
- Configuring a Computer for Troubleshooting
- Troubleshooting Active Directory Replication Problems
- Monitoring and Troubleshooting Active Directory Replication Using Repadmin

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

The local computer isn't joined to an Active Directory domain

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-03-22*

Microsoft Exchange Server 2013 Setup can't continue because it detected that the local computer isn't a member of an Active Directory domain. You must join the local computer to an Active Directory domain before you can install Exchange Server 2013. You may also see this message if you log into a local user account on the computer instead of a domain user account with sufficient administrative rights to install Exchange 2013.

For more information, see Exchange 2013 system requirements.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Installation of the first Exchange server in the organization can't be delegated

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-03-27*

Microsoft Exchange Server 2013 Setup can't continue because the logged-on user doesn't have the account permissions that are required to install the first Exchange 2013 server in the organization.

Although Exchange 2013 Setup allows using delegation to install successive server roles, Setup requires that the user who is logged on is a member of the Enterprise Admins Windows security group when the first Exchange 2013 server in the organization is installed. This is required because

Exchange 2013 Setup creates and configures objects in the Exchange Organization container in Active Directory during installation.

Note:
If you haven't prepared the Active Directory schema for Exchange 2013, the logged-on user must also be a member of the Schema Admins Windows security group. Alternately, another user who's a member of the Schema Admins Windows group can prepare the Active Directory schema before Exchange 2013 is installed.

To resolve this issue, add the logged-on user as a member of the Enterprise Admins security group. Or, log on to an account that's a member of the Enterprise Admins security group. Then run Exchange 2013 Setup again.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Installation of the first Exchange server in the organization can't be delegated

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Active Directory functional level isn't Windows Server 2003 or later

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-04-10*

Microsoft Exchange Server 2013 Setup can't continue because it detected that the forest functional level of the current Active Directory forest isn't Windows Server 2003 native or later. Before you can install Exchange 2013, you must raise the forest functional level to Windows Server 2003 or later.

For information about how to raise the forest functional level of the current Active Directory forest to Windows Server 2003 or later, see Raise the Forest Functional Level.

For more information about Active Directory functional levels, see the following topics:

- What are Active Directory Functional Levels?
- How Active Directory Functional Levels Work

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server,

Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Cannot write to the Exchange organization container

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-08*

Microsoft Exchange Server 2013 Setup can't continue because the logged-on user doesn't have the account permissions that are required to write to the organization container in the Active Directory directory service.

Setup requires that the user who is logged on when Exchange 2013 is installed has permission to create and modify objects in Active Directory. If you're running Exchange 2013 Setup in your organization for the first time, the account you use must be a member of the Schema Admins and Enterprise Admins groups. These permissions are required because Active Directory is prepared for Exchange 2013 the first time Setup is run. After Active Directory is prepared, the account you use to install additional Exchange 2013 servers must be a member of the Organization Management management role group.

To resolve this issue, grant the logged-on user the appropriate permissions, or log on with an account that has those permissions and run Exchange 2013 Setup again.

Important:
Cross-forest installation of Exchange 2013 isn't supported. Use an account that is a member of the Active Directory forest where you're installing Exchange 2013.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Global updates required

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-12*

Microsoft Exchange Server 2013 Setup can't continue because the logged-on user doesn't have the account permissions that are required to make global updates to Active Directory.

Setup requires that the user who is logged on when Exchange 2013 is installed has permission to create and modify objects in Active Directory. If you're running Exchange 2013 Setup in your organization for the first time, the account you use must be a member of the Schema Admins and Enterprise Admins groups. These permissions are required because Active Directory is prepared for Exchange 2013 the first time Setup is run. After Active Directory is prepared, the account you use to install additional Exchange 2013 servers must be a member of the Organization Management management role group.

To resolve this issue, grant the logged-on user the appropriate permissions, or log on with an account that has those permissions and run Exchange 2013 Setup again.

Important:
Cross-forest installation of Exchange 2013 isn't supported. Use an account that is a member of the Active Directory forest where you're installing Exchange 2013.

The Host record for the local computer cannot be found in the DNS database

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-04-10*

Microsoft Exchange Server 2013 Setup can't continue because the Host (A) record for this computer can't be found in the Domain Name System (DNS) database.

Exchange 2013 Setup requires that the local computer have a valid HOST (A) record registered with the authoritative DNS database for the domain.

Exchange depends on DNS Host (A) records for the IP Address of its next internal or external destination server.

To resolve this issue:

- Verify that the local TCP/IP configuration points to the correct DNS server. For more information, see Configure TCP/IP settings.
- Use Nslookup.exe to verify that the Host (A) record exists on the DNS server. For more information, see To verify A resource records exist in DNS.

For information about DNS name resolution, troubleshooting, and Host (A) records, see the following:

- Troubleshooting DNS
- Managing resource records

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Installation on domain controllers is not supported with Active Directory split permissions

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-12*

Microsoft Exchange Server 2013 Setup has detected that you're attempting to run Setup on an Active Directory domain controller and one of the following is true:

- The Exchange organization is already configured for Active Directory split permissions.
- You selected the Active Directory split permissions option in Exchange 2013 Setup.

The installation of Exchange 2013 on domain controllers isn't supported when the Exchange organization is configured for Active Directory split permissions.

If you want to install Exchange 2013 on a domain controller, you must configure the Exchange organization for Role Based Access Control (RBAC) split permissions or shared permissions.

Important:
We don't recommend installing Exchange 2013 on Active Directory domain controllers. For more information, see Installing Exchange on a domain controller is not recommended.

If you want to continue using Active Directory split permissions, you must install Exchange 2013 on a member server.

For more information about split and shared permissions in Exchange 2013, see the following

topics:

Understanding split permissions

Configure Exchange 2013 for split permissions

Configure Exchange 2013 for shared permissions

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

The current account isn't logged into an Active Directory domain

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-04-10*

Microsoft Exchange Server 2013 Setup can't continue because it detected that the current account isn't logged on to an Active Directory domain. You must log in using an Active Directory account that has the permissions required to install Exchange Server 2013.

Setup requires that the user who is logged on when Exchange 2013 is installed has permission to create and modify objects in Active Directory. If you're running Exchange 2013 Setup in your organization for the first time, the account you use must be a member of the Schema Admins and Enterprise Admins groups. These permissions are required because Active Directory is prepared for Exchange 2013 the first time Setup is run. After Active Directory is prepared, the account you use to install additional Exchange 2013 servers must be a member of the Organization Management management role group.

To resolve this issue, grant the logged-on user the appropriate permissions, or log on with an account that has those permissions and run Exchange 2013 Setup again.

Important:
Cross-forest installation of Exchange 2013 isn't supported. Use an account that is a member of the Active Directory forest where you're installing Exchange 2013.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

The computer needs to be restarted before Setup can continue

Applies to: *Exchange Server*

Topic Last Modified: *2014-07-17*

Microsoft Exchange Server 2013 Setup can't continue because it detected that the local computer needs to be restarted to complete the installation of other programs or updates.

Why is this happening?

When programs or updates are installed, they sometimes need to make changes to files or other resources on the computer that can only be made during Windows startup. To tell Windows that it needs to make changes during startup, a program or update makes a change to one or both of the following Windows registry keys:

- HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Updates**UpdateExeVolatile**
- HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager **PendingFileRenameOperations**

This table shows all of the values that you might see in these keys.

Value of UpdateExeVolatile	Value of PendingFileRenameOperations	Results
Greater than 3	Not applicable	An invalid value was returned.
3	Not applicable	An update that's been installed and another update that's been removed are waiting for the computer to be restarted. If it's a security update, the computer might be at risk until it's restarted.
2	Not applicable	An update that's been installed is waiting for the computer to be restarted. If it's a security

		update, the computer might be at risk until it's restarted.
1	Not applicable	An update removal is waiting for the computer to be restarted.
0 or missing	Exists and contains value	The installation of an update didn't finish. The system needs to be restarted to finish the installation. If it's a security update, the computer might be at risk until it's restarted.
0 or missing	Empty	The computer doesn’t need to be restarted.

Exchange Setup won't continue and it'll show this error if the **UpdateExeVolatile** registry key exists and has as value other than 0, or if the **PendingFileRenameOperations** registry key isn't empty. If you see this error, it usually just means that the computer hasn't been restarted since the last time a program or update was installed. However, sometimes the installation of a program or update doesn't complete properly and the values in these keys aren't reset. The values in these keys are considered to be *orphaned*. When this happens, Setup will keep telling you that the computer needs to be restarted even if you already have.

How do I fix it?

There are a couple things you can do to fix this error.

Restart the computer

Restart the computer, and then run Exchange 2013 Setup again. The most common reason for why you'll see this error is because the computer hasn't been restarted since the last time a program or update was installed. Restarting the computer will often fix this error and let Setup continue. If it does, you’re all set and you can get back to installing Exchange.

Remove the orphaned values from the registry

If restarting the computer doesn't fix this error, another program or update probably didn't finish installing properly. When this happens, you'll need to use these steps to remove the orphaned values from the **UpdateExeVolatile** and **PendingFileRenameOperations** registry keys before Setup can continue.

Before you go any further, a note about making changes to the Windows registry (or just "registry"). Making incorrect changes to the registry could cause serious problems, and could even force you to reinstall Windows. Before you make any changes to the registry, make sure you have a working backup of your computer.

1. Press the Windows key + 'R' to open the **Run** window.
2. In **Open**, type `regedit.exe`, and press Enter to open Registry Editor.
3. Navigate to **HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Updates**.
4. If the **UpdateExeVolatile** key exists and contains anything other than 0, do the following:
   a. In the right navigation pane, double-click the **UpdateExeVolatile** key.
   b. Replace the value in the key with **0**, and then click **OK**.
5. Navigate to **HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager**.
6. If the **PendingFileRenameOperations** key contains any value, right-click **PendingFileRenameOperations** in the navigation pane, and then click **Delete**.
7. Close Registry Editor.

After you've finished these steps, this error should no longer appear when you run Exchange Setup.

The logged-on user is not a member of the Schema Admins group

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-12*

Microsoft Exchange Server 2013 Setup can't continue because the user account performing the Active Directory schema update process isn't a member of the Schema Admins and Enterprise Admins groups.

Setup requires that the user who is logged on when Exchange 2013 is installed has permission to create and modify objects in Active Directory. If you're running Exchange 2013 Setup in your organization for the first time, the account you use must be a member of the Schema Admins and Enterprise Admins groups. These permissions are required because Active Directory is prepared for Exchange 2013 the first time Setup is run. After Active Directory is prepared, the account you use to install additional Exchange 2013 servers must be a member of the Organization Management management role group.

To resolve this issue, grant the logged-on user the appropriate permissions, or log on with an account that has those permissions and run Exchange 2013 Setup again.

Important:
Cross-forest installation of Exchange 2013 isn't supported. Use an account that is a member of the Active Directory forest where you're installing Exchange 2013.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

UCMA 4.0, Core Runtime not installed

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-12-10*

Microsoft Exchange Server 2013 Setup can't continue because the local computer requires a software update. You'll need to install this update before Exchange 2013 Setup can continue.

Exchange 2013 Setup requires that the Unified Communications Managed API 4.0 Runtime update be installed on the computer before installation can continue.

Download and install the 64-bit update from the following URL, and then click **retry** on the **Readiness Checks** page.

Note:
If this update requires a reboot to complete installation, you'll need to exit Exchange 2013 Setup, reboot, and then start Setup again.

Unified Communications Managed API 4.0 Runtime

Cannot remove mailbox database

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-08*

Microsoft Exchange Server 2013 Setup can't continue because it can't remove a user mailbox database from the local server without incurring potential data loss.

Exchange 2013 Setup determines whether all mailbox databases have been removed from the server before the Mailbox server role is removed. However, user mailboxes might still remain on the server.

To resolve this issue, move any mailboxes on the server to another Exchange server or, if the mailboxes and the data contained within them are no longer required, disable the mailboxes. Then run Exchange 2013 Setup again.

- For more information about how to identify a mailbox in the database, see Get-Mailbox.
- For more information about how to move a mailbox, see Mailbox moves in Exchange 2013.
- For more information about how to disable a mailbox, see Disable-Mailbox.
- For more information about how to remove a mailbox database, see Manage mailbox databases in Exchange 2013.

Installing Exchange on a domain controller is not recommended

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-03-22*

Microsoft Exchange Server 2013 Setup has detected that the computer you're attempting to install Exchange 2013 on is an Active Directory domain controller. Installing Exchange 2013 on a domain controller isn't recommended.

If you install Exchange 2013 on a domain controller, be aware of the following issues:

- Configuring Exchange 2013 for Active Directory split permissions isn't supported.
- The Exchange Trusted Subsystem universal security group (USG) is added to the Domain Admins group when Exchange is installed on a domain controller. When this occurs, all Exchange servers in the domain are granted domain administrator rights in that domain.
- Exchange Server and Active Directory are both resource-intensive applications. There are

performance implications to be considered when both are running on the same computer.
- You must make sure that the domain controller Exchange 2013 is installed on is a global catalog server.
- Exchange services may not start correctly when the domain controller is also a global catalog server.
- System shutdown will take considerably longer if Exchange services aren't stopped before shutting down or restarting the server.
- Demoting a domain controller to a member server isn't supported.
- Running Exchange 2013 on a clustered node that is also an Active Directory domain controller isn't supported.

We recommend that you install Exchange 2013 on a member server.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

KB2619234 update not installed

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-08*

Microsoft Exchange Server 2013 Setup can't continue because the local computer requires a software update. You'll need to install this update before Exchange 2013 Setup can continue.

Exchange 2013 Setup requires an update to Windows that allows Outlook Anywhere (formerly known as RPC over HTTP) to work correctly.

Download and install the 64-bit update from the following URL, and then click **retry** on the **Readiness Checks** page.

Note:
If this update requires a reboot to complete installation, you'll need to exit Exchange 2013 Setup, reboot, and then start Setup again.

Microsoft Knowledge Base article KB2619234, A hotfix is available to enable the Association Cookie/GUID that is used by RPC over HTTP to also be used at the RPC layer in Windows 7 and in Windows Server 2008 R2)

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

Installation of the first Exchange server in the organization can't be delegated

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-03-27*

Microsoft Exchange Server 2013 Setup can't continue because the logged-on user doesn't have the account permissions that are required to install the first Exchange 2013 server in the organization.

Although Exchange 2013 Setup allows using delegation to install successive server roles, Setup requires that the user who is logged on is a member of the Enterprise Admins Windows security group when the first Exchange 2013 server in the organization is installed. This is required because Exchange 2013 Setup creates and configures objects in the Exchange Organization container in Active Directory during installation.

Note:
If you haven't prepared the Active Directory schema for Exchange 2013, the logged-on user must also be a member of the Schema Admins Windows security group. Alternately, another user who's a member of the Schema Admins Windows group can prepare the Active Directory schema before Exchange 2013 is installed.

To resolve this issue, add the logged-on user as a member of the Enterprise Admins security group. Or, log on to an account that's a member of the Enterprise Admins security group. Then run Exchange 2013 Setup again.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

No Exchange 2010 or Exchange 2007 servers detected

Applies to: *Exchange Server*

Topic Last Modified: *2012-11-08*

Microsoft Exchange Server 2013 Setup displayed this warning because no Exchange Server 2010 or Exchange Server 2007 server roles exist in the organization.

Caution:
If you continue with Exchange Server 2013 installation, you won't be able to add Exchange 2010 or Exchange 2007 servers to the organization at a future date.

Before deploying Exchange 2013, consider the following factors that may require you to deploy Exchange 2010 or Exchange 2007 servers prior to deploying Exchange 2013:

- **Third-party or in-house developed applications** Applications developed for earlier versions of Exchange may not be compatible with Exchange 2013. You may need to maintain Exchange 2010 or Exchange 2007 servers to support these applications.
- **Coexistence or migration requirements** If you plan on migrating mailboxes into your organization, some solutions may require the use of Exchange 2010 or Exchange 2007 servers.

If you decide that you need to deploy Exchange 2010 or Exchange 2007 servers, you must do so before you deploy Exchange 2013. Active Directory must be prepared for each Exchange version in the following order:

1. Exchange 2007
2. Exchange 2010
3. Exchange 2013

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

The computer needs to be restarted before Setup can continue

Applies to: *Exchange Server*

Topic Last Modified: *2014-07-25*

Microsoft Exchange Server 2013 Setup can't continue because it detected that the local computer needs to be restarted to complete the installation of other programs or updates.

Why is this happening?

When programs or updates are installed, they sometimes need to make changes to files or other resources on the computer that can only be made during Windows startup. To tell Windows that it needs to make changes during startup, a program or update makes a change to one or both of the following Windows registry keys:

- HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Updates**UpdateExeVolatile**
- HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager **PendingFileRenameOperations**

This table shows all of the values that you might see in these keys.

Value of UpdateExeVolatile	Value of PendingFileRenameOperations	Results
Greater than 3	Not applicable	An invalid value was returned.
3	Not applicable	An update that's been installed and another update that's been removed are waiting for the computer to be restarted. If it's a security update, the computer might be at risk until it's restarted.
2	Not applicable	An update that's been installed is waiting for the computer to be restarted. If it's a security update, the computer might be at risk until it's restarted.
1	Not applicable	An update removal is waiting for the computer to be restarted.
0 or missing	Exists and contains value	The installation of an update didn't finish. The system needs to be restarted to finish the installation. If it's a security

		update, the computer might be at risk until it's restarted.
0 or missing	Empty	The computer doesn't need to be restarted.

Exchange Setup won't continue and it'll show this error if the **UpdateExeVolatile** registry key exists and has as value other than 0, or if the **PendingFileRenameOperations** registry key isn't empty. If you see this error, it usually just means that the computer hasn't been restarted since the last time a program or update was installed. However, sometimes the installation of a program or update doesn't complete properly and the values in these keys aren't reset. The values in these keys are considered to be *orphaned*. When this happens, Setup will keep telling you that the computer needs to be restarted even if you already have.

How do I fix it?

There are a couple things you can do to fix this error.

Restart the computer

Restart the computer, and then run Exchange 2013 Setup again. The most common reason for why you'll see this error is because the computer hasn't been restarted since the last time a program or update was installed. Restarting the computer will often fix this error and let Setup continue. If it does, you're all set and you can get back to installing Exchange.

Remove the orphaned values from the registry

If restarting the computer doesn't fix this error, another program or update probably didn't finish installing properly. When this happens, you'll need to use these steps to remove the orphaned values from the **UpdateExeVolatile** and **PendingFileRenameOperations** registry keys before Setup can continue.

Before you go any further, a note about making changes to the Windows registry (or just "registry"). Making incorrect changes to the registry could cause serious problems, and could even force you to reinstall Windows. Before you make any changes to the registry, make sure you have a working backup of your computer.

1. Press the Windows key + 'R' to open the **Run** window.
2. In **Open**, type `regedit.exe`, and press Enter to open Registry Editor.
3. Navigate to **HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Updates**.
4. If the **UpdateExeVolatile** key exists and contains anything other than 0, do the following:
   a. In the right navigation pane, double-click the **UpdateExeVolatile** key.
   b. Replace the value in the key with **0**, and then click **OK**.
5. Navigate to **HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager**.
6. If the **PendingFileRenameOperations** key contains any value, right-click **PendingFileRenameOperations** in the navigation pane, and then click **Delete**.

7. Close Registry Editor.

After you've finished these steps, this error should no longer appear when you run Exchange Setup.

Exchange 2007 servers must be upgraded to Service Pack 3, Update Rollup 10

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-02-18*

Microsoft Exchange Server 2013 Setup can't continue because it detected one or more Exchange Server 2007 servers haven't been upgraded to Exchange Server 2007 Service Pack 3 (SP3) Roll Up 10 (RU10). Before you can install Exchange 2013, all Exchange 2007 servers in your organization must be upgraded to Exchange 2007 SP3 RU10. This requirement includes Exchange 2007 Edge Transport servers. For more information, see Upgrade from Exchange 2007 to Exchange 2013.

Important:
After you upgrade your Exchange 2007 Edge Transport servers to Exchange 2007 SP3 RU10, you must re-create the Edge subscription between your Exchange organization and each Edge Transport server to update their server version in Active Directory. For more information about re-creating Edge subscriptions in Exchange 2007, see Subscribing the Edge Transport Server to the Exchange Organization.

Exchange 2010 servers must be upgraded to Service Pack 3

Can't install Exchange 2013 in a forest containing Exchange 2000 or Exchange 2003 servers.

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-04-17*

Microsoft Exchange Server 2013 can't continue because one or more computers running Exchange 2000 Server or Exchange Server 2003 were found in the Active Directory forest. Before you can install Exchange 2013, all Exchange 2000 and Exchange 2003 servers must be removed from the forest. Mailboxes, public folders, and all other Exchange objects or components must be upgraded to either Exchange Server 2007 or Exchange Server 2010. You can't upgrade from Exchange 2000 or Exchange 2003 directly to Exchange 2013.

The path you need to follow to install Exchange 2013 in your organization depends on the version of Exchange you currently have installed in your forest. See the following table for more information.

If you have the following installed in your organization	**You must take this path to upgrade to Exchange 2013**
Exchange 2000	1. Install Exchange 2007 into your Exchange 2000 organization. 2. Configure Exchange 2007 and Exchange 2000 coexistence. 3. Migrate Exchange 2000 mailboxes, public folders, and other components to Exchange 2007. 4. Decommission and remove all Exchange 2000 servers. 5. Install Exchange 2013 into your Exchange 2007 organization. 6. Configure Exchange 2013 and Exchange 2007 coexistence. 7. Migrate Exchange 2007 mailboxes, public folders, and other components to Exchange 2013. 8. Decommission and remove all Exchange 2007 servers. For more information, see Upgrading to Exchange 2007 and Upgrade from Exchange 2007 to Exchange 2013.
Exchange 2003	1. Install Exchange 2010 into your Exchange 2003 organization. 2. Configure Exchange 2010 and Exchange 2003

	coexistence. 3. Migrate Exchange 2003 mailboxes, public folders, and other components to Exchange 2010. 4. Decommission and remove all Exchange 2003 servers. 5. Install Exchange 2013 into your Exchange 2010 organization. 6. Configure Exchange 2013 and Exchange 2010 coexistence. 7. Migrate Exchange 2010 mailboxes, public folders, and other components to Exchange 2013. 8. Decommission and remove all Exchange 2010 servers. For more information, see Exchange 2003 - Planning Roadmap for Upgrade and Coexistence and Upgrade from Exchange 2010 to Exchange 2013.

When upgrading to Exchange 2010 or Exchange 2013, you can use the Exchange Deployment Assistant to help you complete your deployment. For more information, see the following links:

- Exchange 2010 Deployment Assistant
- Exchange 2013 Deployment Assistant

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Did you find what you're looking for? Please take a minute to send us feedback about the information you were hoping to find.

An incompatible operating system was found

Applies to: *Exchange Server*

Topic Last Modified: *2014-01-30*

Microsoft Exchange Server 2013 Setup can't continue because it detected an incompatible operating system. You must install a compatible operating system on this computer before you install Exchange 2013. The following table shows the operating systems that are compatible with Exchange 2013.

Important:
Exchange 2013 doesn't support the Server Core installation option of Windows Server 2008 R2, Windows Server 2012, or Windows Server 2012 R2.

Supported operating systems for Exchange 2013

Component	Requirement
Mailbox, Client Access, and Edge Transport server roles	One of the following: • Windows Server 2012 R2 Standard or Datacenter[1] • Windows Server 2012 Standard or Datacenter • Windows Server 2008 R2 Standard with Service Pack 1 (SP1) • Windows Server 2008 R2 Enterprise with Service Pack 1 (SP1) • Windows Server 2008 R2 Datacenter RTM or later
Management tools	One of the following: • Windows Server 2012 R2 Standard or Datacenter[1] • Windows Server 2012 Standard or Datacenter • Windows Server 2008 R2 Standard with SP1 • Windows Server 2008 R2 Enterprise with SP1 • Windows Server 2008 R2 Datacenter RTM or later • 64-bit edition of Windows 8.1[2] • 64-bit edition of Windows 8 • 64-bit edition of Windows 7 with Service Pack 1

[1] Windows Server 2012 R2 is supported only with Exchange 2013 SP1 or later.

[2] Windows 8.1 is supported only with Exchange 2013 SP1 or later.

For more information, see Exchange 2013 system requirements.

Exchange 2010 servers must be upgraded to Service Pack 3

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2013-01-28*

Microsoft Exchange Server 2013 Setup can't continue because it detected one or more Microsoft Exchange Server 2010 servers haven't been upgraded to Service Pack 3 (SP3) for Exchange Server 2010. Before you can install Exchange 2013, all Exchange 2010 servers in your organization must be upgraded to Exchange 2010 SP3. This requirement includes Exchange 2010 Edge Transport servers. For more information, see Upgrade from Exchange 2010 to Exchange 2013.

Important:
After you upgrade your Exchange 2010 Edge Transport servers to Exchange 2010 SP3, you must re-create the Edge subscription between your Exchange organization and each Edge Transport server to update their server version in Active Directory. For more information about re-creating Edge subscriptions in Exchange 2010, see Managing Edge Subscriptions.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

ExecutionPolicy GPO is defined

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2014-01-31*

Microsoft Exchange Server 2013 Setup can’t continue because it detected that the **ExecutionPolicy** Group Policy Object (GPO) defines one or both of the following policies:

- **MachinePolicy**
- **UserPolicy**

It doesn't matter how the policies have been defined. It only matters that they have been defined.

When you run Exchange 2013 Setup, Exchange stops and disables the Windows Management Instrumentation (WMI) service. When either of these policies are defined, the WMI service needs to be enabled to run a Windows PowerShell script. If the policies are defined and the WMI service is stopped, Setup will fail and the server will be left in an inconsistent state.

To allow Setup to continue, you need to temporarily remove any definition of **MachinePolicy** or **UserPolicy** in the **ExecutionPolicy** GPO.

For information on how to remove any definitions of **MachinePolicy** or **UserPolicy** in the **ExecutionPolicy** GPO, see Knowledge Base article KB981474.

Note:
Even though this Knowledge Base article was written for Exchange 2010, it also applies to Exchange 2013 cumulative updates and service packs.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Primary DNS Suffix is missing

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2014-01-15*

Microsoft Exchange Server 2013 Setup can't continue because the primary domain name system (DNS) suffix for the computer you're installing Exchange on hasn't been configured.

To resolve this issue, add a primary DNS suffix on the computer using the steps below and then run Setup again.

Important:
Changing the computer name or primary DNS suffix after you install Exchange 2013 isn't supported.

1. Log on to the computer where you want to install the Edge Transport role as a user that's a member of the local Administrators group.
2. Open the **Control Panel** and then double-click **System**.
3. In the **Computer name, domain, and workgroup settings** section, click **Change settings**.
4. In the **System Properties** window, make sure the **Computer Name** tab is selected and then click **Change...**.
5. In **Computer Name/Domain Changes**, click **More...**.
6. In **Primary DNS suffix of this computer**, enter the DNS domain name for the Edge Transport server. For example, contoso.com.
7. Click **OK** to close each window.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because the Microsoft Windows Server™ 2003 Simple Mail Transfer Protocol (SMTP) service is installed on this computer.

Microsoft Exchange setup requires that the SMTP service not be installed on servers that are used for Exchange 2007.

To resolve this issue, uninstall the SMTP service and rerun Microsoft Exchange setup.

To uninstall the SMTP service by using Add or Remove a Windows Component in Control Panel

1. On the **Start** menu, click **Control Panel**.
2. Double-click **Add or Remove Programs**.
3. Click **Add/Remove Windows Components**.

4. In the **Components** list, select the **Application Server** check box and then click **Details**.
5. Select **Internet Information Services Manager** and then click **Details**.
6. Select **SMTP Service** and then click to clear the check box.
7. Click **OK** two times to return to the **Components** list and then click **Next**.
8. Click **Finish** when the SMTP service is uninstalled.

SMTP Addressing Format Not Supported_SMTPAddressLiteral

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 and Exchange Server 2010 setup cannot continue because the specified recipient policy uses an unsupported Simple Mail Transfer Protocol (SMTP) address format.

Exchange 2007 and Exchange 2010 setup requires that all SMTP addresses used for e-mail address policies not contain IP address literals, for example: *user@[10.10.1.1]*.

To resolve this issue, change the value of the SMTP address in the recipient policy so that it does not contain an IP address literal. Replace brackets ([]) and numbers (10.10.1.1) of the IP address literal with the Domain Name System (DNS) naming format, for example: *user@contoso.com*, and then rerun Exchange setup.

For more information about managing recipient policies in Exchange Server 2007, see "Managing E-Mail Address Policies" (http://go.microsoft.com/fwlink/?LinkId=86653).

For more information about managing recipient policies in Exchange Server 2010, see "Managing E-Mail Address Policies" (http://go.microsoft.com/fwlink/?LinkId=179519).

The World Wide Web Publishing

Service is disabled or missing_ShouldReRunSetupForW3SVC

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because its attempt to install the Mailbox Server or Client Access role found that the World Wide Web Publishing Service is either disabled or not installed on this computer.

Exchange 2007 setup requires the computer that you are installing Microsoft Exchange to have the World Wide Web Publishing Service installed and set to something other than disabled.

To resolve this issue, verify that the World Wide Web Publishing service is installed and not disabled on the local computer, and then rerun Microsoft Exchange setup.

To verify that the World Wide Web Publishing Service is installed and not disabled

1. Right-click **My Computer** on the desktop, and then click **Manage**.
2. Expand the **Services and Applications** node, and then click the **Services** node.
3. In the right pane, locate the **World Wide Web Publishing Service**.

If the **World Wide Web Publishing Service** is not displayed in the list of services installed, follow the steps in the procedure below to install it.

4. If the **World Wide Web Publishing Service** is displayed but has a status other than **Started**, continue with the steps below to start it.
5. Right-click **World Wide Web Publishing Service**, and then click **Properties**.
6. Verify the **Startup Type** is **Automatic** and the **Service status** is set to **Started**.
7. Click **Apply**, and then click **OK**.

To install the World Wide Web Publishing Service

1. On the **Start** menu, select **Settings**, **Control Panel**, and then click **Add or Remove Programs**
2. Click **Add/Remove Windows Components**.
3. In the **Components** list, select the **Application Server** check box, and then click **Details**.
4. Select **Internet Information Services Manager**, and then click **Details**.
5. Select **World Wide Web Service**, and then select the check box.
6. Click **OK** two times to return to the **Components** list, and then click **Next**.

7. Click **Finish** when the IIS service is installed.

This Server is the Source for a Send Connector_ServerIsSourceForSendConnector

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because its attempt to remove the Hub Transport server role failed. The local computer is the source for one or more Send connectors in the Exchange organization.

A Send connector represents a logical gateway through which outbound messages are sent.

Exchange 2007 setup requires that all Send connectors for an Exchange organization be moved or deleted from the Hub Transport server computer before the server role can be deleted.

To resolve this issue, move or delete all Send connectors from the local computer and then rerun setup.

For more information about modifying or removing Send connectors, see the following topics in the Exchange Server 2007 product documentation:

- "How to Remove a Send Connector" (http://go.microsoft.com/fwlink/?LinkId=86655).
- "How to Modify the Configuration of a Send Connector" (http://go.microsoft.com/fwlink/?LinkId=86656).

The local computer is responsible for expanding group

membership_ServerIsGroupExpansionServer

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because its attempt to uninstall a Hub Transport role responsible for expanding group membership failed.

Exchange 2007 setup requires that distribution list expansion be removed from the current Bridgehead server before the Hub Transport role can be uninstalled.

The expansion of distribution lists enables identification of individual recipients who belong to the distribution list to be identified, or the identification of additional distribution lists for expansion. An expanded distribution list can return the path for any required delivery status notification (DSN). DSNs notify the Microsoft Exchange administrator or e-mail sender of the status of a particular e-mail message. Additionally, distribution list expansion identifies whether Out of Office messages or automatically generated replies should be sent to the sender of the original message.

To resolve this issue, move distribution group expansion to another server and rerun Microsoft Exchange setup.

To change the expansion server for a distribution group or dynamic distribution group

1. Open the Exchange Management Console.
2. In the console tree, expand **Recipient Configuration**.
3. In the console tree, click **Distribution Group**.
4. Create a filter to view all distribution groups and dynamic distribution groups that use the current Bridgehead server as an expansion server.
   a. In the action pane, click **Create Filter**.
   b. In the property drop-down list, click **Expansion Server**.
   c. In the operator drop-down list, click **Equals**.
   d. At the value box, click the **Browse** button to select the Bridgehead server that currently acting as the expansion server.

Note:
The following step is optional.

1. Click **Add Expression** to specify additional filter criteria. Only messages that meet all filter criteria will be displayed.
2. Click **Apply Filter**. The results that meet the filter criteria are displayed.
1. In the results pane, click the distribution group you want to change the expansion server for, and then click **Properties** in the action pane.
2. On **Properties**, click the **Advanced** tab.
3. In the Expansion server drop-down list, select a specific server from the list or select **Any server in the organization**.
4. Repeat steps 5 through 7 for all distribution groups or for dynamic distribution groups that are using the Bridgehead server as their expansion server.

3. In the Expansion server drop-down list, select a specific server from the list or select **Any server in the organization**.
4. Repeat steps 5 through 7 for all distribution groups or for dynamic distribution groups that are using the Bridgehead server as their expansion server.

The fully-qualified domain name of the computer matches a recipient policy_ServerFQDNMatchesSMTPPolicy

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the

community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because the Fully Qualified Domain Name (FQDN) of the local computer matches the Simple Mail Transfer Protocol (SMTP) address of a recipient policy.

Microsoft Exchange setup requires that the FQDN of the servers in an Exchange organization not match any SMTP addresses of recipient policies in the same Exchange organization.

If the FQDN of a computer matches the SMTP address of a recipient policy, this match can cause mail to fail over SMTP and stall in the MTA queues.

To resolve this issue, rename the local computer or remove or rename the recipient policy and rerun Microsoft Exchange setup.

To rename the local computer

1. Open **System** in **Control Panel**.
2. On the **Computer Name** tab, click **Change**.
3. Under **Computer name**, type a new name for the computer, and then click **OK**. You will be prompted to provide a user name and user password to rename the computer in the domain.
4. Click **OK** to close the **System Properties** dialog box. You will be prompted to restart your computer to apply your changes.

Important:
If the computer that you want to rename is a domain controller, see "Rename a domain controller" (http://go.microsoft.com/fwlink/?LinkId=66828).

To modify the recipient policy SMTP address

1. Start Exchange System Manager.
2. Click **Organization**, click **Recipients**, and then click **Recipient Policies**.
3. Double-click the policy that you want to change.
4. Click the **E-Mail Addresses** tab, and then change the appropriate SMTP address

For more information about Recipient Policy naming issues, see Microsoft Knowledge Base article 288175, "XCON: Recipient Policy Cannot Match the FQDN of Any Server in the Organization, 5.4.8 NDRs" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=288175).

Older database files present_SecondSGFilesExist

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because it detected existing Microsoft Exchange database files in the target installation path.

Exchange 2007 setup requires that the target installation path be empty of Microsoft Exchange database files.

To resolve this issue, remove all existing files from target installation paths and then rerun setup.

To delete existing Exchange Server database files from the target installation path

1. In My Computer or Windows Explorer, locate the target install path.

Note:
By default, the database files are located in: <systemDrive>:\Program Files\Microsoft\Exchange Server\Mailbox\First Storage Group.

2. Right-click the files to be removed, and then select **Delete**.
3. At the **Confirm File Delete** dialog, click **Yes**.
4. Repeat steps 2 and 3 for all files in the target install paths.

The schema master is not running Windows Server 2003 Service Pack 1 or later_SchemaFSMONotWin2003SPn

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because the domain controller assigned the Active Directory directory service schema master role, also known as flexible single master operations (FSMO), is not running Microsoft Windows Server 2003 Service Pack 1 (SP1) or a later version.

Exchange 2007 setup requires that the domain controller that serves as the schema FSMO run Windows Server 2003 SP1 or a later version.

The FSMO controls all updates and modifications to the Active Directory schema.

To resolve this issue, do one or more of the following:

- Upgrade the FSMO domain controller to Windows Server 2003 SP1 or a later version and rerun Microsoft Exchange setup.
- If there is a FSMO domain controller running Microsoft Windows Server 2003 Service Pack 1 (SP1) or a later version in the Exchange organization, run Exchange 2007 setup with the /domaincontroller parameter pointing to that FSMO domain controller:

[*/DomainController*, or */dc <FQDN of domain controller>*]

Use the */DomainController* parameter to specify the domain controller to use to read from and write to Active Directory during setup. You can use NetBIOS or the fully qualified domain name (FQDN) format.

To obtain the latest service pack for Windows Server 2003, see the "Windows Server TechCenter" (http://go.microsoft.com/fwlink/?LinkId=45315).

For more information about Exchange Server 2007 Setup parameters, see "How to Install Exchange 2007 in Unattended Mode" (http://go.microsoft.com/fwlink/?LinkId=86476) in the Exchange Server 2007 product documentation.

Cannot find a recipient update service_RUSMissing

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 or Exchange Server 2010 setup cannot continue because the

Recipient Update Service (RUS) responsible for a domain in the existing Exchange organization cannot be found.

Microsoft Exchange setup requires that each domain in the existing Exchange organization have an instance of the Recipient Update Service.

If an instance of the Recipient Update Service is missing for a domain, new user objects created in the domain will not receive e-mail addresses issued to them.

To resolve this issue, verify that an instance of the Recipient Update Service exists for each domain and create an instance of the Recipient Update Service for the domains that do not have one and then rerun Microsoft Exchange setup.

To create a Recipient Update Service instance for a domain
1. Open Exchange System Manager. 2. Expand **Recipients**. 3. Right-click the **Recipient Update Services** node, click **New**, and then click **Recipient Update Service**. 4. In the New Object window, click **Browse** to locate the name of the domain. 5. Select the name of the domain and then click **OK**. 6. In the New Object window, click **Next**, and then **Finish**.

For more information about the Recipient Update Service, see the following Microsoft Knowledge Base articles:

- "How the Recipient Update Service applies recipient policies" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=328738).
- "How the Recipient Update Service Populates Address Lists" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=253828).
- "How to check the progress of the Exchange Recipient Update Service" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=246127).

Active Directory domain is mixed mode_RootDomainModeMixed

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because an existing Active Directory domain is not set to Microsoft Windows®°2000 Server native mode or better.

Exchange 2007 setup will create Universal Security Groups that can only exist in Windows 2000 Server native mode, or better, domains.

To resolve this issue, follow these steps to raise the domain functional level to at least the Windows 2000 Server native level, and then rerun Exchange 2007 setup.

To raise the domain functional level

1. Open Active Directory Domains and Trusts.
2. In the console tree, right-click the domain for which you want to raise functionality, and then click **Raise Domain Functional Level**.
3. In **Select an available domain functional level**, use one of the following procedures:
   - To raise the domain functional level to Windows 2000 Server native, click **Windows 2000 native**, and then click **Raise**.
   - To raise domain functional level to Windows Server® 2003, click **Windows Server 2003**, and then click **Raise.**

Caution:
If you have or will have any domain controllers running Windows NT® 4.0 and earlier, do not raise the domain functional level to Windows 2000 Server native. After the domain functional level is set to Windows 2000 Server native, it cannot be changed back to Windows 2000 Server mixed. If you have or will have any domain controllers running Windows NT 4.0 and earlier or Windows 2000 Server, do not raise the domain functional level to Windows Server 2003. After the domain functional level is set to Windows Server 2003, it cannot be changed back to Windows 2000 Server mixed or Windows 2000 Server native.

The primary DNS server cannot be contacted_PrimaryDNSTestFailed

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because communication with the primary Domain Name System (DNS) server cannot be established.

Exchange 2007 setup requires that the local computer communicate with the authoritative DNS database for the domain.

Microsoft Exchange depends on DNS to resolve the IP Address of its next internal or external destination server.

Communication with the primary DNS server can fail for the following reasons:

- The local TCP/IP configuration does not point to the correct DNS server.
- The DNS server is down or unreachable because of a network failure or other reasons.

To resolve this issue:

- Verify that the local TCP/IP configuration points to the correct DNS server.

To verify the local TCP/IP configuration

1. Review the local TCP/IP configuration:

For more information, see "Configure TCP/IP to use DNS" (http://go.microsoft.com/fwlink/?LinkId=68094).

- Verify that the DNS server is running and can be contacted.

To verify that the DNS server is running and can be contacted

1. Verify that the DNS server is running by doing one or more of the following checks:
   - Look at the DNS server status from the DNS Administration program on the DNS server.
   - Restart the DNS server.

For more information, see "Start, stop, pause, or restart a DNS server" (http://go.microsoft.com/fwlink/?LinkId=62999).

   - Verify the DNS server responsiveness by using the **nslookup** command.

For more information, see the instructions in "Verify DNS server responsiveness using the nslookup command" (http://go.microsoft.com/fwlink/?LinkId=63000).

Insufficient permissions to run / PrepareDomain_PrepareDomainNotAdmin

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because the attempt to run the **/PrepareDomain** process failed. The logged on user has insufficient permissions to perform the **/PrepareDomain** process.

Exchange 2007 setup requires that the user who is logged on when running the **/PrepareDomain** process be a member of the Domain Admins group for the domain to be prepared, and a member of the Enterprise Admins group.

To resolve this issue, grant the logged-on user Domain Admins group permissions for the domain being prepared and enroll them in the Enterprise Admins groups, or log on with an account that has those permissions and rerun Exchange 2007 setup.

For more information about Active Directory permissions that are needed with Microsoft Exchange, see "Working with Active Directory Permissions in Exchange Server" (http://go.microsoft.com/fwlink/?LinkId=47592).

The operating system is in debug mode_OSCheckedBuild

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

The Microsoft® Exchange Server Analyzer Tool queries the **Win32_OperatingSystem** Microsoft

Windows® Management Instrumentation (WMI) class to determine whether a value is set for the **Debug** property. If the value for this key on an Exchange Server computer is set to **True**, an error is displayed.

Windows debug mode is toggled by adding the **/debug** parameter in the Boot.ini file. When **/debug** is specified in the Boot.ini file of a Windows Server computer, the kernel debugger is loaded during startup and kept in memory at all times. This enables a support professional to dial in to the system being debugged and break in to the debugger, even when the system is not suspended at a Kernel STOP screen. Unlike the **/crashdebug** switch, the **/debug** switch uses the COM port whether you are debugging or not. This switch is used when debugging problems that are regularly reproducible. It is likely that the **/debug** parameter was set as a means to troubleshoot a problem, and was unintentionally left set.

Because of the additional processes that are being run, performance suffers greatly. Therefore, running Exchange Server on a computer where Windows is running in debug mode is not recommended.

To eliminate this error, edit the Boot.ini file and remove the **/debug** parameter.

⊟ To correct this error

1. In Windows Explorer, navigate to the System Partition. This is the partition that holds the hardware specific files such as Boot.ini and NTLDR.
2. If you cannot see the Boot.ini file, it could be because the **Folder Options** are set to **Hide protected operating system files**. If this is the case, in the Windows Explorer window, click **Tools**, click **Folder Options**, and then click **View**. Clear the **Hide protected operating system files (Recommended)** check box. When prompted, click **Yes**.
3. When the Boot.ini file is visible in Windows Explorer, right-click the file, click **Open With**, and then select **Notepad** to open the file.
4. In the **[Operating Systems]** section, remove the **/debug** parameter.
5. Save and close the file, and then restart the Exchange Server computer for the change to take effect.

For more information about the parameters that can be used in the Boot.ini file, see the Microsoft Knowledge Base article 833721, "Available switch options for the Windows XP and Windows Server 2003 Boot.ini files" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=833721).

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because the computer that is running setup is not in the same Active Directory® directory service site or domain as the server that is assigned the domain schema master role, also known as flexible single master operations or FSMO.

Exchange 2007 setup requires the domain controller that serves as the domain schema master to be in the same site and domain as the local computer that is running Exchange setup.

The domain schema master controls all updates and modifications to the Active Directory schema.

To resolve this issue, run Exchange Server 2007 setup using the **/prepareschema** and **/prepareAD** switches from the same site and domain as the domain schema master.

For more information about the **/prepareschema** and **/prepareAD** setup switches, see the Exchange 2007 product documentation topic "How to Prepare Active Directory and Domains" (http://go.microsoft.com/fwlink/?linkid=78453)

You can use the Schema Master tool to identify the role. However, the Schmmgmt.dll DLL must be registered in order to make the Schema tool available as an MMC snap-in.

To view the current schema master

1. At a command prompt, type **regsvr32 schmmgmt.dll**

Note:

RegSvr32 has been successfully registered when the following dialog box is displayed: DllRegisterServer in schmmgmt.dll succeeded.

2. To open a new management console, click **Start**, click **Run**, and then type **mmc**.
3. On the Console menu, click **Add/Remove Snap-in**.
4. Click **Add** to open the **Add Standalone Snap-in** dialog box.
5. Select **Active Directory Schema**, and then click **Add**.
6. "Active Directory Schema" is displayed in the Add/Remove snap-in. Click **Close**, and then click **OK** to return to the console.
7. Select **Active Directory Schema** so that the **Classes** and **Attributes** sections are displayed on the right side.
8. Right-click **Active Directory Schema** and then click **Operations Master**.
9. The current schema master is displayed

After you identify the current schema master, determine which subnet the schema master is located in. Then, use one of the following methods to install Exchange:

- Modify the subnet on the Exchange server to move it into the site in which the schema master is located. Then, install Exchange.
- Temporarily force a site membership change on the Exchange server, and then install Exchange. After Exchange is installed, return the Exchange server to its original site.

To force site membership

1. On the server on which you want to install Exchange, start Registry Editor. To do this, click **Start**, click **Run**, type **regedit**, and then click **OK**.
2. Locate the following registry subkey:

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Netlogon\Parameters

3. Create the following new **String** value:

Value name: **SiteName**

Value type: **REG_SZ**

Value data: **<site_that_contains_the_schema_master>**

4. Exit Registry Editor, and then restart the Netlogon service. This action forces the Exchange server to participate in the site that you specified.
5. Install Exchange.
6. Remove the registry entry that you added in step 3.

7. Restart the Netlogon service. This action returns Exchange to the original site.

Cannot install Exchange 2007 roles after you prepare Active Directory for Exchange 2010_NoE12ServerWarning

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the

community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

When you run Microsoft Exchange Server 2010 **Setup /PrepareAD**, the Microsoft Exchange Server Analyzer Tool queries the existing Active Directory topology to determine whether any Microsoft Exchange Server 2007 server roles exist. If Exchange 2007 server roles are not detected, you receive the following warning message:

> Setup is going to prepare the organization for Exchange Server 2010 via 'Setup /PrepareAD' and no Exchange Server 2007 roles have been detected in this topology. After this operation, it will be impossible to install any Exchange Server 2007 roles.

Before deploying Exchange Server 2010, consider the following factors that may require you to deploy an Exchange 2007 server with all server roles installed prior to deploying Exchange 2007:

- **Third-party or in-house developed applications** Applications developed for Exchange 2003 may not be compatible with Exchange 2010, and thus need to be upgraded or replaced. You can maintain these applications and the associated user population on Exchange 2003; move to Exchange 2007; or replace the software with a compatible version for Exchange 2010.
- **Coexistence or migration requirements** If you plan on migrating mailboxes into your organization, you can either deploy Exchange 2007 and use the Microsoft Transporter Suite, or you can use a third-party coexistence or migration solution. To download the Microsoft Transporter Suite, go to Microsoft Transporter Suite at the Microsoft Download Center.

In addition, when evaluating the options for your organization, make sure you have considered the following questions:

- Do you have a strategy in place to move the dependent applications to Exchange 2010 before Exchange 2003 reaches end of support? For more information, visit the Microsoft Support Lifecycle Web page (http://go.microsoft.com/fwlink/?LinkID=55839).
- Does your strategy require WebDAV and Web Services coexistence (Exchange 2007)?
- Have you considered third-party products that support Exchange or other Microsoft technologies that will allow you to meet your coexistence or migration requirements?
- What is your hardware lifecycle approach (continue to use as many existing 32-bit servers as possible versus buying new 64-bit servers)?
- What is your plan for migration (migrate all servers as fast as possible versus migrating in a phased strategy)? Similarly, what is your timeline for the coexistence of different versions of Exchange?

If you decide that you need to deploy an Exchange 2007 server prior to deploying Exchange 2010, the deployment of a single Exchange 2007 with all server roles is sufficient to enable the deployment of future Exchange 2007 servers in the organization. To deploy the Exchange 2007 server into your Exchange 2003 organization, follow these steps:

1. Run Exchange 2007 **Setup /PrepareSchema**.
2. Run Exchange 2007 **Setup /PrepareAD**.

3. Run Exchange 2007 **Setup /PrepareDomain** on all domains that contain recipients, Exchange 2003 servers, or global catalogs that could be used by an Exchange server.
4. Install an Exchange 2007 server with all four server roles (Hub Transport, Client Access, Mailbox, and Unified Messaging).

The Distributed Transaction Coordinator Service must be started before setup can continue_MSDTCStopped

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because its attempt to install the Client Access Server or Unified Messaging server roles failed because the Distributed Transaction Coordinator service is not started on the target computer.

Exchange 2007 setup requires the computer that you are installing Microsoft Exchange to have the Distributed Transaction Coordinator service status set to **Started**.

The Distributed Transaction Coordinator service provides services designed to ensure successful and complete transactions, even with system failures, process failures, and communication failures.

Each computer participating in a distributed transaction manages its own resources and data and also acts in concert with other computers in the transaction. Above all, a distributed transaction must commit or abort its work entirely on all participating computers. The Distributed Transaction Coordinator performs the transaction coordination role for the components involved and acts as a transaction manager for each computer that manages transactions.

Both the Client Access Server and Unified Messaging server roles have dependencies on the Distributed Transaction Coordinator service.

To resolve this issue, verify that the Distributed Transaction Coordinator service status is set to

Started on the local computer, and then rerun Microsoft Exchange setup.

To set the status of the Distributed Transaction Coordinator service to 'Started'

1. Right-click **My Computer**, and then click **Manage**.
2. Expand the **Services and Applications** node, and then click the **Services** node.
3. In the right pane, locate the **Distributed Transaction Coordinator**.
4. Right-click **Distributed Transaction Coordinator**, and then click **Properties**.
5. Set the **Startup Type** to **Automatic** and the **Service status** to **Started**.
6. Click **Apply**, and then click **OK**.

Messages currently exist in one or more queues_MessagesInQueue

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup displays this warning because its attempt to uninstall a transport role could cause data loss from a transport queue.

Exchange 2007 setup checks to make sure that the transport queues are empty before it removes the roles associated with managing those queues.

If you remove the transport roles before delivery of messages still in the transport queues, those messages may be held indefinitely.

To resolve this issue, inspect the referenced queues to make sure that they are empty of messages before you continue with setup.

To view the contents of a queue

1. Open the Exchange Management Console.
2. In the console tree, click **Toolbox**.
3. In the result pane, click **Exchange Queue Viewer**.
4. In the action pane, click **Open Tool**.
5. In the Queue Viewer, click the **Queues** tab. A list of all queues on the server to which you are connected is displayed.

6. Right-click the queue you want and select **Properties** to view the properties of the queue.

To view messages in a queue

1. Follow steps 1 through 4.
2. In the Queue Viewer, click the **Messages** tab. A list of all messages on the server to which you are connected is displayed. To adjust the view to a single queue, click the **Queues** tab, double-click the queue name, and then click the Server\Queue tab that appears.
3. To view detailed information about a message, select a message, and then click **Properties** in the action pane.

Storage group drive specification is missing_MailboxLogDriveDoesNotExist

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 Disaster Recovery setup cannot continue because Disaster Recovery setup cannot access the storage group database drive specification that was used in the previous installation of this server.

Microsoft Exchange Disaster Recovery setup requires that the same storage group database drive specifications previously used for this server be available during the restore.

To resolve this situation, configure the drives to match the original logical drive configuration and rerun Microsoft Exchange Disaster Recovery setup.

Assign or change a drive letter

1. Open **Computer Management (Local)**.
2. In the console tree, click **Computer Management (Local)**, click **Storage**, and then click **Disk Management**.
3. Right-click a partition, logical drive, or volume, and then click **Change Drive Letter and Paths**.
4. Use one of the following procedures:
   - To assign a drive letter, click **Add**, click the drive letter you want to use, and then click **OK**.
   - To modify a drive letter, click it, click **Change**, click the drive letter you want to use, and then click **OK**.

For more information about how to assign drive letters, see "Assign, change, or remove a drive letter" (http://go.microsoft.com/fwlink/?LinkId=66764).

The Windows Process Activation Service - Process Model component is required_LonghornWASProcessModelInstalled

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Exchange Server 2010 setup cannot continue installation on the Windows Server 2008-or Windows Server 2008 R2-based computer because the Windows Process Activation Service - Process Model feature is not installed on the server.

The Windows Process Activation Service generalizes the Internet Information Services (IIS) process model, removing the dependency on HTTP. All the features of IIS that were previously available only to HTTP applications are now available to applications hosting Windows Communication Foundation (WCF) services, by using non-HTTP protocols. IIS 7.0 also uses Windows Process Activation Service for message-based activation over HTTP.

The Process Model hosts Web and WCF services. Introduced in IIS 6.0, the Process Model is a new architecture that features rapid failure protection, health monitoring, and recycling.

To resolve this issue, install the Windows Process Activation Service - Process Model feature on this server and then rerun Exchange 2010 setup.

Install the Windows Process Activation Service - Process Model feature by using the Server Manager tool

1. Click **Start**, click **Administrative Tools** and then **Server Manager**.
2. In the left navigation pane, right-click **Features**, and then click **Add Features**.
3. On the **Select Features** pane, scroll down to **Windows Process Activation Service**.
4. Select the check boxes for **Process Model**.
5. Click **Next** from the **Select Features** pane, and then click **Install** at the **Confirm Installations Selections** pane.

6. Click **Close** to leave the Add Role Services wizard.

IIS 7 component not installed_LonghornIIS7WindowsAuthNotInstalled

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2010 Setup or Microsoft Exchange Server 2007 Setup cannot install the Client Access Server (CAS) role or the Mailbox server role on a Microsoft Windows Server 2008-based computer or on a Windows Server 2008 R2-based computer because the required Internet Information Server (IIS) 7 components are not installed.

Exchange 2010 Setup and Exchange 2007 Setup require that the Windows Server 2008-based computer or the Windows Server 2008 R2-based computer on which you are installing the CAS role already has the following IIS 7 components installed.

Required IIS 7 Components for the CAS server role
Dynamic Content Compression
Static Content Compression
Basic Authentication
Windows Authentication
IIS 7 Digest Authentication
ASP.NET
Client Certificate Mapping

Directory Browsing
HTTP Errors
HTTP Logging
HTTP Redirection
Tracing
ISAPI Filters
Request Monitor
Static Content

Exchange 2010 Setup and Exchange 2007 Setup require that the Windows Server 2008-based computer or the Windows Server 2008 R2-based computer on which you are installing the Mailbox server role already has the following IIS 7 components installed.

Required IIS 7 Components for the Mailbox server role
Basic Authentication
Windows Authentication

To address this issue, follow the appropriate steps to install the required IIS 7 components on the destination computer, and then run Microsoft Exchange Setup again.

Install the IIS 7 Components for the CAS server role by using the Windows Server 2008 Server Manager

1. Click **Start**, click **Administrative Tools**, and then click **Server Manager**.
2. In the navigation pane, expand **Roles**, right-click **Web Server (IIS),** and then click **Add Role Services**.
3. In the **Select Role Services** pane, scroll down to **IIS**.
4. In the **Security** area, click to select the following check boxes:
   - **Basic Authentication**
   - **Digest Authentication**
   - **Windows Authentication**
5. In the **Performance** area, click to select the following check boxes:
   - **Static Compression**
   - **Dynamic Compression**
6. In the **Select Role Services** pane, click **Next**, and then click **Install** in the **Confirm Installations Selections** pane.

7. Click **Close** to exit the Add Role Services wizard.

Install the IIS 7 Components for the Mailbox server role by using the Windows Server 2008 Server Manager

1. Click **Start**, click **Administrative Tools**, and then click **Server Manager**.
2. In the navigation pane, expand **Roles**, right-click **Web Server (IIS),** and then click **Add Role Services**.
3. In the **Select Role Services** pane, scroll down to **IIS**.
4. In the **Security** area, click to select the following check boxes:
   - **Basic Authentication**
   - **Windows Authentication**
5. In the **Select Role Services** pane, click **Next**, and then click **Install** in the **Confirm Installations Selections** pane.
6. Click **Close** to exit the Add Role Services wizard.

IIS 7 .NET Extensibility component is required_LonghornIIS7NetExt

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2010 Setup cannot continue because the required Internet Information Server (IIS) 7 .NET Extensibility component is not installed on the target server.

Before Exchange 2010 can use Windows PowerShell Remoting, the IIS 7 .NET Extensibility component must be installed on the target server.

To address this error, use Server Manager to install the IIS 7 .NET Extensibility component on this server and then rerun Exchange 2010 setup.

Install the IIS 7 .NET Extensibility component in Windows Server 2008 or in Windows Server 2008 R2 by using the Server Manager tool

1. Click **Start**, click **Administrative Tools** and then **Server Manager**.
2. In the left navigation pane, expand **Roles**, and then right-click **Web Server (IIS)** and select **Add**

Role Services.

3. On the **Select Role Services** pane, scroll down to **Application Development**.
4. Select the check box under **.NET Extensibility**.
5. Click **Next** from the **Select Role Services** pane, and then click **Install** at the **Confirm Installations Selections** pane.
6. Click **Close** to exit the Add Role Services wizard.

Uninstall Unified Messaging Language Packs_AdditionalUMLangPackExists

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because the Unified Messaging server role upgrade failed.

Exchange setup requires that all Unified Messaging server role language packs, except the US English language pack, be uninstalled before the Unified Messaging server role upgrade can continue.

Unified Messaging (UM) language packs that are included with Exchange 2007 contain pre-recorded prompts, Text-to-Speech (TTS) conversion support for a given language.

Exchange 2007 UM language packs enable callers and Outlook Voice Access users to interact with the Unified Messaging system in multiple languages.

The existing non-US English language packs need to be uninstalled so that new language packs can be installed.

To resolve this issue, uninstall all Unified Messaging server role language packs, except the US English language pack, and then rerun Exchange 2007 setup.

For more information about uninstalling Unified Messaging server role language packs, see How to Remove a Unified Messaging Language Pack from a Unified Messaging Server in the Exchange 2007 product documentation.

Insufficient permissions to prepare Active Directory_ADUpdateRequired

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because the attempted domain preparation failed.

Exchange setup requires that the Active Directory directory service be modified for Exchange Server 2007 before domains in the Active Directory can be prepared.

The account being used to run the **setup /PrepareAD** command has insufficient permissions to execute this command even though it appears to belong to the Enterprise Admins group. The account may have expired.

To resolve this issue, verify that the logged-on user account is valid and belongs to the Enterprise Admins group, or log on with an account that has those permissions and rerun **setup /PrepareAD**.

For more information about how to perform the PrepareAD process, see "How to Prepare Active Directory and Domains" (http://go.microsoft.com/fwlink/?LinkId=78453).

For more information about Active Directory permissions that are needed with Microsoft Exchange, see "Working with Active Directory Permissions in Exchange Server" (http://go.microsoft.com/fwlink/?LinkId=47592).

Hub Transport role not detected in local site_BridgeheadRoleNotPresentInSite

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup displays this warning because an existing Hub Transport server role could not be detected in the local Active Directory® directory service site.

You have chosen to install the Mailbox Server role before an instance of the Hub Transport role is installed in the Active Directory site.

Exchange 2007 Hub Transport Services are deployed inside your organization's Active Directory. Hub Transport Services handle all mail flow inside the organization, applies organizational mail flow routing rules, and are responsible for delivering messages to a recipient's mailbox.

Users will be able to log on to their mailboxes, but mail cannot be sent or received from this mailbox server until a Hub Transport role is installed.

Insufficient permissions to remove all server roles_CannotUninstallDelegatedServer

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because the attempt to uninstall all server roles failed.

Exchange 2007 setup requires that the user who is logged on when uninstalling all server roles be a member of the Exchange Organization Administrators groups, or the Enterprise Admins group.

To resolve this issue, grant the logged-on user Exchange Organization Administrator permissions or enroll them in the Enterprise Admins group, or log on with an account that has those permissions and rerun Exchange 2007 setup.

For more information about Active Directory permissions needed with Microsoft Exchange, see "Working with Active Directory Permissions in Exchange Server" (http://go.microsoft.com/fwlink/?LinkId=47592).

Client Access role not detected in local site_ClientAccessRoleNotPresentInSite

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup displayed this warning because an existing Client Access role could not be detected in the local Active Directory® directory service site.

You have chosen to install the Mailbox Server role before an instance of the Client Access role is installed in the Active Directory site.

The Client Access server role accepts connections to your Exchange 2007 server from a variety of different clients. Software clients such as Microsoft Outlook Express and Eudora use POP3 or IMAP4 connections to communicate with the Exchange server. Hardware clients, such as mobile devices, use ActiveSync, POP3, or IMAP4 to communicate with the Exchange server.

If users access their Inbox by using any client other than Microsoft Office Outlook®, you must install the Client Access server role in your Exchange organization.

Users will be able to logon to their mailboxes with Outlook but will not be able to use Outlook Web Access or mobile devices against the same mailbox until a Client Access role is present in the local Active Directory site.

Only the Mailbox role can be installed on a cluster server_ClusSvcInstalledRoleBlock

Microsoft® Exchange Server 2007 setup cannot continue because its attempt to install a role other than the Mailbox Server role on this clustered server failed.

Microsoft Exchange does not support Exchange 2007 roles other than the Mailbox Server role on servers that have the Cluster service installed.

To address this issue, see "High Availability for Exchange 2007" in the Exchange Server 2007 Operations Guide (http://go.microsoft.com/fwlink/?LinkId=68190).

Setup cannot install Exchange to a read-only domain controller_ComputerRODC

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 Setup cannot continue the installation because the target computer is a Read-Only Domain Controller (RODC).

Read-Only Domain Controllers are a feature of Windows Server 2008 Active Directory. The RODC is a type of domain controller install option that can be installed in remote sites that may have lower levels of physical security.

Exchange Setup requires write access to the target install computer.

To resolve this issue, select a target install computer that is not designated as an RODC, and rerun Setup.

Domain Controller Override is set in the Registry_ConfigDCHostNameMismatch

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because its attempt to use the specified domain controller failed. A domain controller has been statically mapped in the registry.

Exchange 2007 setup requires that the domain controller specified in the setup command match the domain controller that has been statically mapped using a registry override.

To resolve this issue, run setup again, specifying the statically mapped domain controller for the **/DomainController:** <*FQDN of the statically mapped domain controller*> parameter.

For more information about DSAccess and directory services detection, see Microsoft Knowledge Base article 250570, "Directory Service Server Detection and DSAccess Usage" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=250570).

Insufficient permissions to prepare Active Directory_DomainPrepWithoutADUpdate

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because the attempted domain preparation failed.

Exchange setup requires that the Active Directory directory service be modified for Exchange Server 2007 before domains in the Active Directory can be prepared.

The account being used to run the **setup /PrepareAD** command has insufficient permissions to execute this command even though it appears to belong to the Enterprise Admins group. The account may have expired.

To resolve this issue, verify that the logged-on user account is valid and belongs to the Enterprise Admins group, or log on with an account that has those permissions and rerun **setup /PrepareAD**.

For more information about how to perform the PrepareAD process, see "How to Prepare Active Directory and Domains" (http://go.microsoft.com/fwlink/?LinkId=78453).

For more information about Active Directory permissions that are needed with Microsoft Exchange, see "Working with Active Directory Permissions in Exchange Server" (http://go.microsoft.com/fwlink/?LinkId=47592).

The local computer is already running

Exchange Server_ExchangeAlreadyInstalled

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because the local computer has previous Microsoft Exchange components installed.

Exchange 2007 setup requires that the local computer not have existing Microsoft Exchange components installed.

To resolve this issue, remove any Microsoft Exchange 2000 Server or Microsoft Exchange Server 2003 components, and then rerun Microsoft Exchange setup.

To remove Microsoft Exchange components

1. Click **Start**, point to **Settings**, and then click **Control Panel**.
2. Double-click **Add or Remove Programs**.
3. In the **Currently installed programs** list, click **Microsoft Exchange**, and then click **Change/ Remove**.
4. In Microsoft Exchange Installation Wizard, click **Next**.
5. In the Action list on the Component Selection page, click the down arrow next to each component that has been installed, and then click **Remove**.

Note:
Installed components have a check mark in the Action list. When you click **Remove**, the check mark is replaced by the word **Remove**.

6. Click **Next** two times.
7. Click **Finish**.

Older database files present_FirstSGFilesExist

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because it detected existing Microsoft Exchange database files in the target installation path.

Exchange 2007 setup requires that the target installation path be empty of Microsoft Exchange database files.

To resolve this issue, remove all existing files from target installation paths and then rerun setup.

To delete existing Exchange Server database files from the target installation path

1. In My Computer or Windows Explorer, locate the target install path.

Note:
By default, the database files are located in: <systemDrive>:\Program Files\Microsoft\Exchange Server\Mailbox\First Storage Group.

2. Right-click the files to be removed, and then select **Delete**.
3. At the **Confirm File Delete** dialog, click **Yes**.
4. Repeat steps 2 and 3 for all files in the target install paths.

One or more Active Directory Connector servers were found_ADCFound

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 and Exchange Server 2010 setup cannot continue because one or more Active Directory Connectors (ADC) have been found in the current Microsoft Exchange environment.

ADC replicates objects from Exchange Server version 5.5 to the Active Directory directory service in a mixed mode Microsoft Exchange environment and is not supported by Exchange 2007 or Exchange 2010.

Exchange 2007 or Exchange 2010 setup requires that all ADC components be removed.

To resolve this issue, remove all ADC components, and rerun Exchange 2007 or Exchange 2010 setup.

To remove Active Directory Connector components
1. To disable the ADC service on the server that is running the ADC service, right-click **My Computer** on the desktop, and then click **Manage**. 2. Expand the **Services and Applications** node, and then click the **Services** node. 3. In the right pane, right-click **Microsoft Active Directory Connector** and then click **Properties**. 4. Change the **Startup Type** to **Disabled**. The next time that the computer starts, the ADC service will not start. 5. Click **Apply**, and then click **OK**. 6. To uninstall the ADC service, use the Active Directory Installation Wizard on the Microsoft Exchange 2000 Server or Microsoft Exchange Server 2003 CD. Open the \ADC\I386 folder and double-click the Setup.exe program. Follow the prompts to **Remove All** ADC service components.
Important:
You must complete step 6 and **Remove All** ADC components to resolve this issue. It is insufficient to disable the ADC service.

For more information about ADC, see the following Microsoft Knowledge Base articles:

- 325300, "Support WebCast: Introduction to the Active Directory Connector" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=325300).
- 325221, "Support WebCast: Microsoft Advanced Active Directory Connector" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=325221).
- 312632, "How To Install and Configure the Active Directory Connector in Exchange 2000 Server" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=312632).

The schema master is not running Windows Server 2003 Service Pack 1 or later_DomainControllerIsOutOfSite

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because the domain controller assigned the Active Directory directory service schema master role, also known as flexible single master operations (FSMO), is not running Microsoft Windows Server 2003 Service Pack 1 (SP1) or a later version.

Exchange 2007 setup requires that the domain controller that serves as the schema FSMO run Windows Server 2003 SP1 or a later version.

The FSMO controls all updates and modifications to the Active Directory schema.

To resolve this issue, do one or more of the following:

- Upgrade the FSMO domain controller to Windows Server 2003 SP1 or a later version and rerun Microsoft Exchange setup.
- If there is a FSMO domain controller running Microsoft Windows Server 2003 Service Pack 1 (SP1) or a later version in the Exchange organization, run Exchange 2007 setup with the /domaincontroller parameter pointing to that FSMO domain controller:

[*/DomainController*, or */dc <FQDN of domain controller>*]

Use the */DomainController* parameter to specify the domain controller to use to read from and write to Active Directory during setup. You can use NetBIOS or the fully qualified domain name (FQDN) format.

To obtain the latest service pack for Windows Server 2003, see the "Windows Server TechCenter" (http://go.microsoft.com/fwlink/?LinkId=45315).

For more information about Exchange Server 2007 Setup parameters, see "How to Install Exchange 2007 in Unattended Mode" (http://go.microsoft.com/fwlink/?LinkId=86476) in the Exchange Server 2007 product documentation.

Domain preparation required_DomainPrepRequired

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because the attempt to install the server role failed.

Microsoft Exchange setup requires that the local domain be prepared for Exchange Server 2007 before certain server roles can be installed.

Preparation of the domain for Exchange Server 2007 consists of the following tasks:

- Setting permissions on the Domain container for the Exchange Servers, Exchange Organization Administrators, Authenticated Users, and Exchange Mailbox Administrators.
- Creating the Microsoft Exchange System Objects container if it does not exist, and setting permissions on this container for the Exchange Servers, Exchange Organization Administrators, and Authenticated Users.
- Creating a new domain global group in the current domain called Exchange Install Domain Servers.
- Adding the Exchange Install Domain Servers group to the Exchange Servers USG in the root domain.

To resolve this issue, run **setup /PrepareDomain** to prepare the local domain and retry the server role installation.

For more information about how to perform the PrepareDomain process, see "How to Prepare Active Directory and Domains" (http://go.microsoft.com/fwlink/?LinkId=78453).

The COM+ Event System Service must be started before setup can

continue_EventSystemStopped

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because its attempt to install the Client Access Server or Edge Transport server roles failed because the COM+ Event System service is not started on the target computer.

Exchange 2007 setup requires the computer that you are installing Microsoft Exchange to have the COM+ Event System service status set to **Started**.

The COM+ Event System service supports system event notification for COM+ components, which provide automatic distribution of events to subscribing COM components.

Both the Client Access Server and Edge Transport server roles have dependencies on COM+ components that subscribe to the COM+ Event System service.

To resolve this issue, verify that the COM+ Event System service status is set to **Started** on the local computer, and then rerun Microsoft Exchange setup.

To set the status of the COM+ Event System service to 'Started'

1. Right-click **My Computer**, and then click **Manage**.
2. Expand the **Services and Applications** node, and then click the **Services** node.
3. In the right pane, locate the **Com+ Event System**.
4. Right-click **Com+ Event System**, and then click **Properties**.
5. Set the **Startup Type** to **Automatic** and the **Service status** to **Started**.
6. Click **Apply**, and then click **OK**.

IIS is in 32-bit compatibility mode_IIS32BitMode

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because the Microsoft Internet Information Service (IIS) is running in 32-bit mode on this 64-bit computer.

Exchange 2007 requires that IIS be in full 64-bit mode when it runs on a 64-bit computer.

To resolve this issue, switch IIS to 64-bit mode, and then rerun Microsoft Exchange setup.

To switch IIS to 64-bit mode

1. Open a command prompt.
2. Type the following:
cscript c:\inetpub\adminscripts\adsutil.vbs SET /w3svc/AppPools/Enable32BitAppOnWin64 False
3. Press enter

Access control list (ACL) inheritance is blocked_InhBlockPublicFolderTree

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 or Exchange Server 2010 setup cannot continue because the required permissions have not been able to propagate.

Exchange setup requires that inheritance for permissions be enabled on the following Exchange objects:

- Exchange Organization object
- Exchange Administrative Group object

- Exchange Servers container object
- Exchange Address List object
- Exchange Public Folder object
- Exchange Public Folder tree object

Failure to enable inheritance for permissions on these objects may result in mail flow problems, store mounting issues, and other service outages.

To resolve this issue, make sure that the "Allow permissions to propagate to this object and child objects" setting is enabled for the object, and then rerun Exchange Server 2007 or Exchange 2010 setup.

To re-enable permissions inheritance for an Exchange configuration object using Exchange Server 2003 Exchange System Manager

1. Enable the **Security** tab for the object properties box of Exchange System Manager by setting a registry parameter.
   a. Start Registry Editor (Regedt32.exe).
   b. Locate the following key in the registry:

HKEY_CURRENT_USER\Software\Microsoft\Exchange\EXAdmin

   c. On the **Edit** menu, click **New**, and then add the following registry value:

Value Name: ShowSecurityPage

Data Type: REG_DWORD

Radix: Binary

Value: 1

   d. Quit Registry Editor.

Note:

By default, the **Security** tab is not enabled in the configuration object properties box.

2. Open Exchange System Manager, find the object in question, right-click the object and select **Properties**.
3. Select the **Security** tab and then click **Advanced**.
4. Select **Allow inheritable permissions from the parent to propagate to this object and all child objects** to re-enable permissions inheritance.
5. Restart Exchange Server.

Caution:

If you incorrectly modify the attributes of Active Directory objects when you use ADSI Edit, the LDP tool, or another LDAP version 3 client, you may cause serious problems. These problems may require that you reinstall Microsoft Windows Server™ 2003, Exchange Server, or both. Modify Active Directory object attributes at your own risk.

To re-enable permissions inheritance for an Exchange configuration object using ADSIEdit from Exchange Server 2007 or Exchange Server 2010
1. Install ADSI Edit. 2. Launch ADSI Edit. Click **Start**, click **Run**, type **adsiedit.msc** in the text box, and then click OK. 3. Navigate to the object in question, right-click the object and select **Properties**. 4. Select the **Security** tab and then click **Advanced**. 5. Select **Allow inheritable permissions from the parent to propagate to this object and all child objects** to re-enable permissions inheritance. 6. Select **Ok** twice to apply the change. 7. Wait for Active Directory replication to propagate the changes or force Active Directory replication by following the guidance in Microsoft Knowledge Base article 232072, "Initiating Replication Between Active Directory Direct Replication Partners" (http://go.microsoft.com/fwlink/?linkid=3052&kbid=232072).

Setup failure occurred while installing a server role_InstallWatermark

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because a previous setup failure occurred while installing a server role.

Exchange 2007 setup requires that a failed server role installation be successfully re-installed, or removed from the setup process, before any other setup task can continue.

To address this issue, either reinstall just the failed server role(s), or remove the server role(s).

To reinstall the failed server role from the command line

1. Open a Command Prompt window, and then navigate to the installation files.

2. Run the following command:

```
Setup /roles:<Failed Server Role>
```

Select from one or more of the following roles, in a comma-separated list:

ClientAccess (or CA, or C)

EdgeTransport (or ET, or E)

Note:
The Edge Transport server role cannot coexist on the same computer with any other server role.

Note:
You must deploy the Edge Transport server role in the perimeter network and outside the Active Directory forest.

HubTransport (or HT, or H)

Mailbox (or MB, or M)

UnifiedMessaging (or UM, or U)

ManagementTools (or MT, or T)

Note:
If you specify ManagementTools, you will install the Exchange Management Console, the Exchange cmdlets for the Exchange Management Shell, the Exchange Help file, the Exchange Best Practices Analyzer Tool, and the Exchange Troubleshooting Assistant. If you install any other server role, the management tools will be installed automatically.

For example, to add the Hub Transport server role to an existing Mailbox server, type the following: **%LocalExchangeInstallationDir%\bin\Setup.com /role:HubTransport /Mode:Install**

Note:
If any Exchange Server 2007 server role previously installed successfully, the Setup wizard will run in maintenance mode. If no Exchange 2007 server roles were previously successfully installed, the Setup wizard will start from where it stopped.

To use the Exchange Server 2007 Setup wizard in maintenance mode to reinstall the failed server role

1. Log on to the server for which you want to reinstall a server role.
2. Open Control Panel and then double-click **Add or Remove Programs**.
3. On the **Change or Remove Programs** page, select **Microsoft Exchange Server**, and then click **Change**.
4. In the Exchange Server 2007 Setup wizard, on the **Exchange Maintenance Mode** page, click **Next**.
5. On the **Server Role Selection** page, select the check boxes for the server roles that you want to install, and then click **Next**.

Note:
The Edge Transport server role cannot coexist on the same computer with any other server

role.

Note:
You must deploy the Edge Transport server role in the perimeter network and outside the Active Directory forest.

Note:
If you select Management Tools, you will install the Exchange Management Console, the Exchange cmdlets for the Exchange Management Shell, and the Exchange Help file. The management tools will be installed automatically if you install any other server role.

6. If you selected **Hub Transport Role**, and if you are installing Exchange 2007 in a forest that has an existing Exchange Server 2003 or Exchange 2000 Server organization, on the **Mail Flow Settings** page, select a bridgehead server in the existing organization that is a member of the Exchange 2003 or Exchange 2000 routing group to which you want to create a routing group connector.
7. On the **Readiness Checks** page, view the status to determine if the organization and server role prerequisite checks completed successfully. If they have completed successfully, click **Install** to install Exchange 2007.
8. On the **Completion** page, click **Finish**.

To use the Exchange Server 2007 Setup wizard to reinstall the failed server role when no other server role was previously successfully installed

1. Follow the guidance in "How to Perform a Custom Installation Using Exchange Server 2007 Setup" (http://go.microsoft.com/fwlink/?LinkId=86648) in the Exchange Server 2007 product documentation.

To remove the failed server role

1. Follow the guidance in "How to Remove Exchange 2007 Server Roles" (http://go.microsoft.com/fwlink/?LinkId=86649) in the Exchange Server 2007 product documentation.

For More Information

For more information about how to install Exchange 2007 in unattended mode, see "How to Install Exchange 2007 in Unattended Mode" (http://go.microsoft.com/fwlink/?LinkId=86476).

Setup failure occurred while uninstalling a server role_InterruptedUninstallNotContinued

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Exchange Server 2010 setup cannot continue because a previous setup failure occurred while uninstalling a server role.

Exchange 2010 setup requires that a failed server role uninstall be successfully uninstalled before any other setup task can continue.

To address this issue, uninstall the failed server role(s), and then rerun setup.

For more information about how to remove a server role, see the Exchange 2007 product documentation topic, "How to Remove Exchange 2007 Server Roles" (http://go.microsoft.com/fwlink/?linkid=86649).

Cannot determine the name of the Active Directory site_InvalidADSite

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because this server does not appear to belong to a valid Active Directory® directory service site.

Microsoft Exchange setup requires that the server that is used for installation of Exchange 2007 belong to a valid Active Directory site.

To resolve this issue, verify that the local server is a member of a valid Active Directory site and rerun Exchange Server 2007 setup.

You can use the **/DsGetSite** option of the Nltest.exe command line tool to verify and display site membership. For more information, see "Nltest.exe: NLTest Overview" in the "Tools and Settings Collection" of *Windows Server 2003 Technical Reference* (http://go.microsoft.com/fwlink/?LinkId=27734).

For more information about Active Directory troubleshooting, see “Troubleshooting Active Directory Operations” in *Windows Server 2003: Operations* (http://go.microsoft.com/fwlink/?linkid=68099).

The local computer is a domain controller of a child domain_LocalComputerIsDCInChildDomain

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because the local computer is a domain controller for a child domain.

Exchange 2007 setup will not install on to a domain controller for a child domain unless the domain controller is a global catalog server.

To resolve this issue, promote the domain controller to a global catalog server or install Exchange 2007 to a non-domain controller, a member server, in the child domain, and then rerun the Microsoft Exchange setup.

To correct this warning by making the Exchange server a global catalog server

1. On the domain controller, click **Start**, point to **Programs**, click **Administrative Tools**, and then click **Active Directory Sites and Services**.
2. In the console tree, double-click **Sites**, double-click the name of the site, and then double-click **Servers**.

3. Double-click the target domain controller.
4. In the results pane, right-click **NTDS Settings**, and then click **Properties**.
5. On the **General** tab, click to select the **Global catalog** check box.
6. Restart the domain controller.

Active Directory domain is mixed mode_LocalDomainModeMixed

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because an existing Active Directory domain is not set to Microsoft Windows®°2000 Server native mode or better.

Exchange 2007 setup will create Universal Security Groups that can only exist in Windows 2000 Server native mode, or better, domains.

To resolve this issue, follow these steps to raise the domain functional level to at least the Windows 2000 Server native level, and then rerun Exchange 2007 setup.

To raise the domain functional level

1. Open Active Directory Domains and Trusts.
2. In the console tree, right-click the domain for which you want to raise functionality, and then click **Raise Domain Functional Level**.
3. In **Select an available domain functional level**, use one of the following procedures:
   - To raise the domain functional level to Windows 2000 Server native, click **Windows 2000 native**, and then click **Raise**.
   - To raise domain functional level to Windows Server® 2003, click **Windows Server 2003**, and then click **Raise.**

Caution:

If you have or will have any domain controllers running Windows NT® 4.0 and earlier, do not raise the domain functional level to Windows 2000 Server native. After the domain functional level is set to Windows 2000 Server native, it cannot be changed back to Windows 2000 Server mixed.

If you have or will have any domain controllers running Windows NT 4.0 and earlier or Windows 2000 Server, do not raise the domain functional level to Windows Server 2003. After the domain functional level is set to Windows Server 2003, it cannot be changed back to Windows 2000 Server mixed or Windows 2000 Server native.

Microsoft Exchange Server 2007 setup cannot continue because the logged on user does not have the account permissions that are required for domain preparation.

Exchange setup requires that the user who is logged on when **Setup /PrepareDomain** is run be a member of the Domain Administrators and Exchange Organization Administrators groups, or the Enterprise Admins group.

To resolve this issue, grant the logged on user Domain Admins and Exchange Organization Administrator permissions, enroll them in the Enterprise Admins group, or log on with an account that has those permissions and rerun Exchange 2007 setup.

For more information about Active Directory permissions that are needed with Microsoft Exchange, see "Working with Active Directory Permissions in Exchange Server" (http://go.microsoft.com/fwlink/?LinkId=47592).

IIS 6 Compatibility components not installed_LonghornIIS6MetabaseNotInstalled

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 Setup cannot continue its attempt to install the Client Access Server server role, the Mailbox server role, or the Exchange 2007 Administrative Tools on the following Windows operating systems:

- Windows Server 2008 R2
- Windows Server 2008
- Windows 7 (Administrative Tools only)
- Windows Vista (Administrative Tools only)

This problem occurs because the Internet Information Server (IIS) 6 Metabase Compatibility component and the IIS 6 Management Console component are not installed.

Exchange 2007 setup requires that the computer on which you are installing the Exchange 2007 Client Access server role, the Mailbox server role, or the Exchange 2007 Administrative Tools has the IIS 6 Metabase Compatibility component and the IIS 6 Management Console component installed.

To resolve this problem, install the IIS 6 Metabase Compatibility component on the destination computer, and then rerun Microsoft Exchange Setup.

Install the IIS 6.0 Management Compatibility Components in Windows Server 2008 R2 or in Windows Server by using the Server Manager tool

1. Click **Start**, click **Administrative Tools**, and then click **Server Manager**.
2. In the navigation pane, expand **Roles**, right-click **Web Server (IIS)**, and then click **Add Role Services**.
3. In the **Select Role Services** pane, scroll down to **IIS 6 Management Compatibility**.
4. Click to select the **IIS 6 Metabase Compatibility**, **IIS 6 WMI Compatibility**, and **IIS 6 Management Console** check boxes.
5. In the **Select Role Services** pane, click **Next**.
6. In the **Confirm Installations Selections** pane, click **Install**.
7. Click **Close** to exit the Add Role Services wizard.

Install the IIS 6.0 Management Compatibility Components in Windows 7 or in Windows Vista from Control Panel

1. Click **Start**, click **Control Panel**, click **Programs and Features**, and then click **Turn Windows features on or off**.

2. Open **Internet Information Services**.
3. Open **Web Management Tools**.
4. Open **IIS 6.0 Management Compatibility**.
5. Click to select the **IIS 6 Metabase and IIS 6 configuration compatibility**, **IIS 6 WMI Compatibility**, and **IIS 6 Management Console** check boxes.
6. Click **OK**.

The World Wide Web Publishing Service is disabled or missing_W3SVCDisabledOrNotInstalled

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft® Exchange Server 2007 setup cannot continue because its attempt to install the Mailbox Server or Client Access role found that the World Wide Web Publishing Service is either disabled or not installed on this computer.

Exchange 2007 setup requires the computer that you are installing Microsoft Exchange to have the World Wide Web Publishing Service installed and set to something other than disabled.

To resolve this issue, verify that the World Wide Web Publishing service is installed and not disabled on the local computer, and then rerun Microsoft Exchange setup.

To verify that the World Wide Web Publishing Service is installed and not disabled

1. Right-click **My Computer** on the desktop, and then click **Manage**.
2. Expand the **Services and Applications** node, and then click the **Services** node.
3. In the right pane, locate the **World Wide Web Publishing Service**.

If the **World Wide Web Publishing Service** is not displayed in the list of services installed, follow the steps in the procedure below to install it.

4. If the **World Wide Web Publishing Service** is displayed but has a status other than **Started**, continue with the steps below to start it.
5. Right-click **World Wide Web Publishing Service**, and then click **Properties**.
6. Verify the **Startup Type** is **Automatic** and the **Service status** is set to **Started**.
7. Click **Apply**, and then click **OK**.

To install the World Wide Web Publishing Service

1. On the **Start** menu, select **Settings**, **Control Panel**, and then click **Add or Remove Programs**
2. Click **Add/Remove Windows Components**.
3. In the **Components** list, select the **Application Server** check box, and then click **Details**.
4. Select **Internet Information Services Manager**, and then click **Details**.
5. Select **World Wide Web Service**, and then select the check box.
6. Click **OK** two times to return to the **Components** list, and then click **Next**.
7. Click **Finish** when the IIS service is installed.

OAB server has been

deleted_OffLineABServerDeleted

Planning and deployment > Deployment reference > Exchange 2013 readiness checks >

Applies to: *Exchange Server*

Topic Last Modified: *2012-06-05*

The content in this topic hasn't been updated for Microsoft Exchange Server 2013. While it hasn't been updated yet, it may still be applicable to Exchange 2013. If you still need help, check out the community resources below.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Microsoft Exchange Server 2007 setup cannot continue because its attempt to install the Client Access server role failed. The Exchange Mailbox server designated to host the Offline Address Book (OAB) has been deleted.

Exchange 2007 setup requires that there be a valid Exchange Mailbox server hosting OAB generation for the Client Access server role installation to continue.

To address this issue, designate a valid Exchange Mailbox server as OAB generation host, and then rerun Exchange 2007 setup.

For information about how to designate an Exchange server to be the host for Offline Address Book generation, see "How to Create an Offline Address Book" (http://go.microsoft.com/fwlink/?LinkId=86314) in the Exchange 2007 product documentation.

Multi-tenancy in Exchange 2013

Exchange Server 2013 > Planning and deployment >

Applies to: *Exchange Server 2013, Exchange Server, Exchange Online*

Topic Last Modified: *2012-12-10*

A multi-tenant (hosted) Exchange 2013 deployment is defined as one where the Exchange organization is configured to host multiple and discrete organizations or business units (the tenants) that ordinarily don’t share email, data, users, global address lists (GALs), or other commonly used Exchange objects. This sharing of hardware, software and resources (all while maintaining a logical separation between tenants), allows organizations to leverage the simplicity of a standard Exchange deployment while providing multi-tenant functionality and services to meet their hosting needs.

Multi-tenancy in Exchange 2013 organizations

In Exchange 2013, we continue to support hosting by using a standard, on-premises Exchange installation similar to the approach used in Exchange 2010 Service Pack 2 (SP2). We discontinued the `/hosting` mode switch and are emphasizing the use of address book policies (ABPs) in combination with hosting management solutions and automation tools provided by approved Independent Software Vendors (ISVs). These solutions are built on a framework of Microsoft-approved configuration guidelines and practices and will offer Exchange organizations an easier, more robust way to provide hosting services and features.

Exchange 2013 supports multi-tenancy by leveraging the following primary components and features:

- **Active Directory** Instead of having separate *ExchangeOrganization* Active Directory containers for each business unit in a multi-tenant Exchange organization, Exchange 2013 multi-tenancy is supported by using a single *ExchangeOrganization* Active Directory container. This allows for a simpler Active Directory structure and reduces the likelihood of Active Directory-related permission problems.

To learn more about Active Directory changes in Exchange 2013, see Active Directory.

- **Address book policies (ABPs)** Introduced in Exchange 2010 SP2, ABPs are used in Exchange 2013 to control user access to an address list, the global address list (GAL), and an offline address books (OABs) in the Exchange organization. ABPs group these different Active Directory objects into a single, virtual object that can be assigned to individual users and to create a logical grouping of these resources along a multi-tenant organizational structure. ABP functionality in Exchange 2013 is similar to what it was in Exchange 2010 SP2.

To learn more about ABPs in Exchange 2013, see Address book policies.

- **Hosting management solutions** Some administrators using Exchange 2013 to provide a hosted Exchange solution will benefit from using a customized hosting management approach. Due to some limitations of the Exchange Administration Center (EAC), Microsoft works with third-party vendors to assist them in the development of control panel and automation solutions that are in compliance with the guidelines and approved framework for hosted Exchange 2013 organizations. We recommend that organizations configuring a hosted Exchange solution leverage these tools to manage their hosted organizations where circumstances require it.

To learn more about hosted management solutions, including validated solution vendors, see Exchange Server 2013 hosting and multi-tenancy solutions and guidance

Permissions

Exchange Server 2013 >

Applies to: *Exchange Server*

Topic Last Modified: *2013-05-17*

Microsoft Exchange Server 2013 includes a large set of predefined permissions, based on the Role Based Access Control (RBAC) permissions model, which you can use right away to easily grant permissions to your administrators and users. You can use the permissions features in Exchange 2013 so that you can get your new organization up and running quickly.

Note:

Several RBAC features and concepts aren't discussed in this topic because they're advanced features. If the functionality discussed in this topic doesn't meet your needs, and you want to further customize your permissions model, see Understanding Role Based Access Control.

Looking for a list of all permissions topics? See Permissions documentation.

Contents

Role-based permissions

In Exchange 2013, the permissions that you grant to administrators and users are based on management roles. A role defines the set of tasks that an administrator or user can perform. For example, a management role called `Mail Recipients` defines the tasks that someone can perform on a set of mailboxes, contacts, and distribution groups. When a role is assigned to an administrator or user, that person is granted the permissions provided by the role.

There are two types of roles, administrative roles and end-user roles:

- **Administrative roles** These roles contain permissions that can be assigned to administrators or specialist users using role groups that manage a part of the Exchange organization, such as recipients, servers, or databases.
- **End-user roles** These roles, assigned using role assignment policies, enable users to manage aspects of their own mailbox and distribution groups that they own. End-user roles begin with the prefix `My`.

Roles give permissions to perform tasks to administrators and users by making cmdlets available to those who are assigned the roles. Because the Exchange Administration Center (EAC) and Exchange Management Shell use cmdlets to manage Exchange, granting access to a cmdlet gives the administrator or user permission to perform the task in each of the Exchange management interfaces.

Exchange 2013 includes approximately 86 roles that you can use to grant permissions. For a list of roles included with Exchange 2013, see Built-in management roles.

Return to top

Role groups and role assignment policies

Roles grant permissions to perform tasks in Exchange 2013, but you need an easy way to assign them to administrators and users. Exchange 2013 provides you with the following to help you do that:

- **Role groups** Role groups enable you to grant permissions to administrators and specialist users.
- **Role assignment policies** Role assignment policies enable you to grant permissions to end users to change settings on their own mailbox or distribution groups that they own.

For more information about role groups and role assignment policies, see the following sections.

Role groups

Every administrator that manages Exchange 2013 must be assigned at least one or more roles. Administrators might have more than one role because they may perform job functions that span multiple areas in Exchange. For example, one administrator might manage both recipients and Exchange servers. In this case, that administrator might be assigned both the `Mail Recipients` and `Exchange Servers` roles.

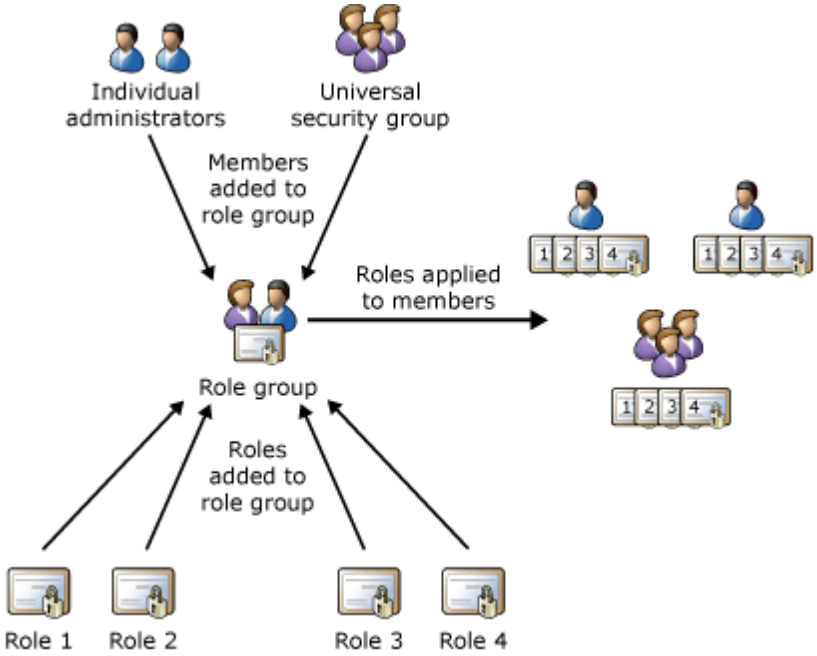
To make it easier to assign multiple roles to an administrator, Exchange 2013 includes role groups. Role groups are special universal security groups (USGs) used by Exchange 2013 that can contain Active Directory users, USGs, and other role groups. When a role is assigned to a role group, the permissions granted by the role are granted to all the members of the role group. This enables you to assign many roles to many role group members at once. Role groups typically encompass broader management areas, such as recipient management. They're used only with administrative roles, and not end-user roles.

Note:

It's possible to assign a role directly to a user or USG without using a role group. However, that method of role assignment is an advanced procedure and isn't covered in this topic. We recommend that you use role groups to manage permissions.

The following figure shows the relationship between users, role groups, and roles.

Roles, role groups, and role group members



Exchange 2013 includes several built-in role groups, each one providing permissions to manage specific areas in Exchange 2013. Some role groups may overlap with others. The following table lists each role group with a description of its use. If you want to see the roles assigned to each role group, click the name of the role group in the "Role group" column, and then open the "Management Roles Assigned to This Role Group" section.

Built-in role groups

Role group	Description
Organization Management	Administrators who are members of the Organization Management role group have administrative access to the entire Exchange 2013 organization and can perform almost any task against any Exchange 2013 object, with some exceptions, such as the `Discovery Management` role. **Important:** Because the Organization Management role group is a powerful role, only users or USGs that perform organizational-level administrative tasks that can potentially impact the entire Exchange organization should be members of this role group.
View-only Organization Management	Administrators who are members of the View Only Organization Management role group can view the properties of any object in the

	Exchange organization.
Recipient Management	Administrators who are members of the Recipient Management role group have administrative access to create or modify Exchange 2013 recipients within the Exchange 2013 organization.
UM Management	Administrators who are members of the UM Management role group can manage features in the Exchange organization such as Unified Messaging (UM) service configuration, UM properties on mailboxes, UM prompts, and UM auto attendant configuration.
Help Desk	The Help Desk role group, by default, enables members to view and modify the Microsoft Office Outlook Web App options of any user in the organization. These options might include modifying the user's display name, address, and phone number. They don't include options that aren't available in Outlook Web App options, such as modifying the size of a mailbox or configuring the mailbox database on which a mailbox is located.
Hygiene Management	Administrators who are members of the Hygiene Management role group can configure the antivirus and anti-spam features of Exchange 2013. Third-party programs that integrate with Exchange 2013 can add service accounts to this role group to grant those programs access to the cmdlets required to retrieve and configure the Exchange configuration.

Records Management	Users who are members of the Records Management role group can configure compliance features, such as retention policy tags, message classifications, and transport rules.
Discovery Management	Administrators or users who are members of the Discovery Management role group can perform searches of mailboxes in the Exchange organization for data that meets specific criteria and can also configure legal holds on mailboxes.
Public Folder Management	Administrators who are members of the Public Folder Management role group can manage public folders on servers running Exchange 2013.
Server Management	Administrators who are members of the Server Management role group can configure server-specific configuration of transport, Unified Messaging, client access, and mailbox features such as database copies, certificates, transport queues and Send connectors, virtual directories, and client access protocols.
Delegated Setup	Administrators who are members of the Delegated Setup role group can deploy servers running Exchange 2013 that have been previously provisioned by a member of the Organization Management role group.
Compliance Management	Users who are members of the Compliance Management role group can configure and manage Exchange compliance settings in

	accordance with their organization's policy.

If you work in a small organization that has only a few administrators, you might need to add those administrators to the Organization Management role group only, and you may never need to use the other role groups. If you work in a larger organization, you might have administrators who perform specific tasks administering Exchange, such as recipient or server management. In those cases, you might add one administrator to the Recipient Management role group, and another administrator to the Server Management role group. Those administrators can then manage their specific areas of Exchange 2013 but won't have permissions to manage areas they're not responsible for.

If the built-in role groups in Exchange 2013 don't match the job function of your administrators, you can create role groups and add roles to them. For more information, see Work with Role Groups later in this topic.

Return to top

Role assignment policies

Exchange 2013 provides role assignment policies so that you can control what settings your users can configure on their own mailboxes and on distribution groups they own. These settings include their display name, contact information, voice mail settings, and distribution group membership.

Your Exchange 2013 organization can have multiple role assignment policies that provide different levels of permissions for the different types of users in your organizations. Some users can be allowed to change their address or create distribution groups, while others can't, depending on the role assignment policy associated with their mailbox. Role assignment policies are added directly to mailboxes, and each mailbox can only be associated with one role assignment policy at a time.

Of the role assignment policies in your organization, one is marked as default. The default role assignment policy is associated with new mailboxes that aren't explicitly assigned a specific role assignment policy when they're created. The default role assignment policy should contain the permissions that should be applied to the majority of your mailboxes.

Permissions are added to role assignment policies using end-user roles. End-user roles begin with `My` and grant permissions for users to manage only their mailbox or distribution groups they own. They can't be used to manage any other mailbox. Only end-user roles can be assigned to role assignment policies.

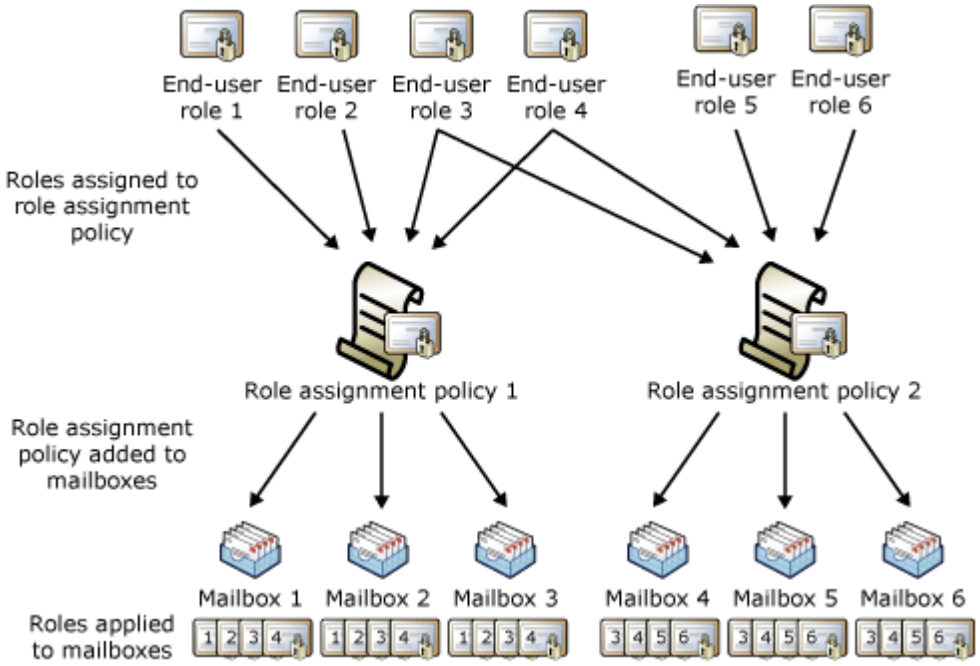
When an end-user role is assigned to a role assignment policy, all of the mailboxes associated with that role assignment policy receive the permissions granted by the role. This enables you to add or remove permissions to sets of users without having to configure individual mailboxes. The following figure shows:

- End-user roles are assigned to role assignment policies. Role assignment policies can share the same end-user roles.
- Role assignment policies are associated with mailboxes. Each mailbox can only be associated

with one role assignment policy.

- After a mailbox is associated with a role assignment policy, the end-user roles are applied to that mailbox. The permissions granted by the roles are granted to the user of the mailbox.

Roles, role assignment policies, and mailboxes

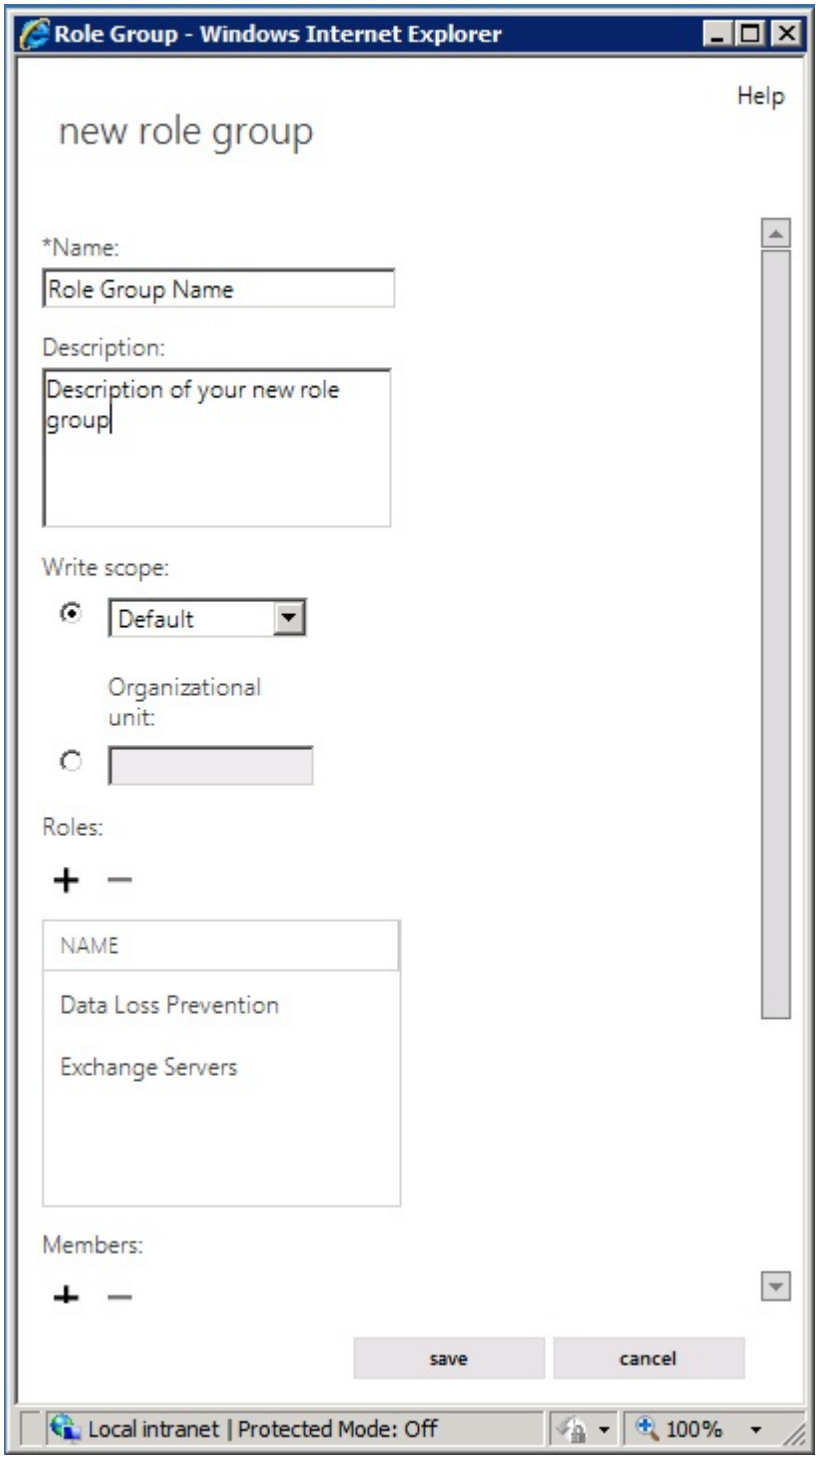


The Default Role Assignment Policy role assignment policy is included with Exchange 2013. As the name implies, it's the default role assignment policy. If you want to change the permissions provided by this role assignment policy, or if you want to create role assignment policies, see Work with Role Assignment Policies later in this topic.

Work with role groups

To manage your permissions using role groups in Exchange 2013, we recommend that you use the Exchange Administration Center. When you use the EAC to manage role groups, you can add and remove roles and members, create role groups, and copy role groups with a few clicks of your mouse. The EAC provides simple dialog boxes, such as the **new role group** dialog box, shown in the following figure, to perform these tasks.

New role group dialog box in the EAC



Exchange 2013 includes several role groups that separate permissions into specific administrative areas. If these existing role groups provide the permissions your administrators need to manage your Exchange 2013 organization, you need only add your administrators as members of the appropriate role groups. After you add administrators to a role group, they can administer the features that relate to that role group. To add or remove members to or from a role group, open the role group in the EAC, and then add or remove members from the membership list. For a list of built-in role groups, see Built-in role groups.

Important:
If an administrator is a member of more than one role group, Exchange 2013 grants the administrator all of the permissions provided by the role groups he or she is a member of.

If none of the role groups included with Exchange 2013 have the permissions you need, you can use

the EAC to create a role group and add the roles that have the permissions you need. For your new role group, you will:

1. Choose a name for your role group.
2. Select the roles you want to add to the role group.
3. Add members to the role group.
4. Save the role group.

After you create the role group, you manage it like any other role group.

If there's an existing role group that has some, but not all of the permissions you need, you can copy it and then make changes to create a role group. You can copy an existing role group and make changes to it, without affecting the original role group. As part of copying the role group, you can add a new name and description, add and remove roles to and from the new role group, and add new members. When you create or copy a role group, you use the same dialog box that's shown in the preceding figure.

Existing role groups can also be modified. You can add and remove roles from existing role groups, and add and remove members from it at the same time, using an EAC dialog box similar to the one in the preceding figure. By adding and removing roles to and from role groups, you turn on and off administrative features for members of that role group. For a list of roles you can add to a role group, see Built-in management roles.

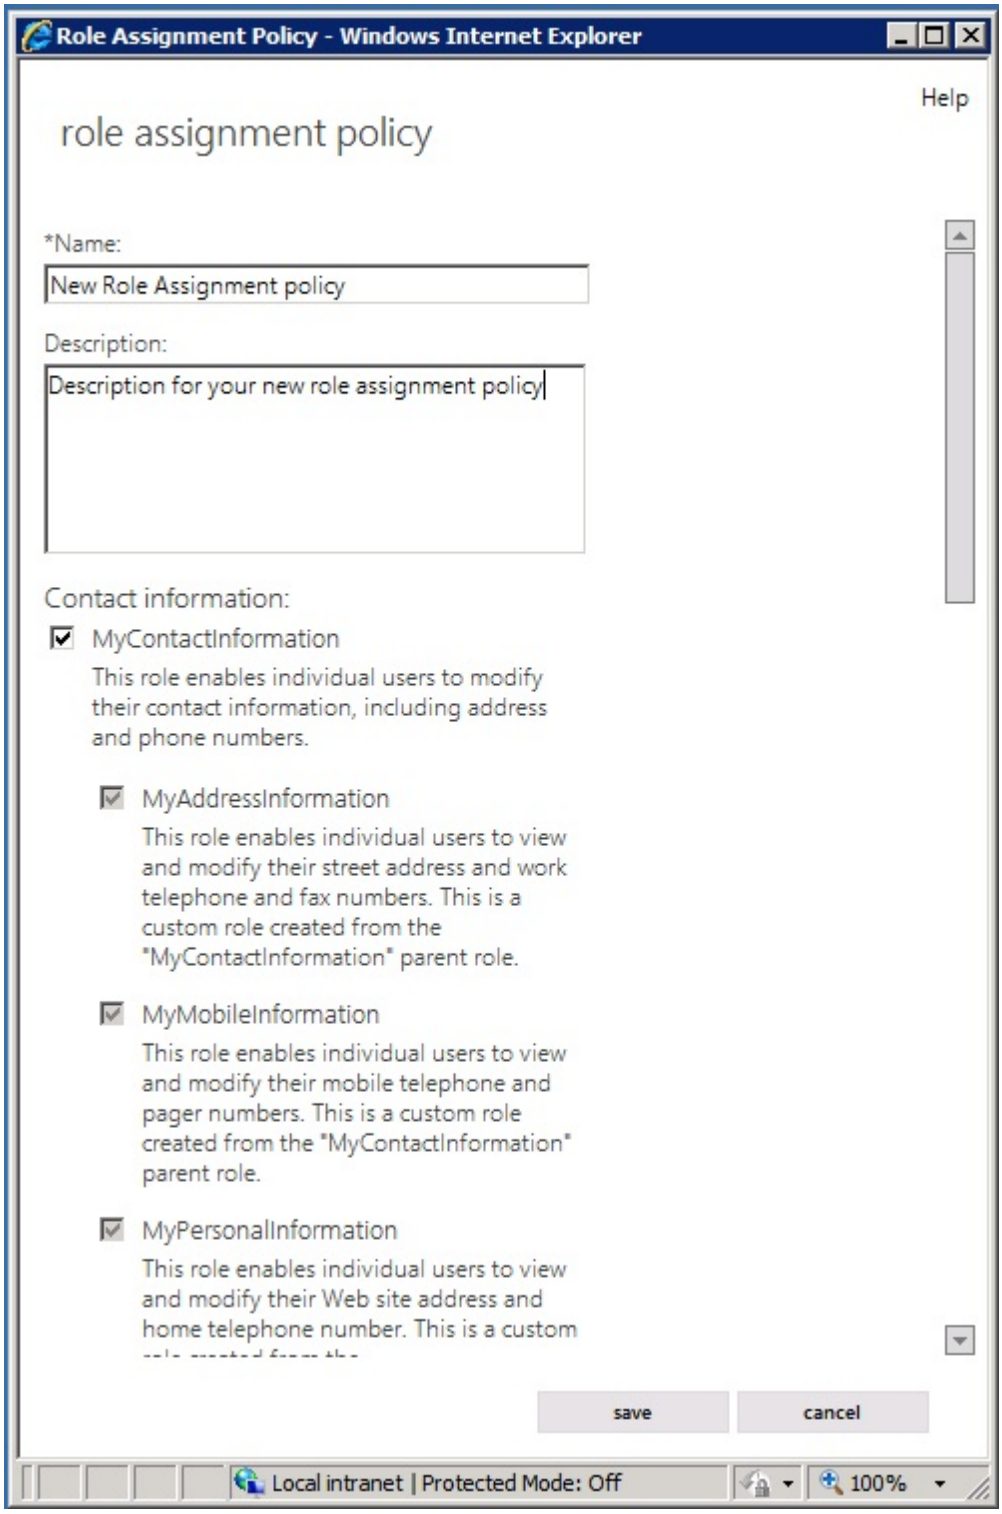
Note:
Although you can change which roles are assigned to built-in role groups, we recommend that you copy built-in role groups, modify the role group copy, and then add members to the role group copy.

Return to top

Work with role assignment policies

To manage the permissions that you grant end users to manage their own mailbox in Exchange 2013, we recommend that you use the EAC. When you use the EAC to manage end-user permissions, you can add roles, remove roles, and create role assignment policies with a few clicks of your mouse. The EAC provides simple dialog boxes, such as the **role assignment policy** dialog box, shown in the following figure, to perform these tasks.

Role assignment policy dialog box in the EAC



Exchange 2013 includes a role assignment policy named Default Role Assignment Policy. This role assignment policy enables users whose mailboxes are associated with it to do the following:

- Join or leave distribution groups that allow members to manage their own membership.
- View and modify basic mailbox settings on their own mailbox, such as Inbox rules, spelling behavior, junk mail settings, and Microsoft ActiveSync devices.
- Modify their contact information, such as work address and phone number, mobile phone number, and pager number.
- Create, modify, or view text message settings.
- View or modify voice mail settings.
- View and modify their marketplace apps.
- Create team mailboxes and connect them to Microsoft SharePoint lists.

If you want to add or remove permissions from the Default Role Assignment Policy or any other role assignment policy, you can use the EAC. The dialog box you use is similar to the one in the preceding figure. When you open the role assignment policy in the EAC, select the check box next to the roles you want to assign to it or clear the check box next to the roles you want to remove. The change you make to the role assignment policy is applied to every mailbox associated with it.

If you want to assign different end-user permissions to the various types of users in your organization, you can create role assignment policies. When you create a role assignment policy, you see a dialog box similar to the one in the preceding figure. You can specify a new name for the role assignment policy, and then select the roles you want to assign to the role assignment policy. After you create a role assignment policy, you can associate it with mailboxes using the EAC.

If you want to change which role assignment policy is the default, you must use the Shell. When you change the default role assignment policy, any mailboxes that are created will be associated with the new default role assignment policy if one wasn't explicitly specified. The role assignment policy associated with existing mailboxes doesn't change when you select a new default role assignment policy.

Note:

If you select a check box for a role that has child roles, the check boxes for the child roles are also selected. If you clear the check box for a role with child roles, the check boxes for the child roles are also cleared.
For detailed steps about how to create role assignment policies or make changes to existing role assignment policies, see the following topics:

- Manage role assignment policies
- Change the assignment policy on a mailbox

Return to top

Permissions documentation

The following table contains links to topics that will help you learn about and manage permissions in Exchange 2013.

Topic	Description
Understanding Role Based Access Control	Learn about each of the components that make up RBAC and how you can create advanced permissions models if role groups and management roles aren’t enough.
Understanding multiple-forest permissions	Learn about implementing RBAC permissions in organizations with account and resource forests.

Understanding split permissions	Learn about splitting Exchange and security principal management using RBAC and Active Directory split permissions.
Understanding permissions coexistence with Exchange 2007 and Exchange 2010	Configure permissions to enable administration of Exchange 2013 in existing Exchange 2007 and Exchange 2010 organizations.
Manage role groups	Configure permissions for Exchange administrators and specialist users using role groups.
Manage role group members	Add members to and from role groups. By adding and removing members to and from role groups, you configure who's able to administer Exchange features.
Manage linked role groups	Configure permissions for Exchange administrators and specialist users in multi-forest Exchange deployments.
Manage role assignment policies	Configure which features end-users have access to on their mailboxes using role assignment policies.
Change the assignment policy on a mailbox	Configure which role assignment policy is applied to one or more mailboxes.
Create linked role groups that mirror built-in role groups	Re-create the built-in role groups as linked role groups in multi-forest Exchange deployments.
View effective permissions	View who has permissions to administer Exchange features.
Feature permissions	Learn more about the permissions required to manage Exchange features and services.

Advanced permissions	Use advanced RBAC features to create highly customized permission models to fit the needs of any organization.

Understanding Role Based Access Control

Exchange Server 2013 > Permissions >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-05*

Role Based Access Control (RBAC) is the permissions model used in Microsoft Exchange Server 2013. With RBAC, you don't need to modify and manage access control lists (ACLs), which was done in Exchange Server 2007. ACLs created several challenges in Exchange 2007, such as modifying ACLs without causing unintended consequences, maintaining ACL modifications through upgrades, and troubleshooting problems that occurred due to using ACLs in a nonstandard way.

RBAC enables you to control, at both broad and granular levels, what administrators and end-users can do. RBAC also enables you to more closely align the roles you assign users and administrators to the actual roles they hold within your organization. In Exchange 2007, the server permissions model applied only to the administrators who managed the Exchange 2007 infrastructure. In Exchange 2013, RBAC now controls both the administrative tasks that can be performed and the extent to which users can now administer their own mailbox and distribution groups.

RBAC has two primary ways of assigning permissions to users in your organization, depending on whether the user is an administrator or specialist user, or an end-user: management role groups and management role assignment policies. Each method associates users with the permissions they need to perform their jobs. A third, more advanced method, direct user role assignment, can also be used. The following sections in this topic explain RBAC and provide examples of its use.

Note:

This topic focuses on advanced RBAC functionality. If you want to manage basic Exchange 2013 permissions, such as using the Exchange admin center (EAC) to add and remove members to and from role groups, create and modify role groups, or create and modify role assignment policies, see Permissions.

Contents

Management role groups

Management role groups associate management roles to a group of administrators or specialist users. Administrators manage a broad Exchange organization or recipient configuration. Specialist users manage the specific features of Exchange, such as compliance. Or they may have limited management abilities, such as Help desk members, but aren't given broad administrative rights. Role groups typically associate administrative management roles that enable administrators and specialist users to manage the configuration of their organization and recipients. For example, whether administrators can manage recipients or use mailbox discovery features is controlled using role groups.

Adding or removing users to or from role groups is how you most often assign permissions to administrators or specialist users. For more information, see Understanding management role groups.

Role groups consist of the following components that define what administrators and specialist users can do:

- **Management role group** The *management role group* is a special universal security group (USG) that contains mailboxes, users, USGs, and other role groups that are members of the role group. This is where you add and remove members, and it's also what management roles are assigned to. The combination of all the roles on a role group defines everything that users added to a role group can manage in the Exchange organization.
- **Management role** A *management role* is a container for a grouping of management role entries. Roles are used to define the specific tasks that can be performed by the members of a role group that's assigned the role. A *management role entry* is a cmdlet, script, or special permission that enables each specific task in a role to be performed. For more information, see Understanding management roles.
- **Management role assignment** A *management role assignment* links a role and a role group. Assigning a role to a role group grants members of the role group the ability to use the cmdlets and parameters defined in the role. Role assignments can use management scopes to control where the assignment can be used. For more information, see Understanding management role assignments.
- **Management role scope** A *management role scope* is the scope of influence or impact on a role assignment. When a role is assigned with a scope to a role group, the management scope targets specifically what objects that assignment is allowed to manage. The assignment, and its scope, are then given to the members of the role group, and restrict what those members can manage. A scope can consist of a list of servers or databases, organizational units (OUs), or filters on server, database or recipient objects. For more information, see Understanding management role

scopes.

When you add a user to a role group, the user is given all of the roles assigned to the role group. If scopes are applied to any of the role assignments between the role group and the roles, those scopes control what server configuration or recipients the user can manage.

If you want to change what roles are assigned to role groups, you need to change the role assignments that link the role groups to roles. Unless the assignments built into Exchange 2013 don't suit your needs, you won't have to change these assignments. For more information, see Understanding management role assignments.

For more information about role groups, see Understanding management role groups.

Management role assignment policies

Management role assignment policies associate end-user management roles to users. Role assignment policies consist of roles that control what a user can do with his or her mailbox or distribution groups. These roles don't allow management of features that aren't directly associated with the user. When you create a role assignment policy, you define everything a user can do with his or her mailbox. For example, a role assignment policy may allow a user to set the display name, set up voice mail, and configure Inbox rules. Another role assignment policy might allow a user to change the address, use text messaging, and set up distribution groups. Every user with an Exchange 2013 mailbox, including administrators, is given a role assignment policy by default. You can decide which role assignment policy should be assigned by default, choose what the default role assignment policy should include, override the default for certain mailboxes, or not assign role assignment policies by default at all.

Assigning a user to an assignment policy is how you most often manage permissions for users to manage their own mailbox and distribution group options. For more information, see Understanding management role assignment policies.

Role assignment policies consist of the following components that define what users can do with their own mailboxes. Notice that some of the same components also apply to role groups. When used with role assignment policies, these components are limited to enable users to manage only their own mailbox:

- **Management role assignment policy** The *management role assignment policy* is a special object in Exchange 2013. Users are associated with the role assignment policy when their mailboxes are created or if you change the role assignment policy on a mailbox. This is also what you assign end-user management roles to. The combination of all the roles on a role assignment policy defines everything that the user can manage on his or her mailbox or distribution groups.
- **Management role** A *management role* is a container for a grouping of management role entries. Roles are used to define the specific tasks that a user can do with his or her mailbox or distribution groups. A *management role entry* is a cmdlet, script or special permission that enables each specific task in a management role to be performed. You can only use end-user roles with role assignment policies. For more information, see Understanding management roles.

- **Management role assignment** A *management role assignment* is the link between a role and a role assignment policy. Assigning a role to a role assignment policy grants the ability to use the cmdlets and parameters defined in the role. When you create a role assignment between a role assignment policy and a role, you can't specify any scope. The scope applied by the assignment is either `Self` or `MyGAL`. All role assignments are scoped to the user's mailbox or distribution groups. For more information, see Understanding management role assignments.

If you want to change what roles are assigned to role assignment policies, you need to change the role assignments that link the role assignment policies to roles. Unless the assignments built into Exchange 2013 don't suit your needs, you won't have to change these assignments. For more information, see Understanding management role assignments.

For more information, see Understanding management role assignment policies.

Direct user role assignment

Direct role assignment is an advanced method for assigning management roles directly to a user or USG without using a role group or role assignment policy. Direct role assignments can be useful when you need to provide a granular set of permissions to a specific user and no others. However, using direct role assignments can significantly increase the complexity of your permissions model. If a user changes jobs or leaves the company, you need to manually remove the assignments and add them to the new employee. We recommend that you use role groups to assign permissions to administrators and specialist users, and role assignment policies to assign permissions to users.

For more information about direct user assignment, see Understanding management role assignments.

Summary and examples

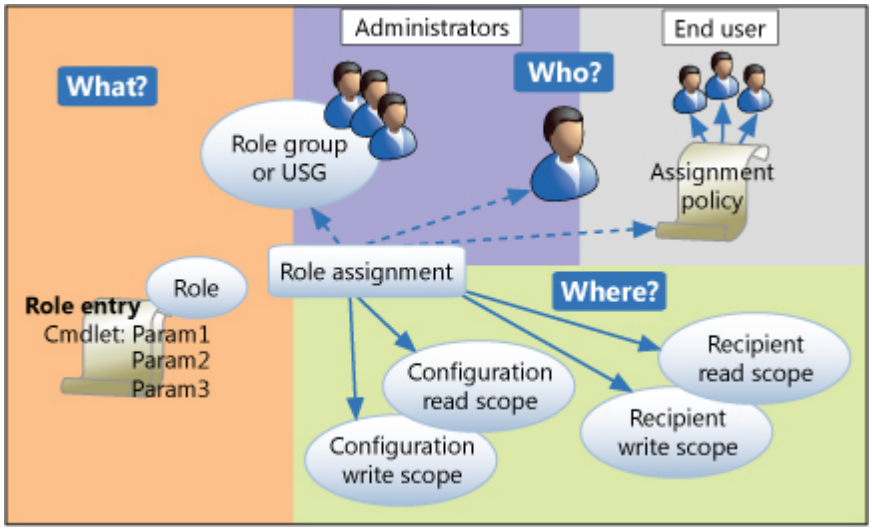
The following figure shows the components in RBAC and how they fit together:

- Role groups:
  - One or more administrators can be members of a role group. They can also be members of more than one role group.
  - The role group is assigned one or more role assignments. These link the role group with one or more administrative roles that define what tasks can be performed.
  - The role assignments can contain management scopes that define where the users of the role group can perform actions. The scopes determine where the users of the role group can modify configuration.
- Role assignment policies:
  - One or more users can be associated with a role assignment policy.
  - The role assignment policy is assigned one or more role assignments. These link the role assignment policy with one or more end-user roles. The end-user roles define what the user can configure on his or her mailbox.
  - The role assignments between role assignment policies and roles have built-in scopes that

restrict the scope of assignments to the user's own mailbox or distribution groups.

- Direct role assignment (advanced):
  - A role assignment can be created directly between a user or USG and one or more roles. The role defines what tasks the user or USG can perform.
  - The role assignments can contain management scopes that define where the user or USG can perform actions. The scopes determine where the user or USG can modify configuration.

RBAC overview



As shown in the preceding figure, many components in RBAC are related to each other. It's how each component is put together that defines the permissions applied to each administrator or user. The following examples provide some additional context about how role groups and role assignment policies are used in an organization.

Jane the Administrator

Jane is an administrator for the medium-size company, Contoso. She's responsible for managing the company's recipients in their Vancouver office. When the permissions model for Contoso was created, Jane was made a member of the Recipient Management - Vancouver custom role group. The Recipient Management - Vancouver custom role group most closely matches her job's duties, which include creating and removing recipients, such as mailboxes and contacts, managing distribution group membership and mailbox properties, and similar tasks.

In addition to the Recipient Management - Vancouver custom role group, Jane also needs a role assignment policy to manage her own mailbox's configuration settings. The organization administrators have decided that all users, except for senior management, receive the same permissions when they manage their own mailboxes. They can configure their voice mail, set up retention policies and change their address information. The default role assignment policy provided with Exchange 2013 now reflects these requirements.

Note:
You may have noticed that because Jane is a member of the Recipient Management - Vancouver custom role group, that should give her permissions to manage her own mailbox. This is true; however, the role group doesn't provide her all of the permissions necessary to

manage all of the features of her mailbox. The permissions needed to manage voice mail and retention policy settings aren't included in her role group. Those are provided only by the default role assignment policy assigned to her.

To allow for this, consider the role group, which provides Jane's administrative permissions over the recipients in Vancouver:

1. A custom role group called Recipient Management - Vancouver was created. When it was created, the following occurred:
   a. The role group was assigned all of the same management roles that are also assigned to the Recipient Management built-in role group. This gives users added to the Recipient Management - Vancouver custom role group the same permissions as those users added to the Recipient Management role group. However, the following steps limit where they can use those permissions.
   b. The Vancouver Recipients custom management scope was created, which matches only recipients who are located in Vancouver. This was done by creating a scope that filters on a user's city or other unique information.
   c. The role group was created with the Vancouver Recipients custom management scope. This means while administrators added to the Recipient Management - Vancouver custom role group have full recipient management permissions, they can only use those permissions against recipients based in Vancouver.

For more information about creating a custom role group, see Manage role groups.

2. Jane is then added as a member of the Recipient Management - Vancouver custom role group.

For more information about adding members to a role group, see Manage role group members.

To give Jane the ability to manage her own mailbox settings, a role assignment policy needs to be configured with the required permissions. The default role assignment policy is used to provide users with the permissions they need to configure their own mailbox. All end-user roles are removed from the default role assignment policy, except for: `MyBaseOptions`, `MyContactInformation`, `MyVoicemail`, and `MyRetentionPolicies`. `MyBaseOptions` is included because this management role provides the basic user functionality in Outlook Web App, such as Inbox rules, calendar configuration, and other tasks.

Nothing else needs to be done because Jane is already assigned the default role assignment policy. This means that the changes made to that role assignment policy are immediately applied to her mailbox, and any other mailboxes also assigned to the default role assignment policy.

For more information about customizing the default role assignment policy, see Manage role assignment policies.

Joe the Specialist

Joe works for Contoso, the same company that Jane works for. He's responsible for performing legal discovery, setting the retention policies, and configuring transport rules and journaling for the whole organization. As with Jane, when the permissions model for Contoso was created, Joe was

added to the role groups that match his job duties. The Records Management role group provides Joe with the permissions to configure retention policies, journaling, and transport rules. The Discovery Management role group provides him with the ability to perform mailbox searches.

As with Jane, Joe also needs permissions to manage his own mailbox. He is given the same permissions as Jane: He can set up his voice mail and retention policies, and change his address information.

To give Joe the permissions to perform his job duties, Joe is added to the Records Management and Discovery Management role groups. The role groups don't need to be changed in any way because they already provide him with the permissions he needs, and the management scopes applied to them encompass the entire organization.

For more information about adding a user to a role group, see Manage role group members.

Joe's mailbox is also assigned the same default role assignment policy that's applied to Jane's mailbox. This gives him all the permissions he needs to manage the features of his mailbox that he's allowed to manage.

Isabel the Vice President

Isabel is the Vice President of Marketing at Contoso. Isabel, as part of the senior leadership team of Contoso, is given more permissions than the average user. This includes the permissions she's provided to manage her mailbox, with one exception: Isabel isn't allowed to manage her own retention policies for legal compliance reasons. Isabel can configure her voice mail, change her contact information, change her profile information, create and manage her own distribution groups, and add or remove herself from existing distribution groups owned by others.

So, Isabel is given different permissions on her own mailbox. Most users at Contoso are assigned to the default role assignment policy. However, senior leadership is assigned to the Senior Leadership role assignment policy. The following is done to create the custom role assignment policy:

1. A custom role assignment policy called Senior Leadership is created. The role assignment policy is assigned the `MyBaseOptions`, `MyContactInformation`, `MyVoicemail`, `MyProfileInformation`, `MyDistributionGroupMembership`, and `MyDistributionGroups` roles. `MyBaseOptions` is included because this role provides the basic user functionality in Outlook Web App, such as Inbox rules, calendar configuration, and other tasks.
2. Isabel is then manually assigned the Senior Leadership role assignment policy.

Isabel's mailbox now has the permissions provided by the Senior Leadership role assignment policy. Any changes made to this role assignment policy are automatically applied to her mailbox, and any other mailboxes also assigned to the same role assignment policy.

Manage role assignment policies

Understanding management role groups

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-05*

A *management role group* is a universal security group (USG) used in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. A management role group simplifies the assignment of management roles to a group of users. All members of a role group are assigned the same set of roles. Role groups are assigned administrator and specialist roles that define major administrative tasks in Exchange 2013 such as organization management, recipient management, and other tasks. Role groups enable you to more easily assign a broader set of permissions to a group of administrators or specialist users.

Note:

This topic focuses on advanced RBAC functionality. If you want to manage basic Exchange 2013 permissions, such as using the Exchange admin center (EAC) to add and remove members to and from role groups, create and modify role groups, or create and modify role assignment policies, see Permissions.

Contents

Note:

If you want to assign permissions to users to manage their own mailbox or distribution groups, see Understanding management role assignment policies.

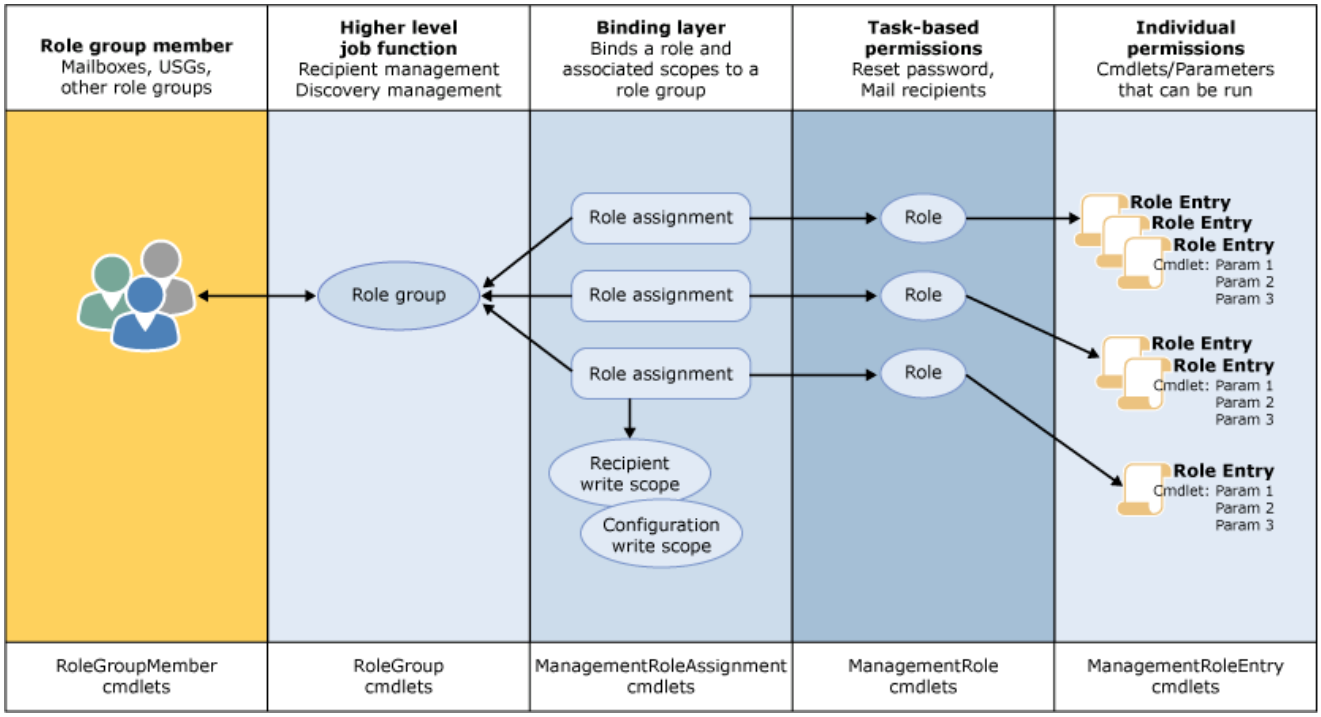
Role group layers

The following are the layers that make up the role group model:

- **Role group member** A *role group member* is a mailbox, universal security group (USG), or other role group that can be added as a member of a role group. When a mailbox, USG, or another role group is added as a member of a role group, the assignments that have been made between management roles and a role group are applied to the new member. This grants the new member all of the permissions provided by the management roles.
- **Management role group** The *management role group* is a special USG that contains mailboxes, USGs, and other role groups that are members of the role group. This is where you add and remove members, and it's also what management roles are assigned to. The combination of all the roles on a role group defines everything that members added to a role group can manage in the Exchange organization.
- **Management role assignment** A *management role assignment* links a management role and a role group. Assigning a management role to a role group grants members of the role group the ability to use the cmdlets and parameters defined in the management role. Role assignments can use management scopes to control where the assignment can be used. For more information, see Understanding management role assignments.
- **Management role scope** A *management role scope* is the scope of influence or impact on a role assignment. When a role is assigned with a scope to a role group, the management scope targets specifically what objects that assignment is allowed to manage. The assignment, and its scope, are then given to the members of the role group, which restricts what those members can manage. A scope can be made up of lists of servers or databases, organizational units, or filters on server, database or recipient objects. For more information, see Understanding management role scopes.
- **Management role** A *management role* is a container for a grouping of management role entries. Roles are used to define the specific tasks that can be performed by the members of a role group assigned the role. For more information, see Understanding management roles.
- **Management role entries** *Management role entries* are the individual entries on a management role that provide access to cmdlets, scripts, and other special permissions that enable access to perform a specific task. Most often, role entries consist of a single cmdlet or script and the parameters that can be accessed by the management role, and therefore the role group to which the role is assigned.

The following figure shows each of the role group layers in the preceding list and how each of the layers relates to the other.

Management role group layers



For more information about RBAC, see Understanding Role Based Access Control.

Return to top

Role group management

When you create a role group, you create the USG that holds the members of the role group, and you create the assignments between the role group and the management roles you specify. Optionally, you can also specify a management scope to apply to the role assignments, and you can add any mailboxes that you want to be members of the new role group.

After you create a role group, each layer becomes an independent object. The role group continues to be the central point at which all of the layers are joined together, however, each layer is managed individually. For example, to modify the management scope that you applied to the role group when it was created, you need to change the scope on each individual role assignment after the role group is created. The management of the role group model is performed using the cmdlets that manage the individual layers of the role group model.

The following table lists the role group layer and the procedural topics that you can use to manage each layer.

Role group management topics

Role group model layer	Management topic
Role group member	Manage role group members
Role group	Manage role groups
Management roles and assignments	Manage role groups

Management role entries	Add a role entry to a role Change a role entry Remove a role entry from a role **Note:** Changing the management role entries in management roles in a role group is an advanced task and is generally not required in most cases. Instead, you may be able to use a pre-existing management role that suits your requirements. For more information, see Built-in role groups.

Return to top

Built-in role groups

Built-in roles groups are roles shipped with Exchange 2013. They provide you with a set of role groups that you can use to provide varying levels of administrative permissions to groups of users. You can add or remove users to or from any built-in role group. You can also add or remove role assignments to or from most role groups. The only exceptions are the following:

- You can't remove any delegating role assignments from the Organization Management role group.
- You can't remove the Role Management role from the Organization Management role group.

The following table lists all the built-in role groups included with Exchange 2013. For more information about built-in role groups, see Built-in role groups.

Built-in role groups

Role group	Description
Organization Management	Administrators who are members of the Organization Management role group have administrative access to the entire Exchange 2013 organization and can perform almost any task against any Exchange 2013 object, with some exceptions. By default, members of this role group can't perform mailbox searches and management of unscoped top-level management roles.

View-only Organization Management	Administrators who are members of the View Only Organization Management role group can view the properties of any object in the Exchange organization.
Recipient Management	Administrators who are members of the Recipient Management role group have administrative access to create or modify Exchange 2013 recipients within the Exchange 2013 organization.
UM Management	Administrators who are members of the UM Management role group can manage features in the Exchange organization such as Unified Messaging (UM) service configuration, UM properties on mailboxes, UM prompts, and UM auto attendant configuration.
Discovery Management	Administrators or users who are members of the Discovery Management role group can perform searches of mailboxes in the Exchange organization for data that meets specific criteria and can also configure litigation holds on mailboxes.
Records Management	Users who are members of the Records Management role group can configure compliance features, such as retention policy tags, message classifications, transport rules, and more.
Server Management	Administrators who are members of this role group can configure server-specific configuration of transport , client access, and mailbox features such as database copies,

	certificates, transport queues and Send connectors, virtual directories, and client access protocols.
Help Desk	Users who are members of the Help Desk role group can perform limited recipient management of Exchange 2013 recipients.
Hygiene Management	Users who are members of the Hygiene Management role group can configure the anti-spam and anti-malware features of Exchange 2013. Third-party programs that integrate with Exchange 2013 can add service accounts to this role group to grant those programs access to the cmdlets required to retrieve and configure the Exchange configuration.
Compliance Management	Users who are members of the Compliance Management role group can configure and manage Exchange compliance configuration in accordance with their policies.
Public Folder Management	Administrators who are members of the Public Folder Management role group can manage public folders on servers running Exchange 2013.
Delegated Setup	Administrators who are members of the Delegated Setup role group can deploy servers running Exchange 2013 that have been previously provisioned by a member of the Organization Management role group.

Return to top

Linked role groups

Linked role groups are used in organizations that install Exchange 2013 in a dedicated resource forest and place users in other, trusted foreign forests. Linked role groups, as the name implies, create a link between a role group in the Exchange forest and a USG in a foreign forest. This is useful when the Active Directory Domain Services (AD DS) user accounts of the administrators you want to administer Exchange don't reside in the same resource forest as Exchange. Linked role groups can only be associated with one foreign USG. Additionally, you don't need to create a two-way trust between the Exchange forest and the foreign forest. The Exchange forest needs to trust the foreign forest but the foreign forest doesn't need to trust the Exchange forest.

For more information about permissions in multiple-forest topologies, see Understanding multiple-forest permissions.

A linked role group consists of two parts:

- **Linked role group** The linked role group is a container object that associates the foreign USG with the management role assignments assigned to the role group.
- **Foreign USG** The foreign USG contains the members that should be granted the permissions provided by the linked role group.

When you create a linked role group, you provide a domain controller in the foreign forest that contains the users you want to manage the Exchange forest and the USG that contains those users as members, the foreign USG name, and the credentials required to access the foreign forest. Exchange adds the security identifier (SID) of the foreign USG to the linked role group. Because the USG SID is the only identification of the foreign USG, we strongly recommend that you specify the foreign forest in the name of the role group if you have multiple foreign forests.

A linked role group doesn't contain any members. All of the members of that role group are managed using the foreign USG. This means you can't use the **Update-RoleGroupMember**, **Add-RoleGroupMember**, or **Remove-RoleGroupMember** cmdlets to add or remove role group members. When you add members to the foreign USG, they are given the permissions provided by the linked role group.

You can't change a standard role group, which contains its own members, to a linked role group and vice versa. If you want to change a role group from a standard role group to a linked role group, you must create a new linked role group and replicate the management role assignments that are present on the standard role group on the linked role group. This is also the case for built-in role groups because they're standard role groups. If you want to perform all of the management of your Exchange forest from a foreign forest, you need to create new linked role groups and add the management roles that exist on the built-in role groups to the new linked role groups. For more information about how to accomplish this, see Create linked role groups that mirror built-in role groups.

Return to top

Role group delegation

By default, members of the Organization Management role group can add and remove members to and from role groups. However, you might want to enable users who aren't members of the Organization Management role group to add and remove role group members. If so, you can use role group delegation.

Role group delegation is controlled by the **ManagedBy** property on each role group. The **ManagedBy** property contains a list of users who can add and remove members to and from that role group or change the configuration of a role group. The users aren't assigned any permissions given by the role group unless they're also members of the role group.

If the **ManagedBy** property is set on a role group, only those users who are listed as role group managers on that property can modify a role group or the membership of a role group by default. However, an optional parameter on cmdlets that modify role groups or role group membership can override that restriction. The *BypassSecurityGroupManagerCheck* switch can be used by users who are members of the Organization Management role or are assigned, either directly or indirectly, the Role Management management role. When this switch is used, the **ManagedBy** property is ignored and the user can modify the role group or role group membership.

If the **ManagedBy** property isn't set on a role group, only users who are members of the Organization Management role or are assigned, either directly or indirectly, the Role Management management role can modify a role group or role group membership.

Note:

Roles assigned to a role group may be assigned using delegating role assignments. With delegating role assignments, members of a role group that's assigned a delegated role can assign that role to another role group, assignment policy, user, or USG. Members of the role group can assign only that role and can't delegate the role group, unless they're also added to the **ManagedBy** property. For more information about delegated role assignments, see Understanding management role assignments.

For more information about how to manage role group delegation, see Manage role groups.

Return to top

Role group membership

When a user is made a member of a role group, the management roles assigned to the role group are assigned to the user. If a user is a member of multiple role groups, the management roles from each role group are aggregated and assigned to the user. Users, USGs, and other role groups can be members of role groups.

Only users who are members of the Organization Management or Role Management role groups and users who have been delegated the ability to add and remove users to or from role groups can manage role group membership.

For more information about how to manage role group membership, see Manage role group members.

Role group creation workflow

As mentioned previously, a role group is made up of several layers. To help you understand what happens when a role group is created, consider the following example, which creates a new role group.

```
New-RoleGroup -Name "Seattle Recipient Management" -Roles
"Mail Recipients", "Distribution Groups", "Move Mailboxes",
"UM Mailboxes" -CustomRecipientWriteScope "Seattle Users",
-ManagedBy "Brian", "David", "Katie" -Members "Ray",
"Jenn", "Maria", "Chris", "Maija", "Carter", "Jenny",
"Sam", "Lukas", "Isabel", "Katie"
```

When the preceding command is run, the following happens:

1. A new role group object, which is a special USG, called Seattle Recipient Management is created.
2. The mailboxes for Ray, Jenn, Maria, Chris, Maija, Carter, Jenny, Sam, Lukas, Isabel, and Katie are added as members of the role group. These users receive the permissions provided by this role group.
3. The users Brian and David are added to the **ManagedBy** property of the role group. These users can add and remove members to and from the role group but won't be given any permissions provided by the role group because they're not members. Katie is also added to the **ManagedBy** property of the role group. Because she's added to the **ManagedBy** property, and she's a member of the role group, she can add or remove members to and from the role group, and she also receives the permissions provided by the role group.
4. The following management role assignments are created. The role assignments assign each management role specified in the command to the role group. The management scope Seattle Users is added to each role assignment. The name of each role assignment is a combination of the management role being assigned and the role group name.
   - `Mail Recipients_Seattle Recipient Management`
   - `Distribution Groups_Seattle Recipient Management`
   - `Move Mailboxes_Seattle Recipient Management`
   - `UM Mailboxes_Seattle Recipient Management`

If you compare the results of this command to the Management role group layers figure earlier in this topic, you can see where each step correlates to the role group layers. You can then refer to the Management role group management topics shown in "Role group management" earlier in this topic to manage each role group layer.

Return to top

Understanding management role assignment policies

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-05*

A *management role assignment policy* is a collection of one or more end-user management roles that enables end users to manage their own Microsoft Exchange Server 2013 mailbox and distribution group configuration. Role assignment policies, which are part of the Role Based Access Control (RBAC) permissions model in Exchange 2013, enable you to control what specific mailbox and distribution group configuration settings your end users can modify. Different groups of users can have role assignment policies specialized to them.

Note:

This topic focuses on advanced RBAC functionality. If you want to manage basic Exchange 2013 permissions, such as using the Exchange admin center (EAC) to add and remove members to and from role groups, create and modify role groups, or create and modify role assignment policies, see Permissions.

For more information about RBAC, see Understanding Role Based Access Control.

Contents

Role assignment policy layers

The following list describes the layers that make up the role assignment policy model:

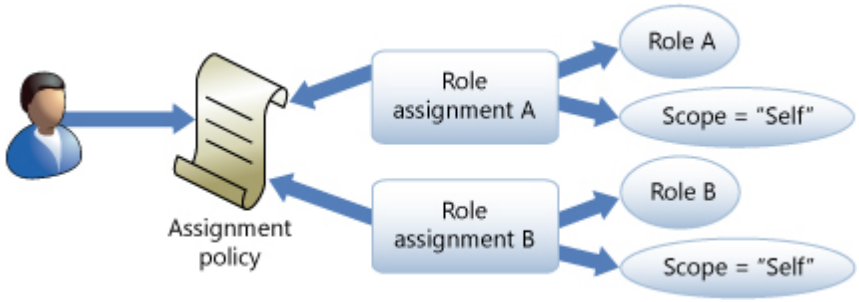
- **Mailbox** Mailboxes are assigned a single role assignment policy. When a mailbox is assigned a role assignment policy, the assignments between management roles and a role assignment policy are applied to the mailbox. This grants the mailbox all of the permissions provided by the management roles.
- **Management role assignment policy** The *management role assignment policy* is a special object in Exchange 2013. Users are associated with a role assignment policy when their mailboxes are created, or if you change the role assignment policy on a mailbox. This is also what you assign end-user management roles to. The combination of all the roles on a role assignment policy

defines everything that the user can manage on his or her mailbox or distribution groups.

- **Management role assignment** A *management role assignment* is the link between a management role and a role assignment policy. Assigning a management role to a role assignment policy grants the ability to use the cmdlets and parameters defined in the management role. When you create a role assignment between a role assignment policy and a management role, you can't specify any scope. The scope applied by the assignment is based on the management role and is either `Self` or `MyGAL`. For more information, see Understanding management role assignments.
- **Management role** A *management role* is a container for a grouping of management role entries. Roles are used to define the specific tasks that a user can do with his or her mailbox or distribution groups. A *management role entry* is a cmdlet, script, or special permission that enables each specific task in a management role to be performed. You can only use end-user management roles with role assignment policies. For more information, see Understanding management roles.
- **Management role entry** Management role entries are the individual entries on a management role that determine what cmdlets and parameters are available to the management role and the role group. Each role entry consists of a single cmdlet and the parameters that can be accessed by the management role.

The following figure shows each of the role assignment policy layers in the preceding list and how each of the layers relates to the other.

Management role assignment policy model



For more information about management roles, role assignments, and scopes, see Understanding Role Based Access Control.

Default and explicit role assignment policies

The following sections describe the two types of role assignment policies in Exchange 2013.

Default role assignment policy

A default role assignment policy is one assigned to a mailbox when the mailbox is created or moved to a server running Exchange 2013, and a role assignment policy wasn't provided using the *RoleAssignmentPolicy* parameter on the **New-Mailbox** or **Enable-Mailbox** cmdlets.

Exchange 2013 includes a default role assignment policy that provides end users with the

permissions most commonly used. You can change the default permissions on the default role assignment policy by adding or removing management roles to or from it.

If you want to replace the built-in default role assignment policy with your own default role assignment policy, you can use the **Set-RoleAssignmentPolicy** cmdlet to select a new default. When you do this, any new mailboxes are assigned the role assignment policy you specified by default if you don't explicitly specify a role assignment policy.

When you change the default role assignment policy, mailboxes assigned the default role assignment policy aren't automatically assigned the new default role assignment policy. If you want to update previously created mailboxes to use the role assignment policy you've set as default, you must use the **Set-Mailbox** cmdlet to do so.

Explicit Role Assignment Policy

An explicit role assignment policy is a policy that you assign to a mailbox manually using the *RoleAssignmentPolicy* parameter on the **New-Mailbox**, **Set-Mailbox**, or **Enable-Mailbox** cmdlets. When you assign an explicit role assignment policy, the new policy takes effect immediately and replaces the previously assigned explicit role assignment policy.

Using role assignment policies

Role assignment policies enable you to tailor permissions based on what business needs your users need to be able to configure. If the default role assignment policy meets your needs, you don't need to do any customization. However, if you have many different user groups with specialized needs, you can create role assignment policies for each of them.

The default role assignment policy you use should contain the permissions that apply to your broadest set of users. Then, create role assignment policies for each of your specialized user groups and tailor those role assignment policies to grant more or less restrictive permissions to them. When you organize your role assignment policies this way, you reduce complexity by only explicitly assigning role assignment policies to your specialized users while the majority of your users receive the more common permissions provided by the default role assignment policy.

A mailbox can have only one role assignment policy. All users, including administrators and specialist users, are assigned one role assignment policy. If you want a user to have a different set of permissions, you must assign that user's mailbox another role assignment policy with the required permissions.

Role assignment policy management

To add a new role assignment policy, you first create one and decide whether it should be the default role assignment policy. After you create a role assignment policy, you assign management roles to the role assignment policy, and then assign the role assignment policy to mailboxes. You

can later choose to add or remove management roles or choose a different role assignment policy to be the default.

The following table lists the role assignment policy layer and the procedural topics that you can use to manage each layer.

Role assignment policy management topics

Role assignment policy model layer	Management topics
Mailbox	Manage user mailboxes Change the assignment policy on a mailbox
Role assignment policy	Manage role assignment policies
Management roles and assignments	Manage role assignment policies
Management role entries	Add a role entry to a role Change a role entry Remove a role entry from a role **Note:** Changing the management role entries in management roles in a role assignment policy is an advanced task and is generally not required in most cases. You may, instead, be able to use a preexisting management role that suits your requirements. For more information, see Built-in role groups.

Understanding management roles

Exchange Server 2013 > Permissions > Understanding Role Based Access Control >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-11-19*

Management roles are part of the Role Based Access Control (RBAC) permissions model used in Microsoft Exchange Server 2013. Roles act as a logical grouping of cmdlets that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailboxes, transport rules, and recipients. Management roles can be further combined into larger groupings called management role groups and management role assignment policies, which

enable management of feature areas and recipient configuration. Role groups and role assignment policies assign permissions to administrators and end users, respectively. For more information about management role groups and management role assignment policies, see Understanding Role Based Access Control.

Note:

This topic focuses on advanced RBAC functionality. If you want to manage basic Exchange 2013 permissions, such as using the Exchange admin center (EAC) to add and remove members to and from role groups, create and modify role groups, or create and modify role assignment policies, see Permissions.

Contents

Management role scopes and management role assignments are important components for the operation of management roles. For more information about these components, see the following topics:

- Understanding management role scopes
- Understanding management role assignments

Looking for management tasks related to management roles? See Permissions.

Built-in management roles

Exchange 2013 provides many built-in management roles that you can use to administer your organization. Each role includes the cmdlets and parameters necessary for users to manage specific Exchange components. The following are examples of some built-in management roles:

- **Mail Recipients** Enables administrators to manage mailboxes, contacts, and mail users.
- **Transport Rules** Enables administrators or specialist users assigned the role to manage the transport rules feature.
- **Distribution Groups** Enables administrators or specialist users assigned the role to manage distribution groups and distribution group members.
- **MyPersonalInformation** Enables end users to modify their own home phone number and Web site address.

For a complete list of the management roles included with Exchange 2013, see Built-in management roles.

You can take the built-in roles provided with Exchange 2013 and combine them in any way to create a permissions model that works with your business. For example, if you want members of a role group to manage recipients and public folders, you assign both the Mail Recipients and Public Folders roles to the role group. Most often, you assign roles to role groups or role assignment policies. You can also assign management roles directly to users if you want to control permissions at a granular level. We recommend that you use role groups and role assignment policies rather than direct user role assignment to simplify your permissions model.

Note:
You can only assign end-user management roles to role assignment policies.

Built-in management roles can't be changed. You can, however, create management roles based on the built-in management roles, and then assign those new roles to role groups or role assignment policies. You can then change the new management roles to suit your needs. Doing so is an advanced task that you should rarely, if ever, need to do.

For more information about creating custom roles based on the built-in Exchange roles, see Custom Management Roles later in this topic.

You need to assign management roles for them to take effect. Most often, you assign management roles to role groups and role assignment policies. In certain circumstances, you might also assign roles directly to users, although this is an advanced task that you should rarely, if ever, need to do.

For more information about assigning management roles, see the following topics:

- Manage role groups
- Manage role assignment policies
- Add a role to a user or USG

For more information about management role assignments, see Understanding management role assignments.

Return to top

Unscoped top-level management roles

Unscoped top-level management roles are a special type of management role that enables you to grant access to custom scripts and non-Exchange cmdlets to users using RBAC. Regular management roles provide access only to Exchange cmdlets. If you need to provide access to non-Exchange cmdlets that run on an Exchange server, or if you need to publish a script that can be run by your users, you need to add them to an unscoped role. They're called a top-level role because if an unscoped role is created without deriving it from a parent role, it has no parent and is a peer of the built-in management roles provided with Exchange 2013. To indicate that you want to create an unscoped top-level role entry, you need to use the *UnscopedTopLevel* switch with the **New-ManagementRole** cmdlet.

Unscoped roles are named as such because, unlike regular management roles, they can't be scoped to a specific target. Unscoped roles are always organization wide. This means that someone assigned an unscoped role can modify any object in the Exchange 2013 organization. For this reason, care must be taken to make sure that scripts and cmdlets made available through an unscoped role are thoroughly tested so that you know what they will modify, and that you carefully assign unscoped roles.

Unscoped roles can be assigned to role assignees such as role groups, management roles, users, and universal security groups (USGs). They can't be assigned to management role assignment policies.

Although Exchange cmdlets can't be added as a management role entry on an unscoped role, they can be included in scripts added as role entries. This enables you to create custom scripts that perform Exchange tasks that you can then assign to users. A useful scenario is where a user must perform a highly privileged task that's normally outside his or her administrative level and where crafting a new management role or role group would be problematic. You can create a script that performs this specific function, add it to an unscoped role, and then assign the unscoped role to the user. The user can then perform only the specific function provided by the script.

The role entries that you add to an unscoped role must also be designated as an unscoped top-level role entry. For more information about unscoped top-level role entries, see Unscoped Top-Level Role Entries later in this topic.

The Organization Management role group doesn't, by default, have permissions to create or manage unscoped role groups. This is to prevent unscoped role groups from mistakenly being created or modified. The Organization Management role group can delegate the Unscoped Role Management management role to itself and other role assignees. For more information about how to create an unscoped top-level management role, see Create an unscoped role.

Return to top

Custom management roles

You can create custom management roles based on built-in Exchange roles when the built-in management roles don't match the needs of your users. When you create a custom management role, the new child role inherits all of the management role entries of the parent role. You can then choose which management role entries you want to keep in the custom management role and remove all of the entries you don't want.

Custom roles become children of the role used to create the new role. You can only use management role entries in the new child role that exist in the parent role. For more information, see the following sections later in this topic:

- Management Role Hierarchy
- Management Role Entries

Creating custom management roles requires multiple steps and is an advanced task that you should

rarely, if ever, need to perform. Before you create a custom management role, make sure one of the existing built-in management roles doesn't provide the permissions you need. For more information about the built-in management roles, or if you want to create custom management roles, see the following topics:

- Built-in management roles
- Advanced permissions

For more information about how to create a management role, see Create a role.

Return to top

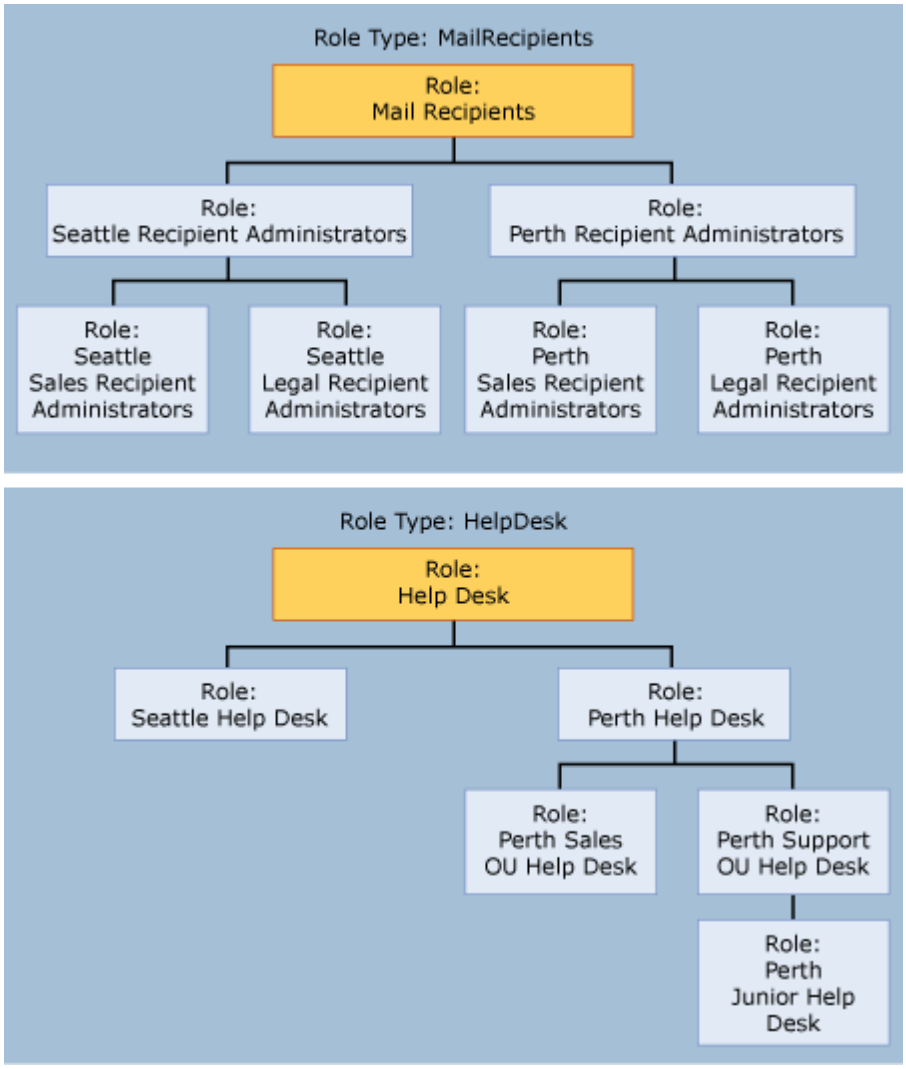
Management role hierarchy

Management roles exist in a parent and child hierarchy. At the top of the hierarchy are the built-in management roles provided in Exchange 2013 by default. When you create a role, a copy of a parent role is made. The new role is a child of the role you copied from. You can then customize the new role to suit the needs of the administrators or users you want to assign it to.

Customized roles can be used to create roles. When you create a role from an existing customized role, the existing customized role remains a child of its parent role, but also becomes the parent for the new role. Each time a role is copied, the new child role can contain only the role entries that exist in the immediate parent role.

Each management role is given a role type that can't be changed. The role type defines the base context of use for the role. The role type is copied from the parent role when the child role is created.

Management role hierarchy



The preceding figure illustrates the hierarchical relationship of several management roles. The Mail Recipients and Help Desk roles are built-in roles. All of the child roles derived from these roles inherit the role type of each built-in role. For example, all child roles derived either directly or indirectly from the Mail Recipients role inherit the `MailRecipients` role type.

The Seattle Recipient Administrators custom role is a child of the Mail Recipients built-in role but it's also the parent of the Seattle Sales Recipient Administrators custom role and the Seattle Legal Recipient Administrators custom role. The Seattle Recipient Administrators custom role contains only a subset of cmdlets that are available in the Mail Recipients role. The child roles of the Seattle Recipient Administrators custom role can only contain cmdlets that also exist in that role. For example, if a cmdlet exists in the Mail Recipients role, but the cmdlet doesn't exist in the Seattle Recipient Administrators custom role, the cmdlet can't be added to the Seattle Sales Recipient Administrators custom role.

All of the custom roles follow the same pattern as the roles discussed previously. For more information about how access to cmdlets is controlled on management roles, see Management Role Entries next in this topic.

Return to top

Management role entries

Every management role, whether it's a custom Exchange role or an unscoped role, must have at least one management role entry. An entry consists of a single cmdlet and its parameters, a script, or a special permission that you want to make available. If a cmdlet or script doesn't appear as an entry on a management role, that cmdlet or script isn't accessible via that role. Likewise, if a parameter doesn't exist in an entry, the parameter on that cmdlet or script isn't accessible via that role.

Exchange 2013 enables you to manage role entries based on built-in Exchange management top-level roles and role entries based on unscoped top-level management roles. Roles based on built-in Exchange top-level roles can only contain role entries that are Exchange 2013 cmdlets. To add custom scripts or non-Exchange cmdlets so that your users can use them, you need to add them as unscoped role entries to an unscoped top-level role. For more information about unscoped role entries, see Unscoped Top-Level Role Entries later in this topic.

All role entries, regardless of whether the role entry is an Exchange cmdlet-based role entry or an unscoped role entry, adhere to the same principles explained in the following sections.

For more information about managing role entries, see Management roles and role entries.

Parent and child management role relationship

As mentioned previously, a management role entry, including the cmdlet and its parameters, must exist in the immediate parent role to add the entry to the child role. For example, if the parent role doesn't have an entry for **New-Mailbox**, the child role can't be assigned that cmdlet. Additionally, if **Set-Mailbox** is on the parent role but the *Database* parameter has been removed from the entry, the *Database* parameter on the **Set-Mailbox** cmdlet can't be added to the entry on the child role.

Because you can't add management role entries to child roles if the entries don't appear in parent roles, and because the role is based on a specific role type, you must carefully choose the parent role to copy when you want to create a customized role.

Return to top

Management role entry names

Management role entry names are a combination of the management role that they're associated with, and the name of the cmdlet or script. The role name and the cmdlet or script are separated by a backslash character (\). For example, the role entry name for the **Set-Mailbox** cmdlet on the Mail Recipients role is `Mail Recipients\Set-Mailbox`. If the name of a role entry contains spaces, enclose the entire name in quotation marks (").

The wildcard character (*) can be used in the role entry name to return all of the role entries that match the input you provide. The wildcard character can be used on either side of the backslash character. The following table contains a few variations on how you can use the wildcard character in a role entry name.

Management role entry name with wildcard characters

Example	Description
`*\*`	Returns a list of all role entries for all roles.
`*\Set-Mailbox`	Returns a list of all role entries that contain the **Set-Mailbox** cmdlet.
`Mail Recipients\*`	Returns a list of all role entries on the Mail Recipients role.
`Mail Recipients\*Mailbox`	Returns a list of all role entries on the Mail Recipients role that contain cmdlets that end in Mailbox.
`My*\*Group*`	Returns a list of all role entries that contain the string Group in the cmdlet name for all roles that begin with My.

Unscoped top-level role entries

Unscoped top-level role entries are used with unscoped top-level management roles to create roles based on custom scripts or non-Exchange cmdlets. Each unscoped role entry is associated with a single custom script or a non-Exchange cmdlet. To indicate that you want to create an unscoped role entry on an unscoped role, you need to specify the *UnscopedTopLevel* parameter on the **Add-ManagementRoleEntry** cmdlet.

When you add the unscoped role entry, you need to specify all of the parameters that can be used with the script or non-Exchange cmdlet. Exchange attempts to verify the parameters that you provide when you add the role entry. Only the parameters that you add to the role entry when it's created will be available to the users assigned to the unscoped role. If you add parameters to the script or non-Exchange cmdlet, or if a parameter is renamed, you must update the role entry manually. Exchange doesn't check whether existing parameters on an unscoped role entry have changed. If a parameter on a role entry changes in a script and you try to use that parameter, the command fails.

Scripts that you add to an unscoped role entry must reside in the Exchange 2013 scripts directory on every server where administrators and users connect using the Exchange Management Shell. If you try to add an unscoped role entry based on a script that doesn't exist in the Exchange 2013 scripts directory on the server you're using to add the role entry, an error occurs. The default installation location of the Exchange 2013 scripts directory is C:\Program Files\Microsoft\Exchange Server\V15\RemoteScripts.

Non-Exchange cmdlets that you add to an unscoped role entry must be installed on every Exchange 2013 server where administrators and users connect using the Shell and want to use the cmdlets. If you try to add an unscoped role entry based on a non-Exchange cmdlet that isn't installed on the Exchange 2013 server you're using to add the role entry, an error occurs. When you add a non-Exchange cmdlet, you must specify the Windows PowerShell snap-in name that contains the non-Exchange cmdlet.

For more information about how to add an unscoped management role entry, see Add a role entry to a role.

Return to top

Management role types

Management role types are the foundation of all management roles. Types define the implicit scopes defined on all management roles of a specified role type and also act as a logical grouping of related roles. All management roles derived from the parent built-in management role have the same role type. Refer to the Management role hierarchy figure earlier in this topic for an illustration of this relationship. Management role types also represent the maximum set of cmdlets and their parameters that can be added to a role associated with a role type.

Management role types are split into the following categories:

- **Administrative or specialist** Roles associated with an administrative or specialist role types have a broader scope of impact in the Exchange organization. Roles of this role type enable tasks such as server or recipient management, organization configuration, compliance administration, auditing, and more.
- **User-focused** Roles associated with a user-focused role type have a scope of impact closely tied with an individual user. Roles of this role type enable tasks such as user profile configuration and self management, management of user-owned distribution groups, and more.

The names of roles associated with user-focused role types and user-focused role type names begin with My.

- **Specialty** Roles associated with specialty role types enable tasks that aren't administrative or user-focused role types. Roles of this role type enable tasks such as application impersonation and the use of non-Exchange cmdlets or scripts.

The following table lists all of the administrative management role types in Exchange 2013 and whether the configuration that's permitted by the role type is applied across the whole Exchange organization or only to an individual server. For more information about each of the management roles associated with these role types, including a description of each role, who may benefit from being assigned the role, and other information, see Built-in management roles.

Administrative role types

Management role type	Built-in management role	Description	Organization or server

`ActiveDirectoryPermissions`	Active Directory Permissions role	This role type is associated with roles that enable administrators to configure Active Directory permissions in an organization. Some features that use Active Directory permissions or an access control list (ACL) include transport Receive and Send connectors, and Send As and send on behalf permissions for mailboxes. **Note:** Permissions set directly on Active Directory objects may not be enforced through RBAC.	Organization
`AddressLists`	Address Lists role	This role type is associated with roles that enable administrators to manage address lists, the global address list (GAL), and offline address lists in an organization.	Organization
`ApplicationImpersonation`	ApplicationImpersonation role	This role type is associated with roles that enable applications to impersonate users in an organization to perform tasks on behalf of the	Organization

		user.	
ArchiveApplication	ArchiveApplication role	This role type is associated with roles that enable partner applications to archive items in user mailboxes in an organization.	Organization
AuditLogs	Audit Logs role	This role type is associated with roles that enable administrators to manage the administrator audit logging configuration in an organization.	Organization
CmdletExtensionAgents	Cmdlet Extension Agents role	This role type is associated with roles that enable administrators to manage cmdlet extension agents in an organization.	Organization
DataLossPrevention	Data Loss Prevention role	This role type is associated with roles that create and manage data loss prevention (DLP) policies and the rules within them in an organization.	Organization
DatabaseAvailabilityGroups	Database Availability Groups role	This role type is associated with roles that enable administrators to manage database	Organization

		availability groups (DAGs) in an organization. Administrators assigned this role either directly or indirectly are the highest level administrators responsible for the high availability configuration in an organization.	
DatabaseCopies	Database Copies role	This role type is associated with roles that enable administrators to manage database copies on individual servers.	Server
Databases	Databases role	This role type is associated with roles that enable administrators to create, manage, mount, and dismount mailbox databases on individual servers.	Server
DisasterRecovery	Disaster Recovery role	This role type is associated with roles that enable administrators to restore mailboxes and mailbox databases, create mailbox databases, and perform datacenter switchovers and switchbacks for database availability groups in an	Organization

		organization.	
DistributionGroups	Distribution Groups role	This role type is associated with roles that enable administrators to create and manage distribution groups and distribution group members in an organization.	Organization
EdgeSubscriptions	Edge Subscriptions role	This role type is associated with roles that enable administrators to manage edge synchronization and subscription configuration between Exchange 2010 Edge Transport servers and Exchange 2013 Mailbox servers in an organization.	Organization
EmailAddressPolicies	E-Mail Address Policies role	This role type is associated with roles that enable administrators to manage email address policies in an organization.	Organization
ExchangeConnectors	Exchange Connectors role	This role type is associated with roles that enable administrators to create, modify, view, and remove delivery agent	Organization

		connectors.	
ExchangeServerCertificates	Exchange Server Certificates role	This role type is associated with roles that enable administrators to create, import, export, and manage Exchange server certificates on individual servers.	Server
ExchangeServers	Exchange Servers role	This role type is associated with roles that enable administrators to manage Exchange server configuration on individual servers.	Server
ExchangeVirtualDirectories	Exchange Virtual Directories role	This role type is associated with roles that enable administrators to manage Outlook Web App, Microsoft ActiveSync, offline address book (OAB), Autodiscover, Windows PowerShell, and Exchange Administration Center virtual directories on individual servers.	Server
FederatedSharing	Federated Sharing role	This role type is associated with roles that enable administrators to manage cross-forest and cross-organization sharing in an	Organization

		organization.	
`InformationRightsManagement`	Information Rights Management role	This role type is associated with roles that enable administrators to manage the Information Rights Management (IRM) features of Exchange in an organization.	Organization
`Journaling`	Journaling role	This role type is associated with roles that enable administrators to manage journaling configuration in an organization.	Organization
`LegalHold`	Legal Hold role	This role type is associated with roles that enable administrators to configure whether data within a mailbox should be retained for litigation purposes in an organization.	Organization
`MailboxImportExport`	Mailbox Import Export role	This role type is associated with roles that enable administrators to import and export mailbox content and to purge unwanted content from a mailbox.	Organization
`MailboxSearch`	Mailbox Search role	This role type is	Organization

		associated with roles that enable administrators to search the content of one or more mailboxes in an organization.	
`MailboxSearchApplication`	MailboxSearchApplication role	This role type is associated with roles that enable partner applications to set and view the legal hold status of a mailbox in an organization.	Organization
`MailEnabledPublicFolders`	Mail Enabled Public Folders role	This role type is associated with roles that enable administrators to configure whether individual public folders are mail-enabled or mail-disabled in an organization. This role type enables you to manage the email properties of public folders only. It doesn't enable you to manage properties of public folders that aren't email properties. To manage properties of public folders that aren't email properties, you need to be assigned a role associated	Organization

		with the `PublicFolders` role type.	
`MailRecipientCreation`	Mail Recipient Creation role	This role type is associated with roles that enable administrators to create mailboxes, mail users, mail contacts, distribution groups, and dynamic distribution groups in an organization. Roles associated with this role type can be combined with roles associated with the `MailRecipients` role type to enable the creation and management of recipients. This role type doesn't enable you to mail-enable public folders. To mail-enable public folders, you must be assigned a role associated with the `MailEnabledPublicFolders` role type. If your organization maintains a split permissions model where recipient creation is performed by a different group from the group that performs recipient	Organization

		management, assign the `MailRecipientCreation` role to the group that performs recipient creation, and the `MailRecipients` role to the group that performs recipient management.	
`MailRecipients`	Mail Recipients role	This role type is associated with roles that enable administrators to manage existing mailboxes, mail users, mail contacts, distribution groups, and dynamic distribution groups in an organization. Roles associated with this role type can't create these recipients but can be combined with roles associated with the `MailRecipientCreation` role type to enable the creation and management of recipients. This role type doesn't enable you to manage mail-enabled public folders or distribution groups. To manage mail-enabled public folders, you must be assigned a	Organization

		role associated with the `MailEnabledPublicFolders` role type. To manage distribution groups, you must be assigned a role associated with the `DistributionGroups` role type. If your organization maintains a split permissions model where recipient creation is performed by a different group from the group that performs recipient management, assign the `MailRecipientCreation` role to the group that performs recipient creation, and the `MailRecipients` role to the group that performs recipient management.	
`MailTips`	Mail Tips role	This role type is associated with roles that enable administrators to manage MailTips in an organization.	Organization
`MessageTracking`	Message Tracking role	This role type is associated with roles that enable administrators to track messages in an	Organization

		organization.	
`Migration`	Migration role	This role type is associated with roles that enable administrators to migrate mailboxes and mailbox content into or out of a server.	Server
`Monitoring`	Monitoring role	This role type is associated with roles that enable administrators to monitor the Microsoft Exchange services and component availability in an organization. In addition to administrators, roles associated with this role type can be used with the service account used by monitoring applications to collect information about the state of Exchange servers.	Organization
`MoveMailboxes`	Move Mailboxes role	This role type is associated with roles that enable administrators to move mailboxes between servers in an organization and between servers in the local organization and another organization.	Organization
`OfficeExtensionAppl ication`	OfficeExtensionApplic	This role type is	Organization

	ation role	associated with roles that enable Microsoft Office extension applications to access user mailboxes in an organization.	
OrgCustomApps	Org Custom Apps role	This role type is associated with roles that enable administrators to view and modify their organization's custom apps in an organization.	Organization
OrgMarketplaceApps	Org Marketplace Apps role	This role type is associated with roles that enable administrators to view and modify their organization's marketplace apps in an organization.	Organization
OrganizationClientAccess	Organization Client Access role	This role type is associated with roles that enable administrators to manage Client Access server settings in an organization.	Organization
OrganizationConfiguration	Organization Configuration role	This role type is associated with roles that enable administrators to manage organization-wide settings in an organization. Organization	Organization

		configuration that can be controlled with this role type include the following and more: • Whether MailTips are enabled or disabled for the organization. • The URL for the managed folder home page. • The Microsoft Exchange recipient SMTP address and alternate email addresses. • The resource mailbox property schema configuration. • The Help URLs for the Exchange Administration Center and Outlook Web App. This role type doesn't include the permissions included in the `OrganizationClientAccess` or `OrganizationTransportSettings` role types.	
`OrganizationTransportSettings`	Organization Transport Settings role	This role type is associated with roles that enable administrators to manage organization-wide transport settings,	Organization

		such as system messages, Active Directory site configuration, and other organization-wide transport settings in an organization. This role doesn't enable you to create or manage transport Receive or Send connectors, queues, hygiene, agents, remote and accepted domains, or rules. To create or manage each of the transport features, you must be assigned roles associated with the following role types: • **Receive connectors** `ReceiveConnectors` • **Send connectors** `SendConnectors` • **Transport queues** `TransportQueues` • **Transport hygiene** `TransportHygiene` • **Transport agents** `TransportAgents` • **Remote and accepted domains** `RemoteAndAcceptedDomains` • **Transport rules** `TransportRules`	
`POP3AndIMAP4Protocols`	POP3 and IMAP4 Protocols role	This role type is associated with roles that	Server

		enable administrators to manage POP3 and IMAP4 configuration, such as authentication and connection settings, on individual servers.	
`PublicFolders`	Public Folders role	This role type is associated with roles that enable administrators to manage public folders in an organization. This role type doesn't enable you to manage whether public folders are mail-enabled. To mail-enable or disable a public folder, you must be assigned a role associated with the `MailEnabledPublicFolders` role type.	Organization
`ReceiveConnectors`	Receive Connectors role	This role type is associated with roles that enable administrators to manage transport Receive connector configuration, such as size limits on an individual server.	Server
`RecipientPolicies`	Recipient Policies role	This role type is associated with roles that enable administrators to manage recipient policies,	Organization

		such as provisioning and mobile device policies, in an organization.	
`RemoteAndAcceptedDomains`	Remote and Accepted Domains role	This role type is associated with roles that enable administrators to manage remote and accepted domains in an organization.	Organization
`ResetPassword`	Reset Password role	This role type is associated with roles that enable users to reset their own passwords and administrators to reset users' passwords in an organization.	Organization
`RetentionManagement`	Retention Management role	This role type is associated with roles that enable administrators to manage retention policies in an organization.	Organization
`RoleManagement`	Role Management role	This role type is associated with roles that enable administrators to manage management role groups, role assignment policies, management roles, role entries, assignments, and scopes in an organization. Users assigned roles	Organization

		associated with this role type can override the **role group managed by** property, configure any role group, and add or remove members to or from any role group.	
`SecurityGroupCreationAndMembership`	Security Group Creation and Membership role	This role type is associated with roles that enable administrators to create and manage USGs and their memberships in an organization. If your organization maintains a split permissions model where USG creation and management is performed by a different group from the group that manages Exchange servers, assign roles associated with this role type to that group.	Organization
`SendConnectors`	Send Connectors role	This role type is associated with roles that enable administrators to manage transport Send connectors in an organization.	Organization
`SupportDiagnostics`	Support Diagnostics	This role type is	Organization

	role	associated with roles that enable administrators to perform advanced diagnostics under the direction of Microsoft support services in an organization. **Caution:** Roles associated with this role type grant permissions to cmdlets and scripts that should only be used under the direction of Microsoft Customer Service and Support.	
`TeamMailboxes`	Team Mailboxes role	This role type is associated with roles that enable administrators to define one or more site mailbox provisioning policies and manage site mailboxes in an organization. Administrators assigned roles associated with this role type can manage site mailboxes they don't own.	Organization
`TeamMailboxLifecycleApplication`	TeamMailboxLifecycle Application role	This role type is associated with roles that enable partner applications to update site mailbox lifecycle states in an organization.	Organization

TransportAgents	Transport Agents role	This role type is associated with roles that enable administrators to manage transport agents in an organization.	Organization
TransportHygiene	Transport Hygiene role	This role type is associated with roles that enable administrators to manage anti-spam and anti-malware features in an organization.	Organization
TransportQueues	Transport Queues role	This role type is associated with roles that enable administrators to manage transport queues on an individual server.	Server
TransportRules	Transport Rules role	This role type is associated with roles that enable administrators to manage transport rules in an organization.	Organization
UMMailboxes	UM Mailboxes role	This role type is associated with roles that enable administrators to manage the Unified Messaging (UM) configuration of mailboxes and other recipients in an organization.	Organization

`UMPrompts`	UM Prompts role	This role type is associated with roles that enable administrators to create and manage custom UM voice prompts in an organization.	Organization
`UnifiedMessaging`	Unified Messaging role	This role type is associated with roles that enable administrators to manage Unified Messaging services in an organization. This role doesn't enable you to manage UM-specific mailbox configuration or UM prompts. To manage UM-specific mailbox configuration, use roles associated with the `UMMailboxes` role type. To manage UM prompts, use the roles associated with the `UMPrompts` role type.	Organization
`UnScopedRoleManagement`	Unscoped Role Management role	This role type is associated with roles that enable administrators to create and manage unscoped top-level management roles in an organization.	Organization

UserOptions	User Options role	This role type is associated with roles that enable administrators to view the Outlook Web App options of a user in an organization. Roles associated with this role type can be used to help a user with diagnosing problems with his or her configuration.	Organization
UserApplication	UserApplication role	This role type is associated with roles that enable partner applications to act on behalf of end users in an organization.	Organization
ViewOnlyAuditLogs	View-Only Audit Logs role	This role type is associated with roles that enable administrators to search the administrator audit log in an organization.	Organization
ViewOnlyConfiguration	View-Only Configuration role	This role type is associated with roles that enable administrators to view all of the non-recipient Exchange configuration settings in an organization. Examples of configuration that are viewable are server	Organization

		configuration, transport configuration, database configuration, and organization-wide configuration. Roles associated with this role type can be combined with roles associated with the `ViewOnlyRecipients` role type to create a role that can view every object in an organization.	
`ViewOnlyRecipients`	View-Only Recipients role	This role type is associated with roles that enable administrators to view the configuration of recipients, such as mailboxes, mail users, mail contacts, distribution groups, and dynamic distribution groups. Roles associated with this role type can be combined with roles associated with the `ViewOnlyConfiguration` role type to create a role that can view every object in the organization.	Organization
`WorkloadManagement`	WorkloadManagement role	This role type is associated with roles that enable administrators to	Organization

		manage workload management policies in an organization. Administrators can configure resource health definitions, workload classifications, and enable or disable workload management.	

The following table lists all of the user-focused management role types and their associated built-in management roles in Exchange 2013.

User-focused role types

Management role type	Built-in user-focused roles	Description
`MyBaseOptions`	MyBaseOptions role	This role type is associated with roles that enable individual users to view and modify the basic configuration of their own mailbox and associated settings.
`MyContactInformation`	MyAddressInformation role MyContactInformation role MyMobileInformation role MyPersonalInformation role	This role type is associated with roles that enable individual users to modify their contact information. This information includes their address and phone numbers.
MyCustomApps	My Custom Apps role	This role type is associated with roles that enable individual users to view and modify their custom apps.
MyDiagnostics	MyDiagnostics role	This role type is associated with roles that enable individual

		users to perform basic diagnostics on their mailbox, such as retrieving calendar diagnostic information.
`MyDistributionGroupMembership`	MyDistributionGroupMembership role	This role type is associated with roles that enable individual users to view and modify their membership in distribution groups in an organization, provided that those distribution groups allow manipulation of group membership.
`MyDistributionGroups`	MyDistributionGroups role	This role type is associated with roles that enable individual users to create, modify, and view distribution groups and modify, view, remove, and add members to distribution groups they own.
`MyProfileInformation`	MyDisplayName role MyName role MyProfileInformation role	This role type is associated with roles that enable individual users to modify their name.
MyMarketplaceApps	My Marketplace Apps role	This role type is associated with roles that enable individual users to view and modify their marketplace apps.
`MyRetentionPolicies`	MyRetentionPolicies role	This role type is associated with roles that enable individual users to view their retention

		tags and view and modify their retention tag settings and defaults.
MyTeamMailboxes	MyTeamMailboxes role	This role type is associated with roles that enable individual users to create site mailboxes and connect them to Microsoft SharePoint sites.
`MyTextMessaging`	MyTextMessaging role	This role type is associated with roles that enable individual users to create, view, and modify their text messaging settings.
`MyVoiceMail`	MyVoiceMail role	This role type is associated with roles that enable individual users to view and modify their voice mail settings.

Understanding management role

scopes

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-10-15*

Management role scopes enable you to define the specific scope of impact or influence of a management role when a management role assignment is created. When you apply a scope, the role assignee assigned to the role can only modify the objects contained within that scope. A role assignee can be a management role group, management role, management role assignment policy, user, or universal security group (USG). For more information about management roles, see Understanding Role Based Access Control.

Note:

This topic focuses on advanced RBAC functionality. If you want to manage basic Exchange 2013 permissions, such as using the Exchange admin center (EAC) to add and remove members to and from role groups, create and modify role groups, or create and modify role assignment policies, see Permissions.

Every management role, whether it's a built-in role or a custom role, has management scopes. Management scopes can be either of the following:

- **Regular** A *regular scope* isn't exclusive. It determines where, in Active Directory, objects can be viewed or modified by users assigned the management role. In general, a management role indicates what you can create or modify, and a management role scope indicates where you can create or modify. Regular scopes can be either implicit or explicit scopes, both of which are discussed later in this topic.
- **Exclusive** An *exclusive scope* behaves almost the same as a regular scope. The key difference is that it enables you to deny users access to objects contained within the exclusive scope if those users aren't assigned a role associated with the exclusive scope. All exclusive scopes are explicit scopes, which are discussed later in this topic.

For more information about exclusive scopes, see Understanding exclusive scopes.

Scopes can be inherited from the management role, specified as a predefined relative scope on a management role assignment, or created using custom filters and added to a management role assignment. Scopes inherited from management roles are called *implicit scopes* while predefined and custom scopes are called *explicit scopes*. The following sections describe each type of scope:

- Implicit Scopes
- Explicit Scopes
- Predefined Relative Scopes
- Custom Scopes
  - Recipient Filter Scopes
  - Configuration Scopes

Each role can have the following types of scopes:

- **Recipient read scope** The implicit recipient read scope determines what recipient objects the user assigned the management role is allowed to read from Active Directory.
- **Recipient write scope** The implicit recipient write scope determines what recipient objects the user assigned the management role is allowed to modify in Active Directory.
- **Configuration read scope** The implicit configuration read scope determines what configuration objects the user assigned the management role is allowed to read from Active Directory.
- **Configuration write scope** The implicit configuration write scope determines what organizational, database, and server objects the user assigned the management role is allowed to modify in Active Directory.

Recipient objects include mailboxes, distribution groups, mail enabled users, and other objects. Configuration objects include servers running Microsoft Exchange Server 2013, and databases located on servers running Exchange. Each type of scope can be either an implicit scope or explicit scope.

Implicit scopes

Implicit scopes are the default scopes that apply to a management role type. Because implicit scopes are associated with a management role type, all of the parent and child management roles with the same role type also have the same implicit scopes. Implicit scopes apply to both built-in management roles and also to custom management roles. For more information about management roles and management role types, see Understanding management roles.

The following tables list all of the implicit scopes that can be defined on management roles.

Implicit scopes defined on management roles

Implicit scopes	Description
`Organization`	If `Organization` is present in the role's recipient write scope, the role can create or modify recipient objects across the Exchange organization. If `Organization` is present in the role's recipient read scope, roles can view any recipient object across the Exchange organization. This scope is used only with recipient read and write scopes.
`MyGAL`	If `MyGAL` is present in the role's recipient write scope, the role can view the properties of any

	recipient within the current user's global address list (GAL). If `MyGAL` is present in the role's recipient read scope, the role can view the properties of any recipient within the current GAL. This scope is used only with recipient read scopes.
`Self`	If `Self` is present in the role's recipient write scope, the role can modify only the properties of the current user's mailbox. If `Self` is present in the role's recipient read scope, the role can view only the properties of the current user's mailbox. This scope is used only with recipient read and write scopes.
`MyDistributionGroups`	If `MyDistributionGroups` is present in the role's recipient write scope, the role can create or modify distribution list objects owned by the current user. If `MyDistributionGroups` is present in the role's recipient read scope, the role can view distribution list objects owned by the current user. This scope is used only with recipient read and write scopes.
`OrganizationConfig`	If `OrganizationConfig` is present in the role's configuration write scope, the role can create or modify any server or database configuration object across the Exchange organization. If `OrganizationConfig` is present in the role's

	configuration read scope, the role can view any server or database configuration object across the Exchange organization. This scope is used only with configuration read and write scopes.
None	If None is in a scope, that scope isn't available to the role. For example, a role that has None in the recipient write scope can't modify recipient objects in the Exchange organization.

If a role is assigned to a role assignee and no predefined or custom scopes are specified, the implicit scopes defined on the role are used to control the recipient or organization objects the user can view or modify.

The implicit write scope of a role is always equal to, or less than, the implicit read scope. This means that a role can never modify objects that can't be seen by the scope.

You can't change the implicit scopes defined on management roles. You can, however, override the implicit write scope and configuration scope on a management role. When a predefined relative scope or custom scope is used on a role assignment, the implicit write scope of the role is overridden, and the new scope takes precedence. The implicit read scope of a role can't be overridden and always applies. For more information, see Predefined Relative Scopes and Custom Scopes.

Expand the following table to see a list of all the built-in management roles and their implicit scopes. For more information about each built-in role, see Built-in management roles.

Built-in management role implicit scopes

Explicit scopes

Explicit scopes are scopes that you set yourself to control which objects a management role can modify. Although implicit scopes are defined on a management role, explicit scopes are defined on a management role assignment. This enables the implicit scopes to be applied consistently across all management roles unless you choose to use an overriding explicit scope. For more information about management role assignments, see Understanding management role assignments.

Explicit scopes override the implicit write and configuration scopes of a management role. They don't override the implicit read scope of a management role. The implicit read scope continues to define what objects the management role can read.

Explicit scopes are useful when the implicit write scope of a management role doesn't meet the needs of your business. You can add an explicit scope to include nearly anything you want as long as the new scope doesn't exceed the bounds of the implicit read scope. The cmdlets that are part of a management role must be able to read information about the objects or containers that contain objects for the cmdlets to create or modify objects. For example, if the implicit read scope on a management role is set to `Self`, you can't add an explicit write scope of `Organization` because the explicit write scope exceeds the bounds of the implicit read scope.

For more information, see the following sections:

- Predefined Relative Scopes
- Custom Scopes

Predefined relative scopes

Exchange 2013 provides several predefined relative write scopes that you can use to modify scope of a management role. Predefined relative scopes provide an easy way for you to more closely

match the needs of your business without having to create custom scopes manually. They're called relative scopes because they're relative to the role assignee to which the associated role assignment is assigned. For example, the `Self` predefined relative scope restricts that write scope to the current user only. The `MyDistributionGroups` predefined relative scope restricts the write scope to the distribution group the current user owns only. Predefined relative scopes can only be used to scope recipient objects. Predefined relative scopes can't be used to scope configuration objects. The following table lists the predefined relative scopes that you can use.

Predefined relative scopes

Implicit scopes	Description
`Organization`	If `Organization` is present in the role's recipient write scope, the role can create or modify recipient objects across the Exchange organization. If `Organization` is present in the role's recipient read scope, roles can view any recipient object across the Exchange organization. This scope is used only with recipient read and write scopes.
`Self`	If `Self` is present in the role's recipient write scope, the role can modify only the properties of the current user's mailbox. If `Self` is present in the role's recipient read scope, the role can view only the properties of the current user's mailbox. This scope is used only with recipient read and write scopes.
`MyDistributionGroups`	If `MyDistributionGroups` is present in the role's recipient write scope, the role can create or modify distribution list objects owned by the current user. If `MyDistributionGroups` is present in the

	role's recipient read scope, the role can view distribution list objects owned by the current user. This scope is used only with recipient read and write scopes.

Predefined relative scopes are applied when you create a new management role assignment. During the creation of the role assignment, using the **New-ManagementRoleAssignment** cmdlet, you can specify a predefined relative scope using the *RecipientRelativeWriteScope* parameter. When the new role assignment is created, the new predefined role overrides the implicit write scope of the management role. You can't specify a custom recipient scope when you create a role assignment with a predefined relative scope. You can, however, specify a custom configuration scope if needed.

For more information about how to add a management role assignment with a predefined relative scope, see Add a role to a user or USG.

Custom scopes

Custom scopes are needed when neither the implicit write scope nor the predefined relative scopes meet the needs of your business. Custom scopes enable you to define, at a granular level, the scope to which your management role will be applied. For example, you might want to target a specific organizational unit (OU), a specific type of recipient, or both. Or, you might only want to allow a group of administrators to be able to manage a specific set of mailbox databases.

As with predefined relative scopes, custom scopes override the implicit write and organization configuration scopes defined on management roles. The implicit read scope on management roles continue to apply and the resulting custom scope must not exceed the boundaries of the implicit read scope. You can create the following three types of custom scopes:

- **OU scope** An OU scope, which is the simplest custom scope, is created using the *RecipientOrganizationalUnitScope* parameter on the **New-ManagementRoleAssignment** cmdlet. By specifying an OU scope when a role is assigned, the role assignee assigned the role can modify only recipient objects within that OU. For more information about how to add a management role assignment with an OU scope, see Add a role to a user or USG.
- **Recipient filter scope** Recipient filter scopes use filters to target specific recipients based on recipient type or other recipient properties such as department, manager, location, and more. For more information, see the Recipient Filter Scopes section.
- **Configuration scope** Configuration scopes use filters or lists to target specific servers based on server lists or filterable properties that can be defined on servers, such as an Active Directory site or a server role. Configuration scopes can also use database scopes to target specific databases based on database lists or filterable database properties. For more information, see the

Configuration Scopes section.

Simple and broad or complex and granular recipient and configuration custom scopes can be created by using the **New-ManagementScope** cmdlet. When you create either a recipient or configuration scope, only the recipient, server, or database objects that match their respective scopes are returned. When these scopes are applied to a role assignment using the **New-ManagementRoleAssignment** or **Set-ManagementRoleAssignment** cmdlets, only the objects that match the scopes can be modified by the role assignees who are assigned the role. After a custom scope has been created, you can't change the scope type. A recipient scope is always a recipient scope and a configuration scope is always a configuration scope.

By default, a custom scope enables a role assignee to access a set of objects that match the scopes you define. However, they don't actively exclude access to other role assignees who aren't also assigned the same or equivalent scope. Any custom scope can access the same objects if the lists or filters on those scopes match the same objects. There might be objects where this behavior isn't wanted, such as in the case of executives. For these objects, you can define exclusive scopes. Exclusive scopes use filters or lists in the same way as regular scopes but unlike regular scopes, deny access to objects included in the scope to anyone who isn't part of the same or equivalent exclusive scope. For more information about exclusive scopes, see Understanding exclusive scopes.

Recipient filter scopes

Recipient filter scopes enable you to control which recipient objects role assignees can manage by evaluating one or more properties on a recipient object against a value that you specify in a filter statement. Recipients included in recipient scopes are mailboxes, mail-enabled users, distribution groups and mail contacts. Only the recipients that match the filter you specify can be managed by the role assignees assigned that role assignment. An example of a filter statement is `{ Name -Eq "David" }` where **Name** is the property on the recipient object that's being evaluated and **David** is the value you want to evaluate against the property. The **-Eq** comparison operator indicates that the value stored in the property must be equal to the value that was specified for the filter to be true. If the filter is true, that recipient is included in scope.

Recipient filter scopes are created by specifying the recipient filter to use with the *RecipientRestrictionFilter* parameter on the **New-ManagementScope** cmdlet. By default, the **New-ManagementScope** cmdlet creates regular scopes. If you want to create an exclusive scope, include the *Exclusive* switch along with the *RecipientRestrictionFilter* parameter.

When you create a recipient restriction filter, Exchange evaluates the filter you provided against every recipient object in the organization by default. If you want to limit which recipients the scope evaluates, you can use the *RecipientRoot* parameter along with the *RecipientRestrictionFilter* parameter. The *RecipientRoot* parameter accepts an OU. When you use the *RecipientRoot* parameter, Exchange evaluates only the recipients included in the specified OU against the filter you provided.

When you add a recipient filter scope to a role assignment, specify the name of the recipient scope in the *CustomRecipientWriteScope* parameter on the **New-ManagementRoleAssignment** if you're

creating a new role assignment, or the **Set-ManagementRoleAssignment** cmdlet if you're updating an existing role assignment. Each role assignment can have one recipient scope, including predefined relative scopes. You can add one configuration scope to the same role assignment you added a recipient scope to.

For more information about filter syntax and for a full list of filterable recipient properties on recipients, see Understanding management role scope filters.

Configuration scopes

The following are the two types of configuration scopes offered in Exchange 2013:

- **Server scopes** There are two types of server scopes, server filter scopes and server list scopes. Server configuration, including Receive connectors, transport queues, server certificates, virtual directories, and so on, can be managed if a server object is included in a server scope.
  - **Server filter scopes** Server filter scopes enable you to control which server objects role assignees can manage by evaluating one or more properties on a server object against a value that you specify in a filter statement. To create a server filter scope, use the *ServerRestrictionFilter* parameter on the **New-ManagementScope** cmdlet.
  - **Server list scopes** Server list scopes enable you to control which server objects role assignees can manage by defining a list of servers that a role assignee can access. To create a server list scope, use the *ServerList* parameter on the **New-ManagementScope** cmdlet.
- **Database scopes** There are two types of database scopes, database filter scopes and database list scopes. Database configuration that can be managed if a database object is included in a database scope include database quota limits, database maintenance, public folder replication, whether a database is mounted, and so on. In addition to database configuration, database scopes can also be used to control which databases recipients can be created in. If you have pre-Exchange 2010 SP1 servers in your organization, see the Database scopes and previous versions of Exchange section later in this topic.
  - **Database filter scopes** Database filter scopes enable you to control which database objects role assignees can manage by evaluating one or more properties on a database object against a value that you specify in a filter statement. To create a database filter scope, use the *DatabaseRestrictionFilter* parameter on the **New-ManagementScope** cmdlet.
  - **Database list scopes** Database list scopes enable you to control which database objects role assignees can manage by defining a list of databases that a role assignee can access. To create a database list scope, use the *DatabaseList* parameter on the **New-ManagementScope** cmdlet.

For more information about filter syntax and for a full list of filterable server and database properties, see Understanding management role scope filters.

Server and database lists can be defined by specifying each server and database you want to include in their respective scopes. Multiple servers or databases can be specified in their respective scopes by separating the server and database names with commas.

When you add a server or database configuration scope to a role assignment, specify the name of

the server or database configuration scope in the *CustomConfigWriteScope* parameter on the **New-ManagementRoleAssignment** cmdlet if you're creating a new role assignment, or the **Set-ManagementRoleAssignment** cmdlet if you're updating an existing role assignment. Each role assignment can only have one configuration scope.

In addition to controlling which databases role assignees can manage, database scopes also enable you to control which databases role assignees can create mailboxes on. This is separate from controlling which recipients a role assignee can manage. If a role assignee has permissions to create a new mailbox, mail-enable an existing user, or move mailboxes, you can further refine their permissions by using database scopes to control the database on which the mailbox is created, or which database a mailbox is moved to. Controlling which recipients a role assignee can manage is done using a recipient scope specified in the *CustomRecipientWriteScope* parameter on the **New-ManagementRoleAssignment** or **Set-ManagementRoleAssignment** cmdlet. Controlling which databases a mailbox can be created on or moved to is controlled using a database scope specified in the *CustomConfigurationWriteScope* parameter on the same cmdlets.

Note:
Automatic mailbox distribution can be controlled using database scopes.

Exchange features may require either server scopes, database scopes, or both, to be managed. If a feature requires both server and database scopes to be managed, two role assignments must be created and assigned to the role assignee that should have access to manage the feature. One role assignment should be associated with the server scope, and one role assignment should be associated with the database scope.

Some cmdlets may use configuration scopes that aren't immediately obvious. The following table includes a list of cmdlets and the configuration scopes that you can use to control their usage. For cmdlets included in the recipients feature area, configuration scopes enable you to control on which databases recipients can be created. They don't control which recipients can be managed. The **Required scopes** column can contain the following:

- **Database** To run the cmdlet, the role assignee must be assigned a role assignment with a database scope that includes the database to be managed or the role's implicit configuration write scope must include the database to be managed.
- **Server** To run the cmdlet, the role assignee must be assigned a role assignment with a server scope that includes the server to be managed or the role's implicit configuration write scope must include the server to be managed.
- **Server or database** To run the cmdlet, the role assignee must be assigned a role assignment where either a database scope includes the database being managed, or where a server scope includes the server where the database is located. Or, the role's implicit configuration write scope must contain the database to be managed, or contain the server where the database is located, and the role assignment can't have a custom write scope.
- **Server and database** To run this cmdlet, the role assignee must be assigned two role assignments. The first role assignment must include a database scope that includes the database to be managed. The second role assignment must include a server scope that includes the server

where the database is located. The role assignments can have custom configuration scopes defined, or the role assignments can inherit the implicit configuration write scope from the role. To inherit the implicit write scope from the role, the role assignment can't have a custom write scope.

Feature areas and applicable database and server scopes

Feature area	Cmdlet	Required scopes
Databases	**Dismount-Database**	Database
Databases	**Mount-Database**	Database
Databases	**Move-DatabasePath**	Server and database
Databases	**Remove-MailboxDatabase**	Server or database
Databases	**Set-MailboxDatabase**	Database
High availability	**Add-DatabaseAvailabilityGroupServer**	Server
High availability	**Add-MailboxDatabaseCopy**	Server
High availability	**Move-ActiveMailboxDatabase**	Server
High availability	**Remove-DatabaseAvailabilityGroupServer**	Server
High availability	**Remove-MailboxDatabaseCopy**	Server or database
High availability	**Resume-MailboxDatabaseCopy**	Server or database
High availability	**Set-MailboxDatabaseCopy**	Server or database
High availability	**Suspend-MailboxDatabaseCopy**	Server or database

High availability	**Update-MailboxDatabaseCopy**	Server or database
Recipients	**Connect-Mailbox**	Database
Recipients	**Enable-Mailbox**	Database
Recipients	**New-Mailbox**	Database
Recipients	**New-MoveRequest**	Database
Troubleshooting	**Test-MapiConnectivity**	Database

Database scopes and previous versions of Exchange

Database scopes were first introduced in Microsoft Exchange 2010 Service Pack 1 (SP1) and continue to be supported in Exchange 2013. Versions of Exchange prior to Exchange 2010 SP1 support only recipient scopes and server configuration scopes. When you create a new database scope on an Exchange 2010 SP1 or later server, you'll receive the following warning:

```
WARNING: Database management scopes will only be applied
when a user connects to a server running Exchange 2010 SP1
or later. Servers running a version of Exchange prior to
Exchange 2010 SP1 won't apply any roles from a role
assignment linked to a database scope. Database management
scopes also won't be visible to the Get-ManagementScope
cmdlet when it's run from a pre-Exchange 2010 SP1 server.
```

When you create a database scope, it's only applied to users who connect to servers running Exchange 2010 SP1 or later. Users who connect to pre-Exchange 2010 SP1 servers won't have any role assignments associated with database scopes applied to them. This means that any permissions provided by these role assignments won't be granted to users when they connect to pre-Exchange 2010 SP1 servers. Database scopes can't be created, removed, modified, or viewed from pre-Exchange 2010 SP1 servers.

A database scope can include any database in your Exchange organization. This includes Exchange Server 2007, Exchange 2010, and Exchange 2013 servers. This enables you to control which databases, regardless of Exchange version, that users can manage. As with other database scopes, role assignments associated with database scopes that contain Exchange 2007 and Exchange 2010 databases are only applied to users when they connect to an Exchange 2010 SP1 or later server.

Users who connect to a pre-Exchange 2010 SP1 server can view and modify role assignments associated with database scopes. This includes changing the configuration scope on an existing

role assignment to a server scope if it's currently associated with a database scope. However, if the configuration scope on a role assignment is changed to a server scope and a user later wants to change it back to a database scope, or if the user wants to change the configuration scope to another database scope, the user must make the change while connected to an Exchange 2010 SP1 or later server. Users can only specify server scopes when they change the configuration scope on a role assignment if they're connected to a pre-Exchange 2010 SP1 server.

Understanding management role scope filters

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-29*

Management role scope filters can be used to define management scopes that are highly customizable. Using scope filters, you can create a scope that matches how you segment your recipients, databases, and servers so that administrators can manage only those objects they should have access to. Scope filters can use nearly any recipient, database, or server object property.

To use management role scope filters, you must be familiar with management role scopes. For more information about management role scopes, see Understanding management role scopes.

Filtered custom scopes in Microsoft Exchange Server 2013 are created by using the **New-ManagementScope** cmdlet. The two types of filtered scopes, recipient and configuration (which consists of server and database scopes), are divided into regular scopes and exclusive scopes. The following list shows which parameter on the **New-ManagementScope** cmdlet to use to create each type of filtered scope:

- **Recipient regular filtered scope** To create this type of filtered scope, use the *RecipientRestrictionFilter* parameter.
- **Recipient exclusive filtered scope** To create this type of filtered scope, use the *RecipientRestrictionFilter* parameter along with the *Exclusive* switch.
- **Server-based configuration regular filtered scope** To create this type of filtered scope, use the *ServerRestrictionFilter* parameter.
- **Server-based configuration exclusive filtered scope** To create this type of filtered scope, use the *ServerRestrictionFilter* parameter along with the *Exclusive* switch.
- **Database-based configuration regular filtered scope** To create this type of filtered scope, use the *DatabaseRestrictionFilter* parameter.
- **Database-based configuration exclusive filtered scope** To create this type of filtered scope, use the *DatabaseRestrictionFilter* parameter along with the *Exclusive* switch.

When you create a filtered custom scope, the scope attempts to match the filter with any objects accessible within the implicit read scope of the management role. If an object is found, it's included in the results returned by the filter, and the object is made available to the management role by the custom scope. A filter can't return results that are outside of the implicit read scope of the management role.

If you specify a recipient filter using the *RecipientRestrictionFilter* parameter, you can use the *RecipientRoot* parameter to specify an organizational unit (OU) to restrict the filter to. When you specify an OU in the *RecipientRoot* parameter, the recipient filter attempts to match recipients that reside in that OU only, rather than within the entire implicit read scope.

To create a management scope using the filterable properties included in this topic, see Create a regular or exclusive scope.

Filter syntax

Both recipient and configuration filters use the same syntax to create a filter query. All filter queries must have, at minimum, the following components:

- **Opening bracket** The opening brace ({) indicates the start of the filter query.
- **Property to examine** The property is the value on an object that you want to test. For example, this can be the city or department on a recipient object, an Active Directory site name or server name on a server configuration object, or a database name on a database configuration object.
- **Comparison operator** The comparison operator directs how the query should evaluate the value that you specify against the value that's stored in the property. For example, comparison operators can be **Eq**, which means equal to; **Ne**, which means not equal to; **Like**, which means similar to, and so on. For a full list of operators that you can use in the Exchange Management Shell, see Comparison operators.
- **Value to compare** The value you specify in the filter query will be compared to the value that's stored in the property you specified. The value you specify must be enclosed in quotation marks ("). If you want to specify a partial string, you can enclose the string you provide in wildcard characters (*) and use a comparison operator that supports wildcard characters, such as **Like**. Any string that contains the partial string will match the filter query.
- **Closing bracket** The closing brace (}) indicates the end of the filter query.

The following components are optional and enable you to create more complex filter queries:

- **Parentheses** As in mathematics, parentheses, ( ), in a filter query enable you to force the order in which an operation occurs. Innermost parentheses are evaluated first and the filter query works outward to the outermost parentheses.
- **Logical operators** Logical operators tie together one or more comparison operations and require the filter query to evaluate the entire statement. For example, logical operators include **And**, **Or**, and **Not**.

When put together, a simple query looks like `{ City -Eq "Vancouver" }`. This filter matches any recipient where the value in the property **City** equals the string "Vancouver".

Another, more complex, query is `{ ((City -Eq "Vancouver") -And (Department -Eq "Sales")) -Or (Title -Like "*Manager*") }`. The filter query is evaluated in the following order:

1. The properties **City** and **Department** are evaluated. Each is set to either `True` or `False`, depending on the values stored in each property.
2. The results of the **City** and **Department** statements are then evaluated. If both are `True`, the entire **And** statement becomes `True`. If one or both are `False`, the entire **And** statement becomes `False`. The following applies:
   - If the **And** statement evaluates as `True`, the entire filter query becomes `True` because the **Or** operator indicates that one side of the query, or the other, must be `True`. The object is exposed to the role assignment.
   - If the **And** statement is `False`, the filter query continues on to evaluate the **Title** property.
3. The **Title** property is then evaluated. It's set to `True` or `False`, depending on the value that's stored in the **Title** property. The following applies:
   - If the **Title** property evaluates as `True`, the entire filter query becomes `True` because the **Or** operator indicates that one side of the query, or the other, must be `True`. The object is exposed to the role assignment.
   - If the **Title** property evaluates as `False`, the entire filter query evaluates as `False`, and the object isn't exposed to the role assignment.

The following table shows an example with values, which indicates when the complex query would evaluate as `True`, and when it would evaluate as `False`.

Complex query

City	Department	Title	Result
Vancouver (True)	Sales (True)	CEO (False)	True because both **City** and **Department** evaluated as True. **Title** isn't evaluated because the filter query conditions are already satisfied.
Seattle (False)	Sales (True)	IT Manager (True)	True because **Title** evaluated as True. The results of the **City** and **Department** comparison are discarded because **Title** evaluated as True, which

			satisfied the filter query conditions. **Note:** IT Manager matches the filter query because the **Like** comparison operator was used, which matches partial strings when wildcard characters (*) are used in the filter query.
Vancouver (True)	Marketing (False)	Writer (False)	False because **City** and **Department** didn't both evaluate as True, and **Title** also didn't evaluate as True.

Filterable recipient properties

You can use almost any property on a recipient object when you create a recipient filter. For a list of filterable recipient properties, see Filterable properties for the -RecipientFilter parameter. Although this topic discusses the properties that can be used with the *RecipientFilter* parameter on other cmdlets, most of these properties also work with the *RecipientRestrictionFilter* parameter on the **New-ManagementScope** cmdlet.

Filterable server properties

You can use the following server properties when you create a management scope with the *ServerRestrictionFilter* parameter:

- **CurrentServerRole**
- **CustomerFeedbackEnabled**
- **DataPath**
- **DistinguishedName**
- **ExchangeLegacyDN**
- **ExchangeLegacyServerRole**
- **ExchangeVersion**
- **Fqdn**
- **Guid**
- **InternetWebProxy**

- **Name**
- **NetworkAddress**
- **ObjectCategory**
- **ObjectClass**
- **ProductID**
- **ServerRole**
- **ServerSite**
- **WhenChanged**
- **WhenChangedUTC**
- **WhenCreated**
- **WhenCreatedUTC**

Filterable database properties

You can use the following database properties when you create a management scope with the *DatabaseRestrictionFilter* parameter:

- **AdminDisplayName**
- **AllowFileRestore**
- **BackgroundDatabaseMaintenance**
- **CircularLoggingEnabled**
- **DatabaseCreated**
- **DeletedItemRetention**
- **Description**
- **DistinguishedName**
- **EdbFilePath**
- **EventHistoryRetentionPeriod**
- **ExchangeLegacyDN**
- **ExchangeVersion**
- **Guid**
- **IssueWarningQuota**
- **LogFilePrefix**
- **LogFileSize**
- **LogFolderPath**
- **MasterServerOrAvailabilityGroup**
- **MountAtStartup**
- **Name**
- **ObjectCategory**
- **ObjectClass**
- **RetainDeletedItemsUntilBackup**
- **Server**
- **WhenChanged**
- **WhenChangedUTC**

- **WhenCreated**
- **WhenCreatedUTC**

Understanding exclusive scopes

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-12-05*

Exclusive scopes are a special type of explicit management scope that can be associated with management role assignments. Exclusive scopes are designed to enable situations where you have a group of highly valuable objects, such as a CEO mailbox, and you want to tightly control who has access to manage those objects.

A role assignment that has an exclusive scope is called an *exclusive role assignment*.

When you create an exclusive scope, only those who are assigned that exclusive scope, or an equivalent exclusive scope, can modify the objects that match the scope. Role assignees who aren't assigned that exclusive scope, or an equivalent, can't modify the objects that match the scope, even if their own roles have scopes that would otherwise include the objects. Exclusive scopes override any other regular scope that isn't exclusive. This behavior is similar to how a deny access control entry (ACE) on an Active Directory access control list (ACL) functions.

An *equivalent exclusive scope* refers to another exclusive scope that matches some of the same objects as another exclusive scope. The scopes don't have to match the same complete set of objects. Both scopes may be able to modify some, or all, of the objects that match them.

Creating exclusive scopes

Exclusive scopes can be created like any other explicit scope. You can specify a prebuilt relative scope; a recipient, database, or server filter; or a database or server list. Unlike regular scopes, which don't take effect until you associate a scope to a management role assignment, the deny aspect of an exclusive scope takes effect immediately. This means that as soon as an exclusive scope is created, the objects contained within that scope are immediately no longer accessible by any user until the role assignment has been created.

After the assignment has been created, the exclusive scope provides access to those assigned the management role and scope. If another equivalent exclusive scope matches the same objects, the role assignment associated with that exclusive scope is still able to access the objects.

For more information about management scope filters, see Understanding management role scope filters.

Important:
Active Directory replication times should be taken into account when making changes to any management role components, including exclusive scopes.

If you have objects contained within more than one exclusive scope, being assigned to any one of the exclusive scopes provides access to the objects. For more information, see Exclusive and regular scope interaction later in this topic.

Exclusive scopes control only the explicit recipient or configuration write scope of a role assignment. The implicit recipient or configuration read scope of the role assigned to a user or group still applies. This means that the following applies:

- Those assigned a role continue to see objects that match the role's implicit read scope.
- Those assigned other roles may be able to see objects contained within an exclusive scope, if the read scopes of the other roles include the objects. However, the objects can only be modified by those who are assigned a role associated with the exclusive scope.

Exclusive scopes can only be used with administrative or specialist roles and can't be used with end-user roles. For more information about roles, see Understanding management roles.

Exclusive and regular scope interaction

The figure at the end of this section illustrates how exclusive scopes interact with each other, and with regular scopes. The users in the figure all have the following attributes associated with them.

User	City	Title	Department
Terry	Vancouver	Accountant	Accounting
David	Vancouver	Writer	Marketing
Walter	Vancouver	Manager	Marketing
Bob	Vancouver	CEO	Board
Christine	Vancouver	President	Board
Fred	Vancouver	CFO	Executives
Martin	Vancouver	CIO	Executives
Kim	Vancouver	Vice President, Operations	Executives
Jennifer	Vancouver	Vice President, Technology	Executives

The following three management role assignments in the figure manage the users in the preceding table. Each has an associated scope, some of which are exclusive scopes.

Role assignment	Scope filter	Exclusive or regular
Recipient Administrators	City = Vancouver	Regular
VIP Administrators	Title = CEO or CFO or CIO or President	Exclusive
Executive Administrators	Department = Executives	Exclusive

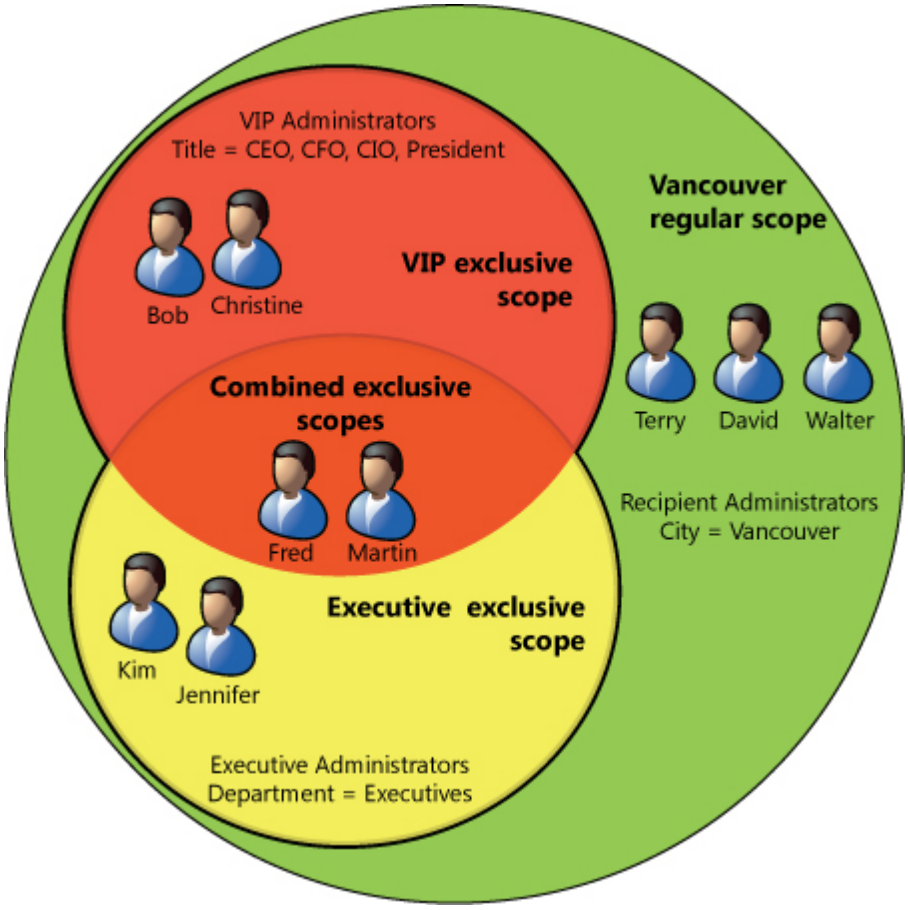
The Recipient Administrators role assignment has a scope that matches all of the users because every user is located in Vancouver. Without any exclusive scopes, this would mean that the Recipient Administrators role assignment could manage any of the users. However, this organization has created two exclusive scopes: VIP Administrators and Executive Administrators. These exclusive scopes restrict who can manage the users that match their respective scope filters. The VIP Administrators role assignment has a scope filter that matches any user who has a title of CEO, CFO, CIO, or President. The Executive Administrators role assignment has a scope filter that matches any user who is in the Executives department.

When the regular and exclusive scopes are evaluated, the following is the result:

- The Recipient Administrators role assignment can manage the users Terry, David, and Walter. This role assignment can't manage any of the other users because they match the exclusive scope filters of the VIP Administrators and Executive Administrators role assignments.
- The VIP Administrators role assignment can manage the users Bob, Christine, Fred, and Martin. This is because the exclusive scope filter associated with this role assignment matches the attributes on these objects. This role assignment can't manage the users Kim and Jennifer because their attributes don't match this exclusive scope.
- The Executive Administrators role assignment can manage the users Kim, Jennifer, Fred, and Martin. This is because the exclusive scope filter associated with this role assignment matches the attributes on these objects. This role assignment can't manage the users Bob and Christine because their attributes don't match this exclusive scope.

Notice that Fred and Martin are accessible by both exclusive scopes. This is because the attributes on these users match the filters of both exclusive scopes.

Interaction between exclusive scopes and regular scopes



For more information about management scopes, see Understanding management role scopes.

Understanding management role assignments

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-10-04*

A *management role assignment*, which is part of the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013, is the link between a management role and a role assignee. A *role assignee* is a role group, role assignment policy, user, or universal security group (USG). A role must be assigned to a role assignee for it to take effect. For more information about RBAC, see Understanding Role Based Access Control.

Note:

This topic focuses on advanced RBAC functionality. If you want to manage basic Exchange 2013 permissions, such as using the Exchange admin center (EAC) to add and remove members to and from role groups, create and modify role groups, or create and modify role assignment policies, see Permissions.

This topic discusses the assignment of roles to role groups and role assignment policies and direct role assignment to users and USGs. It doesn't talk about assignment of role groups or role assignment policies to users. For more information about role groups and role assignment policies, which are the recommended way to assign permissions to users, see the following topics:

- Understanding management role groups
- Understanding management role assignment policies

You can create the following types of role assignments, which are explained in detail later in this topic:

- Regular and delegating role assignments
- Exclusive role assignments

Managing role assignments

When you change role assignments, the changes you make will probably be between role groups and role assignment policies. By adding, removing, or modifying role assignments to or from these role assignees, you can control what permissions are given to your administrators and users, in effect turning on and off management of related features.

You might also want to assign roles directly to users or USGs. This is a more advanced task that enables you to define at a granular level what permissions your users are given. Although this provides you with flexibility, it also increases the complexity of your permissions model. For example, if the user changes jobs, you might need to manually reassign the roles assigned to that user to another user. This is why we recommend that you use role groups and role assignment policies to give permissions to your users. You can assign the roles to a role group or role assignment policy, and then just add or remove members of the role group, or change role assignment policies as needed.

You can add, remove, and enable role assignments, modify the management scope on an existing role assignment, and move role assignments to other role assignees. The process of assigning roles to role groups, role assignment policies, users, and USGs is largely the same for each role assignee. The following are the only exceptions:

- Role assignment policies can only be assigned end-user management roles.
- Role assignment policies can't be assigned delegating role assignments.
- You can't specify a management scope when creating a role assignment to role assignment policies.

For more information about managing role assignments, see the following topics:

- Role groups:
  - Manage role groups
- Role assignment policies:
  - Manage role assignment policies
  - Change a role assignment
- Users and USGs:
  - Add a role to a user or USG

- Remove a role from a user or USG
- Change a role assignment
- Change a role scope
- Delegate role assignments

Regular and delegating role assignments

Regular role assignments enable the role assignee to access the management role entries made available by the associated management role. If multiple management roles are assigned to a role assignee, the management role entries from each management role are aggregated and applied. This means that if a role assignee is assigned the Transport Rules and Journaling roles, the roles are combined, and all the associated management role entries are given to the role assignee. If the role assignee is a role group or role assignment policy, the permissions provided by the roles are then given to the users assigned to the role group or role assignment policy. For more information about management roles and role entries, see Understanding management roles.

Delegating role assignments doesn't give access to manage features. Delegating role assignments gives a role assignee the ability to assign the specified role to other role assignees. If the role assignee is a role group, any member of the role group can assign the role to another role assignee. By default, only the Organization Management role group has the ability to assign roles to other role assignees. Only the user that installed Exchange 2013 is a member of the Organization Management role group by default. You can, however, add other users to this role group as needed, or create other role groups and assign delegating role assignments to those groups.

Note:

Delegating role assignments enables role assignees to delegate management roles to other role assignees. This doesn't enable users to delegate role groups. For more information about role group delegation, see Understanding management role groups.

If you want a user to be able to manage a feature and assign the role that gives permissions to use the feature to other users, assign the following:

1. A regular role assignment for each management role that grants access to the features that need to be managed.
2. A delegating role assignment for each management role that you allow to be assigned to other role assignees.

The regular and delegating role assignments for a role assignee don't need to be identical. For example, a user is a member of a role group assigned the Transport Rules role using a regular role assignment. This enables the user to manage the Transport Rules feature. However the user isn't assigned a delegating role assignment for the Transport Rules role so the user can't assign this role to other users. However, the user is a member of a role group assigned the Journaling management role using a delegating role assignment. The role group the user is a member of doesn't have a regular role assignment for the Journaling role but because it has a delegating role assignment, the user can assign the role to other role assignees.

Management scopes

When you create either a regular or delegating management role assignment, you have the option of creating the assignment with a management scope to limit the objects that the user can manipulate. You can create recipient scopes or configuration scopes. Recipient scopes enable you to control who can manipulate mailboxes, mail users, distribution groups, and so on. Configuration scopes enable you to control who can manipulate servers and databases.

Recipient and configuration scopes enable you to segment the management of server, database or recipient objects in your organization. For example, a recipient scope can be added to a role assignment so that administrators in Vancouver can only manage recipients in the same office. A server configuration scope could be added to a different role assignment so that administrators in Sydney can only manage servers in their Active Directory site.

Scopes enable permissions to be assigned to groups of users and enable you to direct where those administrators can perform their administration. This enables you to create a permissions model that maps to your geographic or organizational boundaries.

You can create an assignment with a predefined scope, or you can add a custom scope to the assignment. Predefined scopes, such as limiting a user to only his or her mailbox or distribution groups, can be applied using options available on the assignment itself. Alternatively, you can create a custom recipient or configuration scope, and then add that scope to the role assignment. Custom scopes give you more granularity over which objects are included in the scope.

You can't specify predefined and custom scopes on the same assignment. You also can't mix exclusive and regular scopes on the same assignment.

Each role assignment can only have one recipient scope and one configuration scope. If you want to apply more than one recipient scope, or one configuration scope, to a role assignee for the same management role, you must create multiple role assignments.

With neither a custom or predefined scope, role assignments are limited to the recipient and configuration scopes that are defined on the role itself. These scopes are called implicit scopes. Any role assignment that doesn't have a predefined or custom scope inherits the implicit scopes from the role it's associated with.

For more information about scopes, see Understanding management role scopes.

Exclusive role assignments

Exclusive role assignments are created when you associate an exclusive scope with a role assignment. Exclusive scopes work like regular scopes and enable role assignees to manage recipients that match the exclusive scope. However, unlike regular scopes, all other role assignees are denied the ability to manage the recipient, even if the recipient matches scopes applied to their role assignments. This can be useful when you want to limit who can manage a recipient to a few administrators. Only those specific administrators can manage the recipient, and all other

administrators are denied access.

For example, consider the following:

- John is an executive at Contoso. His mailbox matches an exclusive scope called VIP Users, which is associated with the VIP Restricted exclusive assignment.
- John's mailbox is also included in a regular scope called Redmond Users, which is associated with the Redmond Administration regular assignment.
- Bill is an administrator who is associated with the VIP Restricted exclusive assignment.
- Chris is an administrator who is associated with the Redmond Administration regular assignment.

Because John's mailbox matches the VIP Users exclusive scope, only Bill can manage his mailbox. Even though John's mailbox also matches the Redmond Users regular scope, Chris isn't associated with the VIP Restricted exclusive assignment. Therefore, Exchange denies Chris the ability to manage John's mailbox. For Chris to manage John's mailbox, Chris needs to be assigned an exclusive assignment that has an exclusive scope that matches John's mailbox.

For more information, see Understanding exclusive scopes.

Built-in role groups

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-08-21*

Microsoft Exchange Server 2013 includes several management role groups by default. The following built-in role groups provide you with a preconfigured set of roles that you can assign to various administrator and specialist users in your organization.

Note:

Role groups don't control access to end-user mailbox features. To control access to end-user mailbox features, see Understanding management role assignment policies.

- Organization Management
- View-only Organization Management
- Recipient Management
- UM Management
- Help Desk
- Hygiene Management
- Compliance Management
- Records Management
- Discovery Management
- Public Folder Management
- Server Management

- Delegated Setup

For more information about role groups, see Understanding management role groups.

Organization Management

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Organization Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Administrators that are members of the Organization Management role group have administrative access to the entire Exchange 2013 organization and can perform almost any task against any Exchange 2013 object, with some exceptions. By default, members of this role group can't perform mailbox searches and management of unscoped top-level management roles. For more information, see the "Delegating Only Role Assignments" section later in this topic.

Important:
The Organization Management role group is a very powerful role and as such, only users or universal security groups (USGs) that perform organizational-level administrative tasks that can potentially impact the entire Exchange organization should be members of this role group.

This role group is equivalent to the Exchange Organization Administrators role in Exchange Server 2007.

For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

By default, the account that's used to install Exchange 2013 in the organization is added as a member of the Organization Management role group. This account can then add other members to the role group as needed.

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group

delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or USGs that are members of this role group.

```
Get-RoleGroupMember "Organization Management"
```

For more information about the members of a role group, see Manage role groups.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the “Create a role group” section in Manage role groups.

The following are some ways you might want to customize this role:

- **Permissions owner** If the permissions in your organization are controlled by a specific group other than the Exchange administrators, you can create a role group and move the regular and delegating role assignments for the Role Management role to the new role group. Doing so prevents members of the Organization Management role group from managing any RBAC permissions.
- **Active Directory split permissions** If the creation of security principals in your organization, such as user accounts, is controlled by a specific group other than the Exchange administrators, you can create a role group and move the regular and delegating role assignments for the Mail Recipient Creation role and the Security Group Creation and Membership role to the new role group. Doing so prevents members of the Organization Management role group from creating

Active Directory objects. They can, however, continue to mail-enable the new Active Directory objects. For more information about split permissions, see Understanding split permissions.

Customization limitations

Any role can be added to or removed from this role group, with the following limitations:

- Every role must have at least one delegating role assignment to a role group or USG before the delegating role assignment can be removed from this role group.
- The Role Management role must have at least one regular role assignment to a role group or USG before the regular role assignment can be removed from this role group.

These limitations are intended to help prevent you from inadvertently locking yourself out of the system. By requiring that at least one delegating role assignment exists between every role and one or more role groups or USGs, you will always be able to assign roles to role assignees. By requiring that at least one regular role assignment exists between the Role Management role and one or more role groups or USGs, you will always be able to configure role groups and role assignments.

Important:
These limitations require that role groups or USGs be the targets of the delegating and regular role assignments. You can't remove a delegating role assignment or the regular assignment for the Role Management role if the last assignment is to a user.

Delegating only role assignments

Some role assignments between the Organization Management role group and management roles, such as Mailbox Search and Unscoped Role Management, are delegating only role assignments. These roles allow access to sensitive or personal information, such as the contents of mailboxes, or enable the creation of powerful unscoped management roles.

Delegating only role assignments enable members of the Organization Management role group only to assign the associated roles to other role groups, management role assignment policies, users, or USGs. Members of the Organization Management role group aren't given, by default, any permissions that the roles provide. This helps avoid accidental exposure to personal information or accidental elevation of privileges.

Members of the Organization Management role group can, however, assign themselves any role, in effect enabling them to perform any task. For example, a member of the Organization Management role group can assign the Mailbox Search role to the Organization Management role group. After this role assignment is made, members of the Organization Management role group can perform tasks enabled by the Mailbox Search role.

For more information about delegating role assignments, see Understanding management role assignments.

Additional permissions

The permissions granted to members of the Organization Management role group are primarily determined by the management roles assigned to the role group. However, not all tasks that you need to perform are covered by management roles. Some tasks occur outside of the Exchange management tools, and therefore the RBAC permissions model doesn't apply. For these tasks, permissions are provided by adding the Organization Management role group to the access control lists (ACLs) of certain Active Directory objects.

The following tasks are granted permissions by way of ACLs on Active Directory objects and not by management roles assigned to the Organization Management role group:

- Running DomainPrep and ForestPrep using Setup.exe
- Deploying additional servers in the organization

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Management roles assigned to this role group

View-only Organization Management

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The View-Only Organization Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Administrators who are members of the View-Only Organization Management role group can view the properties of any object in the Exchange organization.

This role is equivalent to the Exchange View-Only Administrators role in Microsoft Exchange Server 2007.

For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "View-Only Organization Management"
```

For more information about the members of a role group, see View the members of a role group in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the “Create a role group” section in Manage role groups.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.

- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Management roles assigned to this role group

Management role	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope

View-Only Configuration role	X		Organization	None	OrganizationConfig	None
View-Only Recipients role	X		Organization	None	OrganizationConfig	None

Recipient Management

Permissions > Understanding Role Based Access Control > Built-in role groups >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Recipient Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Administrators who are members of the Recipient Management role group have administrative

access to create or modify Exchange 2013 recipients within the Exchange 2013 organization.

This role group is equivalent to the Exchange Recipient Administrators role in Exchange Server 2007.

For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "Recipient Management"
```

For more information about the members of a role group, see View the members of a role group in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the "Create a role group" section in Manage role groups.

If the creation of security principals in your organization, such as user accounts, is controlled by a specific group other than the Exchange administrators, you can create a role group and move the Mail Recipient Creation role and the Security Group Creation and Membership role to the new role group. Doing so prevents members of the Recipient Management role group from creating Active Directory objects. They can, however, continue to mail-enable the new Active Directory objects. For more information about split permissions, see Understanding split permissions.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Management roles assigned to this role group

UM Management

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The UM Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Administrators who are members of the UM Management role group can manage features in the Exchange organization such as Unified Messaging (UM) service configuration, UM properties on mailboxes, UM prompts, and UM auto attendant configuration.

For more information about Unified Messaging, see Unified Messaging.

For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "UM Management"
```

For more information about the members of a role group, see the “View the members of a role group” section in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the “Create a role group” section in Manage role groups.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Management roles assigned to this role group

Management role	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope

UM Prompts role	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Unified Messaging role	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Help Desk

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Help Desk management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Users who are members of the Help Desk role group can perform limited recipient management of Exchange 2013 recipients.

The Help Desk role group, by default, enables members to view and modify the Outlook Web App options of any user in the organization. These options might include modifying the user's display name, address, phone number, and so on. They don't include options that aren't available in Outlook Web App options, such as modifying the size of a mailbox or configuring the mailbox database on which a mailbox is located.

The members of this role group can only modify the Outlook Web App options that the user can modify. This means that if a user can modify his or her display name, a member of the Help Desk role group can also modify that user's display name. However, if another user isn't allowed to modify his or her display name, a member of the Help Desk role group can't modify that user's display name.

Caution:

The limitations on which Outlook Web App options a member of the Help Desk role group can modify are enforced by the Exchange Administration Center (EAC). If a member of the Help Desk role group has access to the Exchange Management Shell, he or she can modify any Outlook Web App option for any user. You should carefully consider who you make a member of the Help Desk role group and whether they should also be given access to the Shell.

The Help Desk role group doesn't enable any other tasks because there are so many different types of organizations. Instead, you can add management roles to this role group to create a Help Desk role group that matches the needs of your organization. For example, if you want members of the Help Desk role group to be able to manage mailboxes, mail contacts, and mail-enabled users, assign the Mail Recipients management role to this role group. For more information about how to add management roles to this role group, see the "Role Group Customization" section later in this topic.

For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group

members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "Help Desk"
```

For more information about the members of a role group, see View the members of a role group in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the “Create a role group” section in Manage role groups.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.

- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Management roles assigned to this role group

Management role	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
User Options role	X		Organization	Organization	OrganizationConfig	OrganizationConfig
View-Only Recipients role	X		Organization	None	OrganizationConfig	None

Hygiene Management

Permissions > Understanding Role Based Access Control > Built-in role groups >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Hygiene Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Users who are members of the Hygiene Management role group can configure the anti-spam and

anti-malware features of Exchange 2013. Third-party programs that integrate with Exchange 2013 can add service accounts to this role group to grant those programs access to the cmdlets required to retrieve and configure the Exchange configuration.

For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "Hygiene Management"
```

For more information about the members of a role group, see the “View the members of a role group” section in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the "Create a role group" section in Manage role groups.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Compliance Management

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Compliance Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Users who are members of the Compliance Management role group can configure and manage Exchange compliance configuration in accordance with their policies.

For more information about compliance features, see Messaging policy and compliance. For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "Compliance Management"
```

For more information about the members of a role group, see View the members of a role group in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the “Create a role group” section in Manage role groups.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the

role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Management roles assigned to this role group

Records Management

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Records Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Users who are members of the Records Management role group can configure compliance features, such as retention policy tags, message classifications, and transport rules.

For more information about compliance features, see Messaging policy and compliance. For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "Records Management"
```

For more information about the members of a role group, see View the members of a role group in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the "Create a role group" section in Manage role groups.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

Discovery Management

Permissions > Understanding Role Based Access Control > Built-in role groups >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Discovery Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Administrators or users who are members of the Discovery Management role group can perform searches of mailboxes in the Exchange organization for data that meets specific criteria and can also configure litigation holds on mailboxes. For more information, see In-Place eDiscovery.

Important:
The Organization Management role group doesn't, by default, enable the discovery search feature for users or universal security groups (USGs) that are members of that role group. Members of the Organization Management role group must either be made members of this role group, or the Mailbox Search role listed later in this topic must be manually assigned to the Organization Management role group. For information about how to assign a role to a role group, see Manage role groups.

For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or USGs that are members of this role group.

```
Get-RoleGroupMember "Discovery Management"
```

For more information about the members of a role group, see View the members of a role group in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the “Create a role group” section in Manage role groups.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries

made available by the associated management role.

- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Management roles assigned to this role group

Legal Hold role	X		Organization	Organization	OrganizationConfig	None
Mailbox Search role	X		Organization	Organization	None	None

Public Folder Management

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Public Folder Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Administrators who are members of the Public Folder Management role group can manage public

folders on servers running Exchange 2013.

For more information about public folders, see Public folders. For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "Public Folder Management"
```

For more information about the members of a role group, see View the members of a role group in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group

to the new role group, see the "Create a role group" section in Manage role groups.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.

Server Management

Permissions > Understanding Role Based Access Control > Built-in role groups >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Server Management management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Administrators who are members of this role group can configure server-specific configuration of transport client access, and mailbox features such as database copies, certificates, transport queues and Send connectors, virtual directories, and client access protocols.

This role group is similar to the Exchange Server Administrators role in Microsoft Exchange Server 2007. It grants access to manage the configuration of physical servers. However, unlike the Exchange Server Administrators role in Exchange 2007, which provided access only to a local server running Exchange 2007, the Server Management role group enables access to view and configure all Exchange Server 2010 servers in the organization.

If you want to allow administrators to manage only specific servers in your organization, you can change the management scopes that are applied to this role group. Alternatively, you can create a role group, based on the Server Management role group, and customize the management scopes on the new role group. For more information, see the "Role Group Customization" section later in this topic.

For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "Server Management"
```

For more information about the members of a role group, see View the members of a role group in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in

the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the “Create a role group” section in Manage role groups.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Delegated Setup

Permissions > Understanding Role Based Access Control > Built-in role groups >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Delegated Setup management role group is one of several built-in role groups that make up the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Role groups are assigned one or more management roles that contain the permissions required to perform a given set of tasks. The members of a role group are granted access to the management roles assigned to the role group. For more information about role groups, see Understanding management role groups.

Administrators who are members of the Delegated Setup role group can deploy servers running Exchange 2013 that have been previously provisioned by a member of the Organization Management role group.

Members of the Delegated Setup role group can only deploy Exchange 2013 servers. They can't manage the server after it's been deployed. To manage a server after it's been deployed, a user must be a member of the Server Management role group.

For more information about RBAC, see Understanding Role Based Access Control.

Role group membership

If you want to add or remove members to or from this role group, see Manage role group members.

By default, only members of the Organization Management role group can add or remove members from this role group. For more information about how to add additional role group delegates, see the "Add or remove a role group delegate" section in Manage role groups.

You can use the following command to view a list of users or universal security groups (USGs) that are members of this role group.

```
Get-RoleGroupMember "Delegated Setup"
```

For more information about the members of a role group, see View the members of a role group in Manage role group members.

Role group customization

This role group is assigned management roles by default. The roles that are included are listed in the "Management Roles Assigned to this Role Group" section. You can add or remove role assignments to or from this role group to match the needs of your organization.

The role groups provided with Exchange 2013 are designed to match more granular tasks. By assigning roles to a role group, you enable the members of that role group to perform the tasks associated with the role. For example, the Journaling role enables the management of the Journaling agent and journaling rules. For more information about how roles are assigned to role groups, see Understanding management role assignments.

The roles assigned to this role group are given default management scopes. Management scopes determine what Exchange objects can be viewed or modified by the members of a role group. You can change the scopes associated with assignments between roles and role groups. For example, you might want to do this if you only want members of a role group to be able to change recipients that are under a specific organizational unit or in a specific location. For more information about management scopes, see Understanding management role scopes.

For more information about how to customize this role group, see the following topics:

- Manage role groups
- Manage role group members

If you want to create a role group and assign some of the roles that are assigned to this role group to the new role group, see the “Create a role group” section in Manage role groups.

Additional permissions

The permissions granted to members of the Delegated Setup role group are primarily determined by the management roles assigned to the role group. However, not all tasks that you need to perform are covered by management roles. This is because some tasks occur outside of the Exchange management tools and therefore the RBAC permissions model doesn't apply. For these tasks, permissions are provided by adding the Delegated Setup role group to the access control lists (ACLs) of certain Active Directory objects.

The following task is granted permissions by way of ACLs on Active Directory objects and not by management roles assigned to the Delegated Setup role group:

- Deployment of servers that have been previously provisioned by a member of the Organization Management role group.

Management roles assigned to this role group

The following table lists all the management roles that are assigned to this role group and the following attributes of each role assignment:

- **Regular assignment** Enables members of the role group to access the management role entries made available by the associated management role.
- **Delegating assignment** Gives members of the role group the ability to assign the specified role to other role groups, role assignment policies, users, or USGs.
- **Recipient read scope** Determines what recipient objects members of the role group are allowed to read from Active Directory.
- **Recipient write scope** Determines what recipient objects members of the role group are allowed to modify in Active Directory.
- **Configuration read scope** Determines what configuration and server objects members of the role group are allowed to read from Active Directory.
- **Configuration write scope** Determines what organizational and server objects members of the role group are allowed to modify in Active Directory.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Management roles assigned to this role group

Built-in management roles

Exchange Server 2013 > Permissions > Understanding Role Based Access Control >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-08-21*

Microsoft Exchange Server 2013 includes many management roles by default. The following roles are assigned to management role groups or management role assignment policies in various combinations that grant permissions to manage and use the features provided by Exchange 2013. For more information about roles, see Understanding management roles.

Active Directory Permissions role

Address Lists role

ApplicationImpersonation role

ArchiveApplication role

Audit Logs role

Cmdlet Extension Agents role

Data Loss Prevention role

Database Availability Groups role

Database Copies role

Databases role

Disaster Recovery role

Distribution Groups role

Edge Subscriptions role

E-Mail Address Policies role

Exchange Connectors role

Exchange Server Certificates role

Exchange Servers role

Exchange Virtual Directories role

Federated Sharing role

Information Rights Management role

Journaling role

Legal Hold role

LegalHoldApplication role

Mail Enabled Public Folders role

Mail Recipient Creation role

Mail Recipients role

Mail Tips role

Mailbox Import Export role

Mailbox Search role

MailboxSearchApplication role

Message Tracking role

Migration role

Monitoring role

Move Mailboxes role

My Custom Apps role

My Marketplace Apps role

MyAddressInformation role

Unified Messaging role

Unscoped Role Management role

User Options role

UserApplication role

View-Only Audit Logs role

View-Only Configuration role

View-Only Recipients role

Active Directory Permissions role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Active Directory Permissions` management role enables administrators to configure Active Directory permissions in an organization. Some features that use Active Directory permissions or an access control list (ACL) include transport Receive and Send connectors, and Send As and Send on behalf of permissions for mailboxes.

Note:

Permissions set directly on Active Directory objects may not be enforced through Role Based Access Control (RBAC).

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide

access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:
The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Address Lists role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Address Lists` management role enables administrators to create, modify, view, and remove address lists, global address lists (GALs), address book policies, and offline address lists (OABs) in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC)

permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding

management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.

- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and

from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

ApplicationImpersonation role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-17*

The `ApplicationImpersonation` management role enables applications to impersonate users in an

organization to perform tasks on behalf of the user.

Important:

A process or application that's a member of the `ApplicationImpersonation` role can access the contents of a user's mailbox and act on behalf of that user, even if the user's account is disabled. This might let users access their mailboxes if you have applications, like Blackberry Enterprise Server, that use the `ApplicationImpersonation` role. Third-party products that don't use the `ApplicationImpersonation` role and instead use Exchange ActiveSync can't access a mailbox after its user account has been disabled.

To prevent an application that uses the `ApplicationImpersonation` role from accessing a mailbox or performing tasks on its behalf after its user account has been disabled, do one or more of the following:

- Disable or remove the user in the third-party application.
- Delete the mailbox.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and

server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Hygiene Management	X		Organization	Organization	None	None
Organization Management		X	Organization	Organization	None	None

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG

4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

ArchiveApplication role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `ArchiveApplication` management role enables partner applications to archive items in user mailboxes.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope

allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.

- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups

- Remove a role from a user or USG

4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Audit Logs role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Audit Logs` management role enables administrators to configure the administrator audit log in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can

be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last

assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.

- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Records Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see

the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Cmdlet Extension Agents role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Cmdlet Extension Agents` management role enables administrators to enable, disable, and set the priority of cmdlet extension agents in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group,

user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs.

However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether

the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.

2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Data Loss Prevention role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Data Loss Prevention management role enables administrators to create and manage data loss prevention (DLP) policies and the rules within them, which can affect mail delivery for an entire organization. Furthermore, this role provides administrators with the ability to configure Policy Tips that appear in email clients and manage DLP policy violation reports. This DLP role also enables access to Microsoft Exchange transport rules. For more information about transport rules in Exchange, see the following topics:

- Transport Rules role
- What's new for transport rules

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a

management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is

assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Compliance Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and

from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Database Availability Groups role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Database Availability Groups` management role enables administrators to manage database

availability groups in an organization. Administrators assigned this role either directly or indirectly are the highest level administrators responsible for the high availability configuration in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment

- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Database Copies role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Database Copies` management role enables administrators to add, remove, suspend, resume, view, and update database copies on individual servers.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more

information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Additional scope considerations

The **Set-MailboxDatabaseCopy** and **Remove-MailboxDatabaseCopy** cmdlets, which are included with this role, require that the database you want to configure or remove must be within the database scope and the database must reside on a server that's within the server scope. For more information about scopes, see Understanding management role scopes.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Server Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the

following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Databases role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Databases` management role enables administrators to create, manage, mount, and dismount mailbox databases on individual servers.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role

assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups,

users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Additional scope considerations

The **Move-DatabasePath** cmdlet, which is included with this role, requires that the database you want to configure must be within the database scope and the database must reside on a server that's within the server scope.

Also, the **Remove-MailboxDatabase** cmdlet, which is also included with this role, requires that the database you want to remove must either be within the database scope or the database must reside on a server that's within the server scope. This means you control who can remove mailbox databases using either database or server scopes.

For more information, see Understanding management role scopes.

Default Management Role Assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Server Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Disaster Recovery role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Disaster Recovery` management role enables administrators to restore mailboxes and mailbox databases, create mailbox databases, and perform datacenter switchovers and switchbacks for database availability groups in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide

access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:
The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Distribution Groups role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Distribution Groups` management role enables administrators to create, modify, view, and remove distribution groups, and add or remove distribution group members in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to

one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role

assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Recipient Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters

to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Edge Subscriptions role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Edge Subscriptions` management role enables administrators to manage edge synchronization and subscription configuration between Microsoft Exchange Server 2010 Edge Transport servers and Microsoft Exchange Server 2013 Mailbox servers in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more

information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization	X	X	`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management						

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

E-Mail Address Policies role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `E-Mail Address Policies` management role enables administrators to manage email address policies in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and

role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular	Delegating	Recipient	Recipient	Configurati	Configurati

	assignment	assignment	read scope	write scope	on read scope	on write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee.

For more information, see Delegate role assignments.

Exchange Connectors role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-11-19*

The `Exchange Connectors` management role enables administrators to create, modify, view, and remove delivery agent connectors.

This role can't be used to manage Send and Receive connectors. To manage Send and Receive connectors, use the Send Connectors and Receive Connectors roles. For more information, see:

- Send Connectors role
- Receive Connectors role

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The

permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.

- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Server Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role

assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Exchange Server Certificates role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Exchange Server Certificates` management role enables administrators to create, import, export, and manage Exchange server certificates on individual servers.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:

There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign

this role to role groups, users, or USGs.

- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Server Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role

because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Exchange Servers role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Exchange Servers` management role enables administrators to do the following on individual servers:

- Add and remove database availability groups and configure database copies
- Enable, disable and configure Unified Messaging services
- Modify transport configuration on Mailbox and Client Access servers
- Enable and disable Microsoft Outlook Anywhere on Client Access servers
- Modify Mailbox and Client Access server configuration
- Modify Outlook Anywhere configuration on Client Access servers
- Modify content filtering configuration on Mailbox servers
- Modify general Exchange server configuration
- Modify server monitoring configuration
- View the configuration for each server role

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide

access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Server Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and

from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Exchange Virtual Directories role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Exchange Virtual Directories` management role enables administrators to manage Microsoft

Office Outlook Web App, Microsoft ActiveSync, offline address books (OABs), Autodiscover, Windows PowerShell, and Web administration interface virtual directories on individual servers.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments.

Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment**

cmdlet. For more information, see Change a role assignment.

- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Server Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Federated Sharing role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Federated Sharing` management role enables administrators to manage cross-forest and cross-organization sharing in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization	X	X	`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management						

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Information Rights Management role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Information Rights Management` management role enables administrators to manage the Information Rights Management (IRM) features of Exchange in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and

role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular	Delegating	Recipient	Recipient	Configurati	Configurati

	assignment	assignment	read scope	write scope	on read scope	on write scope
Compliance Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Journaling role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Journaling` management role enables administrators to create, modify, enable, disable, view, and remove journal rules in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG

- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.

- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Records Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups

- Remove a role from a user or USG

4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Legal Hold role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Legal Hold` management role enables administrators to configure whether data within a mailbox should be retained for litigation purposes in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can

be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last

assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Additional scope considerations

In addition to recipient scopes, the **Enable-Mailbox** cmdlet, which is included with this role, is also scoped using database configuration scopes. Database configuration scopes control which databases the cmdlet can create new mailboxes on. The database where you want to create a mailbox must be within the database scope. This applies both when you specify a database using the *Database* parameter on the **Enable-Mailbox** cmdlet, or if you allow automatic mailbox distribution to select the database for you. For more information, see Understanding management role scopes.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Discovery Management	X		Organization	Organization	OrganizationConfig	None
Organization Management	X	X	Organization	Organization	OrganizationConfig	None

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

LegalHoldApplication role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `LegalHoldApplication` management role enables partner applications to set and view the legal hold status of a mailbox.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox

databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:
The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Mail Enabled Public Folders role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Mail Enabled Public Folders` management role enables administrators to configure whether individual public folders are mail-enabled or mail-disabled in an organization.

This role enables you to manage only the e-mail properties of public folders. It doesn't enable you to manage public folder properties that aren't related to e-mail. To manage public folder

properties that aren't related to e-mail, use the `Public Folders` role. For more information, see Public Folders role.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments.

Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment**

cmdlet. For more information, see Change a role assignment.

- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Public Folder Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Mail Recipient Creation role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Mail Recipient Creation` management role enables administrators to create mailboxes, mail users, mail contacts, distribution groups, and dynamic distribution groups in an organization. This role can be combined with the `Mail Recipients` role to enable the creation and management of recipients. For more information, see Mail Recipients role.

This role doesn't enable you to mail-enable public folders. To mail-enable public folders, the `Mail Enabled Public Folders` role must be used. For more information, see Mail Enabled Public Folders role.

If your organization maintains a Role Based Access Control (RBAC) split permissions model where recipient creation is performed by a different group than those who perform recipient management, assign the `Mail Recipient Creation` role to the management role group that performs recipient creation, and the `Mail Recipients` role to the role group that performs recipient management.

If your organization has enabled Active Directory split permissions, all non-delegating management role assignments to this management role were removed. When Active Directory split permissions is enabled, only Active Directory administrators using Active Directory management tools can create new security principals such as users and security groups.

For more information about RBAC and Active Directory split permissions, see Understanding split permissions.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is

assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps

prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Additional scope considerations

In addition to recipient scopes, the **New-Mailbox** cmdlet, which is included with this role, is also scoped using database configuration scopes. Database configuration scopes control which databases the cmdlet can create new mailboxes on. The database where you want to create a

mailbox must be within the database scope. This condition applies when you specify a database using the *Database* parameter on the **New-Mailbox** cmdlet or if you allow automatic mailbox distribution to select the database for you. For more information, see Understanding management role scopes.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Recipient Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Mail Recipients role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Mail Recipients` management role enables administrators to manage existing mailboxes, mail users, and mail contacts in an organization. This role can't create these recipients. Use the `Mail Recipient Creation` role to create them.

This role type doesn't enable you to manage mail-enabled public folders or distribution groups.

Use the following roles to manage these objects:

- Mail Enabled Public Folders role
- Distribution Groups role

If your organization has a split permissions model where recipient creation and management are performed by different groups, assign the `Mail Recipient Creation` role to the group that performs recipient creation and the `Mail Recipients` role to the group that performs recipient management. For more information, see the following topics:

- Mail Recipient Creation role
- Mail Recipients role
- Understanding split permissions

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and

role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Additional scope considerations

In addition to recipient scopes, the **Connect-Mailbox** and **Enable-Mailbox** cmdlets, which are included with this role, are also scoped using database configuration scopes. Database configuration scopes control which databases the cmdlets can create new mailboxes on. The database where you want to create a mailbox must be within the database scope. This condition applies when you specify a database using the *Database* parameter on either cmdlet or if you allow automatic mailbox distribution to select the database for you. For more information, see Understanding management role scopes.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.

- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Recipient Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see

the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Mail Tips role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Mail Tips management role enables administrators to manage mail tips in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role

assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a

role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to

each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and

Remove-ManagementRoleEntry cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Mailbox Import Export role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Mailbox Import Export` management role enables administrators to import and export mailbox content and to purge unwanted content from a mailbox.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more

information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Mailbox Search role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Mailbox Search` management role enables administrators to search the content of one or more mailboxes in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions

without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Discovery Management	X		Organization	Organization	None	None
Organization Management		X	Organization	Organization	None	None

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MailboxSearchApplication role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MailboxSearchApplication` management role enables partner applications to search mailboxes.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox

databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Message Tracking role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Message Tracking` management role enables administrators to track messages in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to

one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role

assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Recipient Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Records Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Migration role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Migration` management role enables administrators to migrate mailboxes and mailbox content into or out of a server.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization	X	X	`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management						
Recipient Management	X		`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee.

For more information, see Delegate role assignments.

Monitoring role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Monitoring management role enables administrators to monitor Exchange services and component availability in an organization. This role can also be used with service accounts used by monitoring applications to collect information about the state of servers running Exchange.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and

server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
View-only Organization Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Server Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role

3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Move Mailboxes role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Move Mailboxes` management role enables administrators to move mailboxes between servers in an organization and between servers in the local organization and another organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions

granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Additional scope considerations

In addition to recipient scopes, the **New-MoveRequest** cmdlet, which is included with this role, is also scoped using database configuration scopes. Database configuration scopes control which databases the cmdlet can move mailboxes to. The database where you want to move a mailbox must be within the database scope. This condition applies when you specify a database using the

TargetDatabase parameter on the **New-MoveRequest** cmdlet or if you allow automatic mailbox distribution to select the database for you. For more information, see Understanding management role scopes.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Recipient Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

My Custom Apps role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-08*

The My Custom Apps role enables individual users to add apps from a file or a URL.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal

security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.

- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	`Self`	`Self`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG

4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

My Marketplace Apps role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-08*

The My Marketplace Apps management role enables individual users to add apps from the Microsoft Office Store.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Default role assignment policy. For more information, see Understanding	X		`Self`	`Self`	`OrganizationConfig`	`OrganizationConfig`

management role assignment policies.						
Organization Management		X	Self	Self	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups

- Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyAddressInformation role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyAddressInformation` management role enables individual users to view and modify their street address and work telephone and fax numbers. This is a custom role created from the MyContactInformation role parent role.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role.

This role is a specific type of role called a custom role. A custom role is one that's created, or derived, from a parent role. It contains a subset of management role entries that exist on the parent role. This role is provided to enable you to control, with a greater level of granularity, the information you allow end users to modify on their own mailboxes. Unlike other built-in roles, custom roles, including this one, can be deleted. If you won't use this role, it can be deleted.

For more information about built-in and custom management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee

is granted the combination of all the permissions granted by all the assigned roles.

Note:
You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, its parent role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- “Add or remove a role to or from a role group” section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role doesn't have any default role assignments. It's provided in case you want control, at a more granular level, of what end-user information you allow your users to modify. For more information about assigning this role to a role assignment policy, see the "Adding or Removing Role Assignments" section.

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry

- Remove a role entry from a role

3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyBaseOptions role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyBaseOptions` management role enables individual users to view and modify the basic configuration of their own mailbox and associated settings.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee

is granted the combination of all the permissions granted by all the assigned roles.

Note:
You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Default role assignment policy. For more	X		Self	Self	OrganizationConfig	OrganizationConfig

information, see Understanding management role assignment policies.

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Remove a role from a user or USG

4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyContactInformation role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyContactInformation` management role enables individual users to modify their contact information, including address and phone numbers.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However

user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups

- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyDiagnostics role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyDiagnostics` management role enables individual users to perform basic diagnostics on their mailbox such as retrieving calendar diagnostic information.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups,

USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	Self	Self	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more

information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyDisplayName role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyDisplayName` management role enables individual users to view and modify their display name. This is a custom role created from the MyProfileInformation role parent role.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role.

This role is a specific type of role called a custom role. A custom role is one that's created, or derived, from a parent role. It contains a subset of management role entries that exist on the parent role. This role is provided to enable you to control, with a greater level of granularity, the information you allow end users to modify on their own mailboxes. Unlike other built-in roles, custom roles, including this one, can be deleted. If you won't use this role, it can be deleted.

For more information about built-in and custom management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, its parent role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- “Add or remove a role to or from a role group” section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role doesn't have any default role assignments. It's provided in case you want control, at a more granular level, of what end-user information you allow your users to modify. For more information about assigning this role to a role assignment policy, see the "Adding or Removing Role Assignments" section.

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyDistributionGroupMembership role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyDistributionGroupMembership` management role enables individual users to view and modify their membership in distribution groups in an organization, provided that those distribution groups allow manipulation of group membership.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to

each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Default role assignment policy. For more information, see Understanding management role assignment policies.	X		MyGAL	MyGAL	None	None
Organization Management		X	MyGAL	MyGAL	None	None

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters

to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyDistributionGroups role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyDistributionGroups` management role enables individual users to create, modify, and view distribution groups, and to modify, view, remove, and add members to distribution groups they own.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:
You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign

this role to role groups, users, or USGs.

- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	MyGAL	MyDistributionGroups	OrganizationConfig	None

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry

- Remove a role entry from a role

3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyMobileInformation role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyMobileInformation` management role enables individual users to view and modify their mobile telephone and pager numbers. This is a custom role created from the MyContactInformation role parent role.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role.

This role is a specific type of role called a custom role. A custom role is one that's created, or derived, from a parent role. It contains a subset of management role entries that exist on the parent role. This role is provided to enable you to control, with a greater level of granularity, the information you allow end users to modify on their own mailboxes. Unlike other built-in roles, custom roles, including this one, can be deleted. If you won't use this role, it can be deleted.

For more information about built-in and custom management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:
You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, its parent role must be assigned to a role group you're a

member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- “Add or remove a role to or from a role group” section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role doesn't have any default role assignments. It's provided in case you want control, at a more granular level, of what end-user information you allow your users to modify. For more information about assigning this role to a role assignment policy, see the "Adding or Removing Role Assignments" section.

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:
The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyName role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyName` management role enables individual users to view and modify their full name and their notes field. This is a custom role created from the MyProfileInformation role parent role.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role.

This role is a specific type of role called a custom role. A custom role is one that's created, or

derived, from a parent role. It contains a subset of management role entries that exist on the parent role. This role is provided to enable you to control, with a greater level of granularity, the information you allow end users to modify on their own mailboxes. Unlike other built-in roles, custom roles, including this one, can be deleted. If you won't use this role, it can be deleted.

For more information about built-in and custom management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, its parent role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- “Add or remove a role to or from a role group” section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role doesn't have any default role assignments. It's provided in case you want control, at a more granular level, of what end-user information you allow your users to modify. For more information about assigning this role to a role assignment policy, see the "Adding or Removing Role Assignments" section.

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:
The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyPersonalInformation role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyPersonalInformation` management role enables individual users to view and modify their website, address, and home telephone number. This is a custom role created from the MyContactInformation role parent role.

This management role is one of several built-in roles in the Role Based Access Control (RBAC)

permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role.

This role is a specific type of role called a custom role. A custom role is one that's created, or derived, from a parent role. It contains a subset of management role entries that exist on the parent role. This role is provided to enable you to control, with a greater level of granularity, the information you allow end users to modify on their own mailboxes. Unlike other built-in roles, custom roles, including this one, can be deleted. If you won't use this role, it can be deleted.

For more information about built-in and custom management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, its parent role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- “Add or remove a role to or from a role group” section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role doesn't have any default role assignments. It's provided in case you want control, at a more granular level, of what end-user information you allow your users to modify. For more information about assigning this role to a role assignment policy, see the "Adding or Removing Role Assignments" section.

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyProfileInformation role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyProfileInformation` management role enables individual users to modify their name.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	Self	Self	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role

because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyRetentionPolicies role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyRetentionPolicies` management role enables individual users to view their retention tags, and to view and modify their retention tag settings and defaults.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and

role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	`Self`	`Self`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyTeamMailboxes role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyTeamMailboxes` management role enables individual users to create site mailboxes and connect them to Microsoft SharePoint sites.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Organization Management		X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and

from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyTextMessaging role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyTextMessaging` management role enables individual users to create, view, and modify their

text messaging settings.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee.

Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role

assignee is allowed to read from Active Directory.

- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Default Role Assignment Policy For more information, see Understanding management role assignment policies.	X		`Self`	`Self`	`OrganizationConfig`	`OrganizationConfig`
Organization Management		X	`Self`	`Self`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a

child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

MyVoiceMail role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `MyVoiceMail` management role enables individual users to view and modify their voice mail settings.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal

security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, such as a role assignment policy. This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

Note:

You can also assign this management role to a role group, USG, or directly to a user. However user-focused roles are most effective when used with role assignment policies.

This user-focused role has implicit scopes that can't be modified. Therefore, you shouldn't add custom scopes to role assignments that assign this role to role assignment policies, role groups, USGs, or users.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role may be assigned to one or more role assignment policies by default. For more information, see the "Default Management Role Assignments" section.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role assignment policies, or you can create role assignment policies and assign this role to them.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from the default role assignment policy, role assignment policies and role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.

- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group or assignment policy	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Default role assignment policy. For more information, see Understanding management role assignment policies.	X		Self	Self	OrganizationConfig	OrganizationConfig
Organization Management		X	Self	Self	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:
The following information enables you to perform advanced management of permissions.

Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

OfficeExtensionApplication role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `OfficeExtensionApplication` management role enables Microsoft Office extension applications to access user mailboxes.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a

management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is

assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	`Self`	`Self`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:
The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Org Custom Apps role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-08*

The Org Custom Apps management role enables administrators to view and modify their organization's apps, and to add custom apps from a file or URL.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to

one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role

assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize

individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Org Marketplace Apps role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-15*

The Org Marketplace Apps management role enables administrators to view and modify their organization's apps, and to add apps from the Microsoft Office Store.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role

assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For

more information, see Change a role assignment.

- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also

been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Organization Client Access role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Organization Client Access` management role enables administrators to manage Client Access server settings in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments.

Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment**

cmdlet. For more information, see Change a role assignment.

- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Organization Configuration role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Organization Configuration` management role enables administrators to manage organization-wide settings. Organization configuration that can be controlled with this role includes the following and more:

- Whether MailTips are enabled or disabled for the organization
- URL for the managed folder home page
- Microsoft Exchange recipient SMTP address and alternate email addresses
- Resource mailbox property schema configuration
- Help URLs for the Exchange Administration Center and Microsoft Office Outlook Web App

This role type doesn't include the permissions included in the `Organization Client Access` or `Organization Transport Settings` roles.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and

server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Organization Transport Settings role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Organization Transport Settings` management role enables administrators to manage organization-wide transport settings, such as system messages, Active Directory site configuration, and transport configuration settings for the whole Exchange organization.

This role doesn't enable you to create or manage Send or Receive connectors, queues, hygiene, agents, remote and accepted domains, or rules. To create or manage each of the transport features, you must be assigned one or more of the following roles:

- Receive Connectors role
- Send Connectors role
- Transport Queues role
- Transport Hygiene role
- Transport Agents role
- Remote and Accepted Domains role
- Transport Rules role

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group,

user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs.

However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether

the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.

2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

POP3 and IMAP4 Protocols role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `POP3 and IMAP4 Protocols` management role enables administrators to manage POP3 and IMAP4 configuration, such as authentication and connection settings, on individual servers.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more

information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Server Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Public Folders role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Public Folders` management role enables administrators to manage public folders in an organization.

This role doesn't enable you to manage whether public folders are mail-enabled. To mail-enable or disable a public folder, you must be assigned a role associated with the `Mail Enabled Public Folders` role. For more information, see Mail Enabled Public Folders role.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to

one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role

assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Public Folder Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters

to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Receive Connectors role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Receive Connectors` management role enables administrators to manage transport Receive connector configuration, such as size limits on an individual server.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment

- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Hygiene Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Organization	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management						
Server Management	X		`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee.

For more information, see Delegate role assignments.

Recipient Policies role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Recipient Policies` management role enables administrators to manage recipient policies, such as throttling policies, Microsoft Office Outlook Web App mailbox policies, and mobile device policies, in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and

server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Recipient Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG

4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Remote and Accepted Domains role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Remote and Accepted Domains` management role enables administrators to manage remote and accepted domains in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope

allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.

- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups

- Remove a role from a user or USG

4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Reset Password role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The Reset Password management role enables individual users to reset their own passwords and administrators to reset users' passwords in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can

be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last

assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.

- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role

assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Retention Management role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Retention Management` management role enables administrators to manage retention policies in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:

There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign

this role to role groups, users, or USGs.

- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Compliance Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Records Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Role Management role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Role Management` management role enables administrators to manage management role groups; role assignment policies and management roles; and role entries, assignments, and scopes in an organization.

Users assigned this role can override the role group managed by property, configure any role group, and add or remove members to or from any role group.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role

entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign

this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in

effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Security Group Creation and Membership role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Security Group Creation and Membership` management role enables administrators to create and manage universal security groups (USGs) and their memberships in an organization.

If your organization maintains a Role Based Access Control (RBAC) split permissions model where USG creation and management is performed by a different group other than those who manage servers running Exchange, assign this role to that group.

If your organization has enabled Active Directory split permissions, all non-delegating management role assignments to this management role were removed. When Active Directory split permissions is enabled, only Active Directory administrators using Active Directory management tools can create new security principals such as users and security groups.

For more information, see Understanding split permissions.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more

information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization	X	X	`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management						

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Send Connectors role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Send Connectors` management role enables administrators to manage transport Send connectors in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and

role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular	Delegating	Recipient	Recipient	Configurati	Configurati

	assignment	assignment	read scope	write scope	on read scope	on write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee.

For more information, see Delegate role assignments.

Support Diagnostics role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Support Diagnostics` management role enables administrators to perform advanced diagnostics under the direction of Microsoft Customer Service and Support in an organization.

Caution:

This role grants permissions to cmdlets and scripts that should only be used under the direction of Customer Service and Support.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role

assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups

- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and

server objects the role assignee is allowed to read from Active Directory.

- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:

- "Add or remove a role to or from a role group" section in Manage role groups
- Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Team Mailboxes role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Team Mailboxes` management role enables administrators to define one or more site mailbox provisioning policies and manage site mailboxes in the organization. Administrators assigned this role can manage site mailboxes they don't own.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role

assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups,

users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role

assignee is allowed to modify in Active Directory.

- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Recipient Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role

3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

TeamMailboxLifecycleApplication role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `TeamMailboxLifecycleApplication` management role enables partner applications to update site mailbox lifecycle states.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions

granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.

- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	`Self`	`Self`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry

- Remove a role entry from a role

3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Transport Agents role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Transport Agents` management role enables administrators to manage transport agents in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is

assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps

prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Hygiene Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Transport Hygiene role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Transport Hygiene` management role enables administrators to manage anti-spam and anti-malware features in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more

information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Hygiene Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Transport Queues role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Transport Queues` management role enables administrators to manage message queues on an individual transport server.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox

databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Server Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and

from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Transport Rules role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Transport Rules` management role enables administrators to manage transport rules in an

organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee.

Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.

- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
Records Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

UM Mailboxes role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `UM Mailboxes` management role enables administrators to manage the Unified Messaging configuration of mailboxes and other recipients in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization	X	X	`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management						
UM Management	X		`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee.

For more information, see Delegate role assignments.

UM Prompts role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `UM Prompts` management role enables administrators to create and manage custom Unified Messaging voice prompts in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and

server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
UM Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG

4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Unified Messaging role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Unified Messaging` role enables administrators to manage Unified Messaging (UM) services in an organization.

This role doesn't enable you to manage UM-specific mailbox configuration or UM prompts. To manage UM-specific mailbox configuration, use roles associated with the `UM Mailboxes` role. To manage UM prompts, use the roles associated with the `UM Prompts` role. For more information, see:

- UM Mailboxes role
- UM Prompts role

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is

assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps

prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig
UM Management	X		Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Unscoped Role Management role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `Unscoped Role Management` management role enables administrators to create and manage unscoped top-level management roles in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more

information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

User Options role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `User Options` management role enables administrators to view the Outlook Web App options of a user in an organization. This role can be used to help diagnose configuration problems.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions

without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Help Desk	X		Organization	Organization	OrganizationConfig	OrganizationConfig
Organization Management	X	X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

UserApplication role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `UserApplication` management role enables partner applications to act on behalf of end users.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a

management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is

assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization Management		X	Organization	Organization	OrganizationConfig	OrganizationConfig

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:
The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

View-Only Audit Logs role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `View-Only Audit Logs` management role enables administrators and specialist users to search the administrator audit logs in an organization.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to

one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role

assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Compliance Management	X		Organization	None	OrganizationConfig	None
Organization Management	X	X	Organization	None	OrganizationConfig	None

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters

to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

View-Only Configuration role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `View-Only Configuration` management role enables administrators to view all the non-recipient Exchange configuration settings in an organization. Examples of configuration that are viewable are server configuration, transport configuration, database configuration, and organization-wide configuration.

This role can be combined with roles associated with the `View-Only Recipients` role to create a role group that can view every object in an organization. For more information, see View-Only Recipients role.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the

scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope

Compliance Management	X		Organization	None	OrganizationConfig	None
Delegated Setup	X		Organization	None	OrganizationConfig	None
Hygiene Management	X		Organization	None	OrganizationConfig	None
Organization Management	X	X	Organization	None	OrganizationConfig	None
View-only Organization Management	X		Organization	None	OrganizationConfig	None

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry

- Remove a role entry from a role

3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:
If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

View-Only Recipients role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `View-Only Recipients` management role enables administrators to view the configuration of recipients, such as mailboxes, mail users, mail contacts, distribution groups, and dynamic distribution groups.

This role can be combined with roles associated with the `View-Only Configuration` role to create a role group that can view every object in the organization. For more information, see View-Only Configuration role.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more

information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Compliance Management	X		Organization	None	OrganizationConfig	None
Help Desk	X		Organization	None	OrganizationConfig	None
Hygiene Management	X		Organization	None	OrganizationConfig	None
Organization Management	X	X	Organization	None	OrganizationConfig	None
View-only Organization Management	X		Organization	None	OrganizationConfig	None

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters

to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - "Add or remove a role to or from a role group" section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

WorkloadManagement role

Permissions > Understanding Role Based Access Control > Built-in management roles >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

The `WorkloadManagement` management role enables administrators to manage workload management policies. Administrators can configure resource health definitions, workload classifications, and enable or disable workload management. Changes should only be made under the direction of Microsoft Customer Service and Support.

This management role is one of several built-in roles in the Role Based Access Control (RBAC) permissions model in Microsoft Exchange Server 2013. Management roles, which are assigned to one or more management role groups, management role assignment policies, users, or universal security groups (USG), act as a logical grouping of cmdlets or scripts that are combined to provide access to view or modify the configuration of Exchange 2013 components, such as mailbox databases, transport rules, and recipients. If a cmdlet or script and its parameters, together called a management role entry, are included on a role, that cmdlet or script and its parameters can be run by those assigned the role. For more information about management roles and management role entries, see Understanding management roles.

For more information about management roles, management role groups, and other RBAC components, see Understanding Role Based Access Control.

Management role assignments

For this role to grant permissions, it must be assigned to a role assignee, which can be a role group, user, or universal security group (USG). This assignment is done using management role assignments. Role assignments link role assignees and roles together. If more than one role is assigned to a role assignee, the role assignee is granted the combination of all the permissions granted by all the assigned roles.

In addition to linking role assignees to roles, role assignments can also apply custom or built-in management scopes. Management scopes control which recipient, server and database objects can be modified by role assignees. If this role is assigned to a role assignee, but a management scope allows the role assignee only to manage certain objects based on a defined scope, the role assignee can only use the permissions granted by this role on those specific objects. The permissions provided by this role can't be applied to objects outside the scope defined on the role assignment. For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

This role is assigned to one or more role groups by default. For more information, see the "Default Management Role Assignments" section later in this topic.

If you want to view a list of role groups, users, or USGs assigned to this role, use the following command.

```
Get-ManagementRoleAssignment -Role "<role name>"
```

Regular and delegating role assignments

This role can be assigned to role assignees using either regular or delegating role assignments. Regular role assignments grant the permissions provided by the role to the role assignee. Delegating role assignments grant the role assignee the ability to assign the role to other role assignees. For more information about regular and delegating role assignments, see Understanding management role assignments.

Adding or removing role assignments

You can change which role assignees are assigned this role. By changing which role assignee is assigned this role, you change who is granted its permissions. You can assign this role to other built-in role groups, or you can create role groups and assign this role to them. You can also assign this role to users or USGs. However, we recommend that you limit assignment of roles to users and USGs because such assignments can greatly increase the complexity of your permissions model.

To assign this role to role assignees, the role must be assigned to a role group you're a member of, directly to you, or to a USG you're a member of, using a delegating role assignment. For more information about delegating role assignments, see the "Regular and Delegating Role Assignments" section.

You can also remove this role from built-in role groups, role groups you create, users, and USGs. However, there must always be at least one delegating role assignment between this role and a role group or USG. You can't delete the last delegating role assignment. This limitation helps prevent you from locking yourself out of the system.

Important:
There must be at least one delegating role assignment between this role and a role group or USG. You can't remove the last delegating role assignment associated with this role if the last assignment is to a user.

For more information about how to add or remove assignments between this role and role groups, users, and USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG
- Remove a role from a user or USG

Changing the management scopes on role assignments

You can also change the management scopes on existing role assignments between this role and role assignees. By changing the scopes on role assignments, you control what objects can be managed using the permissions provided by this role. You have several choices when changing the scope on a role assignment. You can do one of the following:

- Add a new custom scope using the **Set-ManagementRoleAssignment** cmdlet. For more

information, see the following topics:
  - Create a regular or exclusive scope
  - Change a role assignment
- Add or change an organizational unit scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Add or change a predefined scope using the **Set-ManagementRoleAssignment** cmdlet. For more information, see Change a role assignment.
- Change the recipient, server, or database scope on a custom scope associated with a role assignment using the **Set-ManagementScope** cmdlet. For more information, see Change a role scope.

Enabling or disabling role assignments

By enabling or disabling a role assignment, you control whether that role assignment should be in effect. If a role assignment is disabled, the permissions granted by the associated role aren't applied to the role assignee. This is convenient if you want to temporarily remove permissions without deleting a role assignment. For more information, see Change a role assignment.

Default management role assignments

This role has role assignments to one or more role assignees. The following table indicates whether the role assignment is regular or delegating, and also indicates the management scopes applied to each assignment. The following list describes each column:

- **Regular assignment** Regular role assignments enable the role assignee to access the permissions provided by the management role entries on this role.
- **Delegating assignment** Delegating role assignments give the role assignee the ability to assign this role to role groups, users, or USGs.
- **Recipient read scope** The recipient read scope determines what recipient objects the role assignee is allowed to read from Active Directory.
- **Recipient write scope** The recipient write scope determines what recipient objects the role assignee is allowed to modify in Active Directory.
- **Configuration read scope** The configuration read scope determines what configuration and server objects the role assignee is allowed to read from Active Directory.
- **Configuration write scope** The configuration write scope determines what organizational and server objects the role assignee is allowed to modify in Active Directory.

Default management role assignments for this role

Role group	Regular assignment	Delegating assignment	Recipient read scope	Recipient write scope	Configuration read scope	Configuration write scope
Organization	X	X	`Organization`	`Organization`	`OrganizationConfig`	`OrganizationConfig`

Management						

Management role customization

This role has been configured to provide a role assignee with all necessary cmdlets and parameters to manage the features and components listed in the beginning of this topic. Other roles have also been provided to enable management of other features. By adding and removing roles to and from role groups, you can create a customized permissions model without the need to customize individual management roles. For a complete list of roles, see Built-in management roles. For more information about customizing role groups, see Manage role groups.

If you decide that you need to create a customized version of this role, you must create a role as a child of this role, and customize the new role.

Caution:

The following information enables you to perform advanced management of permissions. Customizing management roles can significantly increase the complexity of your permissions model. You could cause certain features to stop functioning if you replace a built-in management role with an incorrectly configured custom role.

The following are the most common steps to create a customized role and assign it to a role assignee:

1. Create a copy of this role. For more information, see Create a role.
2. Change or remove the role entries on the new role using the **Set-ManagementRoleEntry** and **Remove-ManagementRoleEntry** cmdlets. You can't add additional role entries to the new role because it can only contain the role entries on the parent built-in role. For more information, see the following topics:
   - Change a role entry
   - Remove a role entry from a role
3. If you want to replace the built-in role with this new customized role, remove any role assignments associated with the built-in role. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Remove a role from a user or USG
4. Add the new customized role to the required role assignees. For more information, see the following topics:
   - “Add or remove a role to or from a role group” section in Manage role groups
   - Add a role to a user or USG

Important:

If you want other users, in addition to the user that created the role, to be able to assign the new customized role, be sure to add a delegating role assignment to at least one role assignee. For more information, see Delegate role assignments.

Understanding multiple-forest permissions

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-12-05*

Many organizations deploy multiple forests to create security boundaries within their organizations. Using multiple forests helps administrators to define these security boundaries to better match their requirements, whether that's ensuring the fewest number of people have access to resources, or segmenting divisions within an organization.

Microsoft Exchange Server 2013 supports two types of multiple forest topologies:

- **Cross-forest** Cross-forest topologies can have multiple forests, each with their own installation of Exchange.
- **Resource forest** Resource forest topologies have an Exchange forest and one or more accounts forests.

For the purposes of this topic, the forest that contains the universal security groups (USGs) and users outside of the forest where Exchange 2013 is installed, whether it's an accounts forest or other resource forest, is called a foreign forest.

Configuration of permissions in a multiple forest topology relies on the correct configuration of forest trusts and global address list (GAL) synchronization for the creation of linked mailboxes. The Exchange 2013 forest must trust the foreign forest that contains the USGs associated with linked role groups and users associated with linked mailboxes.

Exchange 2013 uses a Role Based Access Control (RBAC) permissions model. The management role groups that administrators are members of, and the management role assignment policies that end users are assigned, determine what each administrator and end user can do. To understand multiple-forest permissions, you need to be familiar with RBAC. For more information about RBAC, role groups, and role assignment policies, see the following topics:

- Understanding Role Based Access Control
- Understanding management role groups
- Understanding management role assignment policies

Looking for management tasks related to managing permissions? See Permissions.

Contents

Permissions in a multiple forest topology

RBAC applies permissions to all Exchange objects within a single forest and the RBAC configuration in each forest is configured independently of all other forests. When you create a role group in one forest, that role group doesn't exist in any other forest and the permissions granted by that role group apply only to the forest in which it was created. For example, a member of a role group that grants permissions to create a mailbox can create a mailbox only in the forest that contains that role group.

If you have multiple Exchange forests and want to configure permissions identically within each forest, you must apply the same configuration explicitly in each forest. For example, if you have two Exchange 2013 forests and want to create a Compliance Management role group to manage permissions for your legal department, you must do the following:

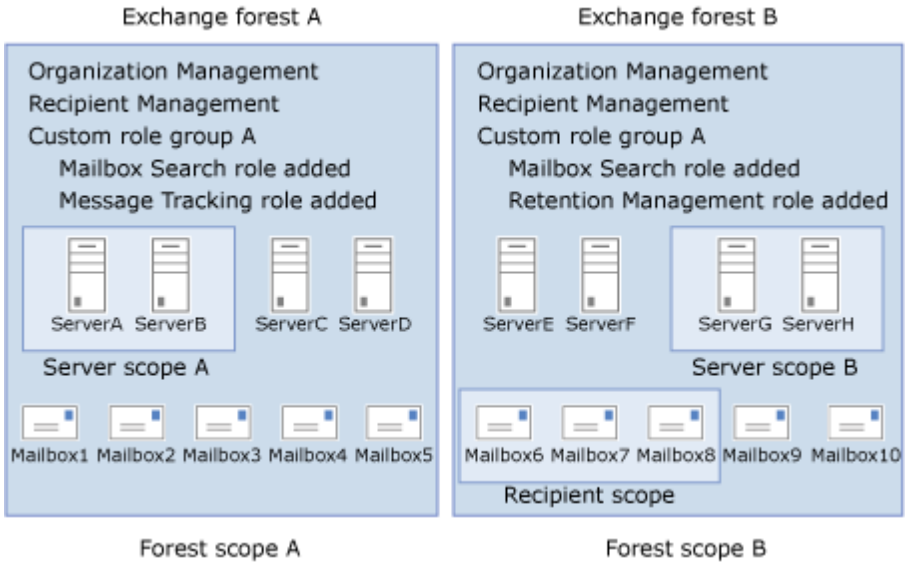
- In each forest, create a role group named Compliance Management. If your administrators are in a separate foreign forest from either Exchange forest, create both role groups as linked role groups. For more information about role groups, see the Cross-Boundary Permissions section.
- In each forest, create role assignments between the new role groups and the roles that you want to use.
- As part of the new role assignments, optionally add management scopes that encompass the server and recipient objects within each forest.
- If you created the role groups as linked role groups, add members to the associated USG in the foreign forest.

The following figure shows how the role groups configured within Exchange 2013 forests are bound to their respective forests. The Organization Management role group in Exchange 2013 forest A grants permissions only to manage the mailboxes and servers that are within that forest. Likewise, the role groups in Exchange 2013 forest B grant permissions only to the mailboxes and servers within that forest.

The figure also shows that the Custom role group A is created in each forest. Even though they were created with the same name, each is its own separate entity. In fact, as the figure shows, each can be assigned different management roles in their respective forests. Custom role group A in Exchange 2013 forest A is assigned the Mailbox Search and Message Tracking roles while Custom role group A in Exchange 2013 forest B is assigned the Mailbox Search and Retention Management roles.

Finally, management scopes created in each forest are also bound by the forest. Server scopes created in each forest can only contain the servers that are members of that forest. Server scope A can contain only servers within Exchange 2013 forest A while Server scope B can contain only servers that are within Exchange 2013 forest B. Similarly, the recipient scope in Exchange 2013 forest B can only contain mailboxes that are within Exchange 2013 forest B.

RBAC and forest scope boundary relationship



Cross-boundary permissions

The permissions granted by RBAC only allow users to view or modify Exchange objects within a specific forest. However, you can grant permissions to view and modify Exchange objects in a forest to users outside of that forest. By using cross-boundary permissions, you can centralize Exchange management accounts in a single forest rather than having to authenticate against each individual forest to perform tasks.

Note:

The permissions that are granted to a user outside of an Exchange forest still apply only to that specific Exchange forest. For example, if a user in a foreign forest is a member of the Organization Management linked role group that's located in ForestA, the user can manage only the Exchange objects contained within ForestA. A user must be made a member of linked role groups in each Exchange forest to be granted permissions to manage each forest.

Cross-boundary permissions also enable you to apply role assignment policies to the mailboxes of users who have mailboxes in an Exchange forest, but have user accounts that reside in an accounts forest. Exchange 2013 supports cross-boundary permission using linked role groups and linked mailboxes, which are discussed in the following sections.

Administrative permissions

Administrative permissions are granted cross forest boundaries by the use of linked role groups and linked mailboxes.

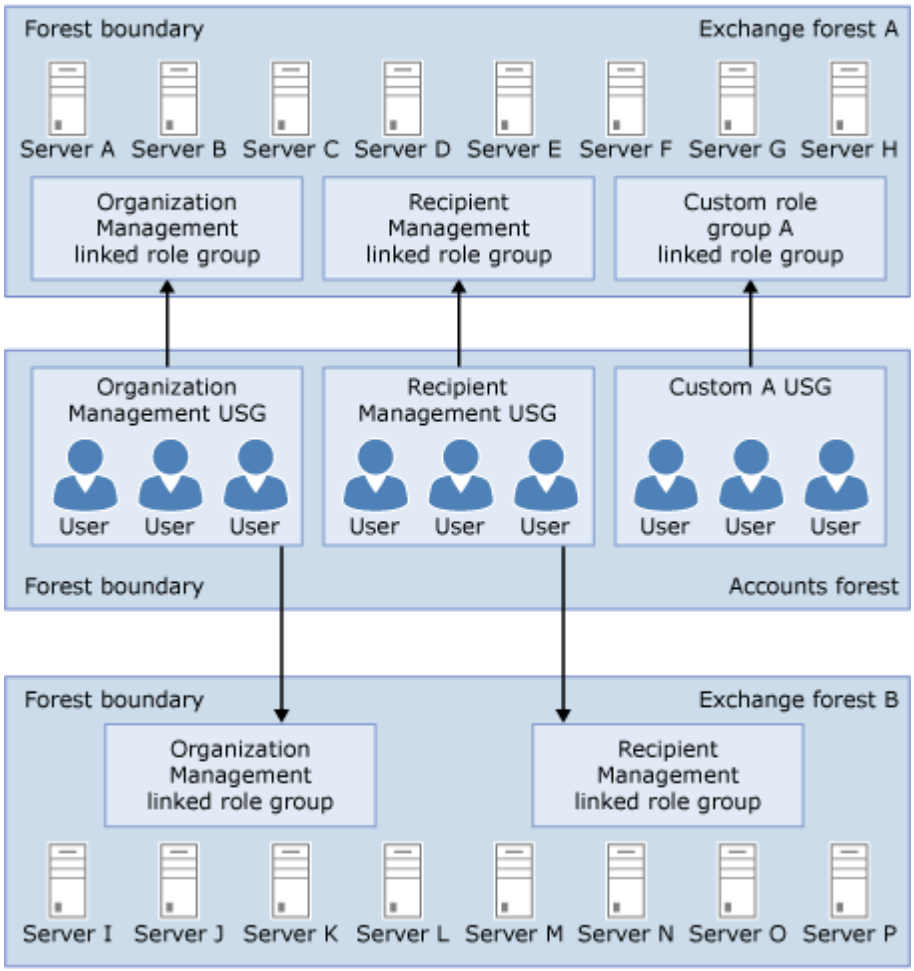
A linked role group is created in the Exchange 2013 organization and is linked to a USG across the forest boundary in the foreign forest. The USG the linked role group is linked to can be any of the following:

- A dedicated USG for the specific use of the linked role group
- A USG that's linked to by linked role groups in multiple Exchange 2013 forests
- A role group USG in another Exchange 2013 forest
- A USG associated with an Exchange Server 2007 administrative role or Exchange 2010 role group

The USG that a linked role group is linked to must be in another forest. You can't link a linked role group to a USG in the same forest.

The following figure shows that USGs in an accounts forest can be associated with role groups in one or more Exchange 2013 resource forests. The members of the USGs in the accounts forest effectively become members of the role groups through the USGs.

Linked role groups associated with USGs in a separate forest



When you create a linked role group, you assign roles to the linked role group in the Exchange 2013 forest. The assignments that associate the roles to the linked role group can include management scopes, if necessary. These scopes are confined to the forest in which the linked role group is created.

Membership of the linked role group is managed by adding and removing members to and from the USG in the foreign forest. When you add members to this USG, they are granted the permissions assigned to the linked role group in the Exchange 2013 forest. If you've linked multiple linked role groups with the same USG, the members of that USG are granted the permissions assigned to each linked role group in each Exchange 2013 forest.

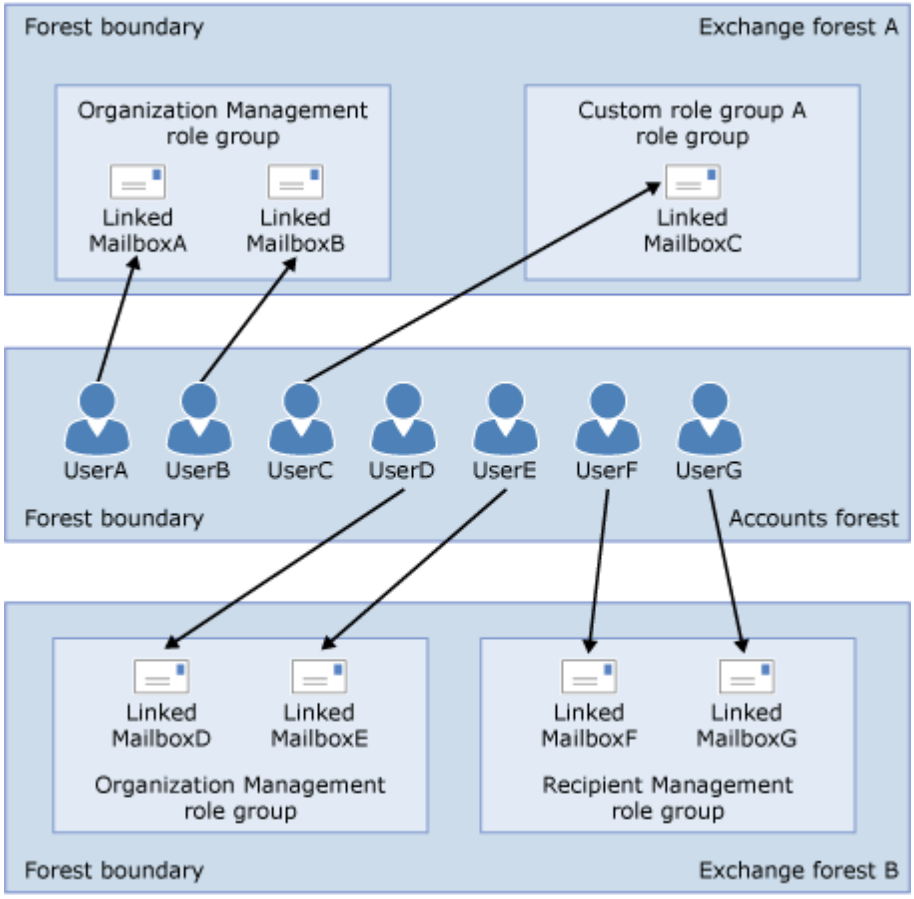
You can't manage the membership of a linked role group from the Exchange 2013 forest.

A second method to assign administrative permissions across forest boundaries is through the use of linked mailboxes. For users in an accounts forest to use an Exchange 2013 deployment in a separate Exchange 2013 resource forest, you must configure linked mailboxes for each user. Linked

mailboxes can be added as members to role groups within the Exchange 2013 forest. When a linked mailbox becomes a member of a role group, that linked mailbox, and in turn the user in the accounts forest associated with the linked mailbox, is granted the permissions provided by the role group.

The following figure shows the relationship between users in an accounts forest, the linked mailboxes associated with them, and the role groups in which they're members.

Users in an accounts forest associated with linked mailboxes that are members of role groups



Linked role groups and linked mailboxes both have advantages and disadvantages when used to assign administrative permission across forest boundaries. The following table describes some of them.

Linked role group and linked mailbox advantages and disadvantages

Linked role groups or linked mailboxes	Advantage	Disadvantage
Linked role groups	You can associate multiple linked role groups from multiple Exchange 2013 forests to a single USG in an accounts forest or other Exchange resource forest. This enables	A regular role group can't be converted to a linked role group. You must manually create linked role groups to replace each regular role group that has the permissions you

	you to administer complex Exchange forest topologies through a small set of USGs in a single forest.	want to grant across a forest boundary. For more information, see Configure cross-boundary permissions.
Linked mailboxes	Linked mailboxes allow you to use the existing role groups within the Exchange forest. Linked mailboxes are added as members to the existing role groups just like regular mailboxes, USGs, and users in the same Exchange forest.	If you grant permissions in multiple Exchange 2013 forests using linked mailboxes linked to a single user in an accounts forest, you must modify the role group membership in each Exchange 2013 forest if you want to modify the permissions granted to the user.

We recommend that you use linked role groups to grant permission across forest boundaries if you plan on having multiple Exchange resource forests.

End-user permissions

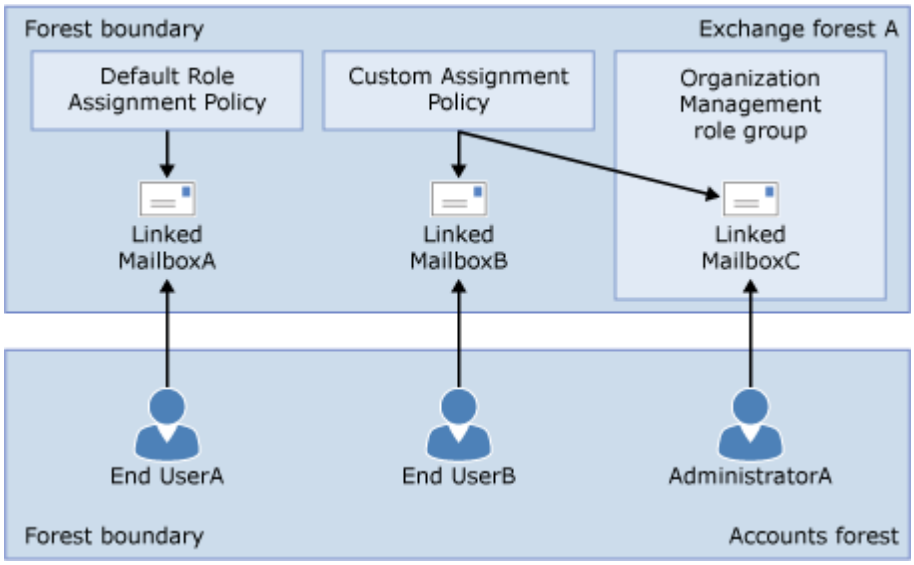
End-user permissions are assigned to individual mailboxes using role assignment policies. When Exchange 2013 is installed in a resource forest, linked mailboxes are created in the resource forest and are associated with user accounts in the accounts forest.

When a linked mailbox is created, it's assigned to a default role assignment policy just like a regular mailbox. The role assignment policy determines which end-user permissions are granted to the mailbox. These permissions enable users to view and modify settings related to the following, and other, features:

- End-user profile information
- End-user voicemail
- End-user distribution membership and ownership

When a role assignment policy is assigned to a linked mailbox, the user in the accounts forest associated with the linked mailbox is granted permissions to manage the features available to that user. The permissions apply to only the resources in the Exchange forest where the linked mailbox is located. The following figure shows the relationship between the end user in the accounts forest, its associated linked mailbox, and the role assignment policy assigned to the linked mailbox. Additionally, a linked mailbox associated with an administrative user in the accounts forest can be associated with multiple role groups in addition to a role assignment policy.

Users in an accounts forest associated with linked mailboxes that are each assigned a role assignment policy



Return to top

Configure cross-boundary permissions

To configure cross-boundary permissions in a multiple-forest topology, you must create linked role groups for each of the role groups you want to link to USGs in a foreign forest. This means that you must create a linked role group for each built-in role group. You need to:

1. Create a USG in the foreign forest for each linked role group to be created. Add members to this USG that you want to grant permissions to.
2. Create a linked role group for each built-in role group. The following happens when the linked role group is created:
   - The same roles that are assigned to the built-in role group are assigned to the new linked role group.
   - The linked role group is associated with the USG in the foreign forest.
3. Create linked role groups for any custom role groups you created.
4. Optionally assign custom scopes to the new linked role groups.

For detailed information about how to perform these steps, see the following topics:

- Create linked role groups that mirror built-in role groups
- Manage linked role groups
- Manage role groups

If you need to change the USG that a linked role group is associated with, see Manage linked role groups.

When a linked mailbox is created, it's automatically assigned to a role assignment policy. You can change the role assignment policy that's assigned to the linked mailbox or change the role assignment policy that's assigned to mailboxes by default when they're created. For more information, see the following topics:

- Change the assignment policy on a mailbox

- Manage role assignment policies

Understanding split permissions

Exchange Server 2013 > Permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-05*

Organizations that separate the management of Microsoft Exchange Server 2013 objects and Active Directory objects use what's called a *split permissions* model. Split permissions enable organizations to assign specific permissions and related tasks to specific groups within the organization. This separation of work helps to maintain standards and workflows, and helps to control change in the organization.

The highest level of split permissions is the separation of Exchange management and Active Directory management. Many organizations have two groups: administrators that manage the organization's Exchange infrastructure, including servers and recipients, and administrators that manage the Active Directory infrastructure. This is an important separation for many organizations because the Active Directory infrastructure often spans many locations, domains, services, applications, and even Active Directory forests. Active Directory administrators must ensure that changes made to Active Directory don't negatively impact any other services. As a result, typically only a small group of administrators is allowed to manage that infrastructure.

At the same time, the infrastructure for Exchange, including servers and recipients, can also be complex and require specialized knowledge. Additionally, Exchange stores extremely confidential information about the business of the organization. Exchange administrators can potentially access this information. By limiting the number of Exchange administrators, the organization limits who can make changes to Exchange configuration and who can access sensitive information.

Split permissions typically make a distinction between the creation of security principals in Active Directory, such as users and security groups, and the subsequent configuration of those objects. This helps to reduce the chance of unauthorized access to the network by controlling who can create objects that grant access to it. Most often only Active Directory administrators can create security principals while other administrators, such as Exchange administrators, can manage specific attributes on existing Active Directory objects.

To support the varying needs to separate the management of Exchange and Active Directory, Exchange 2013 lets you choose whether you want a shared permissions model or a split permissions model. Exchange 2013 offers two types of split permissions models: RBAC and Active Directory. Exchange 2013 defaults to a shared permissions model.

Contents

Shared permissions

Split permissions

RBAC split permissions

Active Directory split permissions

Explanation of Role Based Access Control and Active Directory

To understand split permissions, you need to understand how the Role Based Access Control (RBAC) permissions model in Exchange 2013 works with Active Directory. The RBAC model controls who can perform what actions, and on which objects those actions can be performed. For more information about the various components of RBAC that are discussed in this topic, see Understanding Role Based Access Control.

In Exchange 2013, all tasks that are performed on Exchange objects must be done through the Exchange Management Shell or the Exchange Administration Center (EAC) interface. Both of these management tools use RBAC to authorize all tasks that are performed.

RBAC is a component that exists on every server running Exchange 2013. RBAC checks whether the user performing an action is authorized to do so:

- If the user isn't authorized to perform the action, RBAC doesn't allow the action to proceed.
- If the user is authorized to perform the action, RBAC checks whether the user is authorized to perform the action against the specific object being requested:
  - If the user is authorized, RBAC allows the action to proceed.
  - If the user isn't authorized, RBAC doesn't allow the action to proceed.

If RBAC allows an action to proceed, the action is performed in the context of the Exchange Trusted Subsystem and not the user's context. The Exchange Trusted Subsystem is a highly privileged universal security group (USG) that has read/write access to every Exchange-related object in the Exchange organization. It's also a member of the Administrators local security group and the Exchange Windows Permissions USG, which enables Exchange to create and manage Active Directory objects.

Caution:
Don't make any manual changes to the membership of the Exchange Trusted Subsystem security group. Also, don't add it to or remove it from object access control lists (ACLs). By making changes to the Exchange Trusted Subsystem USG yourself, you could cause irreparable damage to your Exchange organization.

It's important to understand that it doesn't matter what Active Directory permissions a user has

when using the Exchange management tools. If the user is authorized, via RBAC, to perform an action in the Exchange management tools, the user can perform the action regardless of his or her Active Directory permissions. Conversely, if a user is an Enterprise Admin in Active Directory but isn't authorized to perform an action, such as creating a mailbox, in the Exchange management tools, the action won't succeed because the user doesn't have the required permissions according to RBAC.

Important:
Although the RBAC permissions model doesn't apply to the Active Directory Users and Computers management tool, Active Directory Users and Computers can't manage the Exchange configuration. So although a user may have access to modify some attributes on Active Directory objects, such as the display name of a user, the user must use the Exchange management tools, and therefore must be authorized by RBAC, to manage Exchange attributes.

Return to top

Shared permissions

The shared permissions model is the default model for Exchange 2013. You don't need to change anything if this is the permissions model you want to use. This model doesn't separate the management of Exchange and Active Directory objects from within the Exchange management tools. It allows administrators using the Exchange management tools to create security principals in Active Directory.

The following table shows the roles that enable the creation of security principals in Exchange and the management role groups they're assigned to by default.

Security principal management roles

Management role	Role group
Mail Recipient Creation role	Organization Management Recipient Management
Security Group Creation and Membership role	Organization Management

Only role groups, users, or USGs that are assigned the Mail Recipient Creation role can create security principals such as Active Directory users. By default, the Organization Management and Recipient Management role groups are assigned this role. Therefore members of these role groups can create security principals.

Only role groups, users, or USGs that are assigned the Security Group Creation and Membership role can create security groups or manage their memberships. By default, only the Organization Management role group is assigned this role. Therefore only members of the Organization Management role group can create or manage the membership of security groups.

You can assign the Mail Recipient Creation role and the Security Group Creation and Membership

role to other role groups, users, or USGs if you want other users to be able to create security principals.

To enable the management of existing security principals in Exchange 2013, the Mail Recipients role is assigned to the Organization Management and Recipient Management role groups by default. Only role groups, users, or USGs that are assigned the Mail Recipients role can manage existing security principals. If you want other role groups, users, or USGs to be able to manage existing security principals, you must assign the Mail Recipients role to them.

For more information about how to add roles to role groups, users, or USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG

If you switched to a split permissions model and want to change back to a shared permissions model, see Configure Exchange 2013 for shared permissions.

Return to top

Split permissions

If your organization separates Exchange management and Active Directory management, you need to configure Exchange to support the split permissions model. When configured correctly, only the administrators who you want to create security principals, such as Active Directory administrators, will be able to do so and only Exchange administrators will be able to modify the Exchange attributes on existing security principals. This splitting of permissions also falls roughly along the lines of the domain and configuration partitions in Active Directory. Partitions are also called naming contexts. The domain partition stores the users, groups, and other objects for a specific domain. The configuration partition stores the forest-wide configuration information for the services that used Active Directory, such as Exchange. Data that's stored in the domain partition is typically managed by Active Directory administrators, although objects may contain Exchange-specific attributes that can be managed by Exchange administrators. Data that's stored in the configuration partition is managed by the administrators for each respective service that stores data in this partition. For Exchange, this is typically Exchange administrators.

Exchange 2013 supports the two following types of split permissions:

- **RBAC split permissions** Permissions to create security principals in the Active Directory domain partition are controlled by RBAC. Only Exchange servers, services, and those who are members of the appropriate role groups can create security principals.
- **Active Directory split permissions** Permissions to create security principals in the Active Directory domain partition are completely removed from any Exchange user, service, or server. No option is provided in RBAC to create security principals. Creation of security principals in Active Directory must be performed using Active Directory management tools.

Important:

Although Active Directory split permissions can be enabled or disabled by running Setup on a computer that has Exchange 2013 installed, Active Directory split permissions configuration applies to both Exchange 2013 and Exchange 2010 servers. It doesn't, however, have any impact on Microsoft Exchange Server 2007 servers.

If your organization chooses to use a split permissions model instead of shared permissions, we recommend that you use the RBAC split permissions model. The RBAC split permissions model provides significantly more flexibility while providing the nearly same administration separation as Active Directory split permissions, with the exception that Exchange servers and services can create security principals in the RBAC split permissions model.

You're asked whether you want to enable Active Directory split permissions during Setup. If you choose to enable Active Directory split permissions, you can only change to shared permissions or RBAC split permissions by rerunning Setup and disabling Active Directory split permissions. This choice applies to all Exchange 2010 and Exchange 2013 servers in the organization.

The following sections describe RBAC and Active Directory split permissions in more detail.

Return to top

RBAC split permissions

The RBAC security model modifies the default management role assignments to separate who can create security principals in the Active Directory domain partition from those who administer the Exchange organization data in the Active Directory configuration partition. Security principals, such as users with mailboxes and distribution groups, can be created by administrators who are members of the Mail Recipient Creation and Security Group Creation and Membership roles. These permissions remain separate from the permissions required to create security principals outside of the Exchange management tools. Exchange administrators who aren't assigned the Mail Recipient Creation or Security Group Creation and Membership roles can still modify Exchange-related attributes on security principals. Active Directory administrators also have the option of using the Exchange management tools to create Active Directory security principals.

Exchange servers and the Exchange Trusted Subsystem also have permissions to create security principals in Active Directory on behalf of users and third-party programs that integrate with RBAC.

RBAC split permissions is a good choice for your organization if the following are true:

- Your organization doesn't require that security principal creation be performed using only Active Directory management tools and only by users who are assigned specific Active Directory permissions.
- Your organization allows services, such as Exchange servers, to create security principals.
- You want to simplify the process required to create mailboxes, mail-enabled users, distribution groups, and role groups by allowing their creation from within the Exchange management tools.
- You want to manage the membership of distribution groups and role groups within the Exchange management tools.
- You have third-party programs that require that Exchange servers be able to create security

principals on their behalf.

If your organization requires a complete separation of Exchange and Active Directory administration where no Active Directory administration can be performed using Exchange management tools or by Exchange services, see the Active Directory Split Permissions section later in this topic.

Switching from shared permissions to RBAC split permissions is a manual process where you remove the permissions required to create security principals from the role groups that are granted them by default. The following table shows the roles that enable the creation of security principals in Exchange and the management role groups they're assigned to by default.

Security principal management roles

Management role	Role group
Mail Recipient Creation role	Organization Management Recipient Management
Security Group Creation and Membership role	Organization Management

By default, members of the Organization Management and Recipient Management role groups can create security principals. You must transfer the ability to create security principals from the built-in role groups to a new role group that you create.

To configure RBAC split permissions, you must do the following:

1. Disable Active Directory split permissions if it's enabled.
2. Create a role group, which will contain the Active Directory administrators that will be able to create security principals.
3. Create regular and delegating role assignments between the Mail Recipient Creation role and the new role group.
4. Create regular and delegating role assignments between the Security Group Creation and Membership role and the new role group.
5. Remove the regular and delegating management role assignments between the Mail Recipient Creation role and the Organization Management and Recipient Management role groups.
6. Remove the regular and delegating role assignments between the Security Group Creation and Membership role and the Organization Management role group.

After doing this, only members of the new role group that you create will be able to create security principals, such as mailboxes. The new group will only be able to create the objects. It won't be able to configure the Exchange attributes on the new object. An Active Directory administrator, who is a member of the new group, will need to create the object, and then an Exchange administrator will need to configure the Exchange attributes on the object. Exchange administrators won't be able to use the following cmdlets:

- **New-Mailbox**
- **New-MailContact**

- **New-MailUser**
- **New-RemoteMailbox**
- **Remove-Mailbox**
- **Remove-MailContact**
- **Remove-MailUser**
- **Remove-RemoteMailbox**

Exchange administrators will, however, be able to create and manage Exchange-specific objects, such as transport rules, distribution groups, and so on and manage Exchange-related attributes on any object.

Additionally, the associated features in the EAC and Outlook Web App, such as the New Mailbox Wizard, will also no longer be available or will generate an error if you try to use them.

If you want the new role group to also be able to manage the Exchange attributes on the new object, the Mail Recipients role also needs to be assigned to the new role group.

For more information about configuring a split permissions model, see Configure Exchange 2013 for split permissions.

Return to top

Active Directory split permissions

With Active Directory split permissions, the creation of security principals in the Active Directory domain partition, such as mailboxes and distribution groups, must be performed using Active Directory management tools. Several changes are made to the permissions granted to the Exchange Trusted Subsystem and Exchange servers to limit what Exchange administrators and servers can do. The following changes in functionality occur when you enable Active Directory split permissions:

- Creation of mailboxes, mail-enabled users, distribution groups, and other security principals is removed from the Exchange management tools.
- Adding and removing distribution group members can't be done from the Exchange management tools.
- All permissions granted to the Exchange Trusted Subsystem and Exchange servers to create security principals are removed.
- Exchange servers and the Exchange management tools can only modify the Exchange attributes of existing security principals in Active Directory.

For example, to create a mailbox with Active Directory split permissions enabled, a user must first be created using Active Directory tools by a user with the required Active Directory permissions. Then, the user can be mailbox-enabled using the Exchange management tools. Only the Exchange-related attributes of the mailbox can be modified by Exchange administrators using the Exchange management tools.

Active Directory split permissions is a good choice for your organization if the following are true:

- Your organization requires that security principals be created using only the Active Directory

management tools or only by users who are granted specific permissions in Active Directory.

- You want to completely separate the ability to create security principals from those who manage the Exchange organization.
- You want to perform all distribution group management, including creation of distribution groups and adding and removing members of those groups, using Active Directory management tools.
- You don't want Exchange servers, or third-party programs that use Exchange on their behalf, to create security principals.

Important:

Switching to Active Directory split permissions is a choice that you can make when you install Exchange 2013 either by using the Setup wizard or by using the *ActiveDirectorySplitPermissions* parameter while running `setup.exe` from the command line. You can also enable or disable Active Directory split permissions after you've installed Exchange 2013 by rerunning `setup.exe` from the command line. To enable Active Directory split permissions, set the *ActiveDirectorySplitPermissions* parameter to `true`. To disable it, set it to `false`. You must always specify the *PrepareAD* switch along with the *ActiveDirectorySplitPermissions* parameter.
If you have multiple domains within the same forest, you must also either specify the *PrepareAllDomains* switch when you apply Active Directory split permissions or run setup with the *PrepareDomain* switch in each domain. If you choose to run setup with the *PrepareDomain* switch in each domain rather than use the *PrepareAllDomains* switch, you must prepare every domain that contains Exchange servers, mail-enabled objects, or global catalog servers that could be accessed by an Exchange server.

Important:

You can't enable Active Directory split permissions if you've installed Exchange 2010 or Exchange 2013 on a domain controller.
After you enable or disable Active Directory split permissions, we recommend that you restart the Exchange 2010 and Exchange 2013 servers in your organization to force them to pick up the new Active Directory access token with the updated permissions.

Exchange 2013 achieves Active Directory split permissions by removing permissions and membership from the Exchange Windows Permissions security group. This security group, in shared permissions and RBAC split permissions, is given permissions to many non-Exchange objects and attributes throughout Active Directory. By removing the permissions and membership to this security group, Exchange administrators and services are prevented from creating or modifying those non-Exchange Active Directory objects.

For a list of changes that occur to the Exchange Windows Permissions security group and other Exchange components when you enable or disable Active Directory split permissions, see the following table.

Note:

Role assignments to role groups that enable Exchange administrators to create security principals are removed when Active Directory split permissions is enabled. This is done to remove access to cmdlets that would otherwise generate an error when they're run because they don't have permissions to create the associated Active Directory object.

Active Directory split permissions changes

Action	Changes made by Exchange
Enable Active Directory split permissions during first Exchange 2013 server installation	The following happens when you enable Active Directory split permissions either through the Setup wizard or by running `setup.exe` with the `/PrepareAD` and `/ActiveDirectorySplitPermissions:true` parameters: • An organizational unit (OU) called **Microsoft Exchange Protected Groups** is created. • The **Exchange Windows Permissions** security group is created in the **Microsoft Exchange Protected Groups** OU. • The **Exchange Trusted Subsystem** security group isn't added to the **Exchange Windows Permissions** security group. • Creation of non-delegating management role assignments to management roles with the following management role types is skipped: ○ `MailRecipientCreation` ○ `SecurityGroupCreationandMembership` • Access control entries (ACEs) that would have been assigned to the **Exchange Windows Permissions** security group aren't added to the Active Directory domain object. If you run setup with the *PrepareAllDomains* or *PrepareDomain* switch, the following happens in each child domain that's prepared: • All ACEs assigned to the **Exchange Windows Permissions** security group are removed from the domain object. • ACEs are set in each domain with the exception of any ACEs assigned to the **Exchange Windows Permissions** security group.

Switch from shared permissions or RBAC split permissions to Active Directory split permissions	The following happens when you run the `setup.exe` command with the `/PrepareAD` and `/ActiveDirectorySplitPermissions:true` parameters: • An OU called **Microsoft Exchange Protected Groups** is created. • The **Exchange Windows Permissions** security group is moved to the **Microsoft Exchange Protected** Groups OU. • The **Exchange Trusted Subsystem** security group is removed from the **Exchange Windows Permissions** security group. • Any non-delegating role assignments to management roles with the following role types are removed: ○ `MailRecipientCreation` ○ `SecurityGroupCreationandMembership` • All ACEs assigned to the **Exchange Windows Permissions** security group are removed from the domain object. If you run setup with either the *PrepareAllDomains* or *PrepareDomain* switch, the following happens in each child domain that's prepared: • All ACEs assigned to the **Exchange Windows Permissions** security group are removed from the domain object. • ACEs are set in each domain with the exception of any ACEs assigned to the **Exchange Windows Permissions** security group.
Switch from Active Directory split permissions to shared permissions or RBAC split permissions	The following happens when you run the `setup.exe` command with the `/PrepareAD` and `/ActiveDirectorySplitPermissions:false` parameters:

	• The **Exchange Windows Permissions** security group is moved to the **Microsoft Exchange Security Groups** OU. • The **Microsoft Exchange Protected Groups** OU is removed. • The **Exchange Trusted Subsystems** security group is added to the **Exchange Windows Permissions** security group. • ACEs are added to the domain object for the **Exchange Windows Permissions** security group. If you run setup with either the *PrepareAllDomains* or *PrepareDomain* switch, the following happens in each child domain that's prepared: • ACEs are added to the domain object for the **Exchange Windows Permissions** security group. • ACEs are set in each domain including ACEs assigned to the **Exchange Windows Permissions** security group. Role assignments to the Mail Recipient Creation and Security Group Creation and Membership roles aren't automatically created when switching from Active Directory split to shared permissions. If delegating role assignments were customized prior to Active Directory split permissions being enabled, those customizations are left intact. To create role assignments between these roles and the Organization Management role group, see Configure Exchange 2013 for shared permissions.

After you enable Active Directory split permissions, the following cmdlets are no longer available:

- **New-Mailbox**

- **New-MailContact**
- **New-MailUser**
- **New-RemoteMailbox**
- **Remove-Mailbox**
- **Remove-MailContact**
- **Remove-MailUser**
- **Remove-RemoteMailbox**

After you enable Active Directory split permissions, the following cmdlets are accessible but you can't use them to create distribution groups or modify distribution group membership:

- **Add-DistributionGroupMember**
- **New-DistributionGroup**
- **Remove-DistributionGroup**
- **Remove-DistributionGroupMember**
- **Update-DistributionGroupMember**

Some cmdlets, although still available, may offer only limited functionality when used with Active Directory split permissions. This is because they may allow you to configure recipient objects that are in the domain Active Directory partition and Exchange configuration objects that are in the configuration Active Directory partition. They may also allow you to configure Exchange-related attributes on objects stored in the domain partition. Attempts to use the cmdlets to create objects, or modify non-Exchange-related attributes on objects, in the domain partition will result in an error. For example, the **Add-ADPermission** cmdlet will return an error if you attempt to add permissions to a mailbox. However, the **Add-ADPermission** cmdlet will succeed if you configure permissions on a Receive connector. This is because a mailbox is stored in the domain partition while Receive connectors are stored in the configuration partition.

Additionally, the associated features in the Exchange Administration Center and Outlook Web App, such as the New Mailbox wizard, will also no longer be available or will generate an error if you try to use them.

Exchange administrators will, however, be able to create and manage Exchange-specific objects, such as transport rules, and so on.

For more information about configuring an Active Directory split permissions model, see Configure Exchange 2013 for split permissions.

Return to top

Understanding permissions coexistence with Exchange 2007 and Exchange 2010

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2013-05-21*

When you install Microsoft Exchange Server 2013 into an existing Microsoft Exchange Server 2010 or Microsoft Exchange Server 2007 organization, you need to understand how permissions will work in the new organization. Read the section below that applies to your organization.

- Installing Exchange 2013 into an existing Exchange 2010 organization
- Installing Exchange 2013 into an existing Exchange 2007 organization

Installing Exchange 2013 into an existing Exchange 2010 organization

Exchange 2013 uses the same Role Based Access Control (RBAC) permissions model that's used in Exchange 2010. When you install Exchange 2013 into an existing Exchange 2010 organization, the same management role groups, management roles, and management scopes apply to both Exchange 2013 and Exchange 2010 servers and recipients. Members of role groups, or users assigned to roles, can administer any Exchange 2013 or Exchange 2013 server or recipient that's included in the scope of the role group or role. If you don't use scopes in your organization and you want the members of your existing role groups to manage Exchange 2010 and Exchange 2013 servers and recipients, you don't have to do anything else. Those administrators will be able to manage Exchange 2013 servers and recipients that are added to the organization. If you need a reminder on how permissions work in Exchange 2010 and Exchange 2013, see Permissions.

In the new organization, you might want to separate the administration of Exchange 2010 and Exchange 2013 servers and recipients. The group of administrators responsible for administering Exchange 2010 servers and recipients may not be allowed to administer Exchange 2013 servers and recipients, and vice versa. In this case, you can use management scopes to define the servers and recipients each group of administrators should be allowed to manage. After you create the scopes you want, you can then copy existing role groups, add the administrators who should be a member of each, and then add the scopes to those role groups. When you're done, the members of each role group will only be able to administer the servers and recipients that match their respective scopes.

For more information about role groups, scopes, copying role groups, and adding scopes to role groups, see the following topics:

- Manage role groups
- Create a regular or exclusive scope
- Understanding management role groups
- Understanding management role scopes

Installing Exchange 2013 into an existing Exchange 2007

organization

Exchange 2013 includes Role Based Access Control (RBAC) permissions that replace the Active Directory access control entry (ACE)-based authorization model used in Microsoft Exchange Server 2007. RBAC is the authorization mechanism used for most of the management of Exchange 2013. This mechanism includes the following management areas:

- Exchange Management Shell
- Exchange admin center (EAC)
- Exchange Web Services

For more information about how to plan coexistence between Exchange 2013 and Exchange 2007, see Upgrade from Exchange 2007 to Exchange 2013.

Looking for management tasks related to permissions? Check out Permissions.

Exchange 2013 permissions

The Exchange 2013 RBAC permissions model consists of management role groups assigned one of several management roles. Management roles contain permissions that enable administrators to perform tasks in the Exchange organization. Administrators are added as members of the role groups and are granted all the permissions that the roles provide. The following table provides an example of the role groups, some of the roles assigned to role groups, and a description of the kind of user who might be a member of the role group.

Examples of role groups and roles in Exchange 2013

Management role group	Management roles	Members of this role group
Organization Management	The following roles are some of the roles assigned to this role group: • Address Lists • Exchange Servers • Journaling • Mail Recipients • Public Folders	Users who manage the entire Exchange 2013 organization should be members of this role group. With some exceptions, members of this role group can manage nearly any aspect of the Exchange 2013 organization. By default, the user account used to prepare Active Directory for Exchange 2013 is a member of this role group.

		For more information about this role group and for a complete list of roles assigned to this role group, see Organization Management.
View Only Organization Management	The following roles are assigned to this role group: • Monitoring • View-Only Configuration • View-Only Recipients	Users who view the configuration of the entire Exchange 2013 organization should be members of this role group. These users must be able to view server configuration and recipient information, and perform monitoring functions without the ability to change organization or recipient configuration. For more information about this role group, see View-only Organization Management.
Recipient Management	The following roles are assigned to this role group: • Distribution Groups • Mail Enabled Public Folders • Mail Recipient Creation • Mail Recipients • Message Tracking • Migration • Move Mailboxes • Recipient Policies	Users who manage recipients such as mailboxes, contacts, and distribution groups in the Exchange 2013 organization should be members of this role group. These users can create recipients, modify or delete existing recipients, or move mailboxes. For more information about this role group and for a

		complete list of roles assigned to this role group, see Recipient Management.
Server Management	The following roles are some of the roles assigned to this role group: • Databases • Exchange Connectors • Exchange Servers • Receive Connectors • Transport Queues	Users who manage Exchange server configuration such as Receive connectors, certificates, databases, and virtual directories should be members of this role group. These users can modify Exchange server configuration, create databases, and restart and manipulate transport queues. For more information about this role group and for a complete list of roles assigned to this role group, see Server Management.
Discovery Management	The following roles are assigned to this role group: • Legal Hold • Mailbox Search	Users who perform searches of mailboxes to support legal proceedings or to configure legal holds should be members of this role group. This is an example of a role group that might contain non-Exchange administrators, such as personnel in the legal department. Legal personnel can perform their tasks without intervention from Exchange administrators.

		For more information about this role group and for a complete list of roles assigned to this role group, see Discovery Management.

This table shows that Exchange 2013 provides a granular level of control over the permissions that you grant to your administrators. You can choose among 12 role groups in Exchange 2013. For a complete list of role groups and the permissions that they provide, see Built-in role groups.

Because Exchange 2013 provides many role groups and because further customization is possible by creating role groups that have different role combinations, the manipulation of access control lists (ACLs) on Active Directory objects is no longer necessary and has no effect. ACLs are no longer used to apply permissions to individual administrators or groups in Exchange 2013. All tasks, such as an administrator creating a mailbox or a user accessing a mailbox, are managed by RBAC. RBAC authorizes the task, and then Exchange performs the task on behalf of the user if allowed. Exchange performs the task in the Exchange Trusted Subsystem universal security group (USG). With some exceptions, all the ACLs on objects in Active Directory that Exchange 2010 has to access are granted to the Exchange Trusted Subsystem USG. This is a fundamental change from how permissions are handled in Exchange 2007.

The permissions granted to a user in Active Directory are separate from the permissions granted to the user by RBAC when that user is using the Exchange 2013 management tools.

For more information about RBAC, see Understanding Role Based Access Control.

Exchange 2007 permissions

The Exchange 2007 administrative model leverages Active Directory forests to define security boundaries. There is no isolation of security permissions within a specific forest. Forest owners and enterprise administrators can always gain access to all resources in any domain. In Exchange 2007, you may have to grant enterprise administrator rights and top-level domain administrator rights on a temporary basis only.

Exchange 2007 provides the following predefined administrator roles:

- **Exchange Organization Administrator role** This role grants permissions to control all aspects of the Exchange 2007 organization. Additionally, an administrator who has this role can grant permissions to other Exchange administrators. This role is granted to the account that you use to install Exchange 2007.
- **Exchange View-Only Administrator role** This role grants permissions to view Exchange configuration. However, an administrator who has this role can't modify objects in the Exchange 2007 organization.
- **Exchange Recipient Administrator role** This role grants permissions to manage e-mail

recipients. An administrator who has this role can modify Exchange-related items for users, groups, contacts, and distribution groups.

- **Exchange Server Administrator role** This role grants permissions to manage a specific server. However, this role doesn't grant permissions to perform actions that have a global impact on the Exchange 2007 organization.
- **Exchange Public Folder Administrator role** This role was added in Exchange 2007 Service Pack 1**.** This role grants permissions to manage public folders in the Exchange 2007 organization.

This permissions model uses USGs for all roles except for the Exchange Server Administrator role. When you run the Exchange 2007 **Setup /PrepareAD** command, the Setup program creates the USGs in the root domain and gives a forest-wide scope to the USGs. The USGs are assigned ACLs to manage Exchange objects throughout Active Directory.

In Exchange 2007, you can separate administrators by assigning them various roles. The permissions are assigned directly either to the user or to the USG of which the user is a member. Any actions performed by the user are performed in the context of that user's Active Directory account. The following table lists the Exchange 2007 administrator roles together with their Exchange-related permissions.

Exchange 2007 administrator roles

Administrator role	Members	Member of	Exchange permissions
Exchange Organization Administrator	The Administrator account or the account used to install the first Exchange 2007 server	Exchange Recipient Administrator Administrators local group of <*server name*>	Full control of the Microsoft Exchange container in Active Directory
Exchange View-Only Administrator	Exchange Recipient Administrators Exchange Server Administrators (<*server name*>)	Exchange Recipient Administrators Exchange Server Administrators	Read access to the Microsoft Exchange container in Active Directory Read access to all the Windows domains that have Exchange recipients
Exchange Recipient Administrator	Exchange Organization Administrators	Exchange View-Only Administrators	Full control of Exchange properties on

			Active Directory user objects
Exchange Server Administrator	Exchange Organization Administrators	Exchange View-Only Administrators Administrators local group of *<server name>*	Full control of Exchange *<server name>*
Exchange Server	Each Exchange 2007 computer account	Exchange View-Only Administrators	Special
Exchange Public Folder Administrator	Exchange Organization Administrators	Exchange View-Only Administrators	Full control to manage all public folders (granted the Create top level public folder extended right)

If you need to make more granular permission assignments, you can modify the ACLs on individual Exchange 2007 objects, such as address lists or databases. You must add the user or security group of which the user is a member directly to the ACL. Then, the actions are performed in the context of the particular user.

For more information about how to manage permissions in Exchange 2007, see Configuring Permissions in Exchange Server 2007.

Exchange 2013 and Exchange 2007 coexistence permissions

Because the permissions models for Exchange 2013 and for Exchange 2007 differ, Exchange 2013 permission assignments are separate from Exchange 2007 permission assignments. This is true even if both versions of Exchange are installed in the same forest. Without additional configuration, Exchange 2013 administrators don't have the required permissions to manage Exchange 2007-based servers, and Exchange 2007 administrators don't have the required permissions to manage Exchange 2013-based servers. You should consider the following questions:

- Do you want to grant Exchange 2013 administrators access to manage Exchange 2007 servers?
- Do you want to grant Exchange 2007 administrators access to manage Exchange 2013 servers?
- Do you want to customize Exchange 2013 permissions so that they match any customizations that have been made to Exchange 2007 ACLs?

Granting Exchange 2013 permissions to Exchange 2007 administrators

If you want Exchange 2007 administrators to administer Exchange 2013 servers, the Exchange 2007 administrators must be added as members of one or more Exchange 2013 role groups. You can add either users or USGs to role groups. The permissions granted to the role groups are then applied to the users or the USGs that you add as members.

Important:
If you use domain local or global Active Directory security groups, you must change them to USGs if you want to add them as members of an Exchange 2013 role group. Exchange 2013 supports only USGs.

The following table describes the mapping between Exchange 2007 administrator roles and Exchange 2013 role groups.

Exchange 2007 administrator roles and Exchange 2010 role groups

Exchange 2007 administrator role	Exchange 2013 role group
Exchange Organization Administrator	Organization Management
Exchange Recipient Administrator	Recipient Management
Exchange Server Administrator	Server Management
Exchange View-Only Administrator	View Only Organization Management
Exchange Server	No equivalent role group in Exchange 2013 (For more information about how to create custom role groups, see Manage role groups.)
Exchange Public Folder Administrator	Public Folder Management

If all your Exchange 2007 administrators are members of one of the Exchange 2007 administrative roles, you can add the members of each of the administrative groups to their equivalent Exchange 2013 role group. For example, if you want to give all Exchange 2007 organization administrators full access to Exchange 2013 objects, add the Exchange Organization Administrators USG to the Organization Management role group.

For more information about how to add users and USGs to role groups, see Manage role group members.

If you modify ACLs on Exchange 2007 objects to grant more granular permissions to Exchange 2007 administrators, and if you want to assign similar permissions to Exchange 2013 servers to those administrators, follow these steps:

1. Review the ACL customizations that have been made to the Exchange 2007 objects, and locate

the administrators who have been granted permissions to each object.
2. Categorize each Exchange 2007 object. For example, determine whether the object is a database, server, or recipient object.
3. Map the objects to the corresponding Exchange 2013 role group. For a list of built-in role groups, see Built-in role groups.
4. Add the USGs or users for each kind of object to the corresponding Exchange 2013 role groups. For more information about how to add users and USGs to role groups, see Manage role group members.

After you complete these steps, the Exchange 2007 administrators will be members of the specific role group that's mapped to the appropriate Exchange 2013 objects. The Exchange 2007 administrators can use the Exchange 2013 management tools to manage the Exchange 2013 servers and recipients.

Important:
In general, Exchange 2007 servers and recipients must be managed by using Exchange 2007 management tools, and Exchange 2013 servers and recipients must be managed by using Exchange 2013 management tools.

If the built-in role groups don't provide the specific set of permissions that you want to grant to some administrators, you can create custom role groups. When you create a custom role group, you can select which roles to add to it. You can define the specific features you want members of the role group to manage. For example, if you want administrators to manage only distribution groups, you can create a custom role group, and then select only the Distribution Groups role. After you do this, members of that custom role group can manage only distribution groups. For more information about how to create custom role groups, see Manage role groups.

If you assign selective permissions to certain Exchange 2007 objects (for example, you allow administrators to administer only specific databases), and if you want to apply the same configuration to your Exchange 2013 servers, see "Re-Creating Exchange 2007 ACL Customization Using Management Scopes in Exchange 2013" later in this topic.

Granting Exchange 2007 permissions to Exchange 2013 administrators

If you want Exchange 2013 administrators to administer Exchange 2007 servers, add the Exchange 2013 administrators to the USGs or the security group that corresponds to the particular Exchange 2007 administrator role. Alternatively, if you have customized ACL settings, add the administrators to the appropriate ACLs. Role groups are USGs, so role groups can be added directly to Exchange 2007 administrator role USGs.

After you finish, the Exchange 2013 administrators will be members of the appropriate Exchange 2007 administrator role or roles. The Exchange 2013 administrators can use the Exchange 2007 management tools to manage Exchange 2007 servers and recipients.

Re-Creating Exchange 2007 ACL customization using management scopes in Exchange 2013

In Exchange 2007, when you want to restrict who can administer a specific mailbox store, administer specific users, or control which mailbox store mailboxes are created on, you must modify the ACLs on the objects you want to restrict. Exchange 2013 provides the same capabilities, but without having to modify any ACLs. It does this by using management scopes, which are a component of RBAC.

Management scopes provide built-in scopes and custom scopes to define the objects that administrators can manage. By applying management scopes, you can define which recipients can be administered, which mailbox databases mailboxes can be created on, and which recipients or servers should be administered by a small group of administrators and by no one else.

You can create the following types of management scopes:

- **Predefined relative** Predefined relative scopes are included in Exchange 2013. You can control what a user sees and what a user modifies. For example, predefined relative scopes can control whether users see only information about themselves or information about the entire organization.
- **Recipient** Recipient scopes control which recipients an administrator can create, modify, or delete. These selections can be based on an organizational unit (OU), a recipient filter, or both. Recipient filters specify the criteria that a recipient must match to be included in the scope. For example, you might create a recipient filter scope that includes all users in a certain location or in a specific department. You can even combine OUs and recipient filters to match only users who are within a specific OU and who report to a specific manager.
- **Server** Server scopes control which servers an administrator can manage. You can specify either server lists or server filters. For server lists, you define a static list of servers that can be managed. Server filters work in the same manner as recipient filters in that you can specify the criteria that have to be matched. For example, you might create a server scope that matches all servers within a particular Active Directory site.
- **Database** Database scopes control which databases an administrator can manage. They can also control which databases mailboxes can be created on or which databases mailboxes can be moved to. Like server scopes, they can be defined as lists or as filters. For example, you might create a list or filter that allows administrators to create mailboxes on or move mailboxes to specific mailbox databases managed by a specific subsidiary.
- **Exclusive** Recipient, server, and database scopes can also be created as exclusive scopes. Exclusive scopes work in the same manner as deny access ACEs in ACLs. If anything matches an exclusive scope, only the administrators assigned an exclusive scope can manage that object. This is true even if another scope that isn't exclusive matches the same object. This is especially useful when you might want only a few, highly trusted individuals to be able to manage an executive's mailbox. Even if another regular recipient scope is broader and includes the executive's mailbox in the scope, the administrators assigned the broader, regular recipient scope won't be able to manage that executive's mailbox unless they are also assigned the exclusive scope.

Management scopes are used with management roles, management role assignments, and management role groups to control who can manage what objects and in what manner they can manage those objects. For more information, see the following topics:

- Understanding management role scopes
- Understanding exclusive scopes
- Understanding management role assignments
- Understanding management role groups
- Understanding management roles

To create the same permissions model in Exchange 2013 using management scopes that you might have defined using customized ACLs, you must inventory the ACLs that you've customized, and then create management scopes that match them. You can use the filterable properties available on recipient, server, and database objects to create management scopes that include the objects to which you want each management scope to control access. For more information about the properties that you can use with management scope filters, see Understanding management role scope filters.

For more information about how to create management scopes, see Create a regular or exclusive scope.

Manage role groups

Exchange Server 2013 > Permissions >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-10-08*

This topic shows you how to add, remove, copy, and view management role groups in Microsoft Exchange Server 2013. It also shows you how to add, remove, and list management roles on role groups and how to change management scopes and delegates on role groups. For more information about role groups in Exchange 2013, see Understanding management role groups.

For additional management tasks related to role groups, see Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 to 10 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Create a role group

If you want to customize the permissions that you can assign to a group of users, create a new custom management role group.

Use the EAC to create a role group

1. In the Exchange Administration Center (EAC), navigate to **Permissions** > **Admin Roles** and then click **Add +**.
2. In the **New role group** window, provide a name for the new role group.
3. You can either select the roles that you want to be assigned to the role group and the members you want to be added to the role group now, or you can do this at another time.
4. Select the write scope that you want to apply to the new role group.
5. Click **Save** to create the role group.

Use the Shell to create a role group

To create a role group, see the Examples section in New-RoleGroup.

How do you know this worked?

To verify that you have successfully created a role group, do the following:

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Verify that the new role group appears in the role group list and then select it.
3. Verify that members, assigned roles, and scope that you specified on the new role group are listed in the role group details pane.

Copy a role group

Use the EAC to copy a role group

If you have a role group that contains the permissions you want to grant to users, but you want to apply a different management scope, or remove or add one or two management roles without having to add all the other roles manually, you can copy the existing role group.

Important:
You can't use the EAC to copy a role group if you've used the Exchange Management Shell to configure multiple management role scopes or exclusive scopes on the role group. If you've configured multiple scopes or exclusive scopes on the role group, you must use the Shell procedures later in this topic to copy the role group. For more information about management role scopes, see Understanding management role scopes.

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to copy and then click **Copy**.

3. In the **New role group** window, provide a name for the new role group.
4. Review the roles that have been copied to the new role group. Add or remove roles as necessary.
5. Review the write scope, and change it as necessary.
6. Review the members that have been copied to the new role group. Add or remove members as necessary.
7. Click **Save** to create the role group.

Use the Shell to copy a role group with no scope

1. Store the role group that you want to copy in a variable using the following syntax.

```
$RoleGroup = Get-RoleGroup <name of role group to copy>
```

2. Create the new role group, and also add members to the role group and specify who can delegate the new role group to other users, using the following syntax.

```
New-RoleGroup <name of new role group> -Roles
$RoleGroup.Roles -Members <member1, member2, member3...> -
ManagedBy <user1, user2, user3...>
```

For example, the following commands copy the Organization Management role group, and name the new role group "Limited Organization Management". It adds the members Isabelle, Carter, and Lukas and can be delegated by Jenny and Katie.

```
$RoleGroup = Get-RoleGroup "Organization Management"
New-RoleGroup "Limited Organization Management" -Roles
$RoleGroup.Roles -Members Isabelle, Carter, Lukas -
ManagedBy Jenny, Katie
```

After the new role group is created, you can add or remove roles, change the scope of role assignments on the role, and more.

For detailed syntax and parameter information, see Get-RoleGroup and New-RoleGroup.

Use the Shell to copy a role group with a custom scope

1. Store the role group that you want to copy in a variable using the following syntax.

```
$RoleGroup = Get-RoleGroup <name of role group to copy>
```

2. Create the new role group with a custom scope using the following syntax.

```
New-RoleGroup <name of new role group> -Roles
$RoleGroup.Roles -CustomRecipientWriteScope <recipient
scope name> -CustomConfigWriteScope <configuraiton scope
name>
```

For example, the following commands copy the Organization Management role group and create a

new role group called Vancouver Organization Management with the Vancouver Users recipient scope and Vancouver Servers configuration scope.

```
$RoleGroup = Get-RoleGroup "Organization Management"
New-RoleGroup "Vancouver Organization Management" -Roles
$RoleGroup.Roles -CustomRecipientWriteScope "Vancouver
Users" -CustomConfigWriteScope "Vancouver Servers"
```

You can also add members to the role group when you create it by using the *Members* parameter as shown in Use the Shell to copy a role group with no scope earlier in this topic. For more information about management scopes, see Understanding management role scopes.

After the new role group is created, you can add or remove roles, change the scope of role assignments on the role, and perform other tasks.

For detailed syntax and parameter information, see Get-RoleGroup and New-RoleGroup.

Use the Shell to copy a role group with an OU scope

1. Store the role group that you want to copy in a variable using the following syntax.

```
$RoleGroup = Get-RoleGroup <name of role group to copy>
```

2. Create the new role group with a custom scope using the following syntax.

```
New-RoleGroup <name of new role group> -Roles
$RoleGroup.Roles -RecipientOrganizationalUnitScope <OU
name>
```

For example, the following commands copy the Recipient Management role group and create a new role group called Toronto Recipient Management that allows management of only users in the Toronto Users OU.

```
$RoleGroup = Get-RoleGroup "Recipient Management"
New-RoleGroup "Toronto Recipient Management" -Roles
$RoleGroup.Roles -RecipientOrganizationalUnitScope
"contoso.com/Toronto Users"
```

You can also add members to the role group when you create it by using the *Members* parameter as shown in Use the Shell to copy a role group with no scope earlier in this topic. For more information about management scopes, see Understanding management role scopes.

After the new role group is created, you can add or remove roles, change the scope of role assignments on the role, and more.

For detailed syntax and parameter information, see Get-RoleGroup and New-RoleGroup.

How do you know this worked?

To verify that you have successfully copied a role group, do the following:

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Verify that the copied role group appears in the role group list, and then select it.
3. Verify that members, assigned roles, and scope that you specified on the copied role group are listed in the role group details pane.

Remove a role group

If you no longer need a role group you created, you can remove it. When you remove a role group, the management role assignments between the role group and the management roles are deleted. The management roles aren't deleted. If a user depended on the role group for access to a feature, the user will no longer have access to the feature. You can't remove built-in role groups.

Use the EAC to remove a role group

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to remove and then click **Delete** 🗑.
3. Verify that you want to remove the selected role group, and if so, respond **Yes** to the warning.

Use the Shell to remove a role group

To remove a role group, see the Examples section in Remove-RoleGroup.

View role groups

You can view either a list of role groups or the detailed information about a specific role group that exists in your organization.

Use the EAC to view a list of role groups and role group details

1. In the EAC, navigate to **Permissions** > **Admin Roles**. All of the role groups in your organization are listed here.
2. Select a role group to view the members, assigned roles, and scope that are configured on the role group.

Use the Shell to view a list of role groups and role group details

To view a list of role groups, see the Examples section in Get-RoleGroup.

Add a role to a role group

Adding a management role to a role group is the best and simplest way to grant permissions to a group of administrators or specialist users. If you want to give users that are members of a role group the ability to manage a feature, you add the management role that manages the feature to the role group. After the role is added, the members of the role group are granted the permissions

provided by the role.

Use the EAC to add a management role to a role group

Important:
You can't use the EAC to add roles to a role group if you've used the Shell to configure multiple management role scopes or exclusive scopes on the role group. If you've configured multiple scopes or exclusive scopes on the role group, you must use the Shell procedures later in this topic to add roles to the role group. For more information about management role scopes, see Understanding management role scopes.

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to add a role to, and then click **Edit** .
3. In the **Roles** section, select the roles you want to add to the role group.
4. When you've finished adding roles to the role group, click **Save**.

Use the Shell to create a role assignment with no scope

You can create a role assignment with no scope between a role and a role group. When you do this, the implicit read and implicit write scopes of the role apply.

Use the following syntax to assign a role without any scope to a role group. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group
name> -Role <role name>
```

This example assigns the Transport Rules management role to the Seattle Compliance role group.

```
New-ManagementRoleAssignment -SecurityGroup "Seattle
Compliance" -Role "Transport Rules"
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Use the Shell to create a role assignment with a predefined scope

If a predefined scope meets your business requirements, you can apply that scope to the role assignment rather than create a new one. For a list of predefined scopes and their descriptions, see Understanding management role scopes.

For more information about role assignments, see Understanding management role assignments.

Use the following syntax to assign a role to a role group with a predefined scope. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group
name> -Role <role name> -RecipientRelativeWriteScope <
MyGAL | MyDistributionGroups | Organization | Self >
```

This example assigns the Message Tracking role to the Enterprise Support role group and applies the Organization predefined scope.

```
New-ManagementRoleAssignment -SecurityGroup "Enterprise Support" -Role "Message Tracking" -RecipientRelativeWriteScope Organization
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Use the Shell to create a role assignment with a recipient filter-based scope

If you created a recipient filter-based scope, you need to include the scope in the command used to assign the role to a role group by using the *CustomRecipientWriteScope* parameter.

You can also include a configuration write scope when you create a role assignment that has a recipient write scope.

For more information about role assignments and scopes, see the following topics:

- Understanding management role assignments
- Understanding management role scopes

Use the following syntax to assign a role to a role group with a recipient filter-based scope. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group name> -Role <role name> -CustomRecipientWriteScope <role scope name>
```

This example assigns the Message Tracking role to the Seattle Recipient Admins role group and applies the Seattle Recipients scope.

```
New-ManagementRoleAssignment -SecurityGroup "Seattle Recipient Admins" -Role "Message Tracking" -CustomRecipientWriteScope "Seattle Recipients"
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Use the Shell to create a role assignment with a configuration scope

If you created a server or database configuration filter or list-based scope, you need to include the scope in the command used to assign the role to a role group by using the *CustomConfigWriteScope* parameter.

You can also include a recipient write scope when you create a role assignment that has a configuration write scope.

For more information about role assignments and management scopes, see the following topics:

- Understanding management role assignments

- Understanding management role scopes

Use the following syntax to assign a role to a role group with a configuration scope. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group name> -Role <role name> -CustomConfigWriteScope <role scope name>
```

This example assigns the Databases role to the Seattle Server Admins role group and applies the Seattle Servers scope.

```
New-ManagementRoleAssignment -SecurityGroup "Seattle Server Admins" -Role "Databases" -CustomConfigWriteScope "Seattle Servers"
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Use the Shell to create a role assignment with an OU scope

If you want to scope a role's write scope to an OU, you can specify the OU in the *RecipientOrganizationalUnitScope* parameter directly.

For more information about role assignments and management scopes, see the following topics:
- Understanding management role assignments
- Understanding management role scopes

Use the following command to assign a role to a role group and restrict the write scope of a role to a specific OU. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group name> -Role <role name> -RecipientOrganizationalUnitScope <OU>
```

This example assigns the Mail Recipients role to the Seattle Recipient Admins role group and scopes the assignment to the Sales\Users OU in the Contoso.com domain.

```
New-ManagementRoleAssignment -SecurityGroup "Seattle Recipient Admins" -Role "Mail Recipients" -RecipientOrganizationalUnitScope contoso.com/sales/users
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

How do you know this worked?

To verify that you have successfully added roles to a role group, do the following:
1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Select the role group you added roles to. In the role group details pane, verify that the roles that you added are listed.

Remove a role from a role group

Removing a role from a management role group is the best and simplest way to revoke permissions granted to a group of administrators or specialist users. If you don't want administrators or specialist users to have permissions to manage a feature, you remove the management role from the management role group that manages the permissions. After the role is removed, the members of the role group will no longer have permissions to manage the feature.

Note:

Some role groups, such as the Organization Management role group, restrict what roles can be removed from a role group. For more information, see Understanding management role groups.

If an administrator is a member of another role group that contains management roles that grants permissions to manage the feature, you need to either remove the administrator from the other role groups, or remove the role that grants permissions to manage the feature from the other role groups.

Use the EAC to remove a management role from a role group

Important:

You can't use the EAC to remove roles from a role group if you've used the Shell to configure multiple scopes or exclusive scopes on the role group. If you've configured multiple scopes or exclusive scopes on the role group, you must use the Shell procedures later in this topic to remove roles from the role group. For more information about management role scopes, see Understanding management role scopes.

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to remove a role from, and then click **Edit** .
3. In the **Roles** section, select the roles you want to remove from the role group.
4. When you've finished removing roles from the role group, click **Save**.

Use the Shell to remove a role from a role group

You can remove roles from role groups by retrieving the associated management role assignment using the **Get-ManagementRoleAssignment** cmdlet and then piping the role assignment returned to the **Remove-ManagementRoleAssignment** cmdlet. Unless you want to remove both delegating and regular role assignments at the same time, specify the *Delegating* parameter to specify whether you want to remove regular or delegating role assignments.

For more information about regular and delegating role assignments, see Understanding management role assignments.

This procedure uses pipelining. For more information about pipelining, see Pipelining.

To remove a role from a role group, use the following syntax.

```
Get-ManagementRoleAssignment -RoleAssignee <role group
name> -Role <role name> -Delegating <$true | $false> |
Remove-ManagementRoleAssignment
```

This example removes the Distribution Groups role, which enables administrators to manage distribution groups, from the Seattle Recipient Administrators role group. Because we want to remove the role assignment that provides permissions to manage distribution groups, the *Delegating* parameter is set to `$False`, which returns only regular role assignments.

```
Get-ManagementRoleAssignment -RoleAssignee "Seattle
Recipient Administrators" -Role "Distribution Groups" -
Delegating $false | Remove-ManagementRoleAssignment
```

For detailed syntax and parameter information, see Remove-ManagementRoleAssignment.

How do you know this worked?

To verify that you have successfully removed roles from a role group, do the following:

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you removed roles from. In the role group details pane, verify that the roles that you removed are no longer listed.

Change a role group's scope

The management role assignments between a role group and a role contain management scopes, which determine what objects are made available to members of that role group. By changing the write scope on a role group, you can change what objects are made available to role group members to create, change, or remove. You can't change the read scope on a role group.

Exchange 2013 includes scopes that are applied by default to role assignments when no custom scopes are created. If you want to use a custom scope with a role assignment on a role group, you must create one first. For more information about creating custom scopes, which is an advanced task, see Create a regular or exclusive scope.

For more information about management role scopes and assignments in Exchange 2013, see the following topics:

- Understanding management role scopes
- Understanding management role assignments

Use the EAC to change the scope on a role group

When you use the EAC to change the scope on a role group, you're actually changing the scope on all the role assignments between the role group and each of the management roles assigned to the role group. If you want to change the scope on specific role assignments, you must use the Shell procedures later in this topic.

Important:

You can't use the EAC to manage scopes on role assignments between roles and a role group if you've used the Shell to configure multiple scopes or exclusive scopes on those role assignments. If you've configured multiple scopes or exclusive scopes on those role assignments, you must use the Shell procedures later in this topic to manage scopes. For more information about management role scopes, see Understanding management role scopes.

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to change the scope on, and then click **Edit** .
3. Select one of the two following **Write scope** options:
   - A write scope from the drop-down box, where you can select either the default write scope or a custom write scope.
   - **Organizational unit** Select this option and provide an organizational unit (OU) if you want to scope this role group to an OU.
4. Click **Save** to save the changes to the role group.

Use the Shell to change the scope of all role assignments on a role group at the same time

Role assignments between the role group and the roles assigned to it can use the implicit scope obtained from the roles themselves, the same custom scope, or different custom scopes. For more information about role assignments, see Understanding management role assignments.

The scopes on the role assignments are managed using the **Set-ManagementRoleAssignment** cmdlet. You can't manage scopes using the **Set-RoleGroup** cmdlet.

To change the scope of all the role assignments between a role group and a set of management roles at the same time, you need to first retrieve the role assignments on the role group, and then set the new scope on each of the assignments. You can do this by using the **Get-ManagementRoleAssignment** cmdlet to retrieve the role assignments, and then pipe them to the **Set-ManagementRoleAssignment** cmdlet.

This procedure uses the concepts of pipelining and the *WhatIf* switch. For more information, see the following topics:

- Pipelining
- WhatIf, Confirm, and ValidateOnly switches

To set the scope on all of the role assignments on a role group at the same time, use the following syntax.

```
Get-ManagementRoleAssignment -RoleAssignee <name of role
group> | Set-ManagementRoleAssignment -
CustomRecipientWriteScope <recipient scope name> -
CustomConfigWriteScope <configuration scope name> -
RecipientRelativeScopeWriteScope < MyDistributionGroups |
Organization | Self> -ExclusiveRecipientWriteScope
<exclusive recipient scope name> -ExclusiveConfigWriteScope
```

```
<exclusive configuration scope name> -
RecipientOrganizationalUnitScope <organizational unit>
```

You use only the parameters you need to configure the scope you want to use. For example, if you want to change the recipient scope for all role assignments on the Sales Recipient Management role group to Direct Sales Employees, use the following command.

```
Get-ManagementRoleAssignment -RoleAssignee "Sales Recipient
Management" | Set-ManagementRoleAssignment -
CustomRecipientWriteScope "Direct Sales Employees"
```

Note:

You can use the *WhatIf* switch to verify that only the role assignments you want to change are changed. Run the preceding command with the *WhatIf* switch to verify the results, and then remove the *WhatIf* switch to apply the changes.

For more information about changing management role assignments, see Change a role assignment.

For detailed syntax and parameter information, see Get-ManagementRoleAssignment.

Use the Shell to change the scope of individual role assignments on a role group

Role assignments between the role group and the roles assigned to it can use the implicit scope obtained from the roles themselves, the same custom scope, or different custom scopes. For more information about role assignments, see Understanding management role assignments.

The scopes on the role assignments are managed using the **Set-ManagementRoleAssignment** cmdlet. You can't manage scopes using the **Set-RoleGroup** cmdlet.

This procedure uses the concepts of pipelining and the **Format-List** cmdlet. For more information, see the following topics:

- Pipelining
- Working with command output

To change the scope on a role assignment between a role group and a management role, you first find the name of the role assignment, and then set the scope on the role assignment.

1. To find the names of all the role assignments on a role group, use the following command. By piping the management role assignments to the **Format-List** cmdlet, you can view the full name of the assignment.

```
Get-ManagementRoleAssignment -RoleAssignee <role group
name> | Format-List Name
```

2. Find the name of the role assignment you want to change. Use the name of the role assignment in the next step.
3. To set the scope on an individual assignment, use the following syntax.

```
Set-ManagementRoleAssignment <role assignment name> -
CustomRecipientWriteScope <recipient scope name> -
CustomConfigWriteScope <configuration scope name> -
RecipientRelativeScopeWriteScope < MyDistributionGroups |
Organization | Self> -ExclusiveRecipientWriteScope
<exclusive recipient scope name> -ExclusiveConfigWriteScope
<exclusive configuration scope name> -
RecipientOrganizationalUnitScope <organizational unit>
```

You use only the parameters you need to configure the scope you want to use. For example, if you want to change the recipient scope for the Mail Recipients_Sales Recipient Management role assignment to All Sales Employees, use the following command.

```
Set-ManagementRoleAssignment "Mail Recipients_Sales
Recipient Management" -CustomRecipientWriteScope "All Sales
Employees"
```

For more information about changing management role assignments, see Change a role assignment.

For detailed syntax and parameter information, see Set-ManagementRoleAssignment.

How do you know this worked?

To verify that you have successfully changed the scope of a role assignment on a role group, do the following:

- If you used the EAC to configure the scope on the role group, do the following:
  1. In the EAC, navigate to **Permissions**> **Admin Roles**. All the role groups in your organization are listed here.
  2. Select a role group to view the scope that's configured on the role group.
- If you used the Shell to configure the scope on the role group, do the following:
  1. Run the following command in the Shell.

```
Get-ManagementRoleAssignment -RoleAssignee <role group
name> | Format-Table *WriteScope
```

  2. Verify that the write scope on the role assignments has been changed to the scope you specified.

Add or remove a role group delegate

Role group delegates are users or universal security groups (USGs) that can add or remove members from a role group or change the properties of a role group. By adding or removing role group delegates, you can control who is allowed to manage a role group.

Important:

After you add a delegate to a role group, the role group can only be managed by the delegates on the role group, or by users who are assigned, either directly or indirectly, the Role Management management role.
If a user is assigned, either directly or indirectly, the Role Management role and isn't added as a delegate of the role group, the user must use the *BypassSecurityGroupManagerCheck* switch on the **Add-RoleGroupMember**, **Remove-RoleGroupMember**, **Update-RoleGroupMember**, and **Set-RoleGroup** cmdlets to manage a role group.

Note:

You can't use the EAC to add a delegate to a role group.

Use the Shell to add a delegate to a role group

To change the list of delegates on a role group, you use the *ManagedBy* parameter on the **Set-RoleGroup** cmdlet. The *ManagedBy* parameter overwrites the entire delegate list on the role group. If you want to add delegates to the role group rather than replace the entire list of delegates, use the following steps:

1. Store the role group in a variable using the following command.

```
$RoleGroup = Get-RoleGroup <role group name>
```

2. Add the delegate to the role group stored in the variable using the following command.

```
$RoleGroup.ManagedBy += (Get-User <user to add>).Identity
```

Note:

Use the **Get-Group** cmdlet if you want to add a USG.

3. Repeat Step 2 for each delegate you want to add.
4. Apply the new list of delegates to the actual role group using the following command.

```
Set-RoleGroup <role group name> -ManagedBy
$RoleGroup.ManagedBy
```

This example adds the user David Strome as a delegate on the Organization Management role group.

```
$RoleGroup = Get-RoleGroup "Organization Management"
$RoleGroup.ManagedBy += (Get-User "David Strome").Identity
Set-RoleGroup "Organization Management" -ManagedBy
$RoleGroup.ManagedBy
```

For detailed syntax and parameter information, see Set-RoleGroup.

Use the Shell to remove a delegate from a role group

To change the list of delegates on a role group, you use the *ManagedBy* parameter on the **Set-RoleGroup** cmdlet. The *ManagedBy* parameter overwrites the entire delegate list on the role group. If you want to remove delegates from the role group rather than replace the entire list of delegates, use the following steps:

1. Store the role group in a variable using the following command.

```
$RoleGroup = Get-RoleGroup <role group name>
```

2. Remove the delegate from the role group stored in the variable using the following command.

```
$RoleGroup.ManagedBy -= (Get-User <user to
remove>).Identity
```

Note:
Use the **Get-Group** cmdlet if you want to remove a USG.

3. Repeat Step 2 for each delegate you want to remove.
4. Apply the new list of delegates to the actual role group using the following command.

```
Set-RoleGroup <role group name> -ManagedBy
$RoleGroup.ManagedBy
```

This example removes the user David Strome as a delegate on the Organization Management role group.

```
$RoleGroup = Get-RoleGroup "Organization Management"
$RoleGroup.ManagedBy -= (Get-User "David Strome").Identity
Set-RoleGroup "Organization Management" -ManagedBy
$RoleGroup.ManagedBy
```

For detailed syntax and parameter information, see Set-RoleGroup.

How do you know this worked?

To verify that you have successfully changed the delegate list on a role group, do the following:

1. In the Shell, run the following command.

```
Get-RoleGroup <role group name> | Format-List ManagedBy
```

2. Verify that the delegates listed on the *ManagedBy* property include only the delegates that should be able to manage the role group.

Manage role group members

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-10-08*

This topic shows you how to add, remove and view members of a management role group in Microsoft Exchange Server 2013. For more information about role groups in Exchange 2013, see Understanding management role groups.

For additional management tasks related to role groups, see Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Add members to a role group

To give a user the permissions that are granted by a role group, you need to add the user, or a universal security group (USG), or another role group that the user is a member of, as a member of the role group.

Use the EAC to add members to a role group

1. In the Exchange Administration Center (EAC), navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to add members to, and then click **Edit** .
3. In the **Members** section, click **Add +**.
4. Select the users, USGs, or other role groups you want to add to the role group, click **Add**, and then click **OK**.
5. Click **Save** to save the changes to the role group.

Use the Shell to add members to a role group

To add a role group member, see the Examples section in Add-RoleGroupMember.

To add multiple role group members or to replace the role group membership entirely, see the Examples section in Update-RoleGroupMember.

How do you know this worked?

To verify that you have successfully added one or more members to a role group, do the following:
1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you added members to.
3. In the role group details pane, verify that the members you added are listed.

Remove members from a role group

To remove the permissions granted by a role group from a user, you need to remove the user, or the universal security group (USG) the user is a member of, from the role group's membership.

Use the EAC to remove members from a role group

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to remove members from, and then click **Edit** .
3. In the **Members** section, select the members you want to remove, click **Remove** —, and then click **Save**.

Use the Shell to remove members from a role group

To remove a role group member, see the Examples section in Remove-RoleGroupMember.

To remove multiple role group members or to replace the role group membership entirely, see the Examples section in Update-RoleGroupMember.

How do you know this worked?

To verify that you have successfully removed one or more members to a role group, do the following:
1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you removed members from.
3. In the role group details pane, verify that the members you removed are no longer listed.

View the members of a role group

The members of a role group are granted the permissions provided by the management roles assigned to the role group. You can view the members of a role group to see which users, universal security groups (USG), or other role groups are granted permissions by the role group you specify.

Use the EAC to view the members of a role group

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to view the members of.
3. In the role group details pane, view the members in the role group details pane.

Use the Shell to view the members of a role group

To view the members of a role group, see the “Examples” section in Get-RoleGroupMember.

Manage linked role groups

Exchange Server 2013 > Permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-09*

You can use a linked management role group to enable members of a universal security group (USG) in a foreign Active Directory forest to manage a Microsoft Exchange Server 2013 organization in a resource Active Directory forest. By associating a USG in a foreign forest with a linked role group, the members of that USG are granted the permissions provided by the management roles assigned to the linked role group. For more information about linked role groups, see Understanding management role groups.

To create and configure linked role groups, you need to use the **New-RoleGroup** and **Set-RoleGroup** cmdlets. For detailed syntax and parameter information, see the following topics:

- New-RoleGroup
- Set-RoleGroup

For additional management tasks related to role groups, see Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 to 10 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.
- You can’t use the Exchange Administration Center (EAC) to create or configure linked role groups. You must use the Exchange Management Shell.
- At a minimum, configuring a linked role group requires that a one-way trust is established between the resource Active Directory forest in which the linked role group will reside, and the foreign Active Directory forest where the users or USGs reside. The resource forest must trust the foreign forest.
- You must have the following information about the foreign Active Directory forest:
  - **Credentials** You must have a user name and password that can access the foreign Active Directory forest. This information is used with the *LinkedCredential* parameter on the **New-RoleGroup** and **Set-RoleGroup** cmdlets.
  - **Domain controller** You must have the fully qualified domain name (FQDN) of an Active Directory domain controller in the foreign Active Directory forest. This information is used with the *LinkedDomainController* parameter on the **New-RoleGroup** and **Set-RoleGroup** cmdlets.

- **Foreign USG** You must have the full name of a USG in the foreign Active Directory forest that contains the members you want to associate with the linked role group. This information is used with the *LinkedForeignGroup* parameter on the **New-RoleGroup** and **Set-RoleGroup** cmdlet.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Create a linked role group

Use the Shell to create a linked role group with no scope

To create a linked role group and assign management roles to the linked role group, do the following:

1. Store the foreign Active Directory forest credentials in a variable.

```
$ForeignCredential = Get-Credential
```

2. Create the linked role group using the following syntax.

```
New-RoleGroup <role group name> -LinkedForeignGroup <name
of foreign USG> -LinkedDomainController <FQDN of foreign
Active Directory domain controller> -LinkedCredential
$ForeignCredential -Roles <role1, role2, role3...>
```

3. Add or remove members to or from the foreign USG using Active Directory Users and Computers on a computer in the foreign Active Directory forest.

This example does the following:

- Retrieves the credentials for the users.contoso.com foreign Active Directory forest. These credentials are used to connect to the DC01.users.contoso.com domain controller in the foreign forest.
- Creates a linked role group called Compliance Role Group in the resource forest where Exchange 2013 is installed.
- Links the new role group to the Compliance Administrators USG in the users.contoso.com foreign Active Directory forest.
- Assigns the Transport Rules and Journaling management roles to the new linked role group.

```
$ForeignCredential = Get-Credential
New-RoleGroup "Compliance Role Group" -LinkedForeignGroup
```

```
"Compliance Administrators" -LinkedDomainController
DC01.users.contoso.com -LinkedCredential $ForeignCredential
-Roles "Transport Rules", "Journaling"
```

Use the Shell to create a linked role group with a custom management scope

You can create linked role groups with custom recipient management scopes, custom configuration management scopes, or both. To create a linked role group and assign management roles with custom scopes to it, do the following:

1. Store the foreign Active Directory forest credentials in a variable.

```
$ForeignCredential = Get-Credential
```

2. Create the linked role group using the following syntax.

```
New-RoleGroup <role group name> -LinkedForeignGroup <name
of foreign USG> -LinkedDomainController <FQDN of foreign
Active Directory domain controller> -CustomConfigWriteScope
<name of configuration scope> -CustomRecipientWriteScope
<name of recipient scope> -LinkedCredential
$ForeignCredential -Roles <role1, role2, role3...>
```

3. Add or remove members to or from the foreign USG using Active Directory Users and Computers on a computer in the foreign Active Directory forest.

This example does the following:

- Retrieves the credentials for the users.contoso.com foreign Active Directory forest. These credentials are used to connect to the DC01.users.contoso.com domain controller in the foreign forest.
- Creates a linked role group called Seattle Compliance Role Group in the resource forest where Exchange 2013 is installed.
- Links the new role group to the Seattle Compliance Administrators USG in the users.contoso.com foreign Active Directory forest.
- Assigns the Transport Rules and Journaling management roles to the new linked role group with the Seattle Recipients custom recipient scope.

```
$ForeignCredential = Get-Credential
New-RoleGroup "Seattle Compliance Role Group" -
LinkedForeignGroup "Seattle Compliance Administrators" -
LinkedDomainController DC01.users.contoso.com -
LinkedCredential $ForeignCredential -
CustomRecipientWriteScope "Seattle Recipients" -Roles
"Transport Rules", "Journaling"
```

For more information about management scopes, see Understanding management role scopes.

Use the Shell to create a linked role group with an OU scope

You can create linked role groups that use an OU recipient scope. To create a linked role group and assign management roles to it with an OU scope, do the following:

1. Store the foreign Active Directory forest credentials in a variable.

```
$ForeignCredential = Get-Credential
```

2. Create the linked role group using the following syntax.

```
New-RoleGroup <role group name> -LinkedForeignGroup <name
of foreign USG> -LinkedDomainController <FQDN of foreign
Active Directory domain controller> -LinkedCredential
$ForeignCredential -RecipientOrganizationalUnitScope <OU
name> -Roles <role1, role2, role3...>
```

3. Add or remove members to or from the foreign USG using Active Directory Users and Computers on a computer in the foreign Active Directory forest.

This example does the following:

- Retrieves the credentials for the users.contoso.com foreign Active Directory forest. These credentials are used to connect to the DC01.users.contoso.com domain controller in the foreign forest.
- Creates a linked role group called Executives Compliance Role Group in the resource forest where Exchange 2013 is installed.
- Links the new role group to the Executives Compliance Administrators USG in the users.contoso.com foreign Active Directory forest.
- Assigns the Transport Rules and Journaling management roles to the new linked role group with the OU recipient scope Executives OU.

```
$ForeignCredential = Get-Credential
New-RoleGroup "Executives Compliance Role Group" -
LinkedForeignGroup "Executives Compliance Administrators" -
LinkedDomainController DC01.users.contoso.com -
LinkedCredential $ForeignCredential -
RecipientOrganizationalUnitScope "Executives OU" -Roles
"Transport Rules", "Journaling"
```

For more information about management scopes, see Understanding management role scopes.

Change the foreign USG on a linked role group

Use the Shell to change the foreign USG on a linked role group

To change the foreign USG associated with a linked role group, do the following:
1. Store the foreign Active Directory forest credentials in a variable.

```
$ForeignCredential = Get-Credential
```

2. Change the foreign USG on the existing linked role group using the following syntax.

```
Set-RoleGroup <role group name> -LinkedForeignGroup <name
of foreign USG> -LinkedDomainController <FQDN of foreign
Active Directory domain controller> -LinkedCredential
$ForeignCredential
```

This example does the following:

- Retrieves the credentials for the users.contoso.com foreign Active Directory forest. These credentials are used to connect to the DC01.users.contoso.com domain controller in the foreign forest.
- Changes the foreign USG on the Compliance Role Group role group to Regulatory Compliance Officers.

```
$ForeignCredential = Get-Credential
Set-RoleGroup "Compliance Role Group" -LinkedForeignGroup
"Regulatory Compliance Officers" -LinkedDomainController
DC01.users.contoso.com -LinkedCredential $ForeignCredential
```

Manage role assignment policies

Exchange Server 2013 > Permissions >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-10-09*

If you want to customize the permissions that you assign to a group of end users, create a new custom management role assignment policy. The assignment policy you create can be customized to suit your end user's specific requirements. For more information about assignment policies in Microsoft Exchange Server 2013, see Understanding management role assignment policies.

Looking for other management tasks related to managing permissions? Check out Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Assignment policies" entry in the Role management permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Add an assignment policy

After you've created the new assignment policy, you assign users to it. For more information, see Change the assignment policy on a mailbox.

Use the EAC to create a new assignment policy

Note:
You can only create explicit assignment policies using the Exchange Administration Center (EAC). If you want to create a new default assignment policy, you must use the Exchange Management Shell. For more information, see the "Use the Shell to create a default assignment policy" section later in this topic.

1. In the EAC, navigate to **Permissions** > **User Roles** and then click **Add +**.
2. In the role assignment policy window, provide a name for the new assignment policy.
3. Select the check box next to the role or roles you want to add to the assignment policy. You can select multiple roles, including end-user roles you've added. If you select a role that has child roles, the child roles are automatically selected.
4. Click **Save** to save the changes to the assignment policy.

Use the Shell to create an explicit assignment policy

To create an explicit assignment policy that can be manually assigned to mailboxes, use the following syntax.

```
New-RoleAssignmentPolicy <assignment policy name> -Roles
<roles to assign>
```

This example creates the explicit assignment policy Limited Mailbox Configuration and assigns the `MyBaseOptions`, `MyAddressInformation`, and `MyDisplayName` roles to it.

```
New-RoleAssignmentPolicy "Limited Mailbox Configuration" -
Roles MyBaseOptions, MyAddressInformation, MyDisplayName
```

For detailed syntax and parameter information, see New-RoleAssignmentPolicy.

Use the Shell to create a default assignment policy

To create a default assignment policy assigned to new mailboxes, use the following syntax.

```
New-RoleAssignmentPolicy <assignment policy name> -Roles
<roles to assign> -IsDefault
```

This example creates the default assignment policy Limited Mailbox Configuration and assigns the `MyBaseOptions`, `MyAddressInformation`, and `MyDisplayName` roles to it.

```
New-RoleAssignmentPolicy "Limited Mailbox Configuration" -
Roles MyBaseOptions, MyAddressInformation, MyDisplayName -
IsDefault
```

For detailed syntax and parameter information, see New-RoleAssignmentPolicy.

Remove an assignment policy

If you no longer need a management role assignment policy, you can remove it.

What do you need to know before you begin?

- All users assigned the assignment policy must be changed to another assignment policy. For more information about how to change an assignment policy on a mailbox, see Change the assignment policy on a mailbox.
- All the management role assignments between the assignment policy and the assigned management roles must be removed. For more information about how to remove a role assignment from an assignment policy, see the Use the Shell to remove a role from an assignment policy section later in this topic.
- If you want to remove a default assignment policy, it must be the last assignment policy in the Exchange 2013 organization.

Use the EAC to remove an assignment policy

1. In the EAC, navigate to **Permissions** > **User Roles**.
2. Select the assignment policy you want to remove, and then click **Delete** 🗑.

Use the Shell to remove an assignment policy

To remove an assignment policy, use the following syntax.

```
Remove-RoleAssignmentPolicy <role assignment policy>
```

This example removes the New York Temporary Users assignment policy.

```
Remove-RoleAssignmentPolicy "New York Temporary Users"
```

For detailed syntax and parameter information, see Remove-RoleAssignmentPolicy.

View a list of assignment policies or assignment policy details

You can view management role assignment policies in a variety of ways, depending on the information you want and whether you're using the EAC or the Shell.

In the EAC, you can view the list of assignment policies and the roles assigned to them. In the Shell, you can view all the assignment policies in your organization, list the mailboxes assigned a specific policy, and more.

Use the EAC to view a list of assignment policies

1. In the EAC, navigate to **Permissions** > **User Roles**. All of the assignment policies in the organization are listed here.
2. To view the details of a specific assignment policy, select the assignment policy you want to view. The description and the roles assigned to the assignment policy are displayed in the details pane.

Use the Shell to view a list of assignment policies

You can view a list of all the assignment policies in your organization by not specifying any assignment policies when you run the **Get-RoleAssignmentPolicy** cmdlet.

This procedure makes use of pipelining and the **Format-Table** cmdlet. For more information about these concepts, see the following topics:

- Pipelining
- Working with command output

To return a list of all assignment policies in your organization, use the following command.

```
Get-RoleAssignmentPolicy
```

To return a list of specific properties for all the assignment policies in your organization, you can pipe the results to the **Format-Table** cmdlet and specify the properties you want in the list of results. Use the following syntax.

```
Get-RoleAssignmentPolicy | Format-Table <property 1>,
<property 2...>
```

This example returns a list of all the assignment policies in your organization and includes the **Name** and **IsDefault** properties.

```
Get-RoleAssignmentPolicy | Format-Table Name, IsDefault
```

For detailed syntax and parameter information, see Get-Mailbox or Get-RoleAssignmentPolicy.

Use the Shell to view the details of a single assignment policy

You can view the details of a specific assignment policy by using the **Get-RoleAssignmentPolicy** cmdlet and piping the output to the **Format-List** cmdlet.

This procedure makes use of pipelining and the **Format-List** cmdlet. For more information about these concepts, see the following topics:

- Pipelining
- Working with command output

To view the details of a specific assignment policy, use the following syntax.

```
Get-RoleAssignmentPolicy <assignment policy name> | Format-List
```

This example views the details about the Redmond Users - no Text Messaging assignment policy.

```
Get-RoleAssignmentPolicy "Redmond Users - no Text Messaging" | Format-List
```

For detailed syntax and parameter information, see Get-Mailbox or Get-RoleAssignmentPolicy.

Use the Shell to find the default assignment policy

You can find the default assignment policy by piping the output of the **Get-RoleAssignmentPolicy** cmdlet to the **Where** cmdlet. With the **Where** cmdlet, filter the data returned to display only the assignment policy that has its *IsDefault* property set to `$True`.

This procedure makes use of pipelining and the **Where** cmdlet. For more information about these concepts, see the following topics:

- Pipelining
- Working with command output

This example returns the default assignment policy.

```
Get-RoleAssignmentPolicy | Where { $_.IsDefault -eq $True }
```

For detailed syntax and parameter information, see Get-Mailbox or Get-RoleAssignmentPolicy.

Use the Shell to view mailboxes that are assigned a specific policy

You can find all the mailboxes assigned a specific assignment policy by piping the output of the **Get-Mailbox** cmdlet to the **Where** cmdlet. With the **Where** cmdlet, filter the data returned to display only the mailboxes that have their *RoleAssignmentPolicy* property set to the assignment

policy name you specify.

This procedure makes use of pipelining and the **Where** cmdlet. For more information about these concepts, see the following topics:

- Pipelining
- Working with command output

Use the following syntax.

```
Get-Mailbox | Where { $_.RoleAssignmentPolicy -Eq "<role assignment policy>" }
```

This example finds all the mailboxes assigned the policy Vancouver End Users.

```
Get-Mailbox | Where { $_.RoleAssignmentPolicy -Eq "Vancouver End Users" }
```

For detailed syntax and parameter information, see Get-Mailbox or Get-RoleAssignmentPolicy.

Change the default assignment policy

You can change the management role assignment policy assigned to new mailboxes that are created. Changing the default role assignment policy doesn't change the assignment policy assigned to existing mailboxes. To change the assignment policy assigned to existing mailboxes, see Change the assignment policy on a mailbox.

Note:
You can't use the EAC to change the default assignment policy. You need to use the Shell.

Use the Shell to change the default assignment policy

To change the default assignment policy, use the following syntax.

```
Set-RoleAssignmentPolicy <assignment policy name> -IsDefault
```

This example sets the Vancouver End Users assignment policy as the default assignment policy.

```
Set-RoleAssignmentPolicy "Vancouver End Users" -IsDefault
```

Important:
New mailboxes are assigned the default assignment policy even if the policy hasn't been assigned management roles. Mailboxes assigned assignment policies with no assigned management roles can't access any mailbox configuration features in Microsoft Outlook Web App.

For detailed syntax and parameter information, see Set-RoleAssignmentPolicy.

Add a role to an assignment policy

Use the EAC to add a role to an assignment policy

1. In the EAC, navigate to **Permissions** > **User Roles**.
2. Select the assignment policy you want to add one or more roles to, and then click **Edit** ✎.
3. Select the check box next to the role or roles you want to add to the assignment policy. You can select multiple roles, including end-user roles you've added. If you select a role that has child roles, the child roles are automatically selected.
4. Click **Save** to save the changes to the assignment policy.

Use the Shell to add a role to an assignment policy

To create a management role assignment between a role and an assignment policy, use the following syntax.

```
New-ManagementRoleAssignment -Name <role assignment name> -
Role <role name> -Policy <assignment policy name>
```

This example creates the role assignment Seattle Users - Voicemail between the MyVoicemail role and the Seattle Users assignment policy.

```
New-ManagementRoleAssignment -Name "Seattle Users -
Voicemail" -Role MyVoicemail -Policy "Seattle Users"
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Remove a role from an assignment policy

If you don't want end users to have permissions to manage certain features of their mailbox or distribution group, you can remove the management role that grants the permissions from the management role assignment policy to which the user is assigned. If other users are assigned the same assignment policy, they also lose the ability to manage that feature.

Use the EAC to remove a role from an assignment policy

1. In the EAC, navigate to **Permissions** > **User Roles**.
2. Select the assignment policy you want to remove one or more roles from, and then click **Edit** ✎.
3. Clear the check box next to the role or roles you want to remove from the assignment policy. If you clear the check box for a role that has child roles, the check boxes for the child roles are also cleared.
4. Click **Save** to save the changes to the assignment policy.

Use the Shell to remove a role from an assignment policy

You can remove roles from assignment policies by retrieving the associated management role

assignment using the **Get-ManagementRoleAssignment** cmdlet and then piping the role assignment returned to the **Remove-ManagementRoleAssignment** cmdlet.

For more information about regular and delegating role assignments, see Understanding management role assignments.

This procedure uses pipelining. For more information about pipelining, see Pipelining.

To remove a role from an assignment policy, use the following syntax.

```
Get-ManagementRoleAssignment -RoleAssignee <assignment policy name> -Role <role name> | Remove-ManagementRoleAssignment
```

This example removes the MyVoicemail management role, which enables users to manage their voice mail options, from the Seattle Users assignment policy.

```
Get-ManagementRoleAssignment -RoleAssignee "Seattle Users" -Role MyVoicemail | Remove-ManagementRoleAssignment
```

For detailed syntax and parameter information, see Remove-ManagementRoleAssignment.

Change the assignment policy on a mailbox

Exchange Server 2013 > Permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-08*

You can change the management role assignment policy assigned to a mailbox. When you change a mailbox's assignment policy, the change takes effect as soon as the user refreshes the connection, such as the next time they log into their mailbox or open the mailbox options page. For more information about assignment policies in Microsoft Exchange Server 2013, see Understanding management role assignment policies.

Looking for other management tasks related to permissions? Check out Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" entry in the Role management permissions

topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to change the assignment policy on a mailbox

1. In the Exchange Administration Center (EAC), navigate to **Recipients** > **Mailboxes**.
2. Select the user or resource mailbox you want to change the assignment policy on and then click **Edit** .
3. Select **Mailbox Features**.
4. In the **Role assignment policy** list, select the assignment policy you want to assign to the mailbox and then click **Save**.

Use the Shell to change the assignment policy on a mailbox

To change the assignment policy that's assigned to a mailbox, use the following syntax.

```
Set-Mailbox <mailbox alias or name> -RoleAssignmentPolicy <assignment policy>
```

This example sets the assignment policy to Unified Messaging Users on the mailbox Brian.

```
Set-Mailbox Brian -RoleAssignmentPolicy "Unified Messaging Users"
```

Use the Shell to change the assignment policy on a group of mailboxes assigned a specific assignment policy

Note:
You can't use the EAC to change the assignment policy on a group of mailboxes all at once.

This procedure makes use of pipelining, the **Where** cmdlet, and the *WhatIf* parameter. For more information about these concepts, see the following topics:

- Pipelining
- Working with command output
- WhatIf, Confirm, and ValidateOnly switches

If you want to change the assignment policy for a group of mailboxes that are assigned a specific policy, use the following syntax.

```
Get-Mailbox | Where { $_.RoleAssignmentPolicy -Eq
"<assignment policy to find>" } | Set-Mailbox -
RoleAssignmentPolicy <assignment policy to set>
```

This example finds all the mailboxes assigned to the Redmond Users - No Voicemail assignment policy and changes the assignment policy to Redmond Users - Voicemail Enabled.

```
Get-Mailbox | Where { $_.RoleAssignmentPolicy -Eq "Redmond
Users - No Voicemail" } | Set-Mailbox -RoleAssignmentPolicy
"Redmond Users - Voicemail Enabled"
```

This example includes the *WhatIf* parameter so that you can see all the mailboxes that would be changed without committing any changes.

```
Get-Mailbox | Where { $_.RoleAssignmentPolicy -Eq "Redmond
Users - No Voicemail" } | Set-Mailbox -RoleAssignmentPolicy
"Redmond Users - Voicemail Enabled" -WhatIf
```

For detailed syntax and parameter information, see Get-Mailbox or Set-Mailbox.

Create linked role groups that mirror built-in role groups

Exchange Server 2013 > Permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-03*

Using linked management role groups in Microsoft Exchange Server 2013, you can link a role group in an Exchange 2013 resource forest with a universal security group (USG) in a foreign user forest. This is useful when you want administrators with accounts in the user forest to manage the servers running Exchange in the resource forest. For more information about linked role groups, see Understanding management role groups.

By default, Exchange 2013 includes a number of built-in role groups that provide you with permissions to manage a variety of features and job functions. Each role group is tailored to provide specific permissions for each feature and job function. However, these role groups can't be linked to USGs in a foreign forest. They can only contain users and USGs from the local resource

forest. Fortunately, it's possible to replicate these built-in role groups using linked role groups.

You can re-create each built-in role group as a linked role group. All of the management roles and management scopes assigned to each role group are added to the new linked role group. For more information about management roles and scopes, see the following topics:

- Understanding management roles
- Understanding management role scopes

Looking for other management tasks related to role groups? Check out Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 10 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.
- You must use the Shell to perform these procedures.
- Configuring a linked role group requires a one-way trust between the resource Active Directory forest in which the linked role group will reside, and the foreign Active Directory forest where the users or USGs reside. The resource forest must trust the foreign forest.
- You must have the following information about the foreign Active Directory forest:
  - **Credentials** You must have a user name and password that can access the foreign Active Directory forest. This information is used with the *LinkedCredential* parameter on the **New-RoleGroup** cmdlet. This information is obtained by running the **Get-Credential** cmdlet. The format of the user name is *domain**username*.
  - **Domain controller** You must have the fully qualified domain name (FQDN) of an Active Directory domain controller in the foreign Active Directory forest. This information is used with the *LinkedDomainController* parameter on the **New-RoleGroup** cmdlet.
  - **Foreign USG** You must have the full name of a USG in the foreign Active Directory forest that contains the members you want to associate with the linked role group. This information is used with the *LinkedForeignGroup* parameter on the **New-RoleGroup** cmdlet.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Shell to create linked role groups that replicate built-in role groups

Each of the following sections shows you how to re-create each role group as a linked role group. Complete the procedures in each section to re-create all of the built-in role groups as linked role

groups.

Create the Organization Management linked role group

To re-create the Organization Management role group as a linked role group, you perform a procedure that's different than the procedure used to re-create other built-in role groups. This is because the Organization Management role group has delegating role assignments between it and all of the management roles. Re-creating the delegating role assignments requires an additional step.

1. Create a USG in the foreign forest that will be linked to the Organization Management role group.
2. Store the foreign Active Directory forest credentials in a variable.

```
$ForeignCredential = Get-Credential
```

3. Store all of the roles assigned to the Organization Management role group in a variable.

```
$OrgMgmt  = Get-RoleGroup "Organization Management"
```

4. Create the Organization Management linked role group and add the roles assigned to the built-in Organization Management role group.

```
New-RoleGroup "Organization Management - Linked" -
LinkedForeignGroup <name of foreign USG> -
LinkedDomainController <FQDN of foreign Active Directory
domain controller> -LinkedCredential $ForeignCredential -
Roles $OrgMgmt.Roles
```

5. Remove all of the regular assignments between the new Organization Management linked role group and the My* end-user roles.

```
Get-ManagementRoleAssignment -RoleAssignee "Organization
Management - Linked" -Role My* | Remove-
ManagementRoleAssignment
```

6. Add delegating role assignments between the new Organization Management linked role group and all management roles.

```
Get-ManagementRole | New-ManagementRoleAssignment -
SecurityGroup "Organization Management - Linked" -
Delegating
```

This example assumes the following values are used for each parameter:

- **LinkedForeignGroup** `Organization Management Administrators`
- **LinkedDomainController** `DC01.users.contoso.com`

Using the preceding values, this example re-creates the Organization Management role group as a linked role group.

```
$ForeignCredential = Get-Credential
$OrgMgmt  = Get-RoleGroup "Organization Management"
New-RoleGroup "Organization Management - Linked" -
LinkedForeignGroup "Organization Management Administrators"
-LinkedDomainController DC01.users.contoso.com -
LinkedCredential $ForeignCredential -Roles $OrgMgmt.Roles
Get-ManagementRoleAssignment -RoleAssignee "Organization
Management - Linked" -Role My* | Remove-
ManagementRoleAssignment
Get-ManagementRole | New-ManagementRoleAssignment -
SecurityGroup "Organization Management - Linked" -
Delegating
```

Create all other linked role groups

To re-create the built-in role groups (other than the Organization Management role group) as linked role groups, use the following procedure for each group.

1. Create a USG in the foreign forest for each role group that will be linked to each new role group.
2. Store the foreign Active Directory forest credentials in a variable. You only need to do this once.

```
$ForeignCredential = Get-Credential
```

3. Retrieve a list of role groups using the following cmdlet.

```
Get-RoleGroup
```

4. For each role group, other than the Organization Management role group, do the following.

```
$RoleGroup = Get-RoleGroup <name of role group to re-
create>
New-RoleGroup "<role group name> - Linked" -
LinkedForeignGroup <name of foreign USG> -
LinkedDomainController <FQDN of foreign Active Directory
domain controller> -LinkedCredential $ForeignCredential -
Roles $RoleGroup.Roles
```

5. Repeat the preceding step for each built-in role group you want to re-create as a linked role group.

This example assumes the following values are used for each parameter:

- **LinkedDomainController** `DC01.users.contoso.com`

- **Built-in role groups to be re-created as linked role groups** `Recipient Management, Server Management`
- **Foreign group for Recipient Management linked role group** `Recipient Management Administrators`
- **Foreign group for Server Management linked role group** `Server Management Administrators`

Using the preceding values, this example re-creates the Recipient Management and Server Management role groups as linked role groups.

```
$ForeignCredential = Get-Credential
Get-RoleGroup
$RoleGroup = Get-RoleGroup "Recipient Management"
New-RoleGroup "Recipient Management - Linked" -
LinkedForeignGroup "Recipient Management Administrators" -
LinkedDomainController DC01.users.contoso.com -
LinkedCredential $ForeignCredential -Roles $RoleGroup.Roles
$RoleGroup = Get-RoleGroup "Server Management"
New-RoleGroup "Server Management - Linked" -
LinkedForeignGroup "Server Management Administrators" -
LinkedDomainController DC01.users.contoso.com -
LinkedCredential $ForeignCredential -Roles $RoleGroup.Roles
```

Other tasks

After you create linked role groups, you may also want to:

Add members to the foreign USGs using Active Directory Users and Computers in the foreign forest.

Remove members of built-in role groups. For more information, see Manage role group members.

Add, remove, or change the scope of roles on the new linked role groups. For more information, see Manage role groups.

Create additional linked role groups. For more information, see Manage linked role groups.

View effective permissions

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-09*

Permissions in Microsoft Exchange Server 2013 are granted using management roles that are assigned to management role groups, management role assignment policies, universal security

groups (USGs), or directly to users. Users are granted the permissions if they're members of the role groups or USGs, or are assigned role assignment policies.

Most permissions are granted based on role group membership or the assignment of assignment policies to end users. Although using role groups and assignment policies makes it easy to grant permissions to large numbers of users, you may not be aware of who is a member of a role group, or who has been assigned an assignment policy. This is where the *GetEffectiveUsers* switch on the **Get-ManagementRoleAssignment** cmdlet is useful. It shows you what users are granted the permissions given by a management role through the role groups, assignment policies, and USGs that are assigned to them.

The *GetEffectiveUsers* switch is used with the **Get-ManagementRoleAssignment** cmdlet when the *Role* parameter is used. By specifying this switch with a particular role, the **Get-ManagementRoleAssignment** cmdlet examines all the role assignees assigned to the role, such as role groups, assignment policies, and USGs, and lists the members of each.

Note:

The *GetEffectiveUser* switch doesn't list users that are members of a linked foreign role group. Instead of a list of users, if a linked role group is found, **All Linked Group Members** is displayed. For more information about permissions in multiple forests, see Understanding multiple-forest permissions.

For more information about management roles, role groups, and assignment policies, see Understanding Role Based Access Control. For more information about management role assignments, see Understanding management role assignments.

Looking for other management tasks related to managing permissions? Check out Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" or "Role assignment policy" entries in the Role management permissions topic.
- The procedures in this topic can only be performed in the Shell. You can't use the Exchange Administration Center (EAC) to view effective permissions.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Shell to list all effective users

To list all the users that are granted the permissions provided by a management role, use the

following syntax.

```
Get-ManagementRoleAssignment -Role <role name> -
GetEffectiveUsers
```

This example lists all the users that are granted permissions provided by the Mail Recipients role.

```
Get-ManagementRoleAssignment -Role "Mail Recipients" -
GetEffectiveUsers
```

If you want to change what properties are returned in the list or export the list to a comma-separated value (.csv) file, see Use the Shell to customize output and display it later in this topic.

For detailed syntax and parameter information, see Get-ManagementRoleAssignment.

Use the Shell to find a specific user on a role

To find a specific user that's been granted permissions by a management role, you must use the **Get-ManagementRoleAssignment** cmdlet to retrieve a list of all effective users, and then pipe the output of the cmdlet to the **Where** cmdlet. The **Where** cmdlet filters the output and returns only the user you specified. Use the following syntax.

```
Get-ManagementRoleAssignment -Role <role name> -
GetEffectiveUsers | Where { $_.EffectiveUserName -Eq "<name
of user>" }
```

This example finds the user David Strome on the Journaling role.

```
Get-ManagementRoleAssignment -Role Journaling -
GetEffectiveUsers | Where { $_.EffectiveUserName -Eq "David
Strome" }
```

If you want to change what properties are returned in the list or export the list to a .csv file, see Use the Shell to customize output and display it later in this topic.

For detailed syntax and parameter information, see Get-ManagementRoleAssignment.

Use the Shell to find a specific user on all roles

To know every role that a user receives permissions from, you must use the **Get-ManagementRoleAssignment** cmdlet to retrieve all effective users on all management roles and then pipe the output of the cmdlet to the **Where** cmdlet. The **Where** cmdlet filters the output and returns only the role assignments that grant the user permissions.

```
Get-ManagementRoleAssignment -GetEffectiveUsers | Where
{ $_.EffectiveUserName -Eq "<name of user>" }
```

This example finds all the role assignments that grant permissions to the user Kim Akers.

```
Get-ManagementRoleAssignment -GetEffectiveUsers | Where
{ $_.EffectiveUserName -Eq "Kim Akers" }
```

If you want to change what properties are returned in the list or export the list to a CSV file, see Use the Shell to customize output and display it later in this topic.

For detailed syntax and parameter information, see Get-ManagementRoleAssignment.

Use the Shell to customize output and display it

The default output of the **Get-ManagementRoleAssignment** cmdlet might not have the information you want. The output of the cmdlet contains many more properties that you can access. The following are some of the properties that could be useful:

- **EffectiveUserName** Name of the user.
- **Role** Role that's granting the permissions.
- **RoleAssigneeName** Role group, assignment policy, or USG that's assigned to the role and contains the user in the `EffectiveUserName` property.
- **RoleAssigneeType** Indicates whether the role assignment is to a role group, assignment policy, USG, or user.
- **AssignmentMethod** Indicates whether the assignment between the role and the role assignee is direct or indirect.
- **CustomRecipientWriteScope** Indicates the custom recipient write scope, if any, that was applied to the role assignment when it was created. The scope specified in this property overrides the implicit recipient write scope specified in the `RecipientWriteScope` property.
- **CustomConfigWriteScope** Indicates the custom configuration write scope, if any, that was applied to the role assignment when it was created. The scope specified in this property overrides the implicit configuration write scope specified in the `ConfigWriteScope` property.
- **RecipientReadScope** Indicates the implicit recipient read scope that's applied to the role.
- **RecipientWriteScope** Indicates the implicit recipient write scope that's applied to the role.
- **ConfigReadScope** Indicates the implicit configuration read scope that's applied to the role.
- **ConfigWriteScope** Indicates the implicit configuration write scope that's applied to the role.

To select the properties you want to display in your list, you use commands similar to those used in the Use the Shell to list all effective users, Use the Shell to find a specific user on a role, and Use the Shell to find a specific user on all roles sections. The difference is that you pipe the results of those commands to the **Format-Table** or **Select-Object** cmdlets. The **Format-Table** cmdlet is useful to output the list of results to your screen. The **Select-Object** cmdlet is useful to output the list of your results to a .csv file.

Both cmdlets let you specify the properties you want to see and in the order you want to see them. The **Format-Table** cmdlet gives you more options when you list results to a screen while **Select-Object** doesn't modify the output in any way, which is useful when piping the list to a .csv file.

For more information about the **Format-Table** and **Select-Object** cmdlets, see Working with command output.

Output a customized list to your screen

1. Choose the information you want to see and find the associated command from one of the following procedures:
   - Use the Shell to list all effective users
   - Use the Shell to find a specific user a role
   - Use the Shell to find a specific user on all roles
2. Choose the properties you want to see in your list.
3. Use the following syntax to view the list.

```
<command to retrieve list > | Format-Table <property 1>,
<property 2>, <property ...>
```

This example finds the user David Strome on all roles, and displays the `EffectiveUserName`, `Role`, `CustomRecipientWriteScope`, and `CustomConfigWriteScope` properties.

```
Get-ManagementRoleAssignment -GetEffectiveUsers | Where
{ $_.EffectiveUserName -Eq "David Strome" } | Format-Table
EffectiveUserName, Role, CustomRecipientWriteScope,
CustomConfigWriteScope
```

For detailed syntax and parameter information, see Get-ManagementRoleAssignment.

Output a customized list to a .csv file

To export a list to a .csv file, you need to pipe the results of the **Get-ManagementRoleAssignment** command from the appropriate procedure listed previously to the **Select-Object** cmdlet. The output of the **Select-Object** cmdlet is then piped to the **Export-CSV** cmdlet, which saves the .csv output to a file name you specify.

1. Choose the information you want to see and find the associated command from one of the following procedures:
   - Use the Shell to list all effective users
   - Use the Shell to find a specific user a role
   - Use the Shell to find a specific user on all roles
2. Choose the properties you want to see in your list.
3. Use the following syntax to export the list to a .csv file.

```
<command to retrieve list > | Select-Object <property 1>,
<property 2>, <property ...> | Export-CSV <filename>
```

This example finds the user David Strome on all roles, and displays the `EffectiveUserName`, `Role`, `CustomRecipientWriteScope`, and `CustomConfigWriteScope` properties.

```
Get-ManagementRoleAssignment -GetEffectiveUsers | Where
{ $_.EffectiveUserName -Eq "David Strome" } | Select-Object
EffectiveUserName, Role, CustomRecipientWriteScope,
CustomConfigWriteScope | Export-CSV c:\output.csv
```

You can now view the .csv file in a viewer of your choice.

For detailed syntax and parameter information, see Get-ManagementRoleAssignment.

Feature permissions

Exchange Server 2013 > Permissions >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-10-12*

Permissions in Microsoft Exchange Server 2013 are managed using the Role Based Access Control (RBAC) permissions model. The following topics identify the management role groups required to administer the features associated with each functional area in Exchange 2013.

- Role management permissions
- Messaging policy and compliance permissions
- Anti-spam and anti-malware permissions
- Mail flow permissions
- Recipients Permissions
- Email address and address book permissions
- Sharing and collaboration permissions
- Clients and mobile devices permissions
- Unified Messaging permissions
- High availability and site resilience permissions
- Exchange and Shell infrastructure permissions
- Server health and performance permissions

Role management permissions

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-07-05*

The permissions required to perform tasks to configure management roles vary depending on the procedure being performed or the cmdlet you want to run. For more information about management roles, see Understanding management roles.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:
You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Role management permissions

You can use the features in the following table to manage the management role groups, roles, assignment policies, assignments, scopes that define the permissions you can apply to administrators, and end users. Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Management roles	Organization Management
Unscoped management roles	Unscoped Role Management role management role

Role groups	Organization Management
Assignment policies	Organization Management
Role assignments	Organization Management
Management scopes	Organization Management
Management role entries	Organization Management
Legacy permissions	Organization Management
Active Directory split permissions	Organization Management **Important:** To run the `setup.exe` command with the *PrepareAD* and *ActiveDirectorySplitPermissions* parameters, the account you use must be a member of the Schema Admins and Enterprise Administrators groups.

Messaging policy and compliance permissions

Exchange Server 2013 > Permissions > Feature permissions >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-01-23*

The permissions required to configure messaging policy and compliance vary depending on the procedure being performed or the cmdlet you want to run. For more information about messaging policy and compliance, see Messaging policy and compliance.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role

groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:

You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Note:

Some features that you want to manage might exist on Edge Transport servers. To manage features on Edge Transport servers, you need to become a member of the Local Administrators group on the Edge Transport server you want to manage. Edge Transport servers don't use Role Based Access Control (RBAC). Features that can be managed on Edge Transport servers have Edge Transport Local Administrator in the "Permissions required" column in the table below.

Messaging policy and compliance permissions

You can use the features in the following table to configure messaging policy and compliance features. The role groups that are required to configure each feature are listed.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Data loss prevention (DLP)	If using Office 365: • Office 365 global admin, which automatically includes Exchange Organization Management • Office 365 service admin, plus the Organization Management admin role group in Exchange • Office 365 password admin If using Exchange Server 2013 or Exchange Online only: • Compliance Management
Delete mailbox content (using the Search-Mailbox cmdlet with the *DeleteContent*	Mailbox Import Export role **Note:**

switch)	By default, the Mailbox Import Export role isn't assigned to any role group. You can assign a management role to a built-in or custom role group, a user or a universal security group. Assigning a role to a role group is recommended. For more information, see Add a role to a user or USG.
Discovery mailboxes - Create	Organization Management Recipient Management
Journaling	Organization Management Records Management
Mailbox audit logging	Organization Management Records Management
Message classifications	Organization Management
Messaging records management	Compliance Management Organization Management Records Management
In-Place eDiscovery	Discovery Management **Note:** By default, the Discovery Management role group doesn't have any members. No users, including administrators, have the required permissions to search mailboxes. For more information, see Add a user to the Discovery Management role group.
In-Place Hold	Discovery Management Organization Management **Important:** To create a query-based In-Place Hold, a user requires the Mailbox Search and Litigation Hold roles to be assigned directly or via membership in a role group that has both roles assigned. To create an In-Place Hold without using a query,

	which places all mailbox items on hold, you must have the Litigation Hold role assigned. The Discovery Management role group is assigned both roles. The Organization Management role group is assigned the Litigation Hold role. Members of the Organization Management role group can place an In-Place Hold on all items in a mailbox, but can't create a query-based In-Place Hold.
In-Place Archive	Organization Management Recipient Management
In-Place Archive – Test connectivity	Organization Management Server Management
Information Rights Management (IRM) configuration	Compliance Management Organization Management
Retention policies – Apply	Organization Management Recipient Management Records Management
Retention policies - Create	See the entry for Messaging Records Management
Transport rules	Organization Management Records Management

Anti-spam and anti-malware permissions

Exchange Server 2013 > Permissions > Feature permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-11*

The permissions required to perform tasks related to anti-spam and anti-malware vary depending on the procedure being performed or the cmdlet you want to run. For more information about transport features, see Mail flow.

This topic lists the permissions required to manage the mail flow features in Microsoft Exchange Server 2013.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:

You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Note:

Some features that you want to manage might exist on Edge Transport servers. To manage features on Edge Transport servers, you need to become a member of the Local Administrators group on the Edge Transport server you want to manage. Edge Transport servers don't use Role Based Access Control (RBAC). Features that can be managed on Edge Transport servers have Edge Transport Local Administrator in the "Permissions required" column in the table below.

Note:

Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Anti-spam and Anti-Malware Permissions

You can use the features in the following tables to configure anti-spam and anti-malware settings in your organization. The permissions that are required to configure each feature are listed.

Users who are assigned the View Only Management role group can view the configuration of the features shown in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Anti-malware	Organization Management Hygiene Management
Anti-spam features	Organization Management Hygiene Management
Anti-spam features - Edge Transport	Edge Transport Local Administrator

Mail flow permissions

Exchange Server 2013 > Permissions > Feature permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-07*

The permissions required to perform tasks related to mail flow vary depending on the procedure being performed or the cmdlet you want to run. For more information about transport features, see Mail flow.

This topic lists the permissions required to manage the mail flow features in Microsoft Exchange Server 2013. For information about how Office 365 permissions relate to Exchange permissions, see Permissions in Office 365.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:

You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Note:

Some features that you want to manage might exist on Edge Transport servers. To manage features on Edge Transport servers, you need to become a member of the Local Administrators group on the Edge Transport server you want to manage. Edge Transport servers don't use Role Based Access Control (RBAC). Features that can be managed on Edge Transport servers have Edge Transport Local Administrator in the "Permissions required" column in the table below.

Note:

Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Mail flow permissions

You can use the features in the following tables to configure mail flow settings in the Front End Transport service on Client Access servers, in the Transport service on Mailbox servers, in the Mailbox Transport service on Mailbox servers, and on Edge Transport servers. The permissions that are required to configure each feature are listed.

Users who are assigned the View Only Management role group can view the configuration of the features shown in the following table. For more information, see View-only Organization Management.

Mailbox servers and Client Access servers

Feature	Permissions required
Accepted domains	Organization Management

Transport rules - Edge Transport	Edge Transport Local Administrator

Recipients Permissions

Exchange Server 2013 > Permissions > Feature permissions >

Topic Last Modified: *2013-02-21*

The permissions required to perform tasks to manage recipients vary depending on the procedure being performed or the cmdlet you want to run.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or

the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:
You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Mailbox server permissions

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Calendar repair, server configuration	Organization Management Server Management
Delegating Mailbox servers	Organization Management
Email address policies	Organization Management Server Management
Exchange Search	Organization Management View-only Organization Management Server Management
Exchange Search – diagnostics	Organization Management View-only Organization Management Support Diagnostics role

	Note: The Support Diagnostics role isn't assigned to a role group. For more information, see Add a role to a user or USG.
Group metrics	Organization Management Server Management
Import Export	Mailbox Import Export role **Note:** The Mailbox Import Export role isn't assigned to a role group. For more information, see Mailbox Import Export role.
Mailbox Assistants	Organization Management Server Management
Mailbox moves	Organization Management Recipient Management
Mailbox recovery	Organization Management

Mailbox move and migration permissions

The table contains the permissions that are required to move on-premises mailboxes to different

domains or forests and to migrate on-premises mailboxes to and from your cloud-based organization.

Feature	Permissions required
Mailbox moves (local or cross-forest)	Organization Management Recipient Management
Mailbox moves (hybrid deployment)	Organization Management Recipient Management
Migration (on-boarding and off-boarding from the cloud)	Organization Management Recipient Management

Email address and address book permissions

Exchange Server 2013 > Permissions > Feature permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-11*

The permissions required to configure email address and address book features vary depending on the procedure being performed or the cmdlet you want to run. For more information about email addresses and address books, see Email addresses and address books.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:

You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Email address and address book permissions

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Address book policies	Organization Management
Address lists	Organization Management
Email address policies	Organization Management
Details templates	Organization Management
Global address lists	Organization Management
Offline address books	Organization Management
Offline address book connectivity	Organization Management

Sharing and collaboration permissions

Exchange Server 2013 > Permissions > Feature permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-14*

The permissions required to configure sharing and collaboration features vary depending on the procedure being performed or the cmdlet you want to run. For more information about sharing and collaboration, see Collaboration and Sharing.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or

the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:
You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Sharing and collaboration feature permissions

You can use the features in the following table to configure sharing and collaboration features. The role groups that are required to configure each feature are listed.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Partner applications - configure	Organization Management
Public folders, mail-enabled	Organization Management Recipient Management
Public folders	Organization Management
Site mailboxes	Organization Management Recipient Management
Site mailbox provisioning policy	Organization Management Recipient Management

Clients and mobile devices permissions

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-31*

The permissions required to perform tasks for clients and mobile devices vary depending on the procedure being performed or the cmdlet you want to run. For more information about client and mobile device features, see Clients and mobile.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:
You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Note:
Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Client Access server permissions

You can configure any of the following features for the Client Access server.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Client Access server array settings	Organization Management Server Management
Client Access server settings	Server Management
Client Access service email channel settings	Organization Management Server Management
Client Access user settings	Server Management
Client Access virtual directory settings	Organization Management Server Management
RPC Client Access settings	Organization Management Server Management View-only Organization Management
Push notification proxy settings	Organization Management Recipient Management
OAuth authentication redirection settings	Organization Management

Exchange ActiveSync permissions

You can configure any of the following for Exchange ActiveSync.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Exchange ActiveSync Autoblock settings	Organization Management
Exchange ActiveSync mailbox policy settings	Organization Management Server Management
Exchange ActiveSync server settings	Organization Management Server Management

Exchange ActiveSync settings	Organization Management Server Management
Exchange ActiveSync user settings	Recipient Management
Exchange ActiveSync virtual directory settings	Organization Management Server Management
Mobile device mailbox policy settings	Organization Management Server Management
Mobile device user settings	Organization Management Server Management Recipient Management

Autodiscover permissions

You can configure the following for the Autodiscover service.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Autodiscover service configuration settings	Organization Management Server Management View-only Organization Management Delegated Setup Hygiene Management
Autodiscover virtual directory settings	Organization Management Server Management

Availability service permissions

You can configure the following for the Availability service.

Users who are assigned the View-Only Management role group can view the configuration of the

features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Availability service address space settings	Organization Management View-only Organization Management
Availability service configuration settings	Organization Management Server Management View-only Organization Management

Client throttling permissions

You can configure the following for client throttling.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Client throttling settings	Organization Management View-only Organization Management

Exchange Web Services permissions

You can configure the following for Web Services virtual directories.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Exchange Web Services virtual directory settings	Organization Management Server Management
Test Exchange Web Services	Organization Management Server Management
Test Outlook Web Services	Organization Management

Outlook Anywhere permissions

You can configure and manage the following settings for Outlook Anywhere.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Outlook Anywhere configuration (enable, disable, change, view)	Organization Management Server Management View-only Organization Management Delegated Setup Hygiene Management
RPC over HTTP Proxy component	Local Server Administrator
Test Outlook Anywhere connectivity	Organization Management View-only Organization Management Server Management

Outlook Web App permissions

You can use the following features to view Outlook Web App settings, control security and user access to Outlook Web App, and test Outlook Web App connectivity.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Graphics editor	Local Server Administrator
IIS Manager	Local Server Administrator
ISA Server 2006	ISA Server Enterprise Administrator
Outlook Web App mailbox policies	Organization Management Recipient Management
Outlook Web App virtual directories	Organization Management Server Management
Registry Editor	Local Server Administrator

S/MIME configuration	Organization Management
Text editor	Local Server Administrator
View Outlook Web App mailbox policies	Organization Management Recipient Management View-only Organization Management Delegated Setup Hygiene Management

POP3 and IMAP4 permissions

You can configure the following for POP3 and IMAP4.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
IMAP4 settings	Organization Management Server Management View-only Organization Management
POP3 settings	Organization Management Server Management View-only Organization Management
Test IMAP4 settings	Organization Management Server Management View-only Organization Management
Test POP3 settings	Organization Management Server Management View-only Organization Management

Windows PowerShell virtual directory permissions

You can configure the following for Windows PowerShell.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Test Windows PowerShell	Organization Management
Windows PowerShell settings	Organization Management

Text Messaging permissions

You can configure the following for text messaging.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Text messaging notification settings	Recipient Management
Text messaging settings	Recipient Management
Text messaging user settings	Recipient Management

Unified Messaging permissions

Exchange Server 2013 > Permissions > Feature permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-16*

The permissions required to perform tasks on Client Access servers that are running the Microsoft Exchange Unified Messaging Call Router service and Mailbox servers that are running the Microsoft Exchange Unified Messaging service vary depending on the procedure being performed or the cmdlet you want to run.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:
You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

UM component permissions

You can configure settings for the UM components and features in the following table.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
UM auto attendants	Organization Management UM Management
UM call answering rules	Organization Management UM Management
UM call data and summary reports	Organization Management UM Management
Client Access Server (UM call router service)	Organization Management UM Management
UM dial plans	Organization Management UM Management
UM hunt groups	Organization Management

	UM Management
UM IP gateways	Organization Management UM Management
UM mailbox policies	Organization Management UM Management
UM mailboxes	Organization Management UM Management
UM prompts	Organization Management UM Management
Mailbox server (UM service)	Organization Management Server Management

High availability and site resilience permissions

Exchange Server 2013 > Permissions > Feature permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-02*

The permissions required to configure high availability vary depending on the procedure being performed or the cmdlet you want to run. For more information about high availability, see High availability and site resilience.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role

groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:
You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Database availability group permissions

You can use the features in the following table to add, remove, and configure settings for database availability groups (DAGs).

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Database availability group membership	Organization Management Database Availability Groups role
Database availability group properties	Organization Management Database Availability Groups role
Database availability groups	Organization Management Database Availability Groups role
Database availability networks	Organization Management Database Availability Groups role

Mailbox database copy permissions

You can use the features in the following table to add, remove, update, and activate mailbox database copies.

Feature	Permissions required
Database switchover	Organization Management

	Database Copies role
Mailbox database copies	Organization Management Database Copies role
Server switchover	Organization Management Database Copies role
Update a mailbox database copy	Organization Management Database Copies role

Exchange and Shell infrastructure permissions

Exchange Server 2013 > Permissions > Feature permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-24*

The permissions required to perform tasks to configure various components of Microsoft Exchange Server 2013 depend on the procedure being performed or the cmdlet you want to run. See each of the sections in this topic for more information about their respective features.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:
You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-**

ManagementRoleAssignment cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Note:

Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Exchange infrastructure permissions

The following table lists the permissions required to perform tasks that configure general Exchange 2013 settings.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Administrator audit logging	Organization Management Records Management
Exchange Administration Center configuration settings	View-only Organization Management
Exchange Administration Center connectivity	Organization Management Server Management
Exchange server configuration settings	Organization Management Server Management
Exchange Help settings	Organization Management
Message categories	Organization Management Hygiene Management Recipient Management Help Desk
Product key	Organization Management

Test system health	Organization Management Server Management	
View-only administrator audit logging	Organization Management Records Management **Note:** You can also manually assign the View-Only Audit Logs management role to a management role group. For more information, see View-Only Audit Logs role.	
Write to audit log	Users that are members of any role group or assigned any management role can write to the administrator audit log.	

Shell infrastructure permissions

The following table lists the permissions required to perform tasks that configure features that control how the Exchange Management Shell runs.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Active Directory Domain Services server settings	Organization Management Server Management Recipient Management UM Management
Cmdlet extension agents	Organization Management
PowerShell virtual directories	Organization Management Server Management
PowerShell and WinRM installation	Local Server Administrator
Remote Shell	Organization Management

Federation and certificates permissions

The following table lists permissions required for performing tasks related to federation trusts, OAuth configuration, certificate management, and hybrid deployment configuration.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Certificate management	Organization Management Server Management
Federation trusts, OAuth	Organization Management
Test federation trusts, OAuth	Organization Management View-only Organization Management Server Management
Hybrid deployment configuration	Organization Management
Intra-Organization connectors	Organization Management Recipient Management Records Management

Server health and performance permissions

Exchange Server 2013 > Permissions > Feature permissions >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-07-19*

The permissions required to perform tasks to configure various components of Microsoft Exchange Server 2013 depend on the procedure being performed or the cmdlet you want to run. See each of the sections in this topic for more information about their respective features.

To find out what permissions you need to perform the procedure or run the cmdlet, do the

following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

Note:
You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Note:
Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Exchange workload management permissions

The following table lists the permissions required to perform tasks that manage the health and performance of your Exchange 2013 organization. For more information, see the following topics:

- Exchange workload management
- Workload management reference

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required	
User throttling	Organization Management Recipient Management View-only Organization Management	
Exchange workload throttling	Organization Management View-only Organization	

	Management	

Exchange event log permissions

The following table lists the permissions required to perform tasks that manage Exchange event log settings.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Feature	Permissions required
Exchange event log management	Organization Management Server Management View-only Organization Management UM Management

Advanced permissions

Exchange Server 2013 > Permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-09-13*

The procedures in the following sections enable you to configure advanced permissions models for your organization. You should have an in-depth knowledge of Role Based Access Control (RBAC) before performing advanced customization of your permissions model.

Management roles and role entries

Management role scopes

Management role assignments

Managing split permissions

We recommend you manage your permissions using management role groups and management role assignment policies. For more information, see the following topics:

Manage role groups

Manage linked role groups

Manage role assignment policies

For more information about RBAC, see Understanding Role Based Access Control.

Management roles and role entries

Exchange Server 2013 > Permissions > Advanced permissions >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-09-13*

The following procedures enable you to perform advanced permissions management. You should only use these procedures if management role groups and management role assignment policies don't meet the needs of your organization.

Create a role

View a role

Remove a role

Add a role entry to a role

Change a role entry

View role entries

Remove a role entry from a role

Create an unscoped role

Change a role entry on an unscoped top-level role

Add a role entry to an unscoped top-level role

For more information about managing role groups and role assignment policies, see the following topics:

Manage role groups

Manage linked role groups

Manage role assignment policies

Create a role

Permissions > Advanced permissions > Management roles and role entries >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

You can create a management role, change the management role entries, add a scope if needed, and then assign the role to a role assignee. You should rarely need to perform this procedure. We recommend that you check whether a built-in management role can be used instead of creating a management role. For a list of built-in management roles, see Built-in management roles.

For more information about management roles in Microsoft Exchange Server 2013, see Understanding management roles.

Note:

This topic doesn't discuss how to create an unscoped management role. For information about how to create an unscoped management role, see Create an unscoped role.

Looking for other management tasks related to roles? Check out Advanced permissions.

What do you need to know before you begin?

- Estimated time to complete this procedure: 10 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Management roles" entry in the Role management permissions topic.
- You must use the Shell to perform these procedures.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

How do you do this?

Step 1: Create the management role

New management roles are based on existing roles. When you create a role, an existing role and its management role entries are copied to the new role. The existing role becomes the parent to the new child role. You must always choose a role that contains all the cmdlets and parameters you need to use, and then remove the ones you don't want. Child roles can't have management role entries that don’t exist in the parent role.

Use the following syntax to create the new role.

```
New-ManagementRole -Parent <existing role to copy> -Name
<name of new role>
```

This example copies the Mail Recipients role and its management role entries to the Seattle Mail Recipients role.

```
New-ManagementRole -Parent "Mail Recipients" -Name "Seattle
Mail Recipients"
```

For detailed syntax and parameter information, see New-ManagementRole.

Step 2: Change the new role's management role entries

After you create your role, you need to change the role's entries. You can remove an entire role entry, which removes access to the associated cmdlet completely. Or, you can remove parameters from a role entry to remove access to those specific parameters on the associated cmdlet.

You can't add new role entries or parameters on role entries unless they exist in the parent role. Because you just created a role from a parent role in Step 1, you can't add any additional role entries or parameters on role entries because they don't exist in the parent role.

When you change a role entry on a role, you can do one of the following:

- Remove a single, entire role entry.
- Remove multiple, entire role entries.
- Remove parameters from a role entry.

To remove role entries from your new role, see Remove a role entry from a role.

Step 3: Create a custom management role scope, if required

Management role scopes determine the objects made available to a user to view or change using the role entries configured in Step 2. New management roles inherit the read and write management role scopes of their parent role. These are called *implicit scopes*. However, there may be cases where you want to change the write scope of the new role to match your business needs. When you create a custom scope, you override the implicit write scope of the role. The implicit read scope of the role doesn't change. For more information about management role scopes, see Understanding management role scopes.

You can create a custom scope, create an exclusive scope, use a predefined scope, or scope an assignment to an organizational unit (OU). The new scope must be within the implicit read scope of the role. To use a predefined scope or to specify an organizational unit, skip to Step 4.

To add a custom scope to your new role, see Create a regular or exclusive scope.

Step 4: Assign the new management role

The final step when you create and configure a role is to assign it to a role assignee.

When you create a role assignment, you can choose to do one of the following:

- Create the role assignment with no scope.
- Create the role assignment with a predefined scope.
- Create the role assignment with an OU without a domain restriction filter.
- Create the role assignment with the custom or exclusive scope you created in Step 3.

Note:
You can't specify a scope when you create an assignment between a role and a management role assignment policy.

You can assign the new role to a role group, a role assignment policy, a user, or a universal security group (USG). For more information, see the following topics:

- Manage role groups
- Manage role assignment policies
- Add a role to a user or USG

View a role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-03*

Management roles can be listed in a variety of ways, depending on the information you want. For example, you can choose to return only roles of a specific role type, roles that contain only specific cmdlets and parameters, or view the details of a specific management role. For more information about management roles in Microsoft Exchange Server 2013, see Understanding management roles.

If you want to view a list of all management role entries on a role, see View role entries.

Looking for other management tasks related to roles? Check out Advanced permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Management roles" entry in the Role management permissions topic.
- You must use the Shell to perform these procedures.
- This topic makes use of pipelining and the **Format-List** and **Format-Table** cmdlets. For more information about these concepts, see the following topics:
  - Pipelining
  - Working with command output
- For information about keyboard shortcuts that may apply to the procedures in this topic, see

Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

View a specific management role

You can view the details of a specific role by retrieving a specific role using the **Get-ManagementRole** cmdlet and piping the output to the **Format-List** cmdlet.

To view the details of a specific role, use the following syntax.

```
Get-ManagementRole <role name> | Format-List
```

This example retrieves the details about the Mail Recipients management role.

```
Get-ManagementRole "Mail Recipients" | Format-List
```

For detailed syntax and parameter information, see Get-ManagementRole.

List all management roles

You can view a list of all the management roles in your organization by not specifying any roles when you run the **Get-ManagementRole** cmdlet. By default, the role name and role type of each role are included in the results.

This example returns a list of all roles in your organization.

```
Get-ManagementRole
```

To return a list of specific properties for all the roles in your organization, you can pipe the results of the **Format-Table** cmdlet and specify the properties you want in the list of results. Use the following syntax.

```
Get-ManagementRole | Format-Table <property 1>, <property 2...>
```

This example returns a list of all the roles in your organization and includes the **Name** property and any property with the word **Implicit** at the beginning of the property name.

```
Get-ManagementRole | Format-Table Name, Implicit*
```

For detailed syntax and parameter information, see Get-ManagementRole.

List management roles that contain a specific cmdlet

You can return a list of roles that contain a cmdlet that you specify by using the *Cmdlet* parameter on the **Get-ManagementRole** cmdlet.

To return a list of roles that contain the cmdlet you specify, use the following syntax.

```
Get-ManagementRole -Cmdlet <cmdlet>
```

This example returns a list of roles that contain the **New-Mailbox** cmdlet.

```
Get-ManagementRole -Cmdlet New-Mailbox
```

For detailed syntax and parameter information, see Get-ManagementRole.

List management roles that contain a specific parameter

You can return a list of roles that contain one or more specified parameters by using the *CmdletParameters* parameter on the **Get-ManagementRole** cmdlet. Only roles that contain all the parameters you specify are returned.

When you use the *CmdletParameters* parameter, you can choose to include the *Cmdlet* parameter. If you include the *Cmdlet* parameter, only roles that contain the parameters you specify on the cmdlet you specify are returned. If you don't include the *Cmdlet* parameter, roles that contain the parameters you specify, regardless of the cmdlet they're on, are returned.

To return a list of roles that contain the parameters you specify, use the following syntax.

```
Get-ManagementRole [-Cmdlet <cmdlet>] -CmdletParameters
<parameter 1>, <parameter 2...>
```

This example returns a list of roles that contain the *Database* and *Server* parameters, regardless of the cmdlets they exist on.

```
Get-ManagementRole -CmdletParameters Database, Server
```

This example returns a list of roles where the *EmailAddresses* parameter exists only on the **Set-Mailbox** cmdlet.

```
Get-ManagementRole -Cmdlet Set-Mailbox -CmdletParameters
EmailAddresses
```

You can also use the wildcard character (*) with either the *Cmdlet* or *CmdletParameters* parameters to match partial cmdlet or parameter names.

For detailed syntax and parameter information, see Get-ManagementRole.

List management roles of a specific role type

You can return a list of roles based on a specified role type by using the *RoleType* parameter on the **Get-ManagementRole** cmdlet.

To return a list of roles that match the role type you specify, use the following syntax.

```
Get-ManagementRole -RoleType <roletype>
```

This example returns a list of roles based on the `UmMailboxes` role type.

```
Get-ManagementRole -RoleType UmMailboxes
```

For detailed syntax and parameter information, see Get-ManagementRole.

List the immediate child roles of a parent role

You can return a list of roles that are the immediate children of the specified parent role by using the *GetChildren* parameter on the **Get-ManagementRole** cmdlet. Only roles that contain the role you specify as the parent role are returned.

To return a list of the immediate children roles of a parent role, use the following syntax.

```
Get-ManagementRole <parent role name> -GetChildren
```

This example returns a list of immediate children of the Disaster Recovery role.

```
Get-ManagementRole "Disaster Recovery" -GetChildren
```

For detailed syntax and parameter information, see Get-ManagementRole.

List all child roles below a parent role

You can return a list of the entire chain of roles from a specified parent role to the last child role by using the *Recurse* parameter on the **Get-ManagementRole** cmdlet. The *Recurse* parameter tells the **Get-ManagementRole** cmdlet to recurse down through every parent and child relationship it finds until it reaches the last child role. The parent role is included in the list that's returned.

This example returns a list of all the child roles of a parent role.

```
Get-ManagementRole <parent role name> -Recurse
```

This example returns all the child roles of the Mail Recipients role.

```
Get-ManagementRole "Mail Recipients" -Recurse
```

For detailed syntax and parameter information, see Get-ManagementRole.

Remove a role

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-03*

Management roles that are no longer required can be removed from your organization. You can only remove management roles that you created. Built-in management roles can't be removed. For more information about management roles in Microsoft Exchange Server 2013, see Understanding management roles.

Looking for other management tasks related to roles? Check out Advanced permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Management roles" entry in the Role management permissions topic.
- You must use the Shell to perform these procedures.
- Before you can remove a management role, you must remove all its management role assignments. For more information about how to remove a role assignment, see Remove a role from a user or USG.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Remove a management role with no child roles

To remove a role with no child roles, use the following syntax.

```
Remove-ManagementRole <role name>
```

This example removes the Seattle Server Administrators role.

```
Remove-ManagementRole "Seattle Server Administrators"
```

For detailed syntax and parameter information, see Remove-ManagementRole.

Remove a management role with child roles

If a role that you want to remove has child roles, you must remove all the child roles also. You receive an error message if you try to remove a role that has child roles unless you use the *Recurse* switch. If you use the *Recurse* switch when you remove a role, the role you specify and all its child roles are removed.

Caution:

If you use the *Recurse* switch, all child roles of the specified role you want to remove are also removed. Make sure that you're aware of what roles will be removed before you run this command.

To make sure that you remove only the roles that you want to remove, use the *WhatIf* switch with your command to verify that it's correct. Use the following syntax.

```
Remove-ManagementRole <role name> -Recurse -WhatIf
```

The *WhatIf* switch performs the command without committing any changes and reports which roles it would have removed. For more information about the *WhatIf* switch, see WhatIf, Confirm, and ValidateOnly switches.

After you confirm that only the roles you want to remove will be removed, run the same command without the *WhatIf* switch. This example removes the London Administrators role and all its child roles.

```
Remove-ManagementRole "London Administrators" -Recurse
```

For detailed syntax and parameter information, see Remove-ManagementRole.

Remove an unscoped management role

To remove an unscoped role, the same procedures provided in Remove a management role with no child roles and Remove a management role with child roles earlier in this topic can be used. The only difference is that when you remove an unscoped role, you must specify the *UnScopedTopLevel* switch when you run the command. This example removes an unscoped role and all its child roles.

```
Remove-ManagementRole "Custom IT Scripts" -Recurse -
UnScopedTopLevel
```

As with removing other roles, you should use the *WhatIf* switch to verify that you're removing the correct roles.

For detailed syntax and parameter information, see Remove-ManagementRole.

Add a role entry to a role

Permissions > Advanced permissions > Management roles and role entries >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-04*

If you want to grant access to a cmdlet, you need to add the associated management role entry to a management role. After you add the role entry to a role, the users assigned the role will be able to access that cmdlet. For more information about management role entries in Microsoft Exchange Server 2013, see Understanding management roles.

You can't add role entries to built-in roles. If you want to customize roles, you must create a new role. For more information about how to create a new role, see Create a role.

Note:

This topic doesn't discuss how to add unscoped management role entries to an unscoped management role. For more information about how to add unscoped role entries, see Add a role entry to an unscoped top-level role.

Looking for other management tasks related to roles? Check out Advanced permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Management roles" entry in the Role management permissions topic.
- You must use the Shell to perform these procedures.
- A role entry that you want to add to a management role must exist in that role's immediate parent management role.
- This topic makes use of pipelining. For more information about pipelining, see Pipelining.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

What do you want to do?

Add a single role entry from a parent role

You can add a role entry to a role exactly as it appears on the parent role by using the following syntax.

```
Add-ManagementRoleEntry <child role name>\<cmdlet>
```

This example adds the **Set-Mailbox** cmdlet to the Recipient Administrators role.

```
Add-ManagementRoleEntry "Recipient Administrators\Set-Mailbox"
```

This command checks the parent role, and if the role entry exists, adds it to the child role. If the role entry already exists on the child role, you can include the *Overwrite* parameter to overwrite the existing role entry.

For detailed syntax and parameter information, see Add-ManagementRoleEntry.

Add a single role entry from a parent role and include only specific parameters

If you want to add a role entry from a parent role, but you want to include only specific parameters in the role entry on the child role, use the following syntax.

```
Add-ManagementRoleEntry <child role name>\<cmdlet> -Parameters <parameter 1>, <parameter 2>, <parameter...>
```

This example adds the **Set-Mailbox** cmdlet to the Help Desk role, but includes only the *DisplayName* and *EmailAddresses* parameters in the entry on the child role.

```
Add-ManagementRoleEntry "Help Desk\Set-Mailbox" -Parameters DisplayName, EmailAddresses
```

This command checks the parent role, and if the role entry exists, adds it to the child role. If the role entry already exists on the child role, you can include the *Overwrite* parameter to overwrite the existing role entry.

For detailed syntax and parameter information, see Add-ManagementRoleEntry.

Add multiple role entries from a parent role

If you want to add more than one role entry to a role, you need to retrieve a list of role entries that exist on the parent role that you want to add to the child role, and then add them to the child role.

To do this, you retrieve the list of role entries on a parent role by using the **Get-ManagementRoleEntry** cmdlet. Then you pipe the output of the **Get-ManagementRoleEntry** cmdlet to the **Add-ManagementRoleEntry** cmdlet. To retrieve multiple role entries, you need to use the wildcard character (*).

To add multiple entries from a parent role to a child role, use the following syntax.

```
Get-ManagementRoleEntry <parent role name>\*<partial cmdlet name>* | Add-ManagementRoleEntry -Role <child role name>
```

This example adds all the role entries that contain the string `Mailbox` in the cmdlet name on the Mail Recipients parent role to the Seattle Mail Recipients child role.

```
Get-ManagementRoleEntry "Mail Recipients\*Mailbox*" | Add-ManagementRoleEntry -Role "Seattle Mail Recipients"
```

If the role entries already exist on the child role, you can include the *Overwrite* parameter to overwrite the existing role entries.

For more information about retrieving a list of management role entries, see View role entries.

For detailed syntax and parameter information, see Get-ManagementRoleEntry and Add-ManagementRoleEntry.

Change a role entry

Permissions > Advanced permissions > Management roles and role entries >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-03*

Each management role entry on a management role represents a single cmdlet. By adding parameters to or removing parameters from a role entry, which is then added to a management role, you control whether those parameters are available on that cmdlet. For more information about management role entries in Microsoft Exchange Server 2013, see Understanding management roles.

You can't modify the role entries on built-in management roles.

Note:

This topic doesn't discuss how to modify unscoped management role entries on an unscoped management role. For more information about how to modify unscoped role entries, see Create a role.

Caution:

To add or remove parameters from a role entry, you must use the *AddParameter* or *RemoveParameter* parameters. If you omit the *AddParameter* or *RemoveParameter* parameter when you run the **Set-ManagementRoleEntry** cmdlet, only the parameters you specify using the *Parameters* parameter will be included in the role entry. All other parameters on the role entry will be removed.

Looking for other management tasks related to roles? Check out Advanced permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Management roles" entry in the Role management permissions topic.
- You must use the Shell to perform these procedures.
- If you want to add parameters to a role entry, the parameters you add must exist in the role entry in the parent role. The parameters must also exist on the cmdlet you specify.
- If you want to remove parameters from a role entry, the parameters you remove can't exist in the role entries of any child roles. You must remove the parameters from the role entries of the child roles. Use the "Use the Shell to remove one or more parameters from a role entry" procedure later in this topic to remove the parameters from the role entries of all child roles.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.
