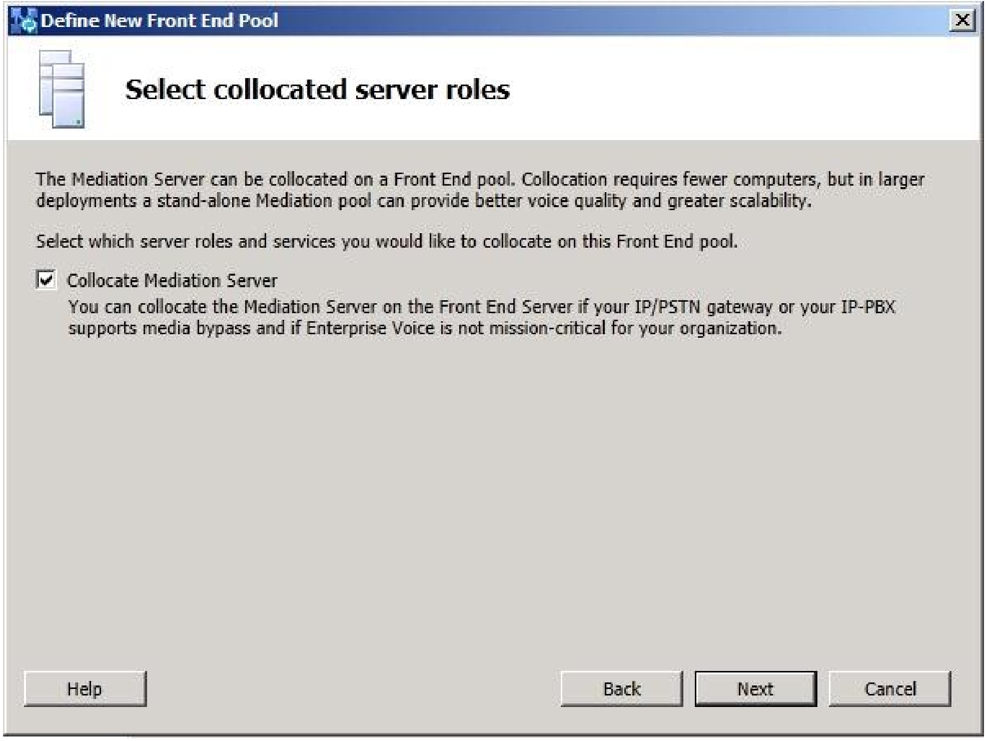
To enable Exchange Server integration, use Lync Server Control Panel.

☑ Monitoring (CDR and QoE metrics)

6. On the **Select collocated server roles** page, we recommend you collocate the Mediation Server in Lync Server 2013. When merging a legacy topology with Lync Server 2013, we require that you first collocate the Lync Server 2013 Mediation Server. After merging the topologies and configuring the Lync Server 2013 Mediation Server, you can decide to keep the collocated Mediation Server or change it to a stand-alone server in your Lync Server 2013 deployment.



Define New Front End Pool

Select collocated server roles

The Mediation Server can be collocated on a Front End pool. Collocation requires fewer computers, but in larger deployments a stand-alone Mediation pool can provide better voice quality and greater scalability.

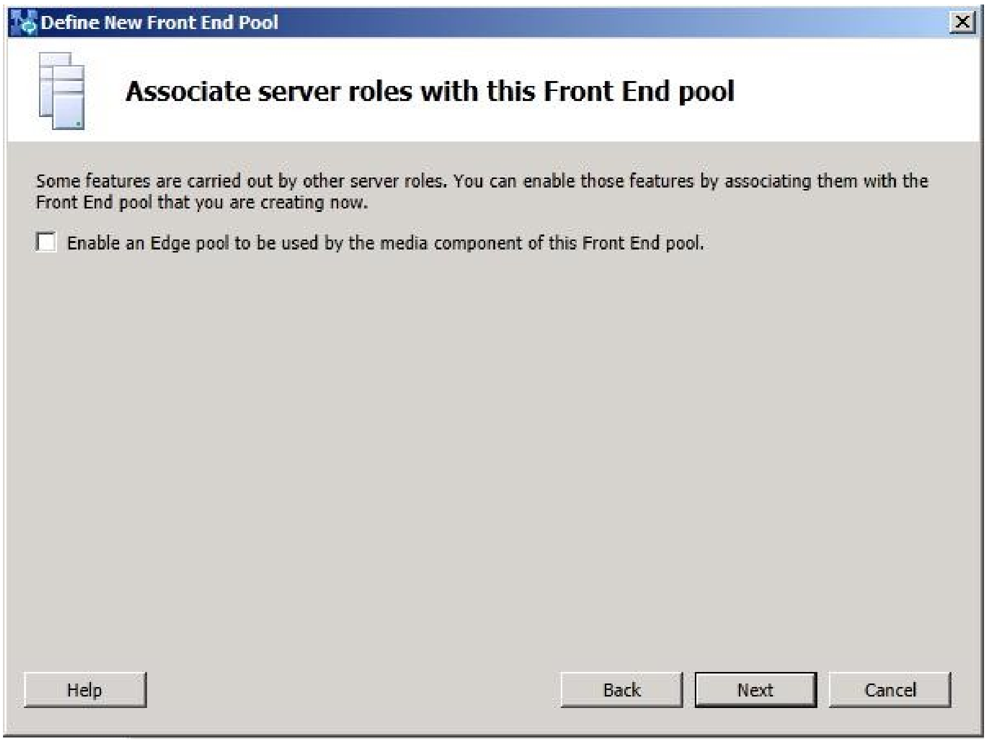
Select which server roles and services you would like to collocate on this Front End pool.

☑ Collocate Mediation Server

You can collocate the Mediation Server on the Front End Server if your IP/PSTN gateway or your IP-PBX supports media bypass and if Enterprise Voice is not mission-critical for your organization.

7. On the **Associate server roles with this Front End pool** page, during pilot

pool deployment, do not choose the **Enable an Edge pool to be used by the media component of this Front End pool** option. This is a feature you will enable and bring online in a later phase of migration. Keep this setting cleared for now.



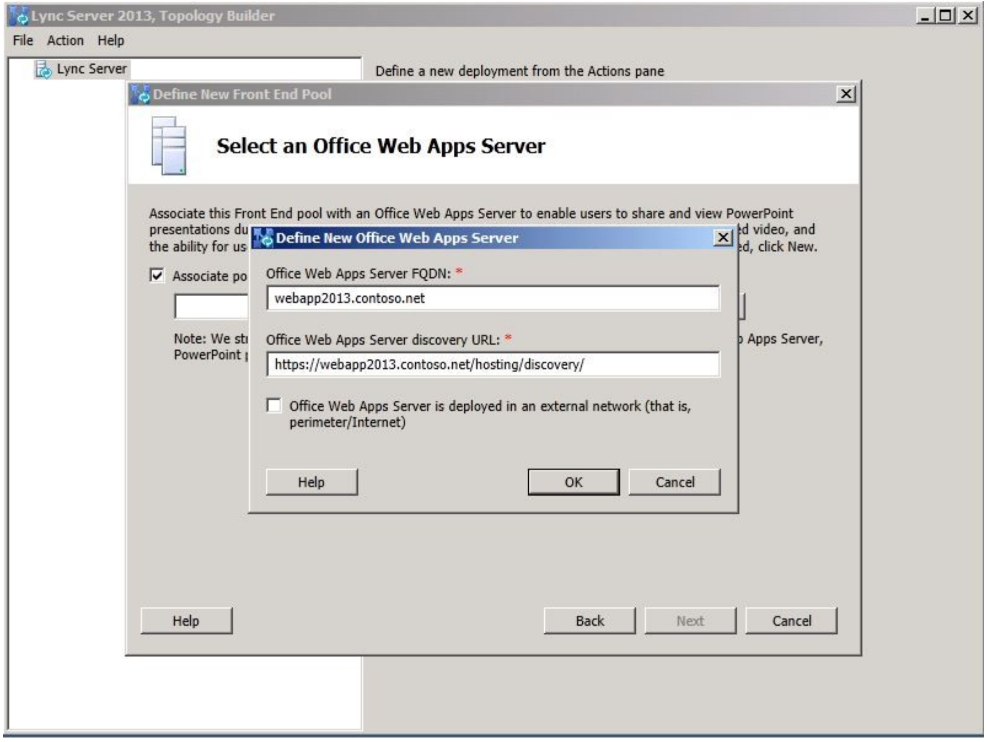
Define New Front End Pool

Associate server roles with this Front End pool

Some features are carried out by other server roles. You can enable those features by associating them with the Front End pool that you are creating now.

☐ Enable an Edge pool to be used by the media component of this Front End pool.

8. On the **Select an Office Web Apps Server** page, click **New**, and specify the FQDN of the application server.



Lync Server 2013, Topology Builder

Define a new deployment from the Actions pane

Define New Front End Pool

Select an Office Web Apps Server

Associate this Front End pool with an Office Web Apps Server to enable users to share and view PowerPoint presentations du… …d video, and the ability for us… …d, click New.

1.6.1.4.4 Verify Pilot Pool Coexistence with Legacy Pool

Verify Pilot Pool Coexistence with Legacy Pool

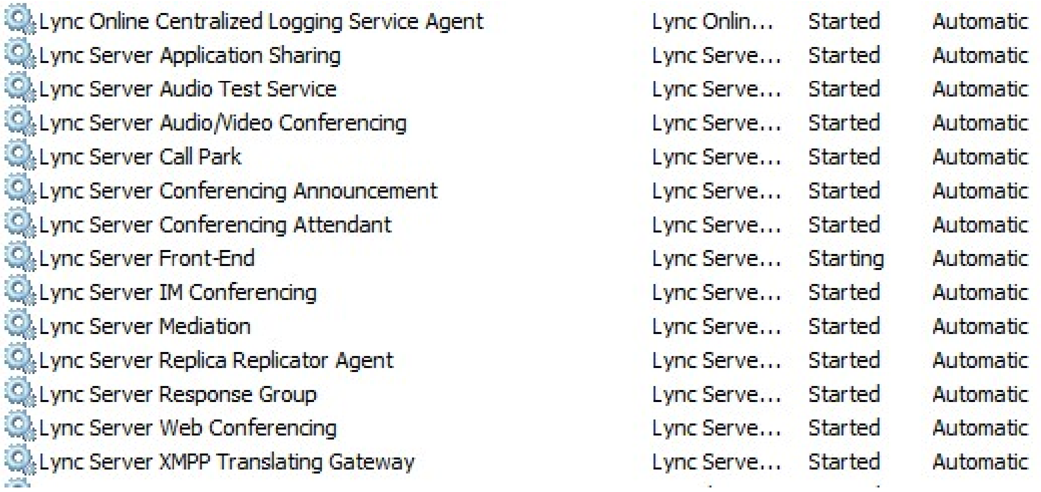
Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 3: Deploy Lync Server 2013 Pilot Pool >

Topic Last Modified: *2012-09-29*

After you deploy the pilot pool, you need to verify the coexistence of the two pools by using the administrative tools to view the pool information. For the Lync Server 2013 pools and legacy pools, you must use the Lync Server 2013 Control Panel and Topology Builder tools.

Verify that Lync Server 2013 services have started

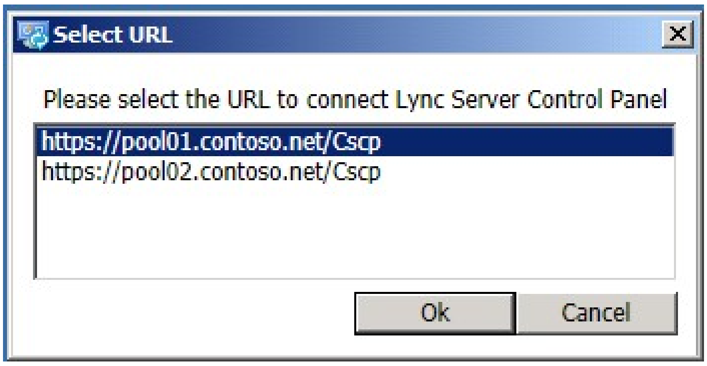
1. From the Lync Server 2013 Front End Server, navigate to the Administrative Tools\Services applet.
2. Verify that the following services are running on the Front End Server:



Lync Online Centralized Logging Service Agent	Lync Onlin...	Started	Automatic
Lync Server Application Sharing	Lync Serve...	Started	Automatic
Lync Server Audio Test Service	Lync Serve...	Started	Automatic
Lync Server Audio/Video Conferencing	Lync Serve...	Started	Automatic
Lync Server Call Park	Lync Serve...	Started	Automatic
Lync Server Conferencing Announcement	Lync Serve...	Started	Automatic
Lync Server Conferencing Attendant	Lync Serve...	Started	Automatic
Lync Server Front-End	Lync Serve...	Starting	Automatic
Lync Server IM Conferencing	Lync Serve...	Started	Automatic
Lync Server Mediation	Lync Serve...	Started	Automatic
Lync Server Replica Replicator Agent	Lync Serve...	Started	Automatic
Lync Server Response Group	Lync Serve...	Started	Automatic
Lync Server Web Conferencing	Lync Serve...	Started	Automatic
Lync Server XMPP Translating Gateway	Lync Serve...	Started	Automatic

Open the Lync Server 2013 Control Panel

From the Front End Server in your Lync Server 2013 deployment, open the Lync Server 2013 Control Panel and select the Lync Server 2010 pool. Repeat the procedure to open the Lync Server 2013 pool.



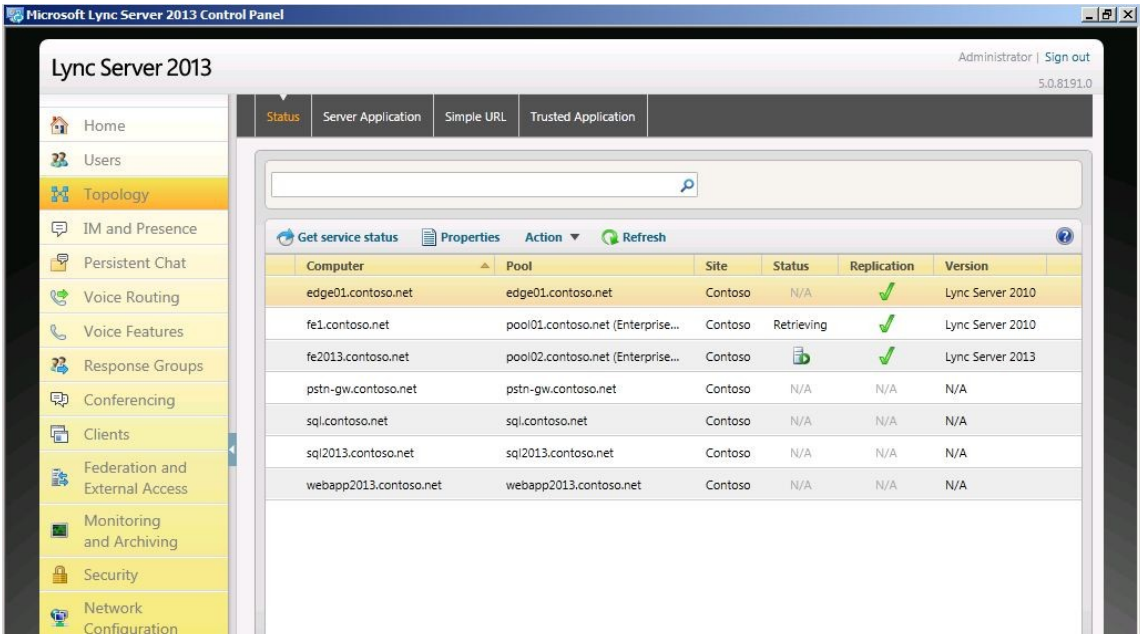
Please select the URL to connect Lync Server Control Panel

https://pool01.contoso.net/Cscp
https://pool02.contoso.net/Cscp

Important:

On Lync Server 2013, you must upgrade Silverlight to Silverlight version 5 prior to using the Lync Server Control Panel.

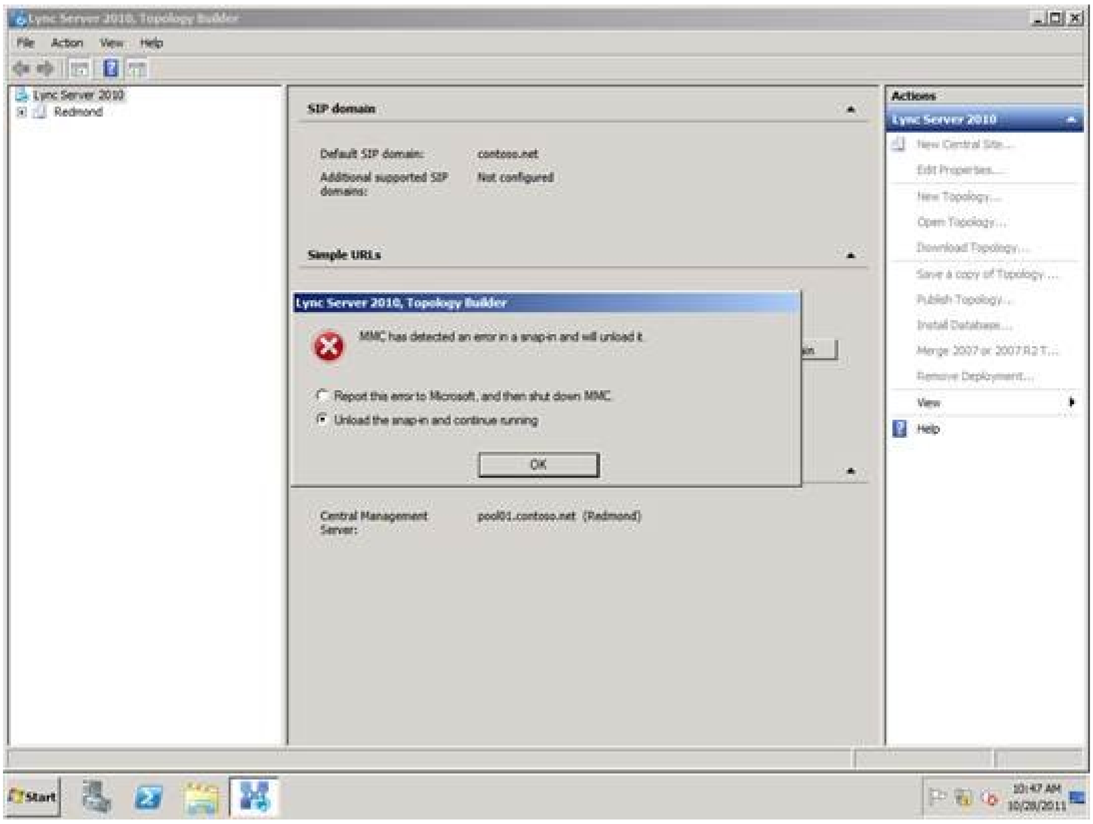
This topology now includes Lync Server 2010 and Lync Server 2013 server roles.



Computer	Pool	Site	Status	Replication	Version
edge01.contoso.net	edge01.contoso.net	Contoso	N/A	✓	Lync Server 2010
fe1.contoso.net	pool01.contoso.net (Enterprise...	Contoso	Retrieving	✓	Lync Server 2010
fe2013.contoso.net	pool02.contoso.net (Enterprise...	Contoso		✓	Lync Server 2013
pstn-gw.contoso.net	pstn-gw.contoso.net	Contoso	N/A	N/A	N/A
sql.contoso.net	sql.contoso.net	Contoso	N/A	N/A	N/A
sql2013.contoso.net	sql2013.contoso.net	Contoso	N/A	N/A	N/A
webapp2013.contoso.net	webapp2013.contoso.net	Contoso	N/A	N/A	N/A

Don’t attempt to open the topology in Lync Server 2010 Topology Builder

If you attempt to open the topology using Lync Server 2010 Topology Builder, you will encounter the error below. The topology can only be viewed using Lync Server 2013 Topology Builder. The Lync Server 2013 Topology Builder must be used to create pools for both Lync Server 2013 and Lync Server 2010.



SIP domain

Default SIP domain: contoso.net

Additional supported SIP domains: Not configured

Simple URLs

1.6.1.4.5 Connect Pilot Pool to Legacy Edge Servers

Connect Pilot Pool to Legacy Edge Servers

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 3: Deploy Lync Server 2013 Pilot Pool >

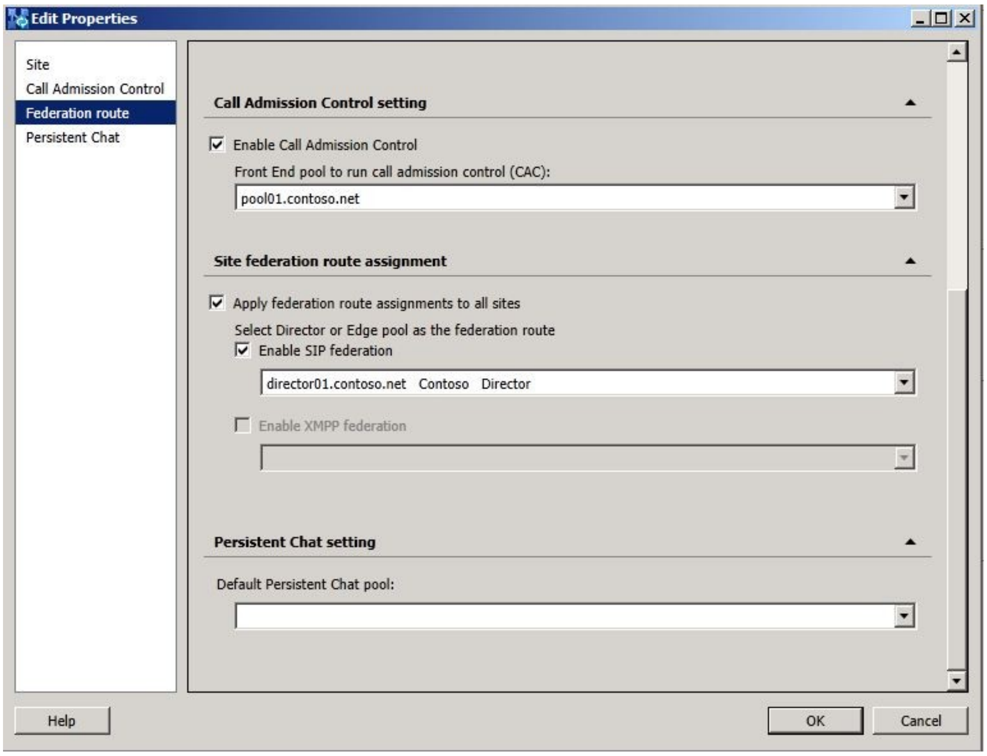
Topic Last Modified: *2012-09-29*

After deploying Lync Server 2013, you need to configure a federation route for your site. In order to use the federated route that is being used by Lync Server 2010, Lync Server 2013 must be configured to use this route.

To enable the Lync Server 2013 site to use the Director and Edge Server of the Lync Server 2010 deployment, use Topology Builder to associate the legacy Edge pool.

To associate the legacy Edge pool by using Topology Builder

1. Open **Topology Builder**.
2. Select your site, which is directly below the **Lync Server** node.
3. On the **Actions** menu, click **Edit Properties**.
4. In the left pane, select **Federation route**.
5. Under **Site federation route assignment**, select **Enable SIP federation**, and then select the Lync Server 2010 Director, or the Lync Server 2010 Edge Server if no Director is listed.



Call Admission Control setting

☑ Enable Call Admission Control

Front End pool to run call admission control (CAC): pool01.contoso.net

Site federation route assignment

☑ Apply federation route assignments to all sites

Select Director or Edge pool as the federation route

☑ Enable SIP federation

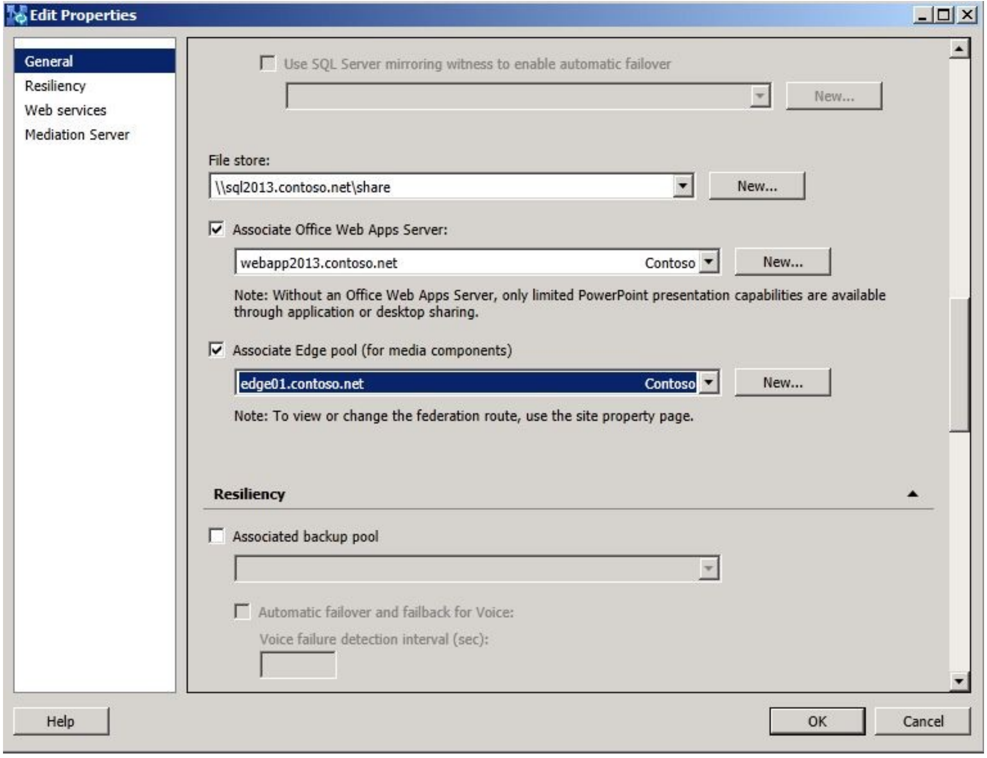
director01.contoso.net Contoso Director

□ Enable XMPP federation

Persistent Chat setting

Default Persistent Chat pool:

6. Click **OK** to close the **Edit Properties** page.
7. In Topology Builder, under the Lync Server 2013 node, navigate to the **Standard Edition server** or **Enterprise Edition Front End pools**, right-click the pool, and then click **Edit Properties**.
8. Under **Associations**, select the check box next to **Associate Edge pool (for media components)**.
9. From the list, select the legacy Edge Server.



□ Use SQL Server mirroring witness to enable automatic failover

File store: \\sql2013.contoso.net\share

☑ Associate Office Web Apps Server: webapp2013.contoso.net Contoso

Note: Without an Office Web Apps Server, only limited PowerPoint presentation capabilities are available through application or desktop sharing.

☑ Associate Edge pool (for media components): edge01.contoso.net Contoso

Note: To view or change the federation route, use the site property page.

Resiliency

□ Associated backup pool

□ Automatic failover and failback for Voice:

Voice failure detection interval (sec):

10. Click **OK** to close the **Edit Properties** page.
11. In **Topology Builder**, select the top-most node, **Lync Server**.
12. From the **Action** menu, click **Publish Topology**, and then click **Next**.
13. When the **Publishing wizard** completes, click **Finish**.

1.6.1.4.6 Configure XMPP Gateway Access Policies and Certificates

Configure XMPP Gateway Access Policies and Certificates

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 3: Deploy Lync Server 2013 Pilot Pool >

***Topic Last Modified:** 2012-10-15*

XMPP federation defines an external deployment based on the eXtensible Messaging and Presence Protocol (XMPP). An XMPP configuration allows Lync users access to XMPP domain users by:

- IM and Presence – person to person only
- Creation of XMPP federated contacts in the Lync client

When you configure policies for support of extensible messaging and presence protocol (XMPP) federated partners, the policies apply to users of XMPP federated domains, but not to users of session initiation protocol (SIP) instant messaging (IM) service providers (for example, Windows Live), or SIP federated domains. You configure an XMPP Federated Partner for each XMPP federated domain that you want to allow your users to add contacts and communicate with. Once the policies are in place, you need to configure the XMPP Gateway certificates.

Note:

To begin the XMPP Gateway migration, you need to deploy the Lync Server 2013 XMPP Gateway, and configure access policies to enable users for Lync Server 2013 XMPP Gateway. All users must be moved to the Lync Server 2013 deployment before you perform these steps. For details, see Configure XMPP Gateway on Lync Server 2013.

⊟Configure an External Access Policy to Enable Users for Lync Server 2013 XMPP Gateway

1. Open Lync Server Control Panel.
2. In the left navigation bar, click **Federation and External Access**, and then click **External Access Policy**.
3. Click **New** and then click **User policy**.
4. Enter a name for the external access user policy.
5. Provide a description for external access user policy.
6. Select **Enable communications with federated users**.
7. Select **Enable communications with XMPP federated users**.
8. Click **Commit** to save your changes to the site or user policy.

1.6.1.5 Phase 4: Move test users to the Pilot Pool

Phase 4: Move test users to the Pilot Pool

Microsoft Lync Server 2013 > Migration > Migration from Lync Server 2010 to Lync Server 2013 >

***Topic Last Modified:** 2012-09-26*

You can move a single user or groups of users to your new Microsoft Lync Server 2013 deployment using the following two methods: Lync Server Control Panel and Lync Server Management Shell. The topics in this section describe tasks you must complete during pilot deployment, as well as prior to moving your deployment of Lync Server 2013 from a pilot deployment to a production-level deployment.

In This Section

- View Current Users in Lync Server 2010 Pool
- Verify User Replication Has Completed
- Move a single user to the Pilot Pool
- Move multiple users to the Pilot Pool

1.6.1.5.1 View Current Users in Lync Server 2010 Pool

View Current Users in Lync Server 2010 Pool

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 4: Move test users to the Pilot Pool >

Topic Last Modified: *2012-09-26*

Prior to learning the various ways you can move users between pools, we must first determine what users exist in the legacy Lync Server 2010 pool. In the image below, the Registrar pool column identifies six users who are configured for the legacy Lync Server 2010 pool. These are the test users we will move to the Lync Server 2013 pool.

To see the list of users in the Lync Server 2010 pool

1. Log on to the Lync Server 2010 Front End Server with an account that is a member of the RTCUniversalServerAdmins group or a member of the CsAdministrator or CsUserAdministrator administrative role.
2. Open **Lync Server Control Panel**.
3. Click **Users**, click Search, and then click **Find**.

1.6.1.5.2 Verify User Replication Has Completed

Verify User Replication Has Completed

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 4: Move test users to

Topic Last Modified: *2012-09-17*

When running the **Move-CsUser** cmdlet, you may experience a failure because user information between Active Directory Domain Services (AD DS) and the Lync Server 2013 databases are out of sync because the initial replication is incomplete. The time it takes for the successful completion of the Lync Server 2013 User Replicator service's initial synchronization depends on the number of domain controllers that are hosted in the Active Directory forest that hosts the Lync Server 2013 pool. The Lync Server 2013 User Replicator service initial synchronization process occurs when the Lync Server 2013 Front End Server is started for the first time. After that, the synchronization is then based on the User Replicator interval. Complete the following steps to verify user replication has completed before running the **Move-CsUser** cmdlet.

To verify user replication has completed

1. Log on to the computer where Topology Builder is installed as a member of the Domain Admins group and the RTCUniversalServerAdmins group.
2. Click the **Start** menu, and then click **Run**.
3. Enter **eventvwr.exe** and then click **OK**.
4. In Event Viewer, click **Applications and Services logs** to expand it, and then select Lync Server.
5. In the **Actions** pane click **Filter Current Log**.
6. From the **Event sources** list, click **LS User Replicator**.
7. In **<All Event IDs>** enter **30024** and then click **OK**.
8. In the filtered events list, on the **General** tab, look for an entry that states user replication has completed successfully.

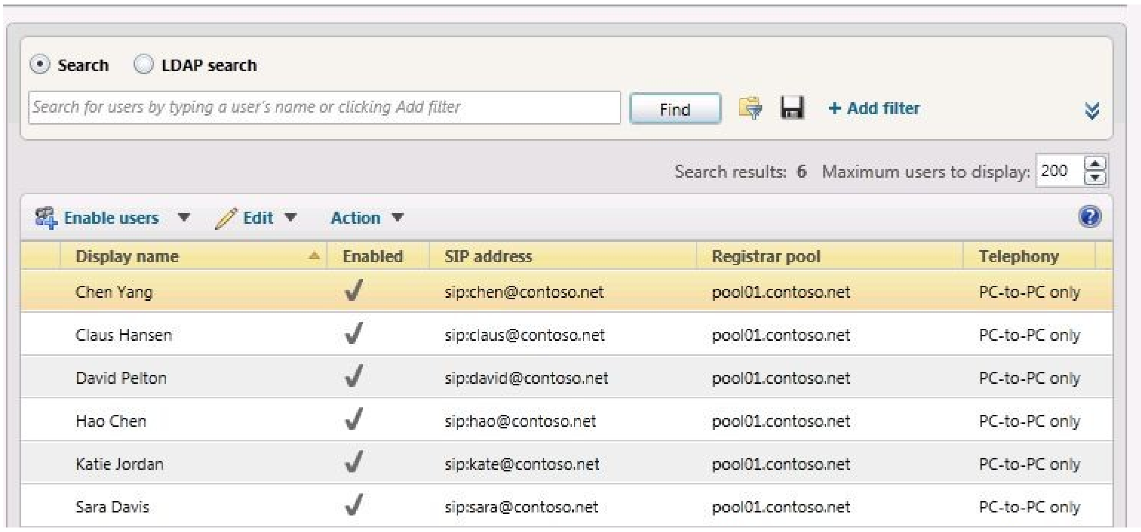
1.6.1.5.3 Move a single user to the Pilot Pool

Move a single user to the Pilot Pool

Topic Last Modified: *2012-09-26*

You can move a user from your Lync Server 2010 pool to your Lync Server 2013 pilot pool using Lync Server 2013 Control Panel or Lync Server 2013 Management Shell. In the example below, in the Registrar pool column, **pool01.contoso.net** is the Lync Server 2010 pool, and all six of these users are connected to this pool. Use the following procedures to move a user to your Lync Server 2013 pool using Lync Server 2013 Control Panel and Lync Server Management Shell.

To move a user by using the Lync Server 2013 Control Panel



● Search
○ LDAP search

1.6.1.5.4 Move multiple users to the Pilot Pool

Move multiple users to the Pilot Pool

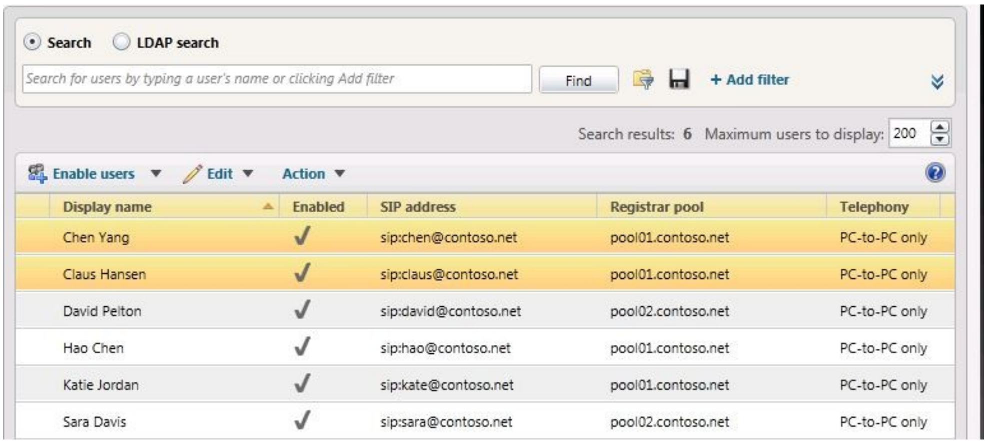
Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 4: Move test users to the Pilot Pool >

Topic Last Modified: *2012-10-02*

You can move multiple users from your Lync Server 2010 pool to your Lync Server 2013 pilot pool using Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

To move multiple users by using the Lync Server 2013 Control Panel

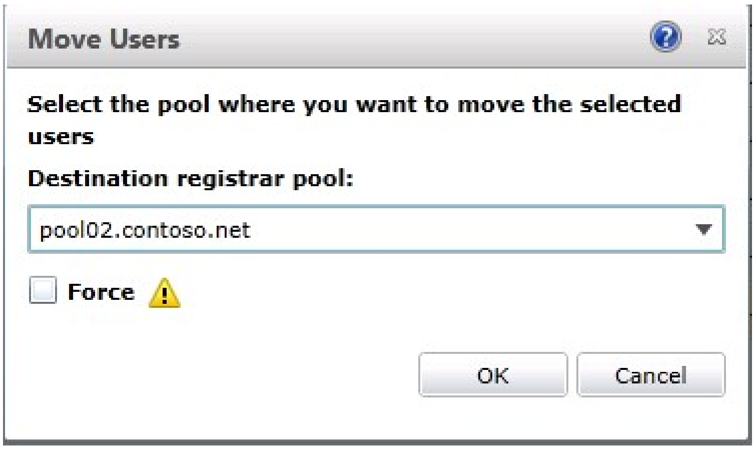
1. Open **Lync Server Control Panel**.
2. Click **Users**, click Search, and then click **Find**.
3. Select two users that you want to move to the Lync Server 2013 pool. In this example, we will move users Chen Yang and Claus Hansen.



Search results: 6 Maximum users to display: 200

Display name	Enabled	SIP address	Registrar pool	Telephony
Chen Yang	✓	sip:chen@contoso.net	pool01.contoso.net	PC-to-PC only
Claus Hansen	✓	sip:claus@contoso.net	pool01.contoso.net	PC-to-PC only
David Pelton	✓	sip:david@contoso.net	pool02.contoso.net	PC-to-PC only
Hao Chen	✓	sip:hao@contoso.net	pool01.contoso.net	PC-to-PC only
Katie Jordan	✓	sip:kate@contoso.net	pool01.contoso.net	PC-to-PC only
Sara Davis	✓	sip:sara@contoso.net	pool02.contoso.net	PC-to-PC only

4. From the **Action** menu, select **Move selected users to pool**.
5. From the drop-down list, select the Lync Server 2013 pool.
6. Click **Action** and then click **Move selected users to pool**. Click OK.



Move Users

Select the pool where you want to move the selected users

Destination registrar pool:

pool02.contoso.net

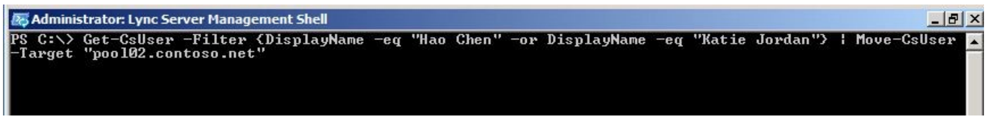
□ Force

7. Verify that the **Registrar pool** column for the users now contains the Lync Server 2013 pool, which indicates that the users have been successfully moved.

To move multiple users by using the Lync Server 2013 Management Shell

1. Open the Lync Server 2013 Management Shell.
2. At the command line, type the following and replace **User1** and **User2** with specific user names you want to move and replace **pool_FQDN** with the name of the destination pool. In this example we will move users Hao Chen and Katie Jordan.

```
Get-CsUser -Filter {DisplayName -eq "User1" -or DisplayName - eq "User
```



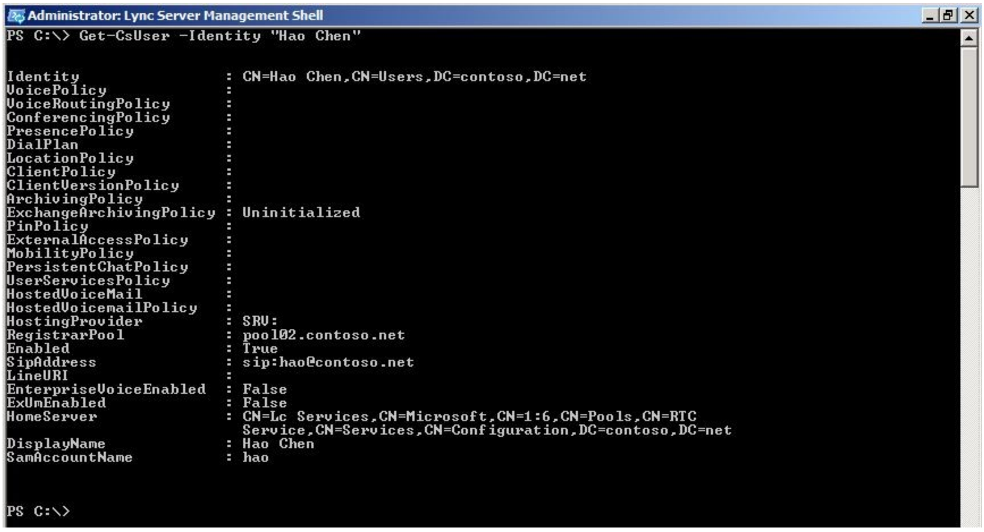
```
PS C:\> Get-CsUser -Filter {DisplayName -eq "Hao Chen" -or DisplayName -eq "Katie Jordan"} | Move-CsUser
-Target "pool02.contoso.net"
```

3. At the command line, type the following

```
Get-CsUser -Identity "User1"
```

4. The **Registrar Pool** identity should now point to the pool you specified as **pool_FQDN** in the previous step. The presence of this identity confirms that

the user has been successfully moved. Repeat step to verify **User2** has been moved.



```
PS C:\> Get-CsUser -Identity "Hao Chen"

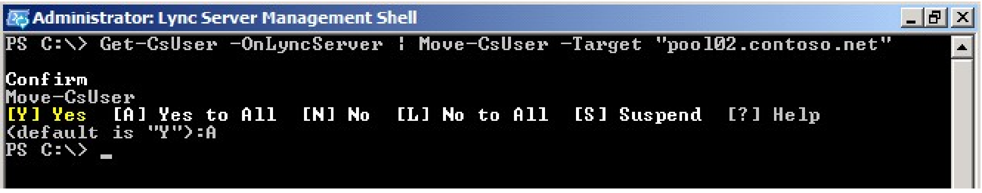
PS C:\>
```

To move all users at the same time by using the Lync Server 2013 Management Shell

In this example, all users have been returned to the Lync Server 2010 pool (pool01.contoso.net). Using the Lync Server 2013 Management Shell, we will move all users at the same time to the Lync Server 2013 pool (pool02.contoso.net).

1. Open the **Lync Server 2013 Management Shell**.
2. At the command line, type the following:

```
Get-CsUser -OnLyncServer | Move-CsUser -Target "pool_FQDN"
```



```
PS C:\> Get-CsUser -OnLyncServer | Move-CsUser -Target "pool02.contoso.net"

Confirm
Move-CsUser
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help
(default is "Y"):A
PS C:\> _
```

3. Next, run **Get-CsUser** for one of the pilot users.

```
Get-CsUser -Identity "Hao Chen"
```

4. The **Registrar Pool** identity for each user now points to the pool you specified as “pool_FQDN” in the previous step. The presence of this identity confirms that the user has been successfully moved.
5. Additionally, we can view the list of users in the Lync Server 2013 Control Panel and verify that the Registrar Pool value now points to the Lync Server 2013 pool.

1.6.1.6 Phase 5: Add Lync Server 2013 Edge Server to Pilot Pool

Phase 5: Add Lync Server 2013 Edge Server to Pilot Pool

Microsoft Lync Server 2013 > Migration > Migration from Lync Server 2010 to Lync Server 2013 >

Topic Last Modified: *2012-09-06*

The topics in this section explain how to add a Lync Server 2013 Edge Server to the pilot pool deployment. The topics provide configuration and verification guidance when running the Deploy New Edge pool wizard.

In This Section

- Deploy Pilot Edge Server
- Verify Configuration Settings

1.6.1.6.1 Deploy Pilot Edge Server

Deploy Pilot Edge Server

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 5: Add Lync Server 2013 Edge Server to Pilot Pool >

Topic Last Modified: *2012-10-19*

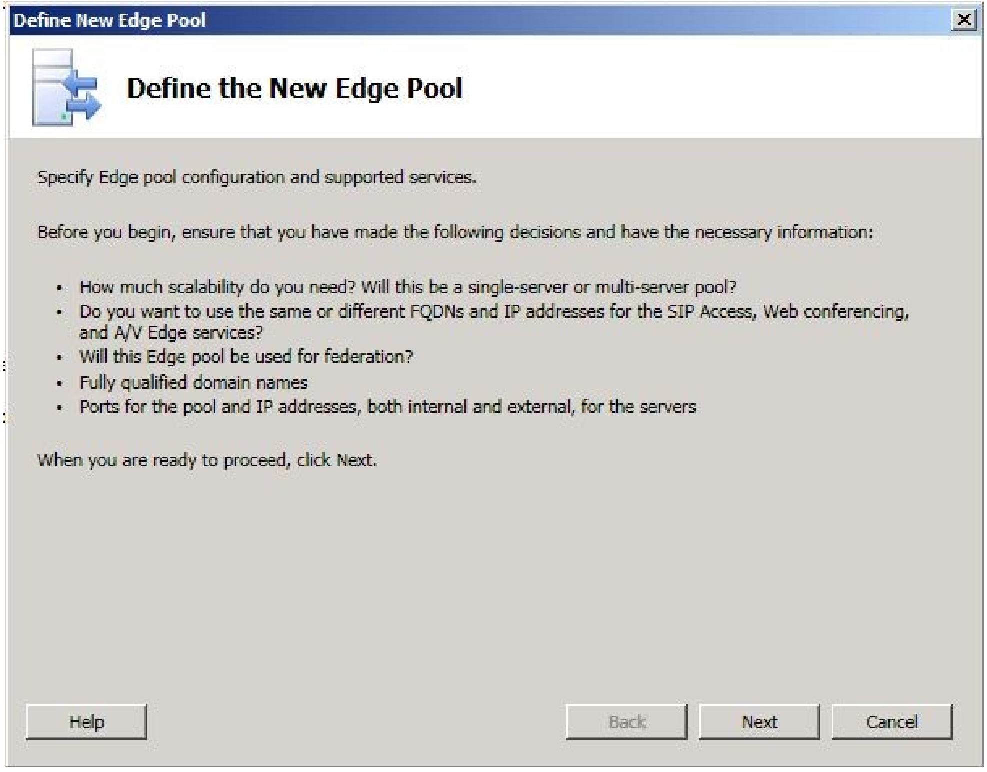
This topic highlights configuration settings you should be aware of prior to deploying your Lync Server 2013 Edge Server. The deployment and configuration processes for Lync Server 2013 are very similar to Lync Server 2010. This section only highlights key points you should consider as part of your pilot pool deployment. For detailed steps, see Deploying External User Access in the Deployment documentation, which describes the deployment process and also gives configuration information for external user access.

As you navigate through the **Define New Edge Pool** wizard, review the key configuration settings shown in the following steps. Note that only a few pages of the **Define New Edge Pool** wizard are shown.

Define an Edge Pool

1. Log on to the computer where Topology Builder is installed as a member of the Domain Admins group and the RTCUniversalServerAdmins group.

2. Navigate to the Lync Server 2013 node. Right-click **Edge pools**, and click **New Edge pool**.



Define New Edge Pool

Define the New Edge Pool

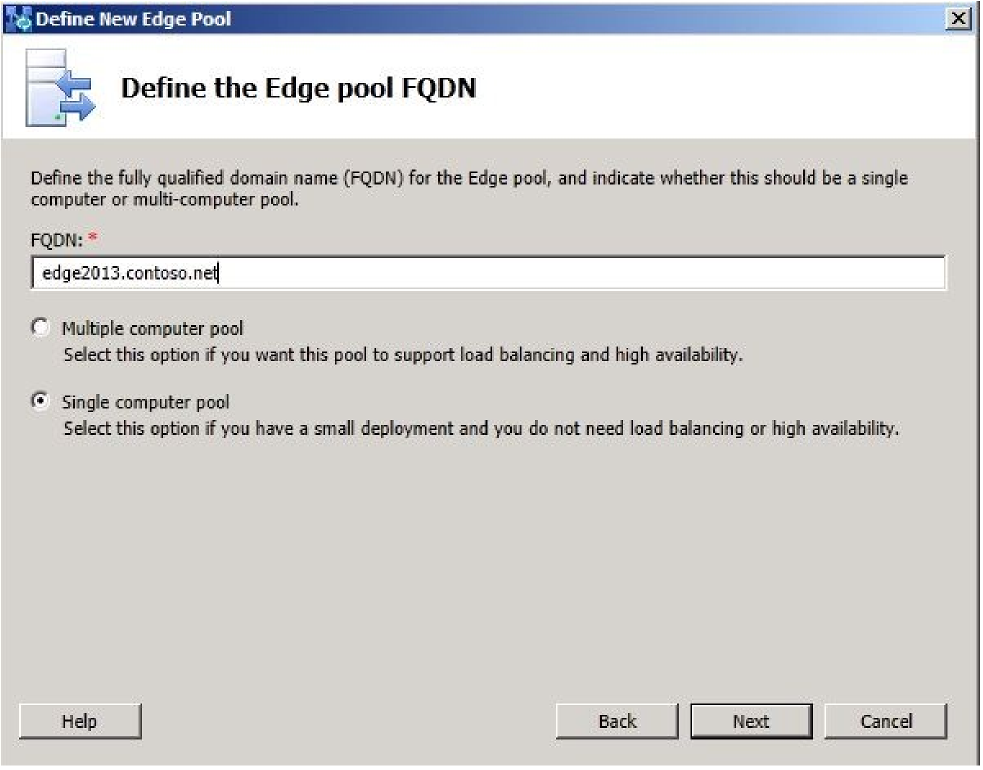
Specify Edge pool configuration and supported services.

Before you begin, ensure that you have made the following decisions and have the necessary information:

- How much scalability do you need? Will this be a single-server or multi-server pool?
- Do you want to use the same or different FQDNs and IP addresses for the SIP Access, Web conferencing, and A/V Edge services?
- Will this Edge pool be used for federation?
- Fully qualified domain names
- Ports for the pool and IP addresses, both internal and external, for the servers

When you are ready to proceed, click Next.

3. An Edge pool can be a **Multiple computer pool** or **Single computer pool**.



Define New Edge Pool

Define the Edge pool FQDN

Define the fully qualified domain name (FQDN) for the Edge pool, and indicate whether this should be a single computer or multi-computer pool.

FQDN: *

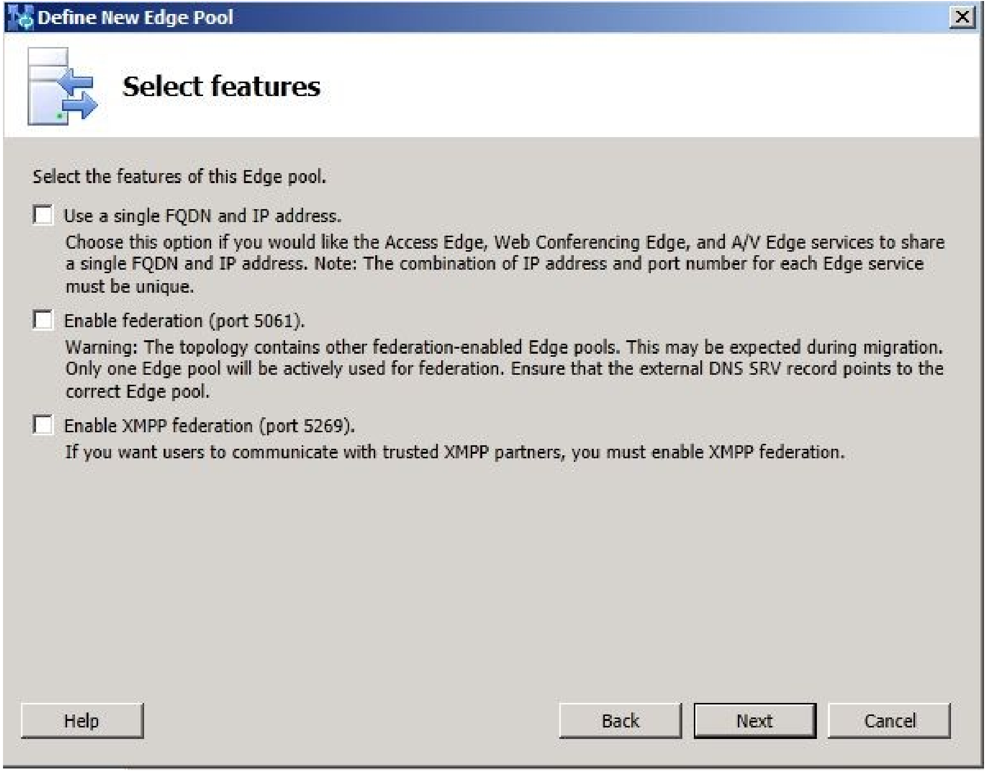
edge2013.contoso.net

○ Multiple computer pool
Select this option if you want this pool to support load balancing and high availability.

● Single computer pool
Select this option if you have a small deployment and you do not need load balancing or high availability.

4. On the **Select features** page, do not enable federation or XMPP federation. Federation and XMPP federation are both currently routed through the legacy Lync Server 2010 Edge Server. These features will be configured in a later

phase of migration.



Define New Edge Pool

Select features

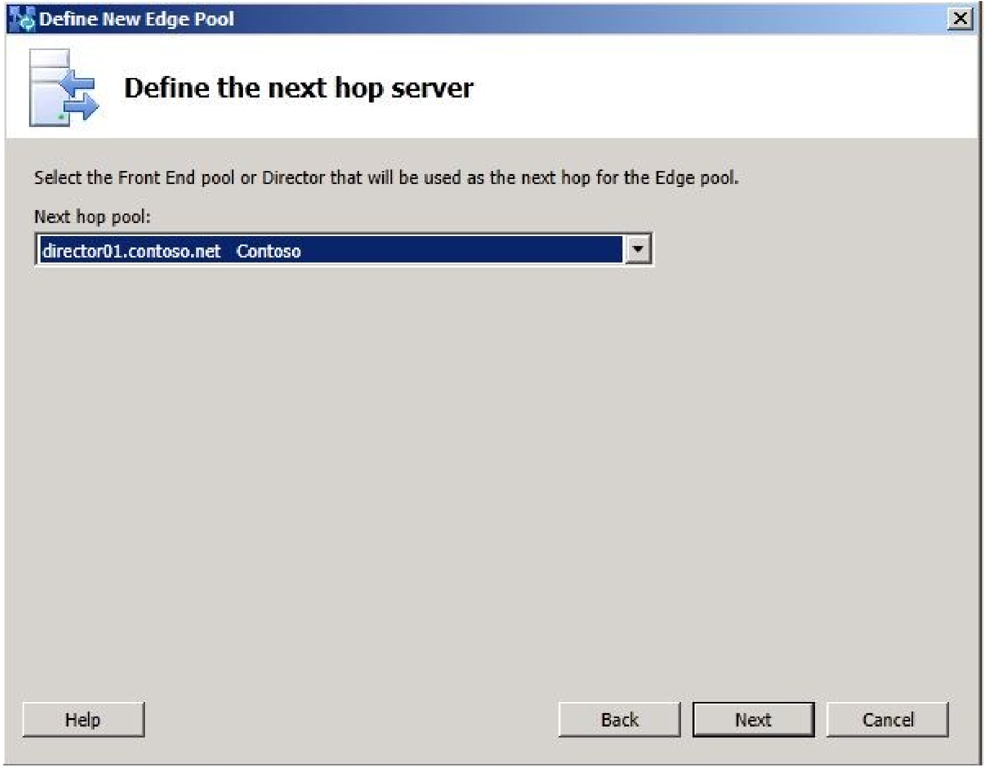
Select the features of this Edge pool.

☐ Use a single FQDN and IP address.
Choose this option if you would like the Access Edge, Web Conferencing Edge, and A/V Edge services to share a single FQDN and IP address. Note: The combination of IP address and port number for each Edge service must be unique.

☐ Enable federation (port 5061).
Warning: The topology contains other federation-enabled Edge pools. This may be expected during migration. Only one Edge pool will be actively used for federation. Ensure that the external DNS SRV record points to the correct Edge pool.

☐ Enable XMPP federation (port 5269).
If you want users to communicate with trusted XMPP partners, you must enable XMPP federation.

5. Next, continue completing the following wizard pages: **External FQDNs**, **Define the internal IP address**, and **Define the external IP address**.
6. On the **Define the next hop** page, select the Director for the next hop of the Lync Server 2010 Edge pool.



Define New Edge Pool

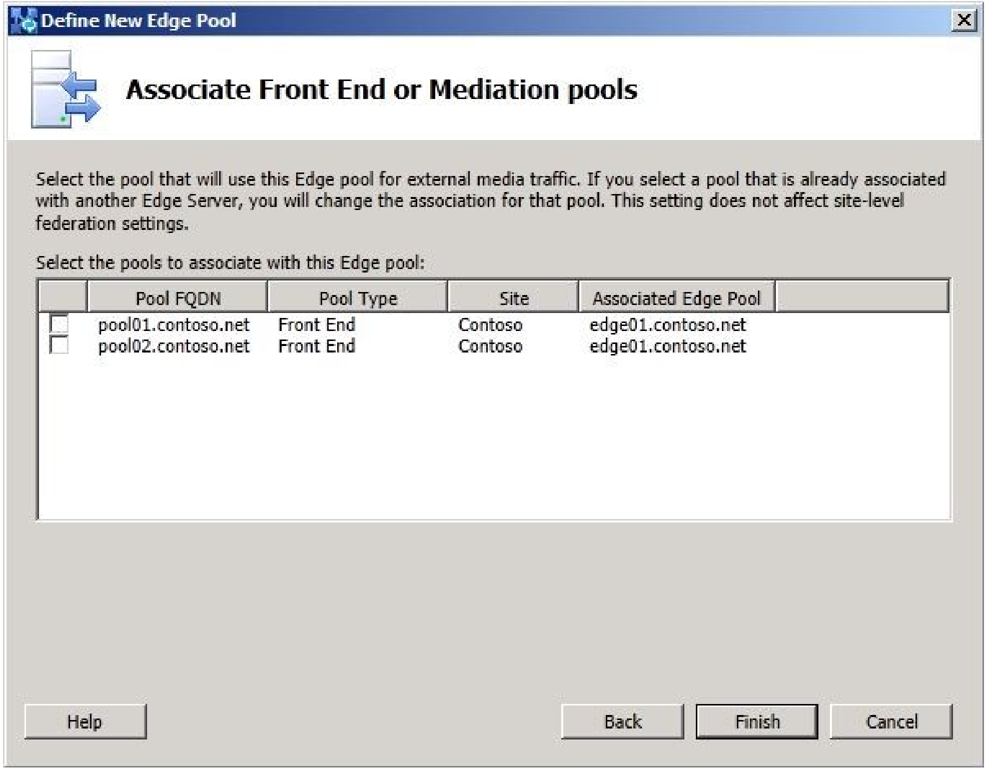
Define the next hop server

Select the Front End pool or Director that will be used as the next hop for the Edge pool.

Next hop pool: director01.contoso.net Contoso

7. On the **Associate Front End or Mediation pools** page, do not associate a

pool with this Edge pool at this time. External media traffic is currently routed through the legacy Lync Server 2010 Edge Server. This setting will be configured in a later phase of migration.



Associate Front End or Mediation pools

Select the pool that will use this Edge pool for external media traffic. If you select a pool that is already associated with another Edge Server, you will change the association for that pool. This setting does not affect site-level federation settings.

Select the pools to associate with this Edge pool:

	Pool FQDN	Pool Type	Site	Associated Edge Pool
□	pool01.contoso.net	Front End	Contoso	edge01.contoso.net
□	pool02.contoso.net	Front End	Contoso	edge01.contoso.net

8. Click **Finish** and then **Publish** the topology.
9. Follow the steps in Install Edge Servers in the Deployment documentation to install the files on the new Edge Server, configure certificates, and start the services.

It’s very important that you follow the guidelines in the topics Deploying External User Access in the Deployment documentation. This section merely provided some guidance on configuration settings when installing these server roles.

You should now have a legacy Lync Server 2010 Edge Server deployed in parallel with a Lync Server 2013 Edge server deployment. Verify that both deployments are running properly, services are started, and you can administer each deployment prior to moving to the next phase.

1.6.1.6.2 Verify Configuration Settings

Verify Configuration Settings

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 5: Add Lync Server 2013 Edge Server to Pilot Pool >

Topic Last Modified: *2012-09-06*

You can validate the replication of configuration information to the Edge server by running the Lync Server 2013 **Get-CsManagementStoreReplicationStatus** cmdlet on the internal computer on which the Central Management store is located, or on any domain joined computer on which Lync Server 2013 Core Components (OcsCore.msi) is installed.

Initial results may indicate the status as "False" instead of "True" for replication. If so, run the **Invoke-CsManagementStoreReplication** cmdlet and allow time for the replication to complete before running the **Get-CsManagementStoreReplicationStatus** again.

1.6.1.7 Phase 6: Move from Pilot Deployment into Production

Phase 6: Move from Pilot Deployment into Production

Microsoft Lync Server 2013 > Migration > Migration from Lync Server 2010 to Lync Server 2013 >

Topic Last Modified: *2012-10-19*

The topics in this section describe tasks you must complete prior to moving your deployment of Lync Server 2013 from a pilot deployment to a production-level deployment.

- Configure Federation Routes and Media Traffic
- Verify Federation and Remote Access for External Users
- Change Simple URLs after Migration
- Move Remaining Users to Lync Server 2013
- Configure XMPP Gateway on Lync Server 2013

1.6.1.7.1 Configure Federation Routes and Media Traffic

Configure Federation Routes and Media Traffic

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 6: Move from Pilot Deployment into Production >

Topic Last Modified: *2012-10-15*

Federation is a trust relationship between two or more SIP domains that permits users in separate organizations to communicate across network boundaries. After you migrate to your Lync Server 2013 pilot pool, you need to transition from the federation route of your Lync Server 2010 Edge Servers to the federation route of your Lync Server 2013 Edge Servers.

Use the following procedures to transition the federation route and the media traffic route from your Lync Server 2010 Edge Server and Director to your Lync Server 2013 Edge Server, for a single-site deployment.

◆Important:

Changing the federation route and media traffic route requires that you schedule maintenance downtime for the Lync Server 2013 and Lync Server 2010 Edge Servers. This entire transition process also means that federated access will be unavailable for the duration of the outage. You should schedule the downtime for a time when you expect minimal user activity. You should also provide sufficient notification to your end users. Plan accordingly for this outage and set appropriate expectations within your organization.

◆Important:

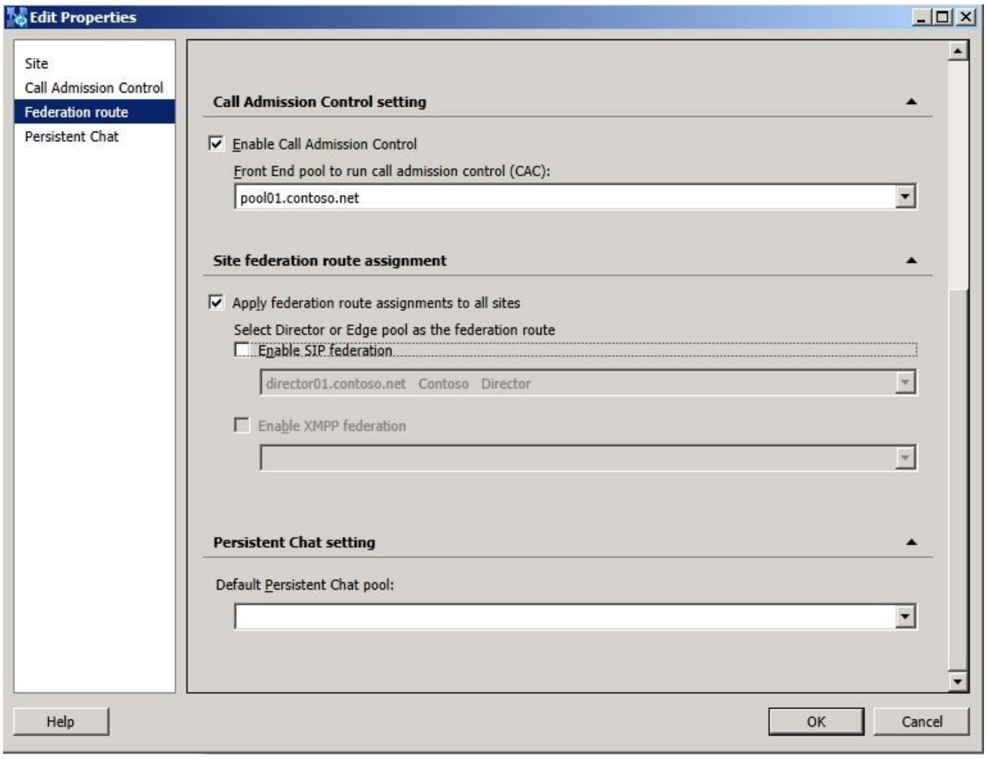
If your legacy Lync Server 2010 Edge Server is configured to use the same FQDN for the Access Edge service, Web Conferencing Edge service, and the A/V Edge service, the procedures in this section are not supported. If the legacy Edge services are configured to use the same FQDN, you must first migrate all your users from Lync Server 2010 to Lync Server 2013, then decommission the Lync Server 2010 Edge Server before enabling federation on the Lync Server 2013 Edge Server.

Important:

If your XMPP federation is routed through a Lync Server 2013 Edge Server, legacy Lync Server 2010 users will not be able to communicate with the XMPP federated partner until all users have been moved to Lync Server 2013, XMPP policies and certificates have been configured, the XMPP federated partner has been configured on Lync Server 2013, and lastly the DNS entries have been updated.

To remove the legacy federation association from Lync Server 2013 sites

1. On the Lync Server 2013 Front End server, open the existing topology in Topology Builder.
2. In the left pane, navigate to the site node, which is located directly below **Lync Server**.
3. Right-click the site and then click **Edit Properties**.
4. In the left pane, select **Federation route**.
5. Under **Site federation route assignment**, clear the **Enable SIP federation** check box to disable the federation route through the legacy Lync Server 2010 environment.



Call Admission Control setting

☑ Enable Call Admission Control

Front End pool to run call admission control (CAC): pool01.contoso.net

Site federation route assignment

☑ Apply federation route assignments to all sites

Select Director or Edge pool as the federation route

☐ Enable SIP federation

director01.contoso.net Contoso Director

☐ Enable XMPP federation

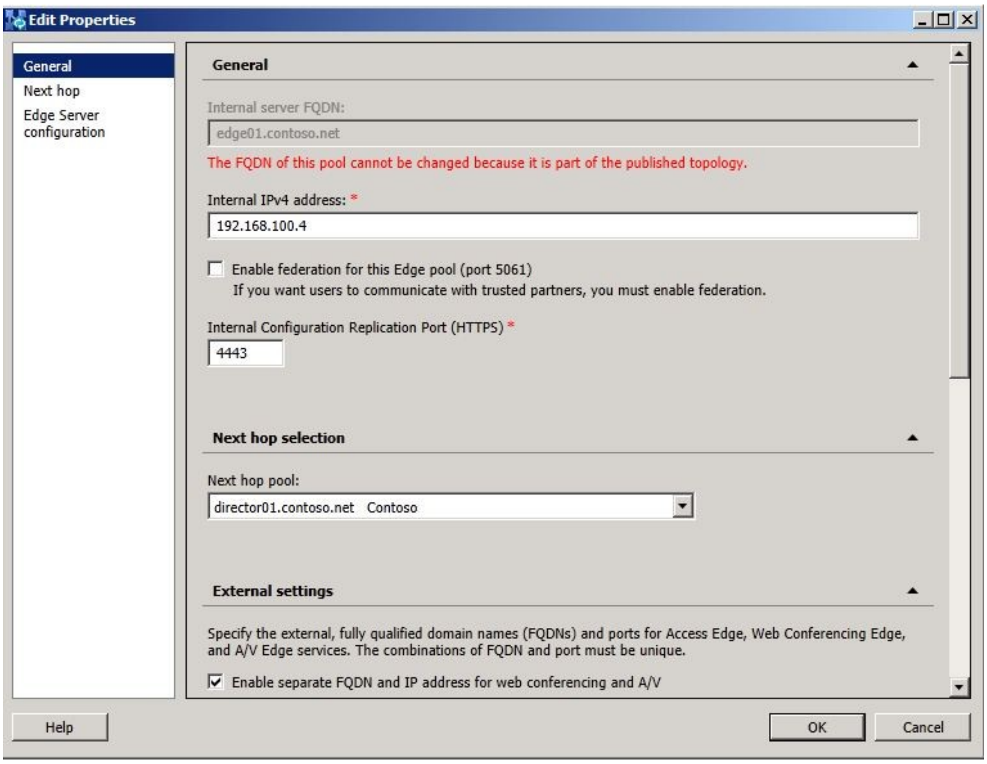
Persistent Chat setting

Default Persistent Chat pool:

6. Click **OK** to close the Edit Properties page.
7. From **Topology Builder**, select the top node **Lync Server**.
8. From the **Action** menu, click **Publish Topology**.
9. Click **Next** to complete the publishing process and then click **Finish** when the publishing process has completed.

To configure the legacy Edge Server as a non-federating Edge Server

1. In the left pane, navigate to the **Lync Server 2010** node and then to the **Edge pools** node.
2. Right-click the Edge server, and then click **Edit Properties**.
3. Select **General** in the left pane.
4. Clear the **Enable federation for this Edge pool (port 5061)** check box entry and select **OK** to close the page.



General

Internal server FQDN:
edge01.contoso.net
The FQDN of this pool cannot be changed because it is part of the published topology.

Internal IPv4 address: *
192.168.100.4

☐ Enable federation for this Edge pool (port 5061)
If you want users to communicate with trusted partners, you must enable federation.

Internal Configuration Replication Port (HTTPS) *
4443

Next hop selection

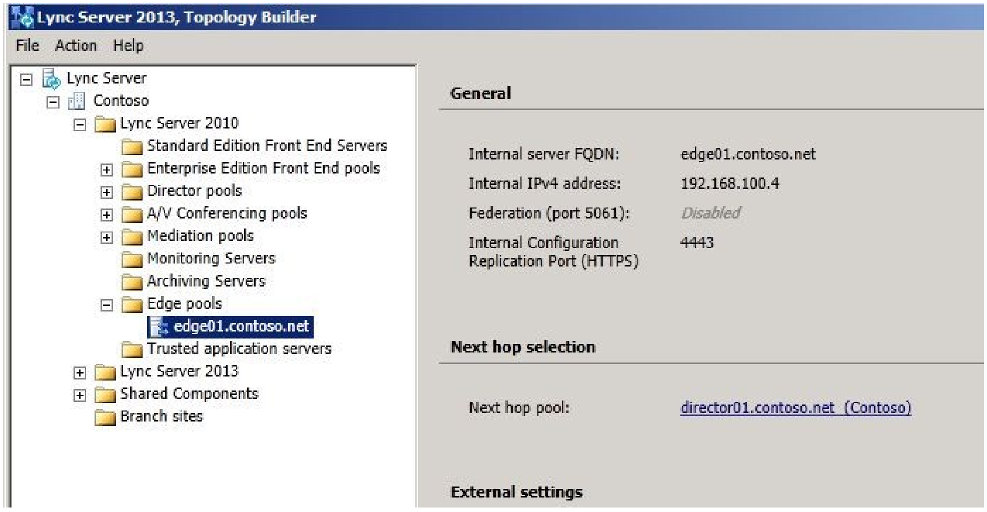
Next hop pool:
director01.contoso.net Contoso

External settings

Specify the external, fully qualified domain names (FQDNs) and ports for Access Edge, Web Conferencing Edge, and A/V Edge services. The combinations of FQDN and port must be unique.

☑ Enable separate FQDN and IP address for web conferencing and A/V

5. From the **Action** menu, select **Publish Topology**, and then click **Next**.
6. When the **Publishing wizard** completes, click **Finish** to close the wizard.
7. Verify federation for the legacy Edge server is disabled.



General

Internal server FQDN: edge01.contoso.net
Internal IPv4 address: 192.168.100.4
Federation (port 5061): *Disabled*
Internal Configuration Replication Port (HTTPS) 4443

Next hop selection

Next hop pool: director01.contoso.net (Contoso)

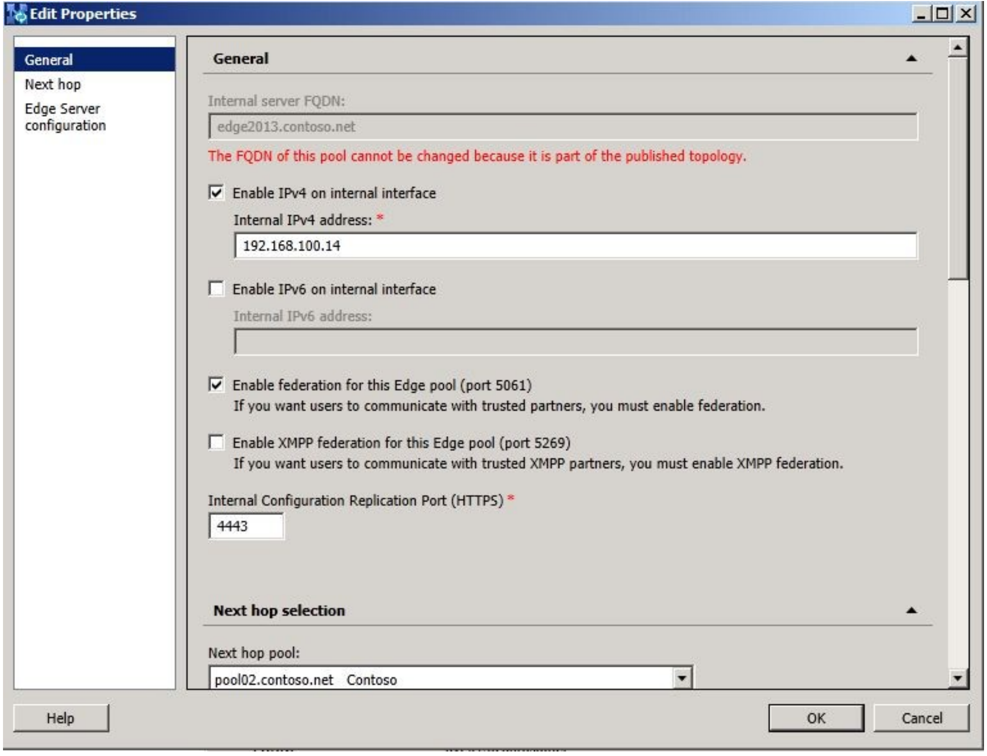
External settings

To configure certificates on the Lync Server 2010 Edge Server

1. Export the external Access Proxy certificate, with the private key, from the legacy Lync Server 2010 Edge Server.
2. On the Lync Server 2013 Edge Server, import the Access Proxy external certificate from the previous step.
3. Assign the Access Proxy external certificate to the Lync Server 2013 external interface of the Edge Server.
4. The internal interface certificate of the Lync Server 2013 Edge Server should be requested from a trusted CA and assigned.

⊟To change Lync Server 2010 federation route to use Lync Server 2013 Edge Server

1. From Topology Builder, in the left pane, navigate to the **Lync Server 2013** node and then to the **Edge pools** node.
2. Right-click the Edge server, and then click **Edit Properties**.
3. Select **General** in the left pane.
4. Select the check box entry for **Enable federation for this Edge pool (port 5061)** and then click **OK** to close the page.



General

Internal server FQDN: edge2013.contoso.net

The FQDN of this pool cannot be changed because it is part of the published topology.

☑ Enable IPv4 on internal interface

Internal IPv4 address: * 192.168.100.14

☐ Enable IPv6 on internal interface

Internal IPv6 address:

☑ Enable federation for this Edge pool (port 5061)
If you want users to communicate with trusted partners, you must enable federation.

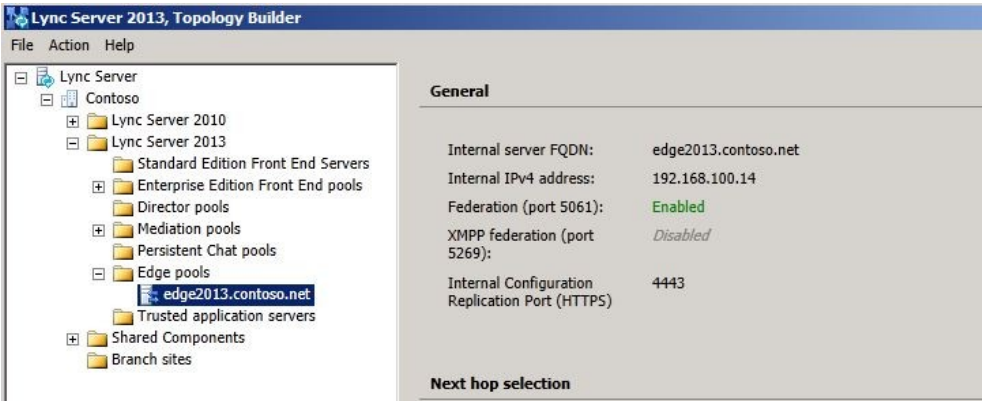
☐ Enable XMPP federation for this Edge pool (port 5269)
If you want users to communicate with trusted XMPP partners, you must enable XMPP federation.

Internal Configuration Replication Port (HTTPS) * 4443

Next hop selection

Next hop pool: pool02.contoso.net Contoso

5. From the **Action** menu, select **Publish Topology**, and then click **Next**.
6. When the **Publishing wizard** completes, click **Finish** to close the wizard.
7. Verify **Federation (port 5061)** is set to **Enabled**.



General

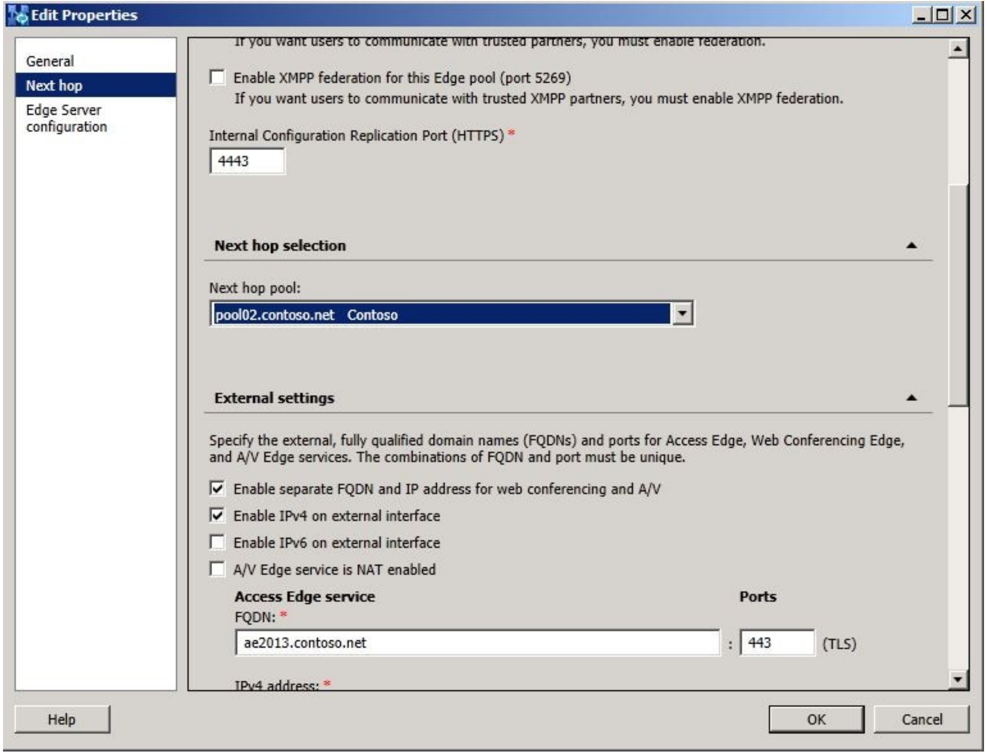
Internal server FQDN:	edge2013.contoso.net
Internal IPv4 address:	192.168.100.14
Federation (port 5061):	Enabled
XMPP federation (port 5269):	Disabled
Internal Configuration Replication Port (HTTPS)	4443

Next hop selection

⊟To update Lync Server 2013 Edge Server federation next hop

1. From Topology Builder, in the left pane, navigate to the **Lync Server 2013** node and then to the **Edge pools** node.
2. Expand the node, right-click the Edge Server listed, and then click **Edit Properties**.

3. On the **General** page, under **Next hop selection**, select from the drop-down list the Lync Server 2013 pool.



If you want users to communicate with trusted partners, you must enable federation.

☐ Enable XMPP federation for this Edge pool (port 5269)
If you want users to communicate with trusted XMPP partners, you must enable XMPP federation.

Internal Configuration Replication Port (HTTPS) *
4443

Next hop selection

Next hop pool:
pool02.contoso.net Contoso

External settings

Specify the external, fully qualified domain names (FQDNs) and ports for Access Edge, Web Conferencing Edge, and A/V Edge services. The combinations of FQDN and port must be unique.

☑ Enable separate FQDN and IP address for web conferencing and A/V
☑ Enable IPv4 on external interface
☐ Enable IPv6 on external interface
☐ A/V Edge service is NAT enabled

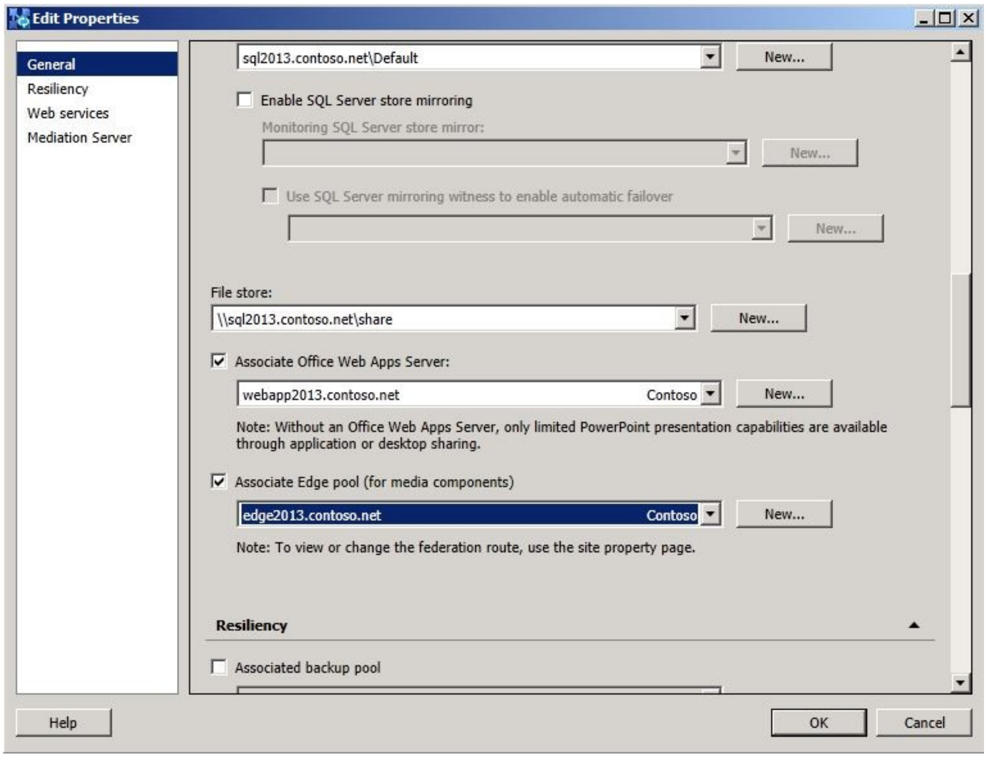
Access Edge service **Ports**
FQDN: *
ae2013.contoso.net : 443 (TLS)

IPv4 address: *

4. Click **OK** to close the Edit Properties page.
5. From **Topology Builder**, select the top node **Lync Server** .
6. From the **Action** menu, click **Publish Topology** and complete the wizard.

⊟To configure Lync Server 2013 Edge Server outbound media path

1. From Topology Builder, in the left pane, navigate to the **Lync Server 2013** node and then to the pool below **Standard Edition Front End Servers** or **Enterprise Edition Front End pools**.
2. Right-click the pool, and then click **Edit Properties**.
3. In the **Associations** section, select the **Associate Edge pool (for media components)** check box.



sql2013.contoso.net\Default

□ Enable SQL Server store mirroring

Monitoring SQL Server store mirror:

□ Use SQL Server mirroring witness to enable automatic failover

File store:
\\sql2013.contoso.net\share

☑ Associate Office Web Apps Server:
webapp2013.contoso.net Contoso

Note: Without an Office Web Apps Server, only limited PowerPoint presentation capabilities are available through application or desktop sharing.

☑ Associate Edge pool (for media components)
edge2013.contoso.net Contoso

Note: To view or change the federation route, use the site property page.

Resiliency

□ Associated backup pool

4. From the drop down box, select the Lync Server 2013 Edge Server.
5. Click **OK** to close the **Edit Properties** page.

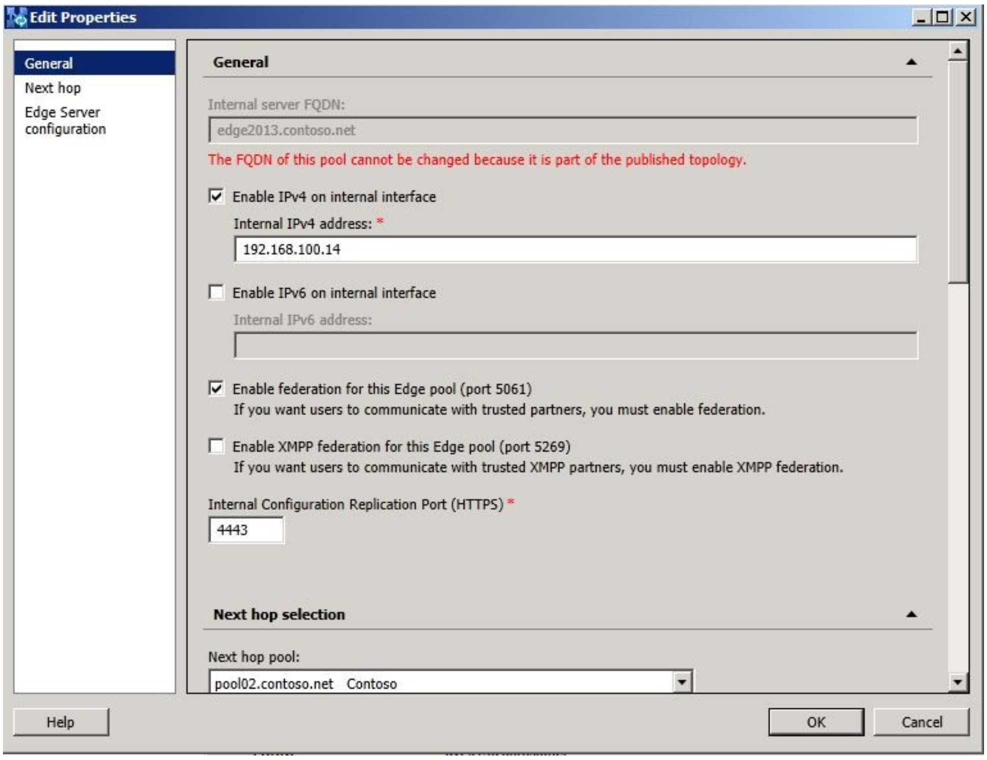
⊟To turn on Lync Server 2013 Edge Server federation

1. From Topology Builder, in the left pane, navigate to the **Lync Server 2013** node and then to the **Edge pools** node.
2. Expand the node, right-click the Edge Server listed, and then click **Edit Properties**.

Note:

Federation can only be enabled for a single Edge pool. If you have multiple Edge pools, select one to use as the federating Edge pool.

3. On the **General** page, verify the **Enable federation for this Edge pool (Port 5061)** setting is checked.



General

Internal server FQDN:

edge2013.contoso.net

The FQDN of this pool cannot be changed because it is part of the published topology.

☑ Enable IPv4 on internal interface

Internal IPv4 address: *

192.168.100.14

☐ Enable IPv6 on internal interface

Internal IPv6 address:

☑ Enable federation for this Edge pool (port 5061)

If you want users to communicate with trusted partners, you must enable federation.

☐ Enable XMPP federation for this Edge pool (port 5269)

If you want users to communicate with trusted XMPP partners, you must enable XMPP federation.

Internal Configuration Replication Port (HTTPS) *

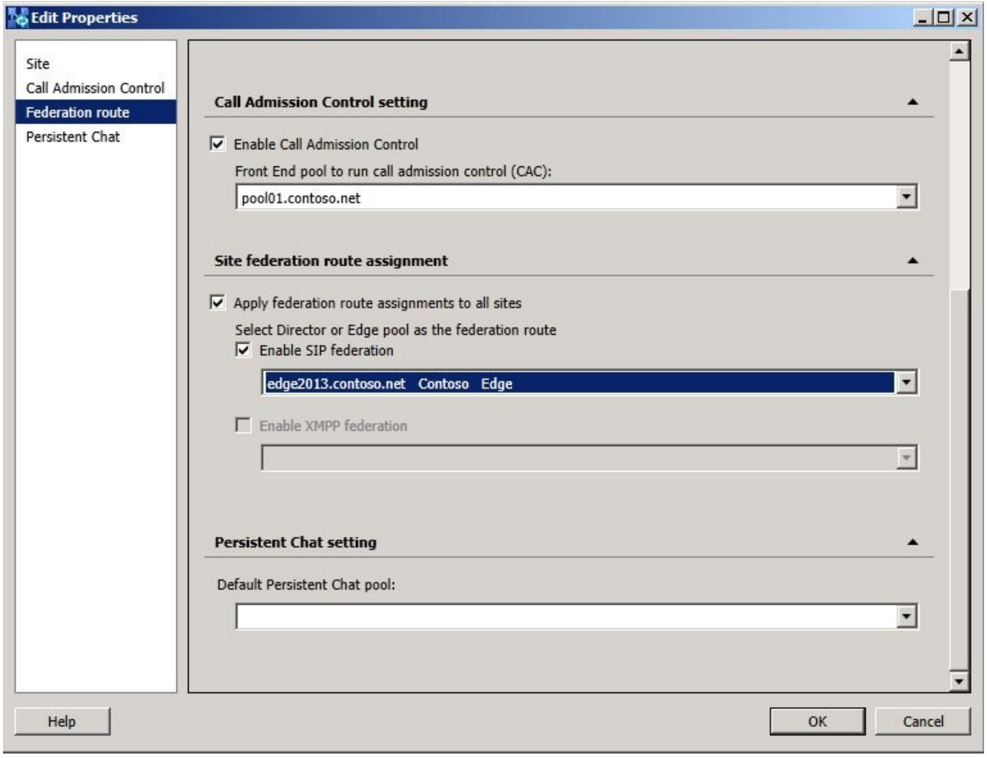
4443

Next hop selection

Next hop pool:

pool02.contoso.net Contoso

4. Click **OK** to close the Edit Properties page.
5. Next, navigate to the site node.
6. Right-click the site, and then click **Edit Properties**.
7. In the left pane, click **Federation route**.
8. Under **Site federation route assignment**, select **Enable SIP federation**, and then from the list select the Lync Server 2013 Edge Server listed.



Call Admission Control setting

☑ Enable Call Admission Control

Front End pool to run call admission control (CAC):

pool01.contoso.net

Site federation route assignment

☑ Apply federation route assignments to all sites

Select Director or Edge pool as the federation route

☑ Enable SIP federation

edge2013.contoso.net Contoso Edge

☐ Enable XMPP federation

Persistent Chat setting

Default Persistent Chat pool:

9. Click **OK** to close the **Edit Properties** page.

For multi-site deployments, complete this procedure at each site.

⊟To publish Edge Server configuration changes

1. From **Topology Builder**, select the top node **Lync Server** .
2. From the **Action** menu, select **Publish Topology** and complete the wizard.
3. Wait for Active Directory replication to occur to all pools in the deployment.

> **Note:**
>
> You may see the following message:
> **Warning: The topology contains more than one Federated Edge Server. This can occur during migration to a more recent version of the product. In that case, only one Edge Server would be actively used for federation. Verify that the external DNS SRV record points to the correct Edge Server. If you want to deploy multiple federation Edge Server to be active concurrently (that is, not a migration scenario), verify that all federated partners are using Lync Server. Verify that the external DNS SRV record lists all federation enabled Edge Servers.**
> This warning is expected and can be safely ignored.

⊟To configure Lync Server 2013 Edge Server

1. Bring all of the Lync Server 2013 Edge Servers online.
2. Update the external firewall routing rules or the hardware load balancer settings to send SIP traffic for external access (usually port 443) and federation (usually port 5061) to the Lync Server 2013 Edge Server, instead of the legacy Edge Server.

> **Note:**
>
> If you do not have a hardware load balancer, you need to update the DNS A record for federation to resolve to the new Lync Server Access Edge server. To accomplish this with minimum disruption, reduce the TLL value for the external Lync Server Access Edge FQDN so that when DNS is updated to point to the new Lync Server Access Edge, federation and remote access will be updated quickly.

3. Next, stop the **Lync Server Access Edge** from each Edge Server computer.
4. From each legacy Edge Server computer, open the **Services** applet from the **Administrative Tools**.
5. In the services list, find **Lync Server Access Edge**.
6. Right-click the services name, and then select **Stop** to stop the service.
7. Set the Startup type to **Disabled**.
8. Click **OK** to close the **Properties** window.

1.6.1.7.2 Verify Federation and Remote Access for External Users

Verify Federation and Remote Access for External Users

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 6: Move from Pilot Deployment into Production >

Topic Last Modified: *2012-09-18*

After transitioning the federation route to the Lync Server 2013 Edge Server, you should perform some functional tests to verify that federation performs as expected. Tests for external user access should include each type of external user that your organization supports, including any or all of the following.

⊟Test Connectivity of External Users and External access

- Users from at least one federated domain, an internal user on Lync Server

2013, and a user on Lync Server 2010. Test instant messaging (IM), presence, audio/video (A/V), and desktop sharing.
- Users of each public IM service provider that your organization supports (and for which provisioning has been completed) communicating with a user on Lync Server 2013 and a user on Lync Server 2010.
- Verify that anonymous users are able to join conferences.
- A user hosted on Lync Server 2010 using remote user access (logging into Lync Server 2010 from outside the intranet but without VPN) with a user on Lync Server 2013, and a user on Lync Server 2010. Test IM, presence, A/V, and desktop sharing.
- A user hosted on Lync Server 2013 using remote user access (logging into Lync Server 2013 from outside the intranet but without VPN) with a user on Lync Server 2013, and a user on Lync Server 2010. Test IM, presence, A/V, and desktop sharing.

1.6.1.7.3 Change Simple URLs after Migration

Change Simple URLs after Migration

See Also

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 6: Move from Pilot Deployment into Production >

Topic Last Modified: *2012-09-22*

Lync Server supports three simple URLs:
- **Meet** is used as the base URL for all conferences in the site or organization. With the Meet simple URL, links to join meetings are easy to comprehend, and easy to communicate and distribute.
- **Dial-in** enables access to the Dial-in Conferencing Settings webpage. The Dial-in simple URL is included in all meeting invitations so that users who want to dial in to the meeting can access the necessary phone number and PIN information.
- **Admin** enables quick access to the Lync Server Control Panel. The Admin simple URL is internal to your organization.

After migrating to Lync Server 2013, you must be aware of how the change impacts your DNS records and certificates for simple URLs. If the legacy Lync Server 2010 Director remains in use in the topology, no changes to your simple URLs are required. If the Lync Server 2010 Director is removed from the topology after migration, the simple URL DNS records must be updated to point to one of the Lync Server 2013 pools. Whenever you change a simple URL name, however, you must run Enable-CsComputer on each Director and Front End Server to register the change.

Changing Simple URLs after Migration

To update the Meet simple URL

1. In Topology Builder, right-click the top node **Lync Server**, and then click **Edit Properties**.
2. Select **Simple URLs** in the left pane, then below **Meeting URLs:** select the Meet URL and then click **Edit URL**.
3. Update the URL to the value you want, and then click **OK** to save the edited URL.

To update the Admin simple URL

1. In Topology Builder, right-click the top node **Lync Server**, and then click **Edit Properties**.
2. Select **Simple URLs** in the left pane, then below **Administrative access URL** box, enter the simple URL you want for administrative access to Lync Server

2013 Control Panel, and then click **OK**.

Tip:

We recommend using the simplest possible URL for the Admin URL. The simplest option is **https://admin.**<*domain*>.

Planning for Simple URLs

1.6.1.7.4 Move Remaining Users to Lync Server 2013

Move Remaining Users to Lync Server 2013

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 6: Move from Pilot Deployment into Production >

Topic Last Modified: *2012-09-29*

You can move users to the new Lync Server 2013 deployment by using either Lync Server Control Panel or Lync Server Management Shell. You must meet some requirements to ensure a smooth transition to Lync Server 2013. For details about prerequisites to completing the procedures in this topic, see Configure Clients for Migration. For detailed steps about moving users, see Phase 4: Move test users to the Pilot Pool.

Important:

You cannot use the Active Directory Users and Computers snap-in or the Lync Server 2010 administrative tools to move users from your legacy environment to Lync Server 2013.

When you move a user to an Lync Server 2013 pool, the data for the user is moved to the back-end database that is associated with the new pool.

Important:

This includes the active meetings created by the legacy user. For example, if a legacy user has configured a **my meeting** conference, that conference will still be available in the new Lync Server 2013 pool after the user has been moved. The details to access that meeting will still be the same **conference URL and conference ID**. The only difference is that the conference is now hosted in the Lync Server 2013 pool, and not in the Lync Server 2010 pool.

Note:

Homing users on Lync Server 2013 does not require that you deploy upgraded clients at the same time. New functionality will be available to users only when they have upgraded to the new client software.

Post Migration Task

1. After you move users, verify the conferencing policy that is assigned to them.
2. To ensure that meetings organized by users homed on Lync Server 2013 work seamlessly with federated users who are homed on Lync Server 2010, the conferencing policy assigned to the migrated users should allow anonymous participants.
3. Conferencing policies that allow anonymous participants have **Allow participants to invite anonymous users** selected in Lync Server 2013 Control Panel and have **AllowAnonymousParticipantsInMeetings** set to **True** in the output from the **Get-CsConferencingPolicy** cmdlet in the Lync Server Management Shell.
4. For details about configuring conferencing policy by using Lync Server

Management Shell, see Set-CsConferencingPolicy in the Lync Server Management Shell documentation.

1.6.1.7.5 Configure XMPP Gateway on Lync Server 2013

Configure XMPP Gateway on Lync Server 2013

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 6: Move from Pilot Deployment into Production >

Topic Last Modified: *2012-10-19*

The final steps for migrating your XMPP Gateway are to configure certificates for the Lync Server 2013 Edge Server, deploy the Lync Server 2013 XMPP Gateway, and update the DNS records for the XMPP Gateway. These steps should be performed in parallel to minimize the down time of your XMPP Gateway. All users must be moved to your Microsoft Lync Server 2013 deployment before performing these steps.

⊟Configure XMPP Gateway Certificates on the Lync Server 2013 Edge Server

1. On the Edge Server, in the Deployment Wizard, next to **Step 3: Request, Install, or Assign Certificates**, click **Run again**.

   Tip:

   If you are deploying the Edge Server for the first time, you will see Run instead of Run Again.

2. On the **Available Certificate Tasks** page, click **Create a new certificate request**.
3. On the **Certificate Request** page, click **External Edge Certificate**.
4. On the **Delayed or Immediate Request** page, select the **Prepare the request now, but send it later** check box.
5. On the **Certificate Request File** page, type the full path and file name of the file to which the request is to be saved (for example, c:\cert_exernal_edge.cer).
6. On the **Specify Alternate Certificate Template** page, to use a template other than the default WebServer template, select the **Use alternative certificate template for the selected certification authority** check box.
7. On the **Name and Security Settings** page, do the following:
   7.a. In **Friendly name**, type a display name for the certificate.
   7.b. In **Bit length**, specify the bit length (typically, the default of 2048).
   7.c. Verify that the **Mark certificate private key as exportable** check box is selected.
8. On the **Organization Information** page, type the name for the organization and the organizational unit (for example, a division or department).
9. On the **Geographical Information** page, specify the location information.
10. On the **Subject Name/Subject Alternate Names** page, the information to be automatically populated by the wizard is displayed. If additional subject alternative names are needed, you specify them in the next two steps.
11. On the **SIP Domain Setting on Subject Alternate Names (SANs)** page, select the domain check box to add a sip.<sipdomain> entry to the subject alternative names list.
12. On the **Configure Additional Subject Alternate Names** page, specify any additional subject alternative names that are required.

    Tip:

    If the XMPP proxy is installed, by default the domain name (such as contoso.com) is populated in the SAN entries. If you require more entries, add them in this step.

13. On the **Request Summary** page, review the certificate information to be

used to generate the request.

14. After the commands finish running, you can **View Log**, or click Next to continue.
15. On the **Certificate Request File** page, you can view the generated certificate signing request (CSR) file by clicking **View** or exit the Certificate Wizard by clicking **Finish**.
16. Copy the request file and submit to your public certification authority.
17. After receiving, importing and assigning the public certificate, you must stop and restart the Edge Server services. You do this by typing in the Lync Server Management console:

```
Stop-CsWindowsService
```

```
Start-CsWindowsService
```

Configure a new Lync Server 2013 XMPP Gateway

1. Open Lync Server Control Panel.
2. In the left navigation bar, click **Federation and External Access** and then click **XMPP Federated Partners**.
3. To create a new configuration, click **New**.
4. Define the following settings:
5. **Primary domain** (Required). The primary domain is the base domain of the XMPP partner. For example, you would enter **fabrikam.com** for the XMPP partner domain name. This is a required entry.
6. **Description** The description is for notes or other identifying information for this particular configuration. This entry is optional.
7. **Additional domains** Additional domains are domains that are a part of your XMPP partner's domain that should be included as part of the allowed XMPP communication. For example, if the primary domain is **fabrikam.com**, then you would list all other domains that are under fabrikam.com that you will communicate with by way of XMPP.
8. **Partner type** The **Partner type** is a required setting. You must choose one of the following to describe and enforce what contacts can be added. You can select from:
   - **Federated** A **Federated** partner type represents a high level of trust between the Lync Server deployment and the XMPP partner. This partner type is recommended for federating with XMPP servers within the same enterprise or where there is an established business relationship. XMPP contacts in Federated partners can:

     8..a.Add Lync contacts and view their presence without express authorization from the Lync user.

     8..b.Send instant messages to Lync contacts whether or not the Lync user has added them into their contact list.

     8..c.See a Lync user's status notes.
   - **Public verified** A **Public verified** partner is a public XMPP provider that is trusted to verify the identity of its users. XMPP contacts in Public Verified networks can add Lync contacts and view their presence and send instant messages to them without express authorization from the Lync users. XMPP contacts in public verified networks never see a Lync users' status notes. This setting is not recommended.
   - **Public unverified** A **Public unverified** partner is a public XMPP provider that is not trusted to verify the identity of its users. XMPP users on Public Unverified networks cannot communicate with Lync users unless the Lync user has expressly authorized them by adding them to the contact list. XMPP users on public unverified networks never see Lync users' status notes. This setting is recommended for any federation with public XMPP providers such as Google Talk.
9. **Connection Type:** Defines the various rules and dialback settings.
   - **TLS Negotiation** Defines the TLS negotiation rules. An XMPP service can require TLS, can make TLS optional, or you define that TLS is not

supported. Choosing Optional leaves the requirement up to the XMPP service for a mandatory-to-negotiate decision. To view all possible settings and details for SASL, TLS and Dialback negotiation –including not valid and known error configurations - see Negotiation Settings for XMPP Federated Partners.

9..a.**Required** The XMPP service requires TLS negotiation.
9..b.**Optional** The XMPP service indicates that TLS is mandatory-to-negotiate.
9..c.**Not Supported** The XMPP service does not support TLS.

- **SASL negotiation** Defines the SASL negotiation rules. An XMPP service can require SASL, can make SASL optional, or you define that SASL is not supported. Choosing Optional leaves the requirement up to the partner XMPP service for a mandatory-to-negotiate decision.

  9..a.**Required** The XMPP service requires SASL negotiation.
  9..b.**Optional** The XMPP service indicates that SASL is mandatory-to-negotiate.
  9..c.**Not Supported** The XMPP service does not support SASL.

- **Support server dialback negotiation** The support server dialback negotiation process uses the domain name system (DNS) and an authoritative server to verify that the request came from a valid XMPP partner. To do this, the originating server creates a message of a specific type with a generated dialback key and looks up the receiving server in DNS. The originating server sends the key in an XML stream to the resulting DNS lookup, presumably the receiving server. On receipt of the key over the XML stream, the receiving server does not respond to the originating server, but sends the key to a known authoritative server. The authoritative server verifies that the key is either valid or not valid. If not valid, the receiving server does not respond to the originating server. If the key is valid, the receiving server informs the originating server that the identity and key is valid and the conversation can commence.

  There are two valid states for **Dialback negotiation**:

  9..a.**True** The XMPP server is configured to use Dialback negotiation if a request should be received from an originating server.
  9..b.**False** The XMPP server is not configured to use Dialback negotiation and if a request should be received from an originating server, it will be ignored.

10.Click **Commit** to save your changes to the site or user policy.

⊟Update DNS Records for Lync Server 2013 XMPP Gateway

1.To configure DNS for XMPP federation, you add the following SRV record to your external DNS:_xmpp-server._tcp.<domain name> The SRV record will resolve to the Access Edge FQDN of the Edge server, with a port value of 5269.

1.6.1.8 Phase 7: Complete Post-Migration Tasks

Phase 7: Complete Post-Migration Tasks

Microsoft Lync Server 2013 > Migration > Migration from Lync Server 2010 to Lync Server 2013 >

Topic Last Modified: *2012-10-19*

The topics in this section describe tasks that you will need to perform after you have completed your migration to Lync Server 2013.

In This Section

1.6.1.8.1 Migrate Existing Meetings and Meeting Content

Migrate Existing Meetings and Meeting Content

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2013-02-22*

When a user account is moved from Lync Server 2010 to a Lync Server 2013 server, the following information is moved with that user account:

- **Meetings already scheduled by the user**. This includes moving the conferencing directories and conferencing data.
- **User's personal identification number (PIN)**. The user's current PIN continues to work until it expires or the user requests a new PIN.

The following user account information does not move to the new server.

- **Meeting content**. In order to move the content shared during a meeting, for example PowerPoint, Whiteboard, attachments or poll data, use the **-MoveConferenceData** parameter as part of the **Move-CsUser** cmdlet.

1.6.1.8.2 Migrate Dial-In Access Numbers

Migrate Dial-In Access Numbers

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-19*

Migrating dial-in access numbers from Lync Server 2010 to Lync Server 2013 requires running the **Move-CsApplicationEndpoint** cmdlet to migrate the contact objects. During the Lync Server 2010 and Lync Server 2013 coexistence period, dial-in access numbers that you created in Lync Server 2013 behave similarly to the dial-in access numbers that you create in Lync Server 2010, as described in this section.

Dial-in access numbers that you created in Lync Server 2010 but moved to Lync Server 2013 or that you created in Lync Server 2013 before, during or after migration have the following characteristics:

- Do not appear on Office Communications Server 2007 R2 meeting invitations and the dial-in access number page.

- Appear on Lync Server 2010 meeting invitations and the dial-in access number page.
- Appear on Lync Server 2013 meeting invitations and the dial-in access number page.
- Cannot be viewed or modified in the Office Communications Server 2007 R2 administrative tool.
- Can be viewed and modified in the Lync Server 2010 Control Panel and in Lync Server 2010 Management Shell.
- Can be viewed and modified in the Lync Server 2013 Control Panel and in Lync Server 2013 Management Shell.
- Can be re-sequenced within the region by using the Set-CsDialinConferencingAccessNumber cmdlet with the Priority parameter.

You must finish migrating dial-in access numbers that point to a Lync Server 2010 pool before you decommission the Lync Server 2010 pool. If you do not complete dial-in access number migration as described in the following procedure, incoming calls to the access numbers will fail.

Important:

You must perform this procedure prior to decommissioning the Lync Server 2010 pool.

Note:

We recommend that you move dial-in access numbers when network usage is low, in case there is a short period of service outage.

To identify and move dial-in access numbers

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. To move each dial-in access number to a pool hosted on Lync Server 2013, from the command line run:

```
Move-CsApplicationEndpoint -Identity <SIP URI of the access number to
```

3. Open Lync Server Control Panel.
4. In the left navigation bar, click **Conferencing**.
5. Click the **Dial-in Access Number** tab.
6. Verify that no dial-in access numbers remain for the Lync Server 2010 pool from which you are migrating.

Note:

When all dial-in access numbers point to the Lync Server 2013 pool, you can then decommission the Lync Server 2010 pool.

Verify the dial-in access number migration using Lync Server Control Panel

1. From a user account that is assigned to the **CsUserAdministrator** role or the **CsAdministrator** role, log on to any computer in your internal deployment.
2. Open Lync Server Control Panel.
3. In the left navigation bar, click **Conferencing**.
4. Click the **Dial-in Access Number** tab.
5. Verify all the dial-in access number are migrated to the pool hosted on Lync Server 2013.

Verify the dial-in access number migration using Lync Server Management Shell

1. Open Lync Server Management Shell.
2. To return all the dial-in conferencing access numbers migrated, from the command line run:

```
Get-CsDialInConferencingAccessNumber -Filter {Pool -eq "<FQDN of the p
```

3. Verify all the dial-in access numbers are migrated to the pool hosted on Lync Server 2013.

1.6.1.8.3 Migrate Call Park Application Settings

Migrate Call Park Application Settings

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-19*

The migration of the Call Park application from Lync Server 2010 to Lync Server 2013 includes provisioning the Lync Server 2013 pool with any custom music on hold files that have been uploaded in Lync Server 2010, restoring the service level settings and retargeting all Call Park orbits to the Lync Server 2013 pool. If customized music-on-hold files have been configured in the Lync Server 2010 pool, these files need to be copied to the new Lync Server 2013 pool. Additionally, it is recommended that you back up any Call Park customized music-on-hold files from Lync Server 2010 to another destination to keep a separate backup copy of any customized music-on-hold files that have been uploaded for Call Park. The customized music-on-hold files for the Call Park application are stored in the file store of the pool. To copy the audio files from a Lync Server 2010 pool file store to a Lync Server 2013 file store, use the **Xcopy** command with the following parameters:

```
Xcopy <Source: Lync Server 2010 Pool CPS File Store Path> <Destination: Lync Serv
```

```
Example usage:  Xcopy "<Lync Server 2010 File Store Path>\OcsFileStore\coX-Applic
```

When all customized audio files have been copied to the Lync Server 2013 file store, the Call Park application settings of the Lync Server 2013 pool must be configured, and the Call Park orbit ranges that are associated with the Lync Server 2010 pool must be reassigned to the Lync Server 2013 pool.

The Call Park application settings include the pickup timeout threshold, enabling or disabling music on hold, the maximum call pickup attempts and the timeout request. You must manage Call Park application settings by using the Lync Server Management Shell to run the **Set-CsCpsConfiguration** cmdlet. You cannot manage the Call Park application settings using the Lync Server Control Panel.

Reconfigure the Call Park Service Settings

1. From the Lync Server 2013 Front End Server, open the Lync Server Management Shell.
2. At the command line, type the following:

   Note:

   If your Lync Server 2013 Call Park application settings are identical to the legacy Lync Server 2010 settings, you can skip running this step. If Call Park application settings are different for the Lync Server 2013 and Lync Server 2010 environments, use the cmdlet below as a template to update those changes.

   ```
   Set-CsCpsConfiguration -Identity "<LS2013 Call Park Service ID>" -Call
   ```

To reassign all Call Park orbit ranges from Lync Server 2010 pool to the Lync Server 2013 pool, you can use either the Lync Server Control Panel or the Lync Server Management Shell.

Reassign all Call Park Orbit Ranges using Lync Server Control Panel

1. Open Lync Server Control Panel.
2. In the left pane, select **Voice Features**.
3. Select the **Call Park** tab.
4. For each Call Park orbit range assigned to a Lync Server 2010 pool, edit the **FQDN of destination server** setting and select the Lync Server 2013 pool that will process the Call Park requests.

5. Select **Commit** to save the changes.

Reassign all Call Park Orbit Ranges using Lync Server Management Shell

1. Open Lync Server Management Shell.
2. At the command line, type the following:

   ```
   Get-CsCallParkOrbit
   ```

   This cmdlet lists all of the Call Park orbit ranges in the deployment. All Call Park orbits that have the **CallParkServiceId** and **CallParkServerFqdn** parameters set as the Lync Server 2010 pool must be reassigned.

   To reassign the Lync Server 2010 Call Park orbit ranges to the Lync Server 2013 pool, at the command line, type the following:

   ```
   Set-CsCallParkOrbit -Identity "<Call Park Orbit Identity>" -CallParkSe
   ```

After reassigning all Call Park orbit ranges to the the Lync Server 2013 pool, the migration process for the Call Park application will be completed and the Lync Server 2013 pool will handle all future Call Park requests.

1.6.1.8.4 Migrate Response Groups

Migrate Response Groups

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

***Topic Last Modified:** 2012-10-19*

After your users are moved to Lync Server 2013 pools, you can migrate your response groups. Migrating response groups includes copying agent groups, queues, workflows, audio files, and moving Response Group contact objects from the legacy deployment to the Lync Server 2013 pool. After you migrate your legacy response groups, calls to the response groups are handled by the Response Group application in the Lync Server 2013 pool. Calls to response groups are no longer handled by the legacy pool.

Note:

Although you can migrate response groups before you move all users to the Lync Server 2013 pool, we recommend that you move all users first. In particular, users who are response group agents will not have full functionality of new features until they are moved to the Lync Server 2013 pool.

Before you migrate response groups, you must have deployed a Lync Server 2013 pool that includes the Response Group application. The Response Group application is installed and activated by default when you deploy Enterprise Voice. You can ensure that the Response Group application is installed by running the **Get-CsService–ApplicationServer** cmdlet.

Note:

You can create new Lync Server 2013 response groups in the Lync Server 2013 pool before you migrate your legacy response groups.

To migrate response groups from a legacy pool to the Lync Server 2013, you run the **Move-CsRgsConfiguration** cmdlet.

Important:

The Response Group migration cmdlet moves the Response Group configuration for the entire pool. You cannot select specific groups, queues, or workflows to migrate.

After you migrate the response groups, you need to use Lync Server Control Panel or Lync Server Management Shell cmdlets to verify that all agent groups, queues, and workflows moved successfully.

When you migrate response groups, the Lync Server 2010 response groups are not removed. When you manage response groups after migration by using either Lync Server Control Panel or Lync Server Management Shell, you can see both the Lync Server 2010 response groups and the Lync Server 2013 response groups. You should apply updates only to the Lync Server 2013 response groups. The Lync Server 2010 response groups are retained only for rollback purposes.

Caution:

Do not remove Lync Server 2010 response groups. If you remove a Lync Server 2010 response group, the response groups in Lync Server 2013 stop working.

Important:

We recommend that you do not remove any data from your previous deployment until you decommission the pool. In addition, we strongly recommend that you export response groups immediately after you migrate. If a Lync Server 2010 response group should get removed, you can then restore your response groups from the backup to get Lync Server 2013 response groups running again.

Lync Server 2013 introduces a new Response Group feature called **Workflow Type**. **Workflow Type** can be **Managed** or **Unmanaged**. All response groups are migrated with **Workflow Type** set to **Unmanaged** and with an empty Manager list.

When you run the **Move-CsRgsConfiguration** cmdlet, the agent groups, queues, workflows, and audio files remain in the legacy pool for rollback purposes. If you do need to roll back to the legacy pool, however, you need to run the **Move-CsApplicationEndpoint** cmdlet to move contact objects back to the legacy pool.

The following procedure for migrating Response Group configurations assumes that you have a one-to-one relationship between your legacy pools and the Lync Server 2013 pools. If you plan to consolidate or split up pools during your migration and deployment, you need to plan which legacy pool maps to which Lync Server 2013 pool.

To migrate Response Group configurations

1. Log on to the computer with an account that is a member of the RTCUniversalServerAdmins group or has equivalent administrator rights and permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Run:

   ```
   Move-CsRgsConfiguration -Source <source pool FQDN> -Destination <desti
   ```

   For example:

   ```
   Move-CsRgsConfiguration -Source lync-old.contoso.net -Destination lync
   ```

4. After you migrate response groups and agents to the Lync Server 2013 pool, the URL that agents use to sign in and sign out is a Lync Server 2013 URL and is available from the **Tools** menu. Remind agents to update any references, such as bookmarks, to the new URL.

To verify Response Group migration by using Lync Server Control Panel

1. Log on to the computer with an account that is a member of RTCUniversalReadOnlyAdmins group or is minimally a member of the CsViewOnlyAdministrator role.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation pane, click **Response Groups**.

4. On the **Workflow** tab, verify that all the workflows in your Lync Server 2010 environment are included in the list.
5. Click the **Queue** tab, and verify that all the queues in your Lync Server 2010 environment are included in the list.
6. Click the **Group** tab, and verify that all the agent groups in your Lync Server 2010 environment are included in the list.

To verify Response Group migration by using Lync Server Management Shell

1. Log on to the computer with an account that is a member of RTCUniversalReadOnlyAdmins group or is minimally a member of the CsViewOnlyAdministrator role.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.

   For details about the following cmdlets, run:

   ```
   Get-Help <cmdlet name> -Detailed
   ```
3. Run:

   ```
   Get-CsRgsAgentGroup
   ```
4. Verify that all the agent groups in your Lync Server 2010 environment are included in the list.
5. Run:

   ```
   Get-CsRgsQueue
   ```
6. Verify that all the queues in your Lync Server 2010 environment are included in the list.
7. Run:

   ```
   Get-CsRgsWorkflow
   ```
8. Verify that all the workflows in your Lync Server 2010 environment are included in the list.

1.6.1.8.5 Migrate Address Book

Migrate Address Book

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-09*

In general, the Lync Server 2010 Address Book is migrated along with the rest of your topology. However, you might need to perform some post-migration steps if you customized the following in your Lync Server 2010 environment:

- Set the **PartitionbyOU** WMI property to group Address Book entries by organizational unit (OU).
- Customized the Address Book normalization rules.
- Changed the default value for the **UseNormalizationRules** parameter to False.

Grouped Address Book Entries

If you set the **PartitionbyOU** WMI property to True to create address books for each OU, you need to set the **msRTCSIP-GroupingId** Active Directory attribute on users and contacts if you want to continue grouping address book entries. You might want to group address book entries to limit the scope of Address Book searches. To use the **msRTCSIP-GroupingId** attribute, write a script to populate the attribute, assigning the same value for all of the users that you want to group together. For example, assign a single value for all the users in an OU.

Address Book Normalization Rules

If you customized Address Book normalization rules in your Lync Server 2010 environment, you must migrate the customized rules to your pilot pool. If you did not customize Address Book normalization rules, you have nothing to migrate for Address Book service. The default normalization rules for Lync Server 2013 are the same as the default rules for Lync Server 2010. Follow the procedure later in this section to migrate customized normalization rules.

> **Note:**
>
> If your organization uses remote call control and you customized Address Book normalization rules, you must perform the procedure in this topic before you can use remote call control. The procedure requires membership in the RTCUniversalServerAdmins group or equivalent rights.

UseNormalizationRules Set to False

If you set the value for **UseNormalizationRules** to False so that users can use phone numbers as they are defined in Active Directory Domain Services (AD DS) without having Lync Server 2013 apply normalization rules, you need to set the **UseNormalizationRules** and **IgnoreGenericRules** parameters to True. Follow the procedure later in this section to set these parameters to True.

To migrate Address Book customized normalization rules

1. Find the Company_Phone_Number_Normalization_Rules.txt file in the root of the Address Book shared folder, and copy it to the root of the Address Book shared folder in your Lync Server 2013 pilot pool.

   > **Note:**
   >
   > The sample Address Book normalization rules have been installed in your ABS Web component file directory. The path is **$installedDriveLetter:\Program Files\Microsoft Lync Server 2013\Web Components\Address Book Files\Files\ Sample_Company_Phone_Number_Normalization_Rules.txt,**. This file can be copied and renamed as **Company_Phone_Number_Normalization_Rules.txt** to the address book shared folder’s root directory. For example, the address book shared in **$serverX**, the path will be similar to: **\\$serverX \LyncFileShare\2-WebServices-1\ABFiles**.

2. Use a text editor, such as Notepad, to open the Company_Phone_Number_Normalization_Rules.txt file.
3. Certain types of entries will not work correctly in Lync Server 2013. Look through the file for the types of entries described in this step, edit them as necessary, and save the changes to the Address Book shared folder in your pilot pool.

   Strings that include required whitespace or punctuation cause normalization rules to fail because these characters are stripped out of the string that is input to the normalization rules. If you have strings that include required whitespace or punctuation, you need to modify the strings. For example, the following string would cause the normalization rule to fail:

   ```
   \s*\(\s*\d\d\d\s*\)\s*\-\s*\d\d\d\s*\-\s*\d\d\d\d
   ```

   The following string would not cause the normalization rule to fail:

   ```
   \s*\(?\s*\d\d\d\s*\)?\s*\-?\s*\d\d\d\s*\-?\s*\d\d\d\d
   ```

To set UseNormalizationRules and IgnoreGenericRules to true

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management**

Shell.

2. Do one of the following:
   - If your deployment includes only Lync Server 2013, run the following cmdlet at the global level to change the values for **UseNormalizationRules** and **IgnoreGenericRules** to True:

     ```
     Set-CsAddressBookConfiguration -identity <XdsIdentity> -UseN
     ```

   - If your deployment includes a combination of Lync Server 2013 and Lync Server 2010 or Office Communications Server 2007 R2, run the following cmdlet and assign it to each Lync Server 2013 pool in the topology:

     ```
     New-CsAddressBookConfiguration -identity <XdsIdentity> -UseN
     ```

3. Wait for Central Management store replication to occur on all pools.
4. Modify the phone normalization rules file, "Company_Phone_Number_Normalization_Rules.txt", for your deployment to clear the content. The file is on the file share of each Lync Server 2013 pool. If the file is not present, then create an empty file named "Company_Phone_Number_Normalization_Rules.txt".
5. Wait several minutes for all Front End pools to read the new files.
6. Run the following cmdlet on each Lync Server 2013 pool in your deployment:

   ```

   Update-CsAddressBook
   ```

1.6.1.8.6 Configure the Meeting Join Page

Configure the Meeting Join Page

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-12-14*

When a user clicks a meeting link in a meeting request, the meeting join page detects whether a Lync 2013 client is already installed on the user’s computer. If a client is already installed, that client opens and joins the meeting. If a client is not installed, by default the 2013 version of Lync Web App opens.

You can modify the behavior of the meeting join page if you want to allow users to join meetings with Office Communicator 2007 R2 or Lync 2010 Attendant. These configuration options have been removed from the Lync Server 2013 Control Panel, but you configure them by using the CsWebServiceConfiguration cmdlet.

Meeting Join Page CsWebServiceConfiguration Parameters

CsWebServiceConfiguration Parameter	Description
ShowJoinUsingLegacyClientLink	If set to True, users joining a meeting by using a client application other than Lync will be given the opportunity to join the meeting by using Office Communicator 2007 R2. The default value is False.
ShowAlternateJoinOptionsExpanded	When set to True then alternate options for joining an online conference (such as Office Communicator 2007 R2) will automatically be expanded and shown to users. When set to False (the default value) these options will be available, but the user will have to display the list of options for themselves.

To configure the meeting join page by using Lync Server 2013 Management Shell

1. Start the Lync Server 2013 Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Run the following cmdlet:

   ```
   Get-CsWebServiceConfiguration
   ```

   This cmdlet returns the web service configuration settings.
3. Run the following command, with the parameters set to True or False, depending on your preference (for details about the parameters for this cmdlet, see the Lync Server 2013 Management Shell documentation):

   ```
   Set-CsWebServiceConfiguration -Identity global -ShowJoinUsingLegacyCli
   ```

1.6.1.8.7 Remove Legacy Archiving and Monitoring Servers

Remove Legacy Archiving and Monitoring Servers

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-19*

If your legacy deployment contained an Archiving Server or a Monitoring Server, after migrating to Lync Server 2013, those servers can be removed from the legacy environment provided all users have been removed from any remaining legacy pools. You can remove the Archiving Server or Monitoring Server in any sequence. The key requirement is that all users have been removed from any remaining legacy pools.

You can move users from Lync Server 2010 to Lync Server 2013 by following the procedures outlined in Phase 4: Move test users to the Pilot Pool.

After you have confirmed that all users have been removed from any remaining pools, follow the procedure in "Uninstalling Microsoft Lync Server 2010 and Removing Server Roles," which can be downloaded at http://go.microsoft.com/fwlink/p/?linkId=246227.

1.6.1.8.8 Configure Trusted Application Servers

Configure Trusted Application Servers

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-11*

In a mixed environment, if you create a new trusted application server, you must set the next hop pool to be a Lync Server 2013 pool. In a mixed environment, both the legacy Lync Server 2010 pool and the Lync Server 2013 pool appear in the drop down list. Selecting the legacy pool is not supported.

Select Lync Server 2013 as next hop when creating a Trusted application server

1. Open Topology Builder.
2. In the left pane, right click **Trusted application servers** and click **New Trusted Application Pool**.
3. Enter the **Pool FQDN** of the trusted application pool and select whether it will be a single-server or multiple-server.
4. Click **Next**.
5. On the **Select the next hop** page, from the list, select the Lync Server 2013 Front End pool.
6. Click **Finish**.
7. Select the top node **Lync Server** and from the **Action** menu, select **Publish**.
   Verify the **Trusted Application Pool** has been created successfully and is associated with the correct Front End pool.

1.6.1.8.9 Deploy Lync Server 2013 Clients

Deploy Lync Server 2013 Clients

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-09-08*

For details, see Deploying Clients and Devices in the Deployment documentation.

1.6.1.8.10 Connect a Survivable Branch Appliance

Connect a Survivable Branch Appliance

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-19*

Every Survivable Branch Appliance (SBA) is associated with a Front End pool which serves as a backup registrar for the SBA. When the Front End pool is migrated to Lync Server 2013, the SBA must be disassociated from the Lync Server 2010 Front End pool while the pool is upgraded, Once the pool has been migrated to Lync Server 2013, the SBA can be re-associated with the upgraded Front End pool. This involves deleting the SBA from the legacy Lync Server 2010 topology in Topology Builder and then adding the SBA to the Lync Server 2013 topology. Users homed on the legacy Lync Server 2010 SBA must first be moved to another Front End pool before removing the SBA from the topology. Once the SBA is added to the Lync Server 2013 topology, those users can then be moved back to the SBA. These steps are summarized below:

1. Move branch users homed on the legacy SBA Lync Server 2010 to another Front End pool.
2. Remove SBA from the legacy Lync Server 2010 topology to disconnect the existing Front End pool as a backup registrar.
3. Add SBA to the Lync Server 2013 topology and configure this new Front End pool as the backup registrar.
4. Move the branch users to the new Lync Server 2013 SBA.

Add Lync Server 2010 SBA Branch Site to Your Topology

1. Open **Topology Builder**.
2. In the left pane right-click **Branch sites**, and then click **New Branch Site**.
3. In the **Define New Branch Site** dialog box, click **Name**, and then type the name of the branch site.
4. (Optional) Click **Description**, and then type a meaningful description for the branch site.
5. Click **Next**.

6.(Optional) In the next **Define New Branch Site** dialog box, do any of the following:
6.a.Click **City**, and then type the name of the city in which the branch site is located.
6.b.Click **State/Region**, and then type the name of the state or region in which the branch site is located.
6.c.Click **Country Code**, and then type the two-digit calling code for the country/region in which the branch site is located.
7.Click **Next**, and then do one of the following:
7.a.If you are using a Lync 2010 Survivable Branch Appliance or Server at this site, be sure to uncheck the **Open the New Survivable Wizard when this wizard closes** option. Click **Finish**.
8.To associate the legacy Lync Server 2010 SBA to the Lync Server 2013 Front End pool:
8.a.Expand the branch site that has been created.
8.b.Right click on **Lync Server 2010** and then click **New**.
8.c.Click **Survivable Branch Appliance…**
9.Follow the directions in the wizard that opens. For information about wizard items, see Define a Survivable Branch Appliance or Server.

> **Note:**
> A Lync Server 2010 Survivable Branch Appliance can only be associated with a Lync Server 2010 Monitoring Store.

10.If you are not using a Survivable Branch Appliance or Server at this site, clear the **Open the New Survivable Wizard when this wizard closes** check box, and then click **Finish**.
11.Repeat the previous steps for each branch site you want to add to the topology.

1.6.1.8.11 Configure SCOM Monitoring

Configure SCOM Monitoring

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-04*

After migrating to Microsoft Lync Server 2013, you must complete a few tasks to configure Lync Server 2013 to work with System Center Operations Manager.

- Apply Lync Server 2010 updates to a server elected to manage the central discovery logic.
- Update the central discovery candidate server registry key.
- Configure your primary System Center Operations Manager management server to override the candidate central discovery node.

Instructions for carrying out each of these tasks are provided below.

Apply Lync Server 2010 updates to a server elected to manage the central discovery logic.
1.Elect a server that has the System Center Operations Manager agent files installed and is configured as a candidate discovery node.
2.Apply Lync Server 2010 updates to this server. See the topic Apply Lync Server 2010 Updates.
Update the central discovery candidate server registry key.
1.On the server elected to manage the central discovery logic, open a Windows PowerShell command window.
2.At the command line, type the following:

```
New-Item -Path "HKLM:\Software\Microsoft\Real-Time Communications\Heal
```

```
New-Item -Path "HKLM:\Software\Microsoft\Real-Time Communications\Heal
```

Note:
Whenever you edit the registry, you may experience an error that the command failed if the registry key already exists. If you experience this, you can safely ignore the error.

Configure your primary System Center Operations Manager management server to override the candidate central discovery watcher node.

1. On a computer where the System Center Operations Manager console has been installed, expand **Management Pack Objects** and then select **Object Discoveries**.
2. Click **Change Scope...**
3. From the **Scope Management Pack Objects** page, select **LS Discovery Candidate**.
4. Override the **LS Discovery Candidate Effective Value** to the name of the candidate server elected in the earlier procedure.

Lastly, to finalize your changes, restart the health service on the System Center Operations Manager Root Management Server.

1.6.1.8.12 Migrate Common Area Phones

Migrate Common Area Phones

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-09-29*

Common Area Phones are IP phones that most often reside in a shared workspace or common area, like a lobby, kitchen, or factory floor. Common Area Phones do not need to be connected to a computer to provide Lync Server UC functionality. After migrating an Lync Server 2010 deployment to Lync Server 2013, you must also migrate the contact objects associated with the legacy Common Area Phone. Using Lync Server Management Shell you will first retrieve all contact objects associated with the Lync Server 2010 Common Area Phones, and then move those objects to the Lync Server 2013 pool.

Migrate Common Area Phones

1. From the Lync Server 2013 Front End server, open Lync Server Management Shell.
2. From the command line, type the following:

```
Get-CsCommonAreaPhone -Filter {RegistrarPool -eq "pool01.contoso.net"}
```

3. To verify all contact objects have been moved to the Lync Server 2013 pool, from the Lync Server Management Shell type the following:

```
Get-CsCommonAreaPhone -Filter {RegistrarPool -eq "pool02.contoso.net"}
```

   Verify all contact objects are now associated with the Lync Server 2013 pool.

1.6.1.8.13 Migrate Analog Devices

Migrate Analog Devices

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 7: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-16*

Lync Server provides support for analog devices. Specifically, the supported analog devices are analog audio phones and analog fax machines. You can configure the qualified gateways to support the use of analog devices in your Lync Server environment.

After you migrate from Lync Server 2010 to Lync Server 2013, you must also migrate the contact objects associated with the analog devices. Use Lync Server Management Shell to first retrieve all contact objects associated with the Lync Server 2010 analog devices, and then move those objects to the Lync Server 2013 pool.

To migrate analog devices

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. At the command line, type:
   ```
   Get-CsAnalogDevice -Filter {RegistrarPool -eq "pool01.contoso.net"} |
   ```
3. Verify that all contact objects have been moved to the Lync Server 2013 pool. At the command line, type:
   ```
   Get-CsAnalogDevice -Filter {RegistrarPool -eq "pool02.contoso.net"}
   ```
4. Verify that all the contact objects are now associated with the Lync Server 2013 pool.

1.6.1.9 Phase 8: Decommission Legacy Pools

Phase 8: Decommission Legacy Pools

Microsoft Lync Server 2013 > Migration > Migration from Lync Server 2010 to Lync Server 2013 >

Topic Last Modified: *2012-10-19*

The following topic provides guidance in updating DNS entries, moving the Content Management Server, decommissioning pools, and deactivating and removing servers and pools from a legacy deployment of Lync Server 2010. Not all of the procedures listed in this section are required. Read the documentation and determine which decommissioning procedure to use.

For exhaustive coverage of removing Lync Server 2010 servers and server roles, and a step-by-step guide to decommissioning a Lync Server 2010 deployment, see "Uninstalling Microsoft Lync Server 2010 and Removing Server Roles," which can be downloaded at http://go.microsoft.com/fwlink/p/?linkId=246227.

Important:

For information on migrating and upgrading Microsoft Unified Communications Managed API (UCMA) applications, prior to decommissioning your legacy environment, see http://go.microsoft.com/fwlink/p/?LinkId=269555

- Update DNS SRV Records
- Move the Lync Server 2010 Configuration Management Server to Lync Server 2013
- Remove the Archiving Server Association
- Remove the Monitoring Server Association
- Remove the Enterprise Edition Front End Server or Standard Edition Front End Server
- Remove SQL Server Instances and Databases on the Back End Server

1.6.1.9.1 Update DNS SRV Records

Update DNS SRV Records

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools >

Topic Last Modified: *2012-09-29*

To successfully complete this procedure, you should be logged on to the server or domain as a member of the Domain Admins group or a member of the DnsAdmins group.

This topic describes how to update the Domain Name System (DNS) records after migrating to Lync Server 2013. After all users have been moved to Lync Server 2013, but before the legacy Lync Server 2010 pool or Director is decommissioned, you must update the DNS SRV records in your internal DNS for every SIP domain. This procedure assumes that your internal DNS has zones for your SIP user domains.

To configure a DNS SRV record

1. On the DNS server, click **Start**, click **Administrative Tools**, and then click **DNS**.
2. In the console tree for your SIP domain, expand **Forward Lookup Zones**, expand the SIP domain in which Lync Server 2013 is installed, and navigate to the **_tcp** setting.
3. In the right pane, right click **_sipinternaltls** and select **Properties**.
4. In **Host offering this service**, update the host FQDN to point to the Lync Server 2013 pool.
5. Click **OK**.

To verify that the FQDN of the Front End pool or Standard Edition server can be resolved

1. Log on to a client computer in the domain.
2. Click **Start**, and then click **Run**.
3. In the **Open** box, type **cmd**, and then click **OK**.
4. At the command prompt, type **nslookup** *<FQDN of the Front End pool>* or *<FQDN of the Standard Edition server>*, and then press ENTER.
5. Verify that you receive a reply that resolves to the appropriate IP address for the FQDN.

1.6.1.9.2 Move the Lync Server 2010 Configuration Management Server to Lync Server 2013

Move the Lync Server 2010 Configuration Management Server to Lync Server 2013

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools >

Topic Last Modified: *2012-10-05*

After migrating from Lync Server 2010 to Lync Server 2013, you need to move the Lync Server 2010 Central Management Server to the Lync Server 2013 Front End Server or pool, before you can remove the legacy Lync Server 2010 server.

The Central Management Server is a single master/multiple replica system, where the read/write copy of the database is held by the Front End Server that contains the Central Management Server. Each computer in the topology, including the Front End Server that contains the Central Management Server, has a read-only copy of the Central Management store data in the SQL Server database (named RTCLOCAL by default) installed on the computer during setup and deployment. The local database receives replica updates by way of the Lync Server Replica Replicator Agent that runs as a service on all computers. The name of the actual database on the Central Management Server and the local replica is XDS, which is made up of the xds.mdf and xds.ldf files. The master database location is referenced by a service control point (SCP) in Active Directory Domain Services (AD DS). All tools that use the Central Management Server to manage and configure Lync Server use the SCP to locate the Central Management store.

After you have successfully moved the Central Management Server, you should remove the Central Management Server databases from the original Front End Server. For information on removing the Central Management Server databases, see Remove the SQL Server Database for a Front End Pool.

You use the Windows PowerShell cmdlet **Move-CsManagementServer** in the Lync Server Management Shell to move the database from the Lync Server 2010 SQL Server database to the Lync Server 2013 SQL Server database, and then update the SCP to point to the Lync Server 2013 Central Management Server location.

Preparing Lync Server 2013 Front End Servers before moving the Central Management Server

Use the procedures in this section to prepare the Lync Server 2013 Front End Servers before you move the Lync Server 2010 Central Management Server.

⊟To prepare an Enterprise Edition Front End pool

1. On the Lync Server 2013 Enterprise Edition Front End pool where you want to relocate the Central Management Server: Log on to the computer where the Lync Server Management Shell is installed as a member of the **RTCUniversalServerAdmins** group. You must also have SQL Server database sysadmin user rights and permissions on the database where you want to install the Central Management store.
2. Open the Lync Server Management Shell.
3. To create the new Central Management store in the Lync Server 2013 SQL Server database, in the Lync Server Management Shell, type:

   ```
   Install-CsDatabase -CentralManagementDatabase -SQLServerFQDN <FQDN of
   ```

4. Confirm that the status of the **Lync Server Front-End** service is **Started**.

⊟To prepare a Standard Edition Front End Server

1. On the Lync Server 2013 Standard Edition Front End Server where you want to relocate the Central Management Server: Log on to the computer where the Lync Server Management Shell is installed as a member of the **RTCUniversalServerAdmins** group.
2. Open the Lync Server Deployment Wizard.
3. In the Lync Server Deployment Wizard, click **Prepare first Standard Edition server**.
4. On the **Executing Commands** page, SQL Server Express is installed as the Central Management Server. Necessary firewall rules are created. When the installation of the database and prerequisite software is completed, click **Finish**.

   Note:

   The initial installation may take some time with no visible updates to the command output summary screen. This is due to the installation of the SQL Server Express. If you need to monitor the installation of the database, use Task Manager to monitor the setup.

5. To create the new Central Management store on the Lync Server 2013 Standard Edition Front End Server, in the Lync Server Management Shell, type:

   ```
   Install-CsDatabase -CentralManagementDatabase -SQLServerFQDN <FQDN of
   ```

6. Confirm that the status of the **Lync Server Front-End** service is **Started**.

⊟To move the Lync Server 2010 Central Management Server to Lync Server 2013

1. On the Lync Server 2013 server that will be the Central Management Server: Log on to the computer where the Lync Server Management Shell is installed as a member of the **RTCUniversalServerAdmins** group. You must also have the SQL Server database administrator user rights and permissions.
2. Open Lync Server Management Shell.
3. In the Lync Server Management Shell, type:

   ```
   Enable-CsTopology
   ```

   > **Warning:**
   >
   > If `Enable-CsTopology` is not successful, resolve the problem preventing the command from completing before continuing. If **Enable-CsTopology** is not successful, the move will fail and it may leave your topology in a state where there is no Central Management store.

4. On the Lync Server 2013 Front End Server or Front End pool, in the Lync Server Management Shell, type:

   ```
   Move-CsManagementServer
   ```

5. Lync Server Management Shell displays the servers, file stores, database stores, and the service connection points of the Current State and the Proposed State. Read the information carefully and confirm that this is the intended source and destination. Type **Y** to continue, or **N** to stop the move.
6. Review any warnings or errors generated by the **Move-CsManagementServer** command and resolve them.
7. On the Lync Server 2013 server, open the Lync Server Deployment Wizard.
8. In Lync Server Deployment Wizard, click **Install or Update Lync Server System**, click **Step 2: Setup or Remove Lync Server Components**, click **Next**, review the summary, and then click **Finish**.
9. On the Lync Server 2010 server, open the Lync Server Deployment Wizard.
10. In Lync Server Deployment Wizard, click **Install or Update Lync Server System**, click **Step 2: Setup or Remove Lync Server Components**, click **Next**, review the summary, and then click **Finish**.
11. To confirm that replication with the new Central Management store is occurring, in the Lync Server Management Shell, type:

    ```
    Get-CsManagementStoreReplicationStatus
    ```

    > **Note:**
    >
    > The replication may take some time to update all current replicas.

To remove Lync Server 2010 Central Management store files after a move

1. On the Lync Server 2010 server: Log on to the computer where the Lync Server Management Shell is installed as a member of the **RTCUniversalServerAdmins** group. You must also have the SQL Server database administrator user rights and permissions.
2. Open Lync Server Management Shell

   > **Warning:**
   >
   > Do not proceed with the removal of the previous database files until replication is complete and is stable. If you remove the files prior to completing replication, you will disrupt the replication process and leave the newly moved Central Management Server in an unknown state. Use the cmdlet **Get-CsManagementStoreReplicationStatus** to confirm the replication status.

3. To remove the Central Management store database files from the Lync Server 2010 Central Management Server, type:

   ```
   Uninstall-CsDatabase -CentralManagementDatabase -SqlServerFqdn <FQDN c
   ```

   For example:

   ```
   Uninstall-CsDatabase -CentralManagementDatabase -SqlServerFqdn sql.con
   ```

Where the *<FQDN of SQL Server>* is either the Lync Server 2010 Back End Server in an Enterprise Edition deployment or the FQDN of the Standard Edition server.

1.6.1.9.3 Remove the Archiving Server Association

Remove the Archiving Server Association

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools >

Topic Last Modified: *2012-10-04*

To remove an Archiving Server, you need to change or clear the dependency on the associated Front End pool, Front End Server, Survivable Branch Appliance and Survivable Branch Server. You edit the properties of the Front End pool, Front End Server, Survivable Branch Appliance and Survivable Branch Server to remove the dependency. After you clear the dependency and you delete the server in Topology Builder, you are notified that the associated database store object in Topology Builder will also be deleted.

⊟To remove the Archiving Server association

1. Open the Lync Server 2013 Front End Server, open Topology Builder.
2. Navigate to the Lync Server 2010 node.
3. In Topology Builder, expand **Enterprise Edition Front End pools**, **Standard Edition Front End Servers**, or **Branch sites**, based on where the Archiving Server is defined.
4. If you have Survivable Branch Server associated, expand **Branch sites**, expand the branch site name, and then expand **Survivable Branch Appliances**.

   > **Note:**
   >
   > **Survivable Branch Appliances** in the user interface applies to both Survivable Branch Server and Survivable Branch Appliance.

5. Right-click the pool, server, or device that is associated with the Archiving Server, and then click **Edit Properties**.
6. In **Edit Properties**, under **General**, under **Associations**, clear the **Associate Archiving Server** check box, and then click **OK**.
7. Repeat the previous step for any other pool, server or device associated with the Archiving Server that you want to remove.
8. Right-click the Archiving Server, and then click **Delete**.
9. On **Delete Dependent Stores**, click **OK**.
10. Publish the topology, check replication status, and then run the Lync Server Deployment Wizard as needed.

1.6.1.9.4 Remove the Monitoring Server Association

Remove the Monitoring Server Association

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools >

Topic Last Modified: *2012-10-04*

To remove the Monitoring Server, you need to change or clear the dependency on the associated Front End pool, Front End Server, Survivable Branch Appliance and Survivable Branch Server. You edit the properties of the Front End pool, Front End Server, Survivable Branch Appliance and Survivable Branch Server to remove the dependency. After you clear the dependency and delete the server in Topology Builder, you are notified that the associated database store object in Topology Builder will also be deleted.

⊟To remove the Monitoring Server association

1. Open the Lync Server 2013 Front End Server, open Topology Builder.
2. Navigate to the Lync Server 2010 node.
3. In Topology Builder, expand **Enterprise Edition Front End pools**, **Standard Edition Front End Servers**, or **Branch sites**, based on where the Monitoring Server is defined.
4. If you have Survivable Branch Server associated, expand **Branch sites**, expand the branch site name, and then expand **Survivable Branch Appliances**.

   Note:

   Survivable Branch Appliances in the user interface applies to both Survivable Branch Server and Survivable Branch Appliance.
5. Right-click the pool, server, or device that is associated with the Monitoring Server, and then click **Edit Properties**.
6. In **Edit Properties**, under **General**, under **Associations**, clear the **Associate Monitoring Server** check box, and then click **OK**.
7. Repeat the previous step for any other pool, server or device associated with the Monitoring Server.
8. Right-click the Monitoring Server, and then click **Delete**.
9. On **Delete Dependent Stores**, click **OK**.
10. Publish the topology, check replication status, and run the Lync Server Deployment Wizard as needed.

1.6.1.9.5 Remove the Enterprise Edition Front End Server or Standard Edition Front End Server

Remove the Enterprise Edition Front End Server or Standard Edition Front End Server

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools >

***Topic Last Modified:** 2012-10-10*

The procedures outlined in this topic are designed to guide you through the process of removing a Microsoft Lync Server 2010 Enterprise Edition Front End pool or a Standard Edition Front End Server. After migrating to Lync Server 2013, this is one of the first steps to decommissioning your legacy Lync Server 2010 environment.

- Reset Call Admission Control
- Prevent Sessions for Services
- Stop Lync Server 2010 Services
- Remove a Front End Server from a Pool
- Remove Front End Pool or Standard Edition Server

1.6.1.9.5.1 Reset Call Admission Control

Reset Call Admission Control

Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools > Remove the Enterprise Edition Front End Server or Standard Edition Front End Server >

***Topic Last Modified:** 2012-10-11*

If a Lync Server 2010 Front End pool is hosting call admission control (CAC), you must move CAC hosting to a Lync Server 2013 pool before you can remove the Lync Server 2010 Front End pool.

⊟To reset CAC

1. Open Topology Builder.
2. Right-click the site node, and then click **Edit Properties**.
3. Under **Call Admission Control setting**, make sure **Enable Call Admission Control** is selected.
4. Under **Front End pool to run call admission control (CAC)**, select the Lync Server 2013 pool that is to host CAC, and then click **OK**.
5. Publish the topology.

1.6.1.9.5.2 Prevent Sessions for Services

Prevent Sessions for Services

Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools > Remove the Enterprise Edition Front End Server or Standard Edition Front End Server >

Topic Last Modified: *2012-10-04*

You can use Microsoft Lync Server 2010 Control Panel to prevent new sessions for all the Lync Server 2010 services running on a specific computer or to prevent new sessions for a specific Lync Server 2010 service.

⊟To prevent new sessions for all Lync Server services on a computer

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open Lync Server Control Panel.
3. In the left navigation bar, click **Topology** and then click **Status**.
4. On the **Status** page, sort or search through the list as needed to find the computer that is running the services for which you want to prevent new sessions, and then click it.
5. Click **Action**.
6. Click **Prevent new sessions for all services**.

⊟To prevent new sessions for a specific service

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open Lync Server Control Panel.
3. In the left navigation bar, click **Topology** and then click **Status**.
4. On the **Status** page, sort or search through the list as needed to find the computer that is running the service you want to start or stop, and then click it.
5. Click **Properties**.
6. Sort the list of services, if necessary, and click the service for which you want to prevent new sessions.
7. Click **Action**.
8. Click **Prevent new sessions for service**.
9. Click **Close**.

1.6.1.9.5.3 Stop Lync Server 2010 Services

Stop Lync Server 2010 Services

Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools > Remove the Enterprise Edition Front End Server or Standard Edition Front End Server >

Topic Last Modified: *2012-10-04*

You can use Lync Server Control Panel to start or stop all the Lync Server 2010 services running on a specific computer or to start or stop a specific Lync Server 2010 service.

⊟To start or stop all Lync Server services on a computer

1. Open Lync Server Control Panel.
2. In the left navigation bar, click **Topology** and then click **Status**.
3. On the **Status** page, sort or search through the list as needed to find the computer that is running the services you want to start or stop, and then click it.
4. Click **Action**.
5. Click **Start All services** or **Stop All services**.

⊟To start or stop a specific service

1. Open Lync Server Control Panel.
2. In the left navigation bar, click **Topology** and then click **Status**.
3. On the **Status** page, sort or search through the list as needed to find the computer that is running the service you want to start or stop, and then click it.
4. Click **Properties**.
5. Sort the list of services, if necessary, and click the service you want to start or stop.
6. Click **Action**.
7. Click **Start service** or **Stop service**.
8. Click **Close**.

1.6.1.9.5.4 Remove a Front End Server from a Pool

Remove a Front End Server from a Pool

Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools > Remove the Enterprise Edition Front End Server or Standard Edition Front End Server >

Topic Last Modified: *2012-10-04*

The Microsoft Lync Server 2010 Enterprise Edition Front End Server cannot exist as a stand-alone computer. It must be defined as a Front End pool, even if there is only a single computer in the pool.

This topic guides you through the process of removing an individual Front End Server from an existing Front End pool. If the Front End Server is the last server in the pool or if you are removing the pool completely, see Remove Front End Pool or Standard Edition Server. There is no need to remove the individual Front End Servers before you remove the Front End pool. When you remove the pool, you remove each Front End Server.

⊟To remove a Front End Server from a pool

1. Open the Lync Server 2013 Front End Server, open Topology Builder.
2. Navigate to the Lync Server 2010 node.

3. Expand **Enterprise Edition Front End pools**, expand the Front End pool with the Front End Server that you want to remove, right-click the Front End Server that you want to remove, and then click **Delete**.

1.6.1.9.5.5 Remove Front End Pool or Standard Edition Server

Remove Front End Pool or Standard Edition Server

Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools > Remove the Enterprise Edition Front End Server or Standard Edition Front End Server >

Topic Last Modified: *2012-10-04*

This topic guides you through the process of removing a Front End pool or a Standard Edition Front End Server. When you remove a Front End pool, you remove each Front End Server that belongs to the pool as a part of the pool removal process. When you remove a Standard Edition Front End Server, you must remove the SQL Store definition from Topology Builder.

⊟To remove a Front End Server pool

1. Open Topology Builder.
2. Navigate to the Lync Server 2010 node.
3. Expand **Enterprise Edition Front End pools**, expand the Front End pool, right-click the Front End pool that you want to remove, and then click **Delete**.
4. Publish the topology, check replication status, and then run the Lync Server Deployment Wizard as needed.

⊟To remove a Standard Edition Front End server

1. Open Topology Builder.
2. Navigate to the Lync Server 2010 node.
3. Expand **Standard Edition Front End servers**, right-click the Front End Server that you want to remove, and then click **Delete**.
4. Expand **SQL stores**, right-click the SQL Server database that is associated with the Standard Edition Front End Server, and then click **Delete**.

Important:
You must remove the definition of the collocated SQL Server databases from the Standard Edition Front End Server.

5. Publish the topology, check replication status, and then run the Lync Server Deployment Wizard as needed.

1.6.1.9.6 Remove SQL Server Instances and Databases on the Back End Server

Remove SQL Server Instances and Databases on the Back End Server

Migration > Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools >

Topic Last Modified: *2012-10-19*

You remove the Microsoft SQL Server databases and instances after you remove the servers running Lync Server 2010 that are dependent on them, or after you reconfigure the servers running Lync Server 2010 to use another database. You need to perform the procedure in this topic when you retire the current SQL Server or reconfigure the current server running Lync Server 2010 in such a way that it renders the databases obsolete or unavailable.

To remove the databases or instances for the Archiving Server or Monitoring Server, you must first remove the server role. Similarly, to remove the instances or databases for Front End pool, you must first remove or reconfigure the dependent server role. These procedures make no distinction between collocated databases or separate instances for servers. The procedures are unaffected by the collocation of databases.

- Remove the SQL Server Database for a Front End Pool
- Remove the SQL Server Database for a Monitoring Server
- Remove the SQL Server Database for an Archiving Server

1.6.1.9.6.1 Remove the SQL Server Database for a Front End Pool

Remove the SQL Server Database for a Front End Pool

Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools > Remove SQL Server Instances and Databases on the Back End Server >

Topic Last Modified: *2012-10-04*

After you remove a Microsoft Lync Server 2010 Front End pool or reconfigure the pool to use a different database, you can remove the SQL Server databases that hosted the pool data. Use the following procedures to remove the definitions from Topology Builder, and then remove the database and log files from the database server.

To remove the SQL Server database using Topology Builder

1. From the Lync Server 2013 Front End Server, open Topology Builder and download the existing topology.
2. In Topology Builder, navigate to **Shared Components** and then **SQL Server Stores**, right-click the SQL Server instance associated with the removed or reconfigured Front End pool, and then click **Delete**.
3. Publish the topology, and then check the replication status.

To remove user and application databases from the SQL Server

1. To remove the databases on the SQL Server, you must be a member of the SQL Server sysadmins group for the SQL Server where you are removing the database files.
2. Open Lync Server Management Shell
3. To remove the database for the pool user store, type:

   ```
   Uninstall-CsDataBase -DatabaseType User -SqlServerFqdn <FQDN> [-SqlIns
   ```

   Where *<FQDN>* is the fully qualified domain name (FQDN) of the database server, and *<instance>* is the named database instance (that is, if one was defined).
4. To remove the database for the pool application store, type:

   ```
   Uninstall-CsDataBase -DatabaseType Application -SqlServerFqdn <FQDN> [
   ```

   Where *<FQDN>* is the FQDN of the database server, and *<instance>* is the named database instance (that is, if one was defined).
5. When the **Uninstall-CsDataBase** cmdlet prompts you to confirm actions, read the information, and then press **Y** (or press Enter) to proceed, or press **N** and then Enter if you want to stop the cmdlet (that is, in case there errors).

1.6.1.9.6.2 Remove the SQL Server Database for a Monitoring Server

Remove the SQL Server Database for a Monitoring Server

Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools > Remove SQL Server Instances and Databases on the Back End Server >

Topic Last Modified: *2012-10-04*

After you remove a Microsoft Lync Server 2010 Monitoring Server, you can remove the SQL Server databases that hosted the server data. Use the following procedures to remove the definitions from Topology Builder, and then remove the database and log files from the database server.

To remove the SQL Server database using Topology Builder

1. On the Lync Server 2013 Front End Server, open Topology Builder.
2. In Topology Builder, navigate to **Shared Components** and then **SQL Server Stores**, right-click the SQL Server instance associated with the removed or reconfigured Monitoring Server, and then click **Delete**.
3. Publish the topology, and then check replication status.

To remove the database files from the SQL Server

1. To remove the databases on the SQL Server-based server, you must be a member of the SQL Server sysadmins group for the SQL Server server where you are removing the database files.
2. Open the Lync Server Management Shell.
3. At the command line, type the following:

   ```
   Uninstall-CsDataBase -DatabaseType Monitoring -SqlServerFqdn <FQDN> [-
   ```

   Where *<FQDN>* is the fully qualified domain name (FQDN) of the database server, and *<instance>* is the optional named database instance.
4. When the **Uninstall-CsDataBase** cmdlet prompts you to confirm actions, read the information, and then press **Y** (or press Enter) to proceed, or press **N** and then Enter if you want to stop the cmdlet (that is, in case there errors).

1.6.1.9.6.3 Remove the SQL Server Database for an Archiving Server

Remove the SQL Server Database for an Archiving Server

Migration from Lync Server 2010 to Lync Server 2013 > Phase 8: Decommission Legacy Pools > Remove SQL Server Instances and Databases on the Back End Server >

Topic Last Modified: *2012-10-04*

After you remove a Microsoft Lync Server 2010 Archiving Server, you can remove the SQL Server databases that hosted the pool data. Use the following procedures to remove the definitions from Topology Builder, and then remove the database and log files from the database server.

To remove the SQL Server database using Topology Builder

1. On the Lync Server 2013 Front End Server, open Topology Builder.
2. In Topology Builder, navigate to **Shared Components** and then **SQL Server Stores**, right-click the SQL Server instance associated with the removed or reconfigured Archiving Server, and then click **Delete**.

3. Publish the topology, and then check replication status.

To remove the database files from the SQL Server

1. To remove the databases on the SQL Server, you must be a member of the SQL Server sysadmins group for the SQL Server where you are removing the database files.
2. Open the Lync Server Management Shell.
3. At the command line, type the following:

   ```
   Uninstall-CsDataBase -DatabaseType Archiving -SqlServerFqdn <FQDN> [-S
   ```

   Where *<FQDN>* is the fully qualified domain name (FQDN) of the database server, and *<instance>* is the named database instance (that is, if one was defined).
4. When the **Uninstall-CsDataBase** cmdlet prompts you to confirm actions, read the information, and then press **Y** (or press Enter) to proceed, or press **N** and then Enter if you want to stop the cmdlet (that is, in case there errors).

1.6.2 Migration from Office Communications Server 2007 R2 to Lync Server 2013

Migration from Office Communications Server 2007 R2 to Lync Server 2013

Microsoft Lync Server 2013 > Migration >

Topic Last Modified: *2012-10-19*

The topics in this section guide you through the process of migrating from Office Communications Server 2007 R2 to Lync Server 2013

Important:

This document describes the steps generally required to accomplish each phase of migration. It does not address every possible legacy deployment topology or every possible migration scenario. Therefore, you may not need to perform every step described, or you may need to perform additional steps, depending on your deployment. This document also provides examples of verification steps. These verification steps are provided to help you understand what you need to look for to ensure that each phase completes successfully as you progress through your migration. Tailor these verification steps to your specific migration process.

This guide provides information specific to upgrading your existing deployment. It does not explain how to change your existing topology. This guide does not cover the implementation of new features. When a detailed procedure is documented elsewhere, this guide directs you to the appropriate document or document section.

This document defines terms as specified in the following list.

migration

Moving your production deployment from a previous version of Office Communications Server 2007 R2 to Lync Server 2013.

upgrade

Installing a newer version of software on a server or client computer.

coexistence

The temporary environment that exists during migration when some functionality has been migrated to Lync Server 2013 and other functionality still remains on a prior version of Office Communications Server 2007 R2.

interoperability

The ability of your deployment to operate successfully during the period of coexistence.

In This Section

- Before You Begin the Migration
- Migration Phases
- Phase 1: Plan Your Migration from Office Communications Server 2007 R2
- Phase 2: Prepare for Migration
- Phase 3: Deploy Lync Server 2013 Pilot Pool
- Phase 4: Merge Topologies
- Phase 5: Configure the Pilot Pool
- Phase 6: Move users to the Pilot Pool
- Phase 7: Add Lync Server 2013 Edge Server to Pilot Pool
- Phase 8: Move from Pilot Deployment into Production
- Phase 9: Complete Post-Migration Tasks
- Phase 10: Decommission Legacy Site

1.6.2.1 Before You Begin the Migration

Before You Begin the Migration

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-08-29*

Before you begin, we recommend that you read this document and the following guides to familiarize yourself with deploying the corresponding Lync Server 2013 roles:

- Deploying Lync Server 2013
- Deploying External User Access
- Deploying Clients and Devices
- Migration Process
- Migration Phases

1.6.2.1.1 Migration Process

Migration Process

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Before You Begin the Migration >

Topic Last Modified: *2012-09-24*

The recommended and supported migration procedure for Lync Server 2013 is the side-by-side migration procedure. This topic describes why you should use side-by-side migration and also includes information about coexistence.

Side-by-Side Migration

In nearly every migration, you should use the side-by-side migration path. In a side-by-side migration, you deploy a new server with Lync Server 2013 alongside a corresponding server that is running Office Communications Server 2007 R2, and then you transfer operations to the new server. If it becomes necessary to roll back to Office Communications Server 2007 R2, you have only to shift operations back to the original servers. Be aware that in this situation any new meetings scheduled with upgraded clients will not work, and the clients would also need to be downgraded.

Coexistence Testing

After you have deployed Lync Server 2013 in parallel with Office Communications Server 2007 R2, the topology represents a coexistence testing state of Lync Server 2013 and Office Communications Server 2007 R2. While in this state, it is important to test and ensure services are started, each site can be administered, and clients can communicate with current and legacy users. Prior to the migration of all users, it is very important that you understand the state of each deployment and ensure that each deployment is functional and working properly. Typically, the coexistence testing phase exists throughout the pilot testing of Lync Server 2013. Legacy users are moved to Lync Server 2013 for a period of time to ensure that application compatibility and features and functions are working properly. After pilot testing, users and applications are moved to the production version of Lync Server 2013, and the legacy pools and applications of Office Communications Server 2007 R2 are retired.

1.6.2.1.2 Migration Phases

Migration Phases

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Before You Begin the Migration >

Topic Last Modified: *2012-08-29*

The following phases describe the process of a pool migration from Office Communications Server 2007 R2 to Lync Server 2013.

- Phase 1: Plan Your Migration from Office Communications Server 2007 R2
- Phase 2: Prepare for Migration
- Phase 3: Deploy Lync Server 2013 Pilot Pool
- Phase 4: Merge Topologies
- Phase 5: Configure the Pilot Pool
- Phase 6: Move users to the Pilot Pool
- Phase 7: Add Lync Server 2013 Edge Server to Pilot Pool
- Phase 8: Move from Pilot Deployment into Production
- Phase 9: Complete Post-Migration Tasks
- Phase 10: Decommission Legacy Site

1.6.2.2 Phase 1: Plan Your Migration from Office Communications Server 2007 R2

Phase 1: Plan Your Migration from Office Communications Server 2007 R2

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-09-29*

This section covers planning topics for migrating from Office Communications Server 2007 R2 to Lync Server 2013.

In This Section

- User Migration

- Migrating Archiving and Monitoring Servers
- Administering Servers after Migration
- Migrating Multiple Sites and Pools
- Migrating XMPP Federation

1.6.2.2.1 User Migration

User Migration

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 1: Plan Your Migration from Office Communications Server 2007 R2 >

Topic Last Modified: *2012-10-19*

A generally accepted best practice for migrations is to create several test users and use them to conduct systems tests. After you have successfully moved and tested those accounts, you should identify a group of pilot production users and move their accounts and conduct validation tests on them. When you get satisfactory results, you can move the rest of your users to the new deployment.

1.6.2.2.2 Migrating Archiving and Monitoring Servers

Migrating Archiving and Monitoring Servers

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 1: Plan Your Migration from Office Communications Server 2007 R2 >

Topic Last Modified: *2012-10-02*

If you deployed Archiving Server and Monitoring Server in your Office Communications Server 2007 R2, you can deploy these servers in your Lync Server 2013 environment after you migrate your Front End pools. If archiving and monitoring functionality are critical to your organization, however, you should add archiving and monitoring to your pilot pool before you migrate so that the functionality is available during the migration process.

If you want archiving and monitoring functionality during the migration and coexistence phase, keep the following considerations in mind:

- Archiving data and monitoring data are not moved to the Lync Server 2013 deployment. The data you back up prior to decommissioning the legacy environment will be your history of activity in the Office Communications Server 2007 R2.
- The Office Communications Server 2007 R2 version of Archiving Server and Monitoring Server can be associated only with a Office Communications Server 2007 R2 Front End pool. In Lync Server 2013, Archiving and Monitoring are no longer server roles, but services integrated into the Lync Server 2013 Front End pool.
- During the time that your legacy and Lync Server 2013 deployments coexist, the Office Communications Server 2007 R2 version of Archiving Server and Monitoring Server gather data for users homed on Office Communications Server 2007 R2 pools. The Lync Server 2013 version of Archiving Server and Monitoring Server gather data for users homed on Lync Server 2013 pools.

> **Note:**
> During the phase of migration when you are still using your legacy Edge server with the new Lync Server 2013 pilot pool, the Office Communications Server 2007 R2 version of Archiving Server continues to gather data for users

homed on Office Communications Server 2007 R2 pools and the Lync Server 2013 version of Archiving Server gathers data for users homed on Lync Server 2013 pools.

- If you use a third-party archiving and monitoring solution in conjunction with Archiving Server and Monitoring Server, talk to your vendor about when and how you need to integrate the third-party solution with Lync Server 2013.

1.6.2.2.3 Administering Servers after Migration

Administering Servers after Migration

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 1: Plan Your Migration from Office Communications Server 2007 R2 >

Topic Last Modified: *2012-09-29*

In general, you must use the administrative tool that corresponds to the server version that you want to manage. You cannot install the Lync Server 2013 and Office Communications Server 2007 R2 administrative tools on the same computer. Also, the Lync Server 2013 Control Panel is not installed automatically on each server. To install the Lync Server 2013 Control Panel, follow the procedure inside the topic Install Lync Server Administrative Tools in the Deployment documentation.

1.6.2.2.4 Migrating Multiple Sites and Pools

Migrating Multiple Sites and Pools

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 1: Plan Your Migration from Office Communications Server 2007 R2 >

Topic Last Modified: *2012-08-26*

Lync Server 2013 supports multi-site and multi-pool deployments. The process of migrating multiple pools from Office Communications Server 2007 R2 to Lync Server 2013 requires the following considerations:

1. After deploying a Lync Server 2013 pilot pool, you need to define a subset of pilot users that will be moved to the Lync Server 2013 pool, and a methodology for validating the functionality of the users.
2. After deploying an Edge Server in the pilot pool, you need to validate that external users can communicate with the Lync Server 2013 pool.
3. After transitioning the federated routes from Office Communications Server 2007 R2 Edge Servers to the pilot Lync Server 2013 Edge Servers, you need to validate that federated users can communicate with the Lync Server 2013 pool.
4. After moving all the users and non-user contact objects, you need to validate that the Office Communications Server 2007 R2 pool is empty.
5. After verifying that the Office Communications Server 2007 R2 pool is empty, you can then deactivate the pool.
   For details about how to deactivate the legacy Office Communications Server 2007 R2 pool and servers, see Phase 10: Decommission Legacy Site.

1.6.2.2.5 Migrating XMPP Federation

Migrating XMPP Federation

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 1: Plan Your Migration from Office Communications Server 2007 R2 >

Topic Last Modified: *2012-10-16*

Previous versions of Office Communications Server provided an extensible messaging and presence protocol (XMPP) gateway that could be deployed as a separate server role to allow federating with XMPP deployments. In Lync Server 2013, the XMPP functionality can be deployed as a feature. XMPP functionality is installed in two parts: as an XMPP proxy that runs on the Lync Server 2013 Edge Server, and the XMPP Gateway that runs on the Lync Server 2013 Front End Server.

From a migration perspective, a Office Communications Server 2007 R2 user account can be moved to a Lync Server 2013 pool and continue to use the Office Communications Server 2007 R2 XMPP gateway. This is possible only when the XMPP federated partner is not configured in Lync Server 2013.

In summary, if Office Communications Server has been deployed with the Office Communications Server 2007 R2 XMPP Gateway and XMPP federation has been enabled for legacy Office Communications Server 2007 R2 users, to migrate the XMPP federation to Lync Server 2013:

1. Deploy a Lync Server 2013 pool.
2. Deploy a Lync Server 2013 Edge server.
3. Move all users to the Lync Server 2013 pool.
4. Create XMPP access policies and certificates for the Edge Server.
5. Enable XMPP federation in Lync Server 2013.
6. Update the DNS entries to point to the Lync Server 2013 XMPP Gateway.

1.6.2.3 Phase 2: Prepare for Migration

Phase 2: Prepare for Migration

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-08-24*

Before you begin to migrate to Lync Server 2013 from Office Communications Server 2007 R2, follow the steps described in this section.

In This Section

- Apply Office Communications Server 2007 R2 Updates
- Configure DNS Records for Pilot Pool Deployment
- Run Best Practices Analyzer
- Back Up Systems and Data
- Configure Clients for Migration
- Verify Office Communications Server 2007 R2 Environment

1.6.2.3.1 Apply Office Communications Server 2007 R2 Updates

Apply Office Communications Server 2007 R2 Updates

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase

2: Prepare for Migration >

Topic Last Modified: *2012-10-19*

Before you migrate to Lync Server 2013, updates must be applied to your Office Communications Server 2007 R2 environment. For the most up-to-date information about Office Communications Server 2007 R2, see **Updates for Communications Server 2007 R2** at http://go.microsoft.com/fwlink/p/?linkid=3052&kbid=968802.

To install updates for Office Communications Server 2007 R2, we recommend you follow the **Method 1 Cumulative Server Update Installer** procedure described in Microsoft Knowledge Base article 968802, "Updates for Communications Server 2007 R2," at http://go.microsoft.com/fwlink/p/?linkid=3052&kbid=968802.

1.6.2.3.2 Configure DNS Records for Pilot Pool Deployment

Configure DNS Records for Pilot Pool Deployment

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 2: Prepare for Migration >

Topic Last Modified: *2012-09-24*

Prior to deploying the Lync Server 2013 pilot pool, you must update the DNS Host A entries for the pilot pool. To successfully complete this procedure, you should be logged on to the server or domain at minimum as a member of the Domain Admins group or a member of the DnsAdmins group.

To configure DNS Host A records

1. On the Domain Name System (DNS) server, click **Start**, click **Administrative Tools**, and then click **DNS**.
2. In the console tree for your domain, expand **Forward Lookup Zones**, and then right-click the domain in which Lync Server 2013 will be installed.
3. Click **New Host (A or AAAA)**.
4. Click **Name**, type the host name for the pool (the domain name is assumed from the zone that the record is defined in and does not need to be entered as part of the A record).
5. Click **IP Address**, type the IP address for the Front End pool.
6. Click **Add Host**, and then click **OK**.
7. When you are finished, click **Done**.

1.6.2.3.3 Run Best Practices Analyzer

Run Best Practices Analyzer

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 2: Prepare for Migration >

Topic Last Modified: *2012-10-11*

The Office Communications Server 2007 R2 Best Practices Analyzer tool gathers configuration information from an Office Communications Server 2007 R2 deployment and determines whether the configuration is set according to Microsoft best practices. You can install the tool on a client computer that runs Microsoft .NET Framework 2.0, or directly on the server that runs Office Communications Server 2007 R2. We recommend that you install and run this tool on a client computer. The Office Communications Server 2007 R2 Administrative Tools should also be installed locally on the client computer so that the Best Practices Analyzer can collect a full set of data.

You can download the Office Communications Server 2007 R2 Best Practices Analyzer from the Microsoft Download Center at http://go.microsoft.com/fwlink/p/?LinkId=268702.

1.6.2.3.4 Back Up Systems and Data

Back Up Systems and Data

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 2: Prepare for Migration >

Topic Last Modified: *2012-10-19*

Before you begin the migration to Lync Server 2013, we strongly recommend that you perform a full system backup and document your existing system, including an inventory of user accounts that are homed on each pool, so that you can roll back to Office Communications Server 2007 R2 if it becomes necessary. Multiple tools and programs are available for backing up and restoring data, settings, and systems. For details and procedures, see "Office Communications Server 2007 R2 Backup and Restoration Guide" at http://go.microsoft.com/fwlink/p/?linkid=168162.

1.6.2.3.5 Configure Clients for Migration

Configure Clients for Migration

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 2: Prepare for Migration >

Topic Last Modified: *2012-10-02*

This topic contains the recommended client deployment steps you should take prior to migrating to Lync Server 2013. These configuration changes should be made on Office Communications Server 2007 R2. It is very important that you perform these steps prior to migrating. For details, see Planning for Clients and Devices in Lync Server 2013.

⊟To configure clients prior to migration

1. Deploy the most recent server, client, and device updates (hotfixes) for Office Communications Server 2007 R2 as listed in Apply Office Communications Server 2007 R2 Updates.
2. On Office Communications Server 2007 R2, use Client Version Filtering to allow only Office Communications Server 2007 R2 clients with the most current updates installed to sign in.
3. On Office Communications Server 2007 R2, use Client Version Filtering to block Lync Server 2013 clients from signing in. Follow the steps described in **Configuring Client Version Filtering** at http://go.microsoft.com/fwlink/p/?linkId=202488 to add the version filters listed in the following table. For each version filter, assign the action **Block**.

Client	User agent header	Version
Lync 2013	OC	15.*.*.*
Lync Web App	CWA	5.*.*.*
Lync Phone Edition	OCPhone	4.*.*.*

Verify Office Communications Server 2007 R2 Environment

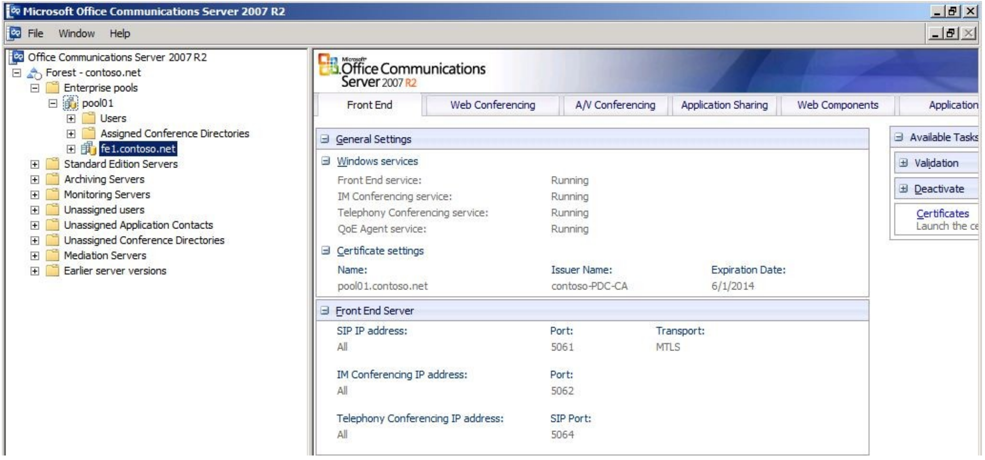
Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 2: Prepare for Migration >

Topic Last Modified: *2012-10-16*

Prior to deploying Lync Server 2013 in a coexistence state with Office Communications Server 2007 R2, you need to verify the Office Communications Server 2007 R2 services are configured and started.

Verify the Pool is started using the Office Communications Server 2007 R2 Administrative Tool

1. Open the Office Communications Server 2007 R2 administrative tool.
2. Expand the **Forest** node, expand the **Standard Edition Servers** or **Enterprise pools** node, and then expand the pool or server name.
3. Ensure that the services are running on the Standard Edition server or Enterprise pool.



General Settings

Windows services

Front End service: Running
IM Conferencing service: Running
Telephony Conferencing service: Running
QoE Agent service: Running

Certificate settings

Name:	Issuer Name:	Expiration Date:
pool01.contoso.net	contoso-PDC-CA	6/1/2014

Front End Server

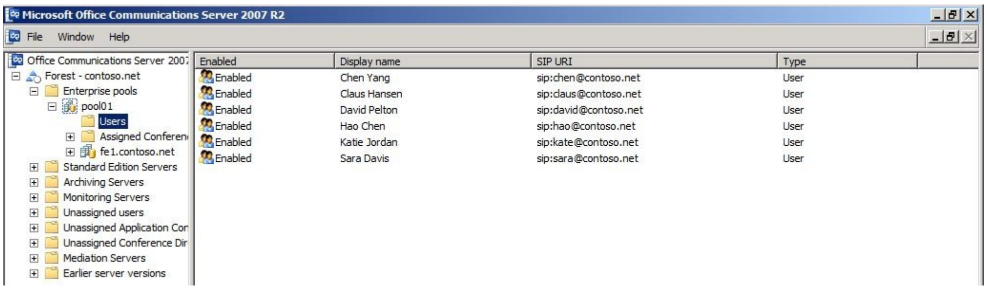
SIP IP address:	Port:	Transport:
All	5061	MTLS

IM Conferencing IP address: All — Port: 5062

Telephony Conferencing IP address: All — SIP Port: 5064

Review Users configured for Office Communications Server 2007 R2

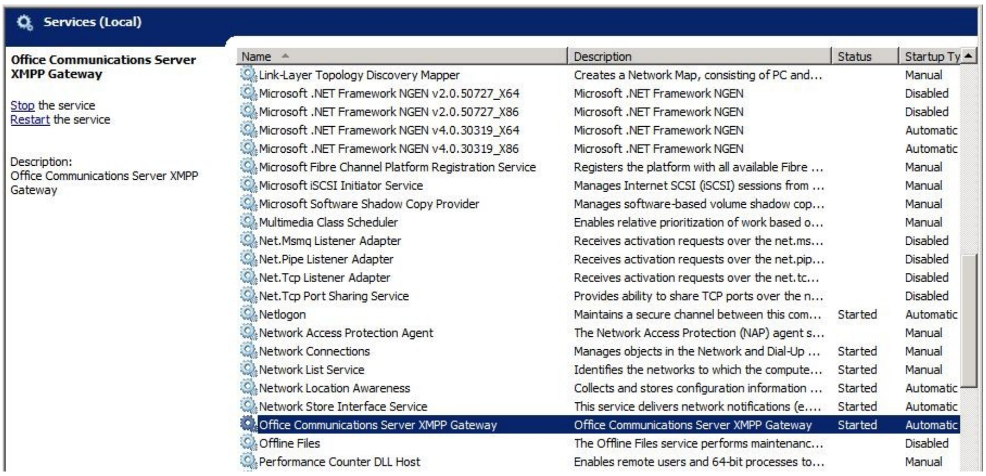
1. Open the Office Communications Server 2007 R2 administrative tool.
2. Expand the **Forest** node, expand the **Standard Edition Servers** or **Enterprise pools** node, and then expand the pool or server name.
3. Click **Users**.
4. Verify the list of Office Communications Server 2007 R2 users.



Enabled	Display name	SIP URI	Type
Enabled	Chen Yang	sip:chen@contoso.net	User
Enabled	Claus Hansen	sip:claus@contoso.net	User
Enabled	David Pelton	sip:david@contoso.net	User
Enabled	Hao Chen	sip:hao@contoso.net	User
Enabled	Katie Jordan	sip:kate@contoso.net	User
Enabled	Sara Davis	sip:sara@contoso.net	User

Verify legacy XMPP Federated Partner Configuration

1. From the legacy XMPP server, navigate to the Administrative Tools\Services applet.
2. Verify that the Office Communications Server XMPP Gateway service is started.



Services (Local)

Office Communications Server XMPP Gateway

Stop the service
Restart the service

1.6.2.4 Phase 3: Deploy Lync Server 2013 Pilot Pool

Phase 3: Deploy Lync Server 2013 Pilot Pool

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-08-28*

This section describes the steps required to deploy a pilot deployment of Lync Server 2013, and a few key validation steps to ensure the two pools are coexisting.

In This Section

- Prepare Active Directory for Lync Server 2013
- Install Lync Server Administration Tools
- Deploy Lync Server 2013 Pilot Pool
- Verify Pilot Pool Coexistence with Legacy Pool

1.6.2.4.1 Prepare Active Directory for Lync Server 2013

Prepare Active Directory for Lync Server 2013

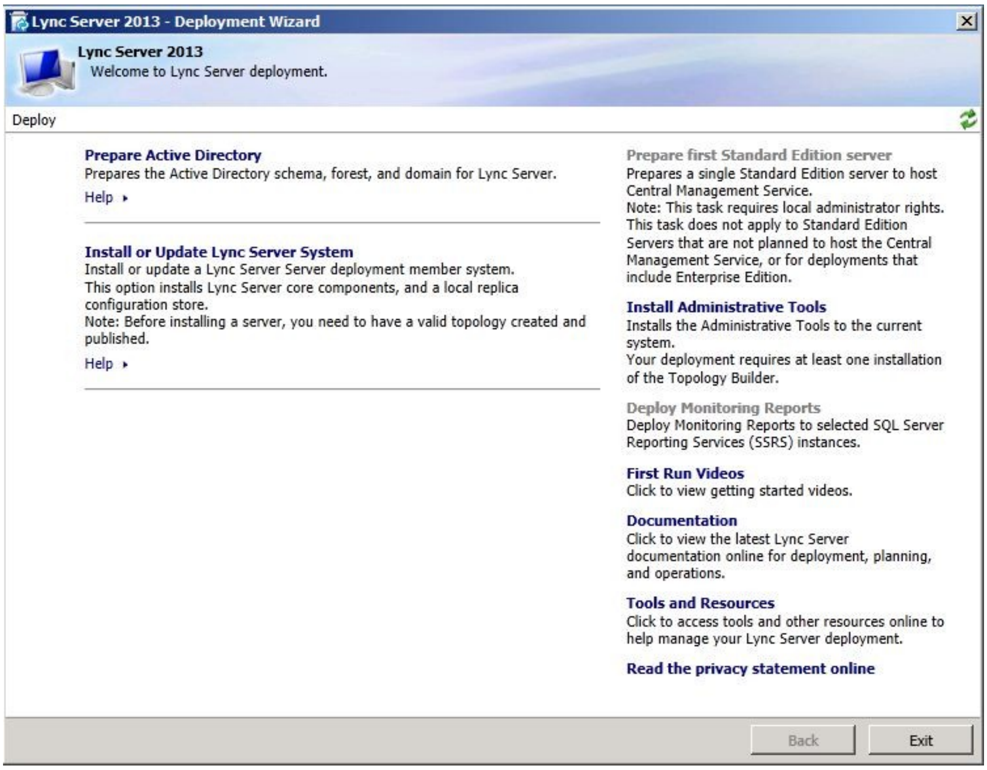
Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 3: Deploy Lync Server 2013 Pilot Pool >

Topic Last Modified: *2012-10-01*

Prior to deploying Lync Server 2013 in a coexistence state with Office Communications Server 2007 R2, you must perform some additional Active Directory tasks to configure the schema, forest, and domain for Lync Server 2013. The schema extensions add the Active Directory classes and attributes that are required by Lync Server. For additional information, see the topic Preparing Active Directory Domain Services for Lync Server 2013.

Prepare Active Directory for Lync Server 2013

1. On the Lync Server 2013 Front End Server, run Lync Server 2013 Setup.
2. Select **Prepare Active Directory**



Lync Server 2013 - Deployment Wizard

Lync Server 2013
Welcome to Lync Server deployment.

Deploy

Prepare Active Directory
Prepares the Active Directory schema, forest, and domain for Lync Server.
Help ▸

Install or Update Lync Server System
Install or update a Lync Server Server deployment member system.
This option installs Lync Server core components, and a local replica configuration store.
Note: Before installing a server, you need to have a valid topology created and published.
Help ▸

Prepare first Standard Edition server
Prepares a single Standard Edition server to host Central Management Service.
Note: This task requires local administrator rights.
This task does not apply to Standard Edition Servers that are not planned to host the Central Management Service, or for deployments that include Enterprise Edition.

Install Administrative Tools
Installs the Administrative Tools to the current system.
Your deployment requires at least one installation of the Topology Builder.

Deploy Monitoring Reports
Deploy Monitoring Reports to selected SQL Server Reporting Services (SSRS) instances.

1.6.2.4.3 Deploy Lync Server 2013 Pilot Pool

Deploy Lync Server 2013 Pilot Pool

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 3: Deploy Lync Server 2013 Pilot Pool >

Topic Last Modified: *2012-10-16*

One of the first steps required for migration to Lync Server 2013 is to deploy a pilot pool. The pilot pool is where you test coexistence of Lync Server 2013 with your Office Communications Server 2007 R2 deployment. Coexistence is a temporary state that lasts until you have moved all users and pools to Lync Server 2013.

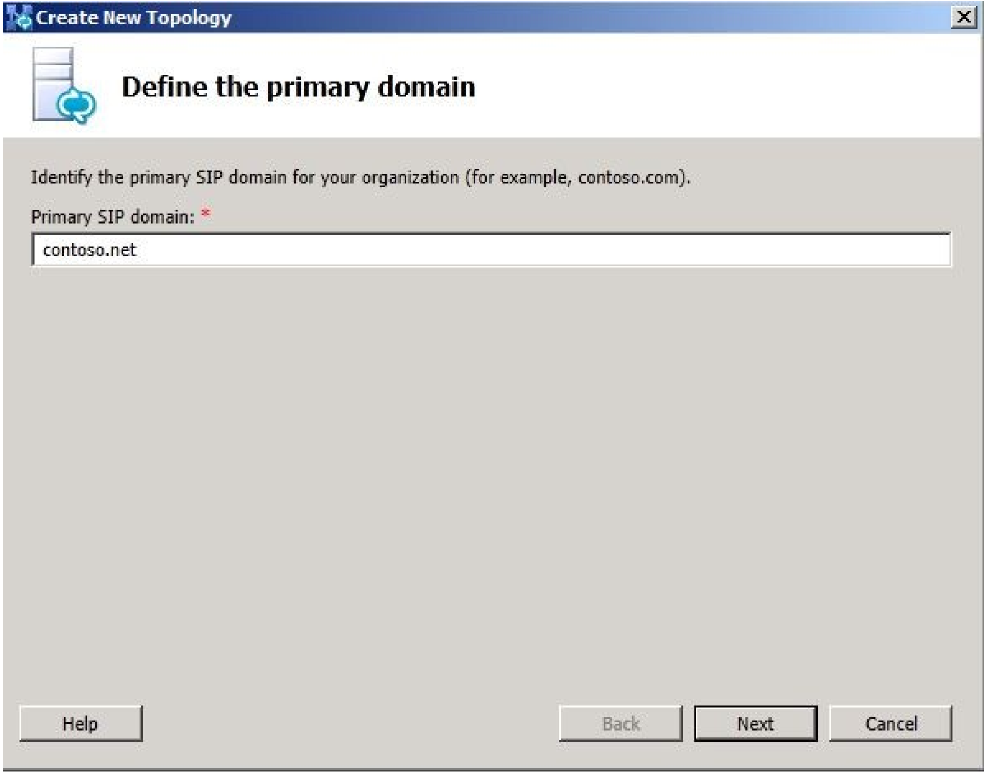
When you deploy a pilot pool, you use the Define New Front End Pool wizard. You should deploy the same features and workloads in your Lync Server 2013 pilot pool that you have in your Office Communications Server 2007 R2 pool. If you deployed Archiving Server, Monitoring Server, or System Center Operations Manager for archiving or monitoring your Office Communications Server 2007 R2 environment, and you want to continue archiving or monitoring throughout the migration, you need to also deploy these features in your pilot environment. The version you deployed to archive or monitor your Office Communications Server 2007 R2 environment will not capture data in your Lync Server 2013 environment.

Note:

The following procedure discusses features and settings you should consider as part of your overall pilot pool deployment process. This section only highlights key points you should consider as part of your pilot pool deployment. For detailed steps, refer to the Deploying Lync Server 2013 deployment guide.

To deploy a Lync Server 2013 pilot pool

1. Log on to the computer where Topology Builder is installed as a member of the Domain Admins group and the RTCUniversalServerAdmins group.
2. Open Topology Builder and choose to create a new topology.
3. Enter the primary SIP domain.

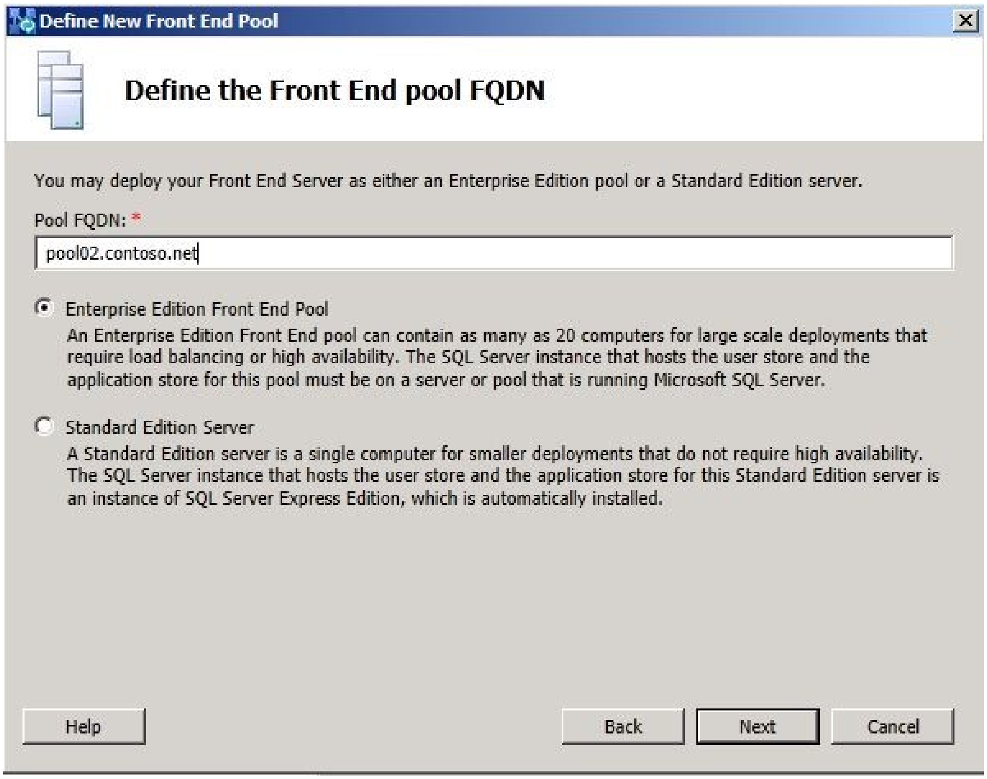


Identify the primary SIP domain for your organization (for example, contoso.com).

Primary SIP domain: * contoso.net

4. Continue completing the wizard until you reach the **Define the New Front End pool** wizard. Click Next.
5. Enter the pool FQDN. When you define your pilot pool, you can choose to deploy an Enterprise Edition Front End pool or a Standard Edition server. Lync Server 2013 does not require that your pilot pool features match what was deployed in your legacy pool.

Warning:
The pool or server fully qualified domain name (FQDN) that you define for the pilot pool must be unique. It cannot match the name of the currently deployed Office Communications Server 2007 R2 pool, or any other servers currently deployed.



Define the Front End pool FQDN

You may deploy your Front End Server as either an Enterprise Edition pool or a Standard Edition server.

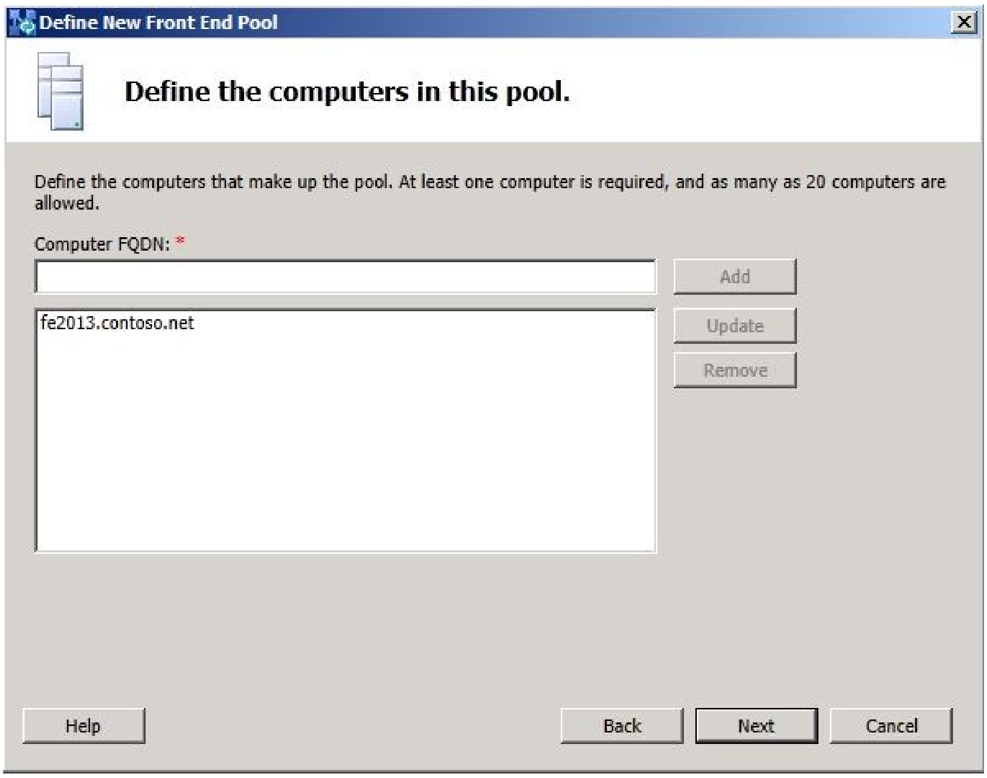
Pool FQDN: *

pool02.contoso.net

● Enterprise Edition Front End Pool
An Enterprise Edition Front End pool can contain as many as 20 computers for large scale deployments that require load balancing or high availability. The SQL Server instance that hosts the user store and the application store for this pool must be on a server or pool that is running Microsoft SQL Server.

○ Standard Edition Server
A Standard Edition server is a single computer for smaller deployments that do not require high availability. The SQL Server instance that hosts the user store and the application store for this Standard Edition server is an instance of SQL Server Express Edition, which is automatically installed.

6. Define the computer that will be added to the pool.



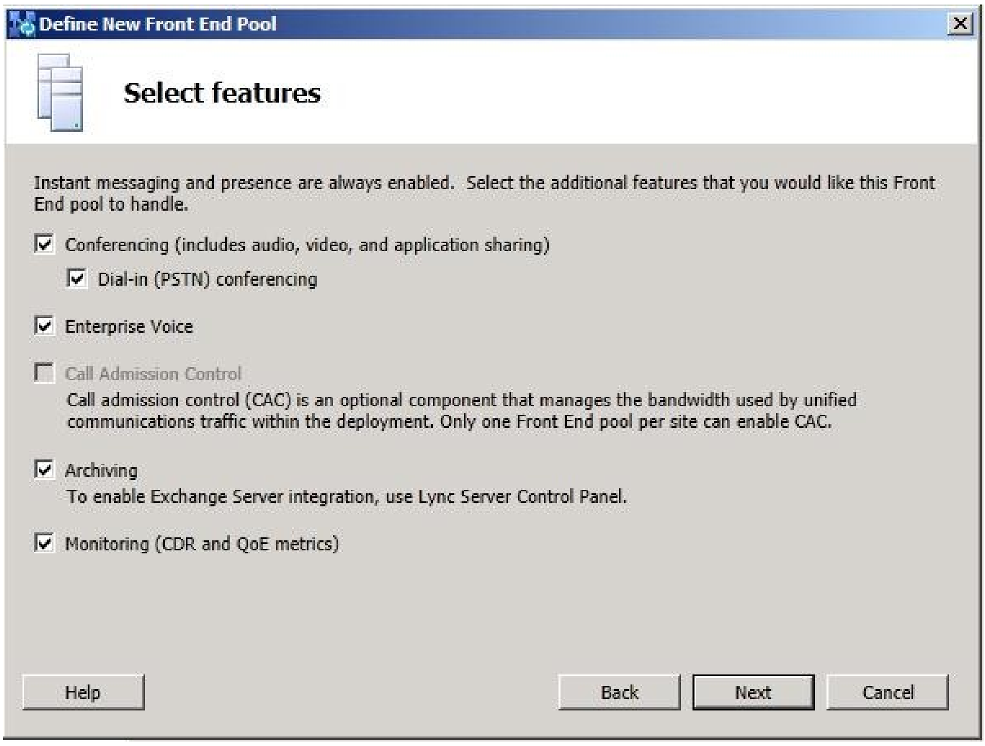
Define the computers in this pool.

Define the computers that make up the pool. At least one computer is required, and as many as 20 computers are allowed.

Computer FQDN: *

fe2013.contoso.net

7. On the **Select features** page, select the check boxes for the features that you want on this Front End pool. For example, if you are deploying only instant messaging (IM) and presence features, you would select the Conferencing check box to allow multiparty IM, but would not select the Dial-in (PSTN) conferencing, Enterprise Voice, or Call Admission Control check boxes, because they represent voice, video, and collaborative conferencing features. For additional information on selecting features, see Define and Configure a Front End Pool or Standard Edition Server in the Deployment documentation.



Define New Front End Pool

Select features

Instant messaging and presence are always enabled. Select the additional features that you would like this Front End pool to handle.

☑ Conferencing (includes audio, video, and application sharing)

☑ Dial-in (PSTN) conferencing

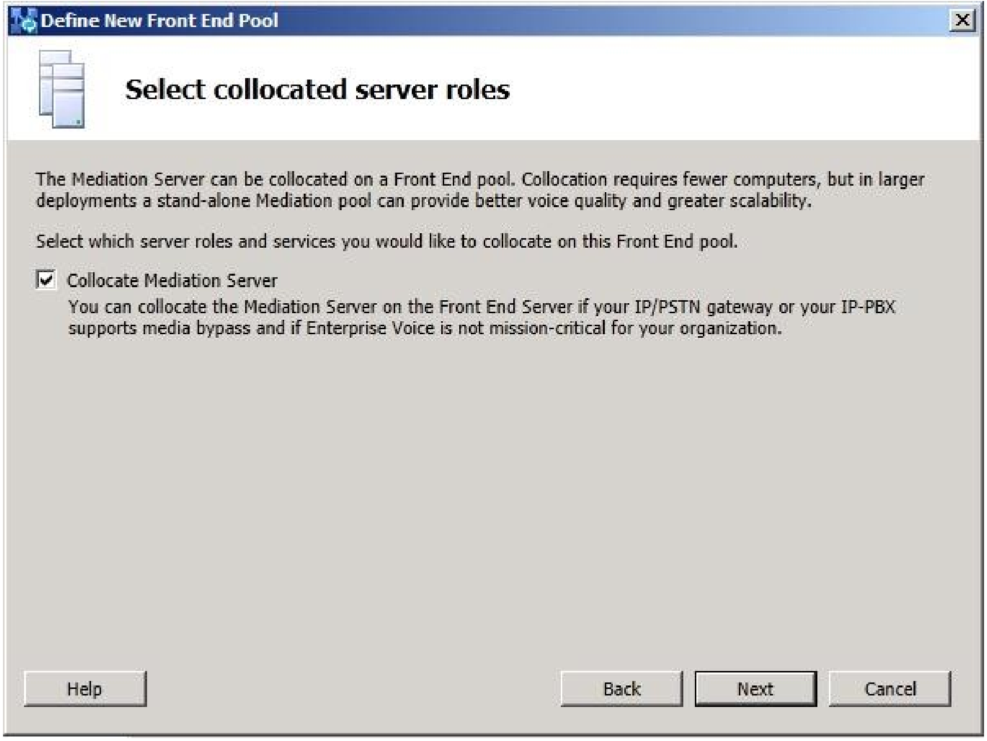
☑ Enterprise Voice

□ Call Admission Control
Call admission control (CAC) is an optional component that manages the bandwidth used by unified communications traffic within the deployment. Only one Front End pool per site can enable CAC.

☑ Archiving
To enable Exchange Server integration, use Lync Server Control Panel.

☑ Monitoring (CDR and QoE metrics)

8. On the **Select collocated server roles** page, we recommend you collocate the Mediation Server in Lync Server 2013. When merging a legacy topology with Lync Server 2013, we require that you first collocate the Office Communications Server 2007 R2 Mediation Server. After merging the topologies and configuring the Lync Server 2013 Mediation Server, you can decide to keep the collocated Mediation Server or change it to a stand-alone server in your Lync Server 2013 deployment.



Define New Front End Pool

Select collocated server roles

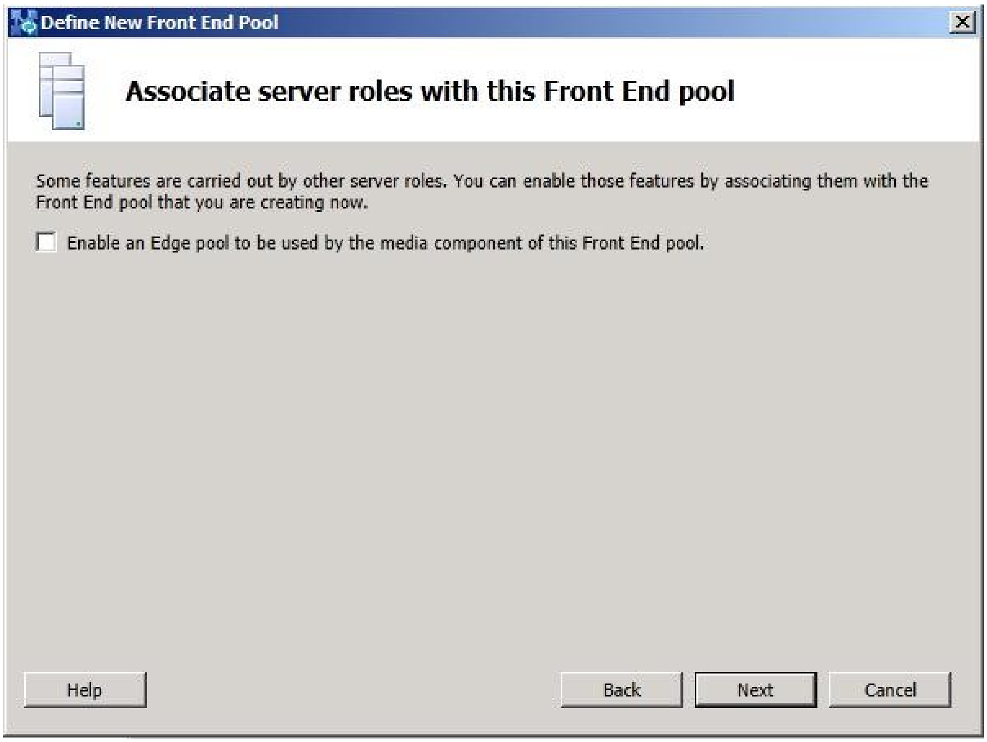
The Mediation Server can be collocated on a Front End pool. Collocation requires fewer computers, but in larger deployments a stand-alone Mediation pool can provide better voice quality and greater scalability.

Select which server roles and services you would like to collocate on this Front End pool.

☑ Collocate Mediation Server
You can collocate the Mediation Server on the Front End Server if your IP/PSTN gateway or your IP-PBX supports media bypass and if Enterprise Voice is not mission-critical for your organization.

9. On the **Associate server roles with this Front End pool** page, during pilot

pool deployment, do not choose the **Enable an Edge pool to be used by the media component of this Front End pool** option. This is a feature you will enable and bring online in a later phase of migration. Keep this setting cleared for now.



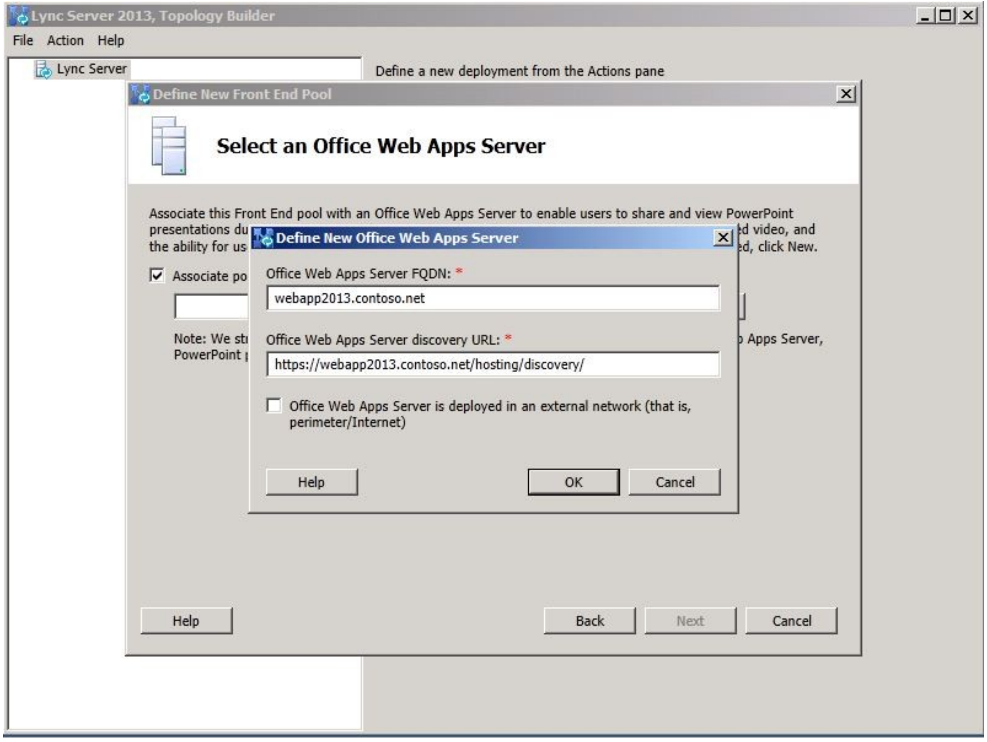
Define New Front End Pool

Associate server roles with this Front End pool

Some features are carried out by other server roles. You can enable those features by associating them with the Front End pool that you are creating now.

☐ Enable an Edge pool to be used by the media component of this Front End pool.

10.On the **Select an Office Web Apps Server** page, click **New**, and specify the FQDN of the application server.



Lync Server 2013, Topology Builder

Define a new deployment from the Actions pane

Define New Front End Pool

Select an Office Web Apps Server

Associate this Front End pool with an Office Web Apps Server to enable users to share and view PowerPoint presentations du … d video, and the ability for us … d, click New.

☑ Associate po

Note: We st … Apps Server, PowerPoint

Define New Office Web Apps Server

Office Web Apps Server FQDN: *

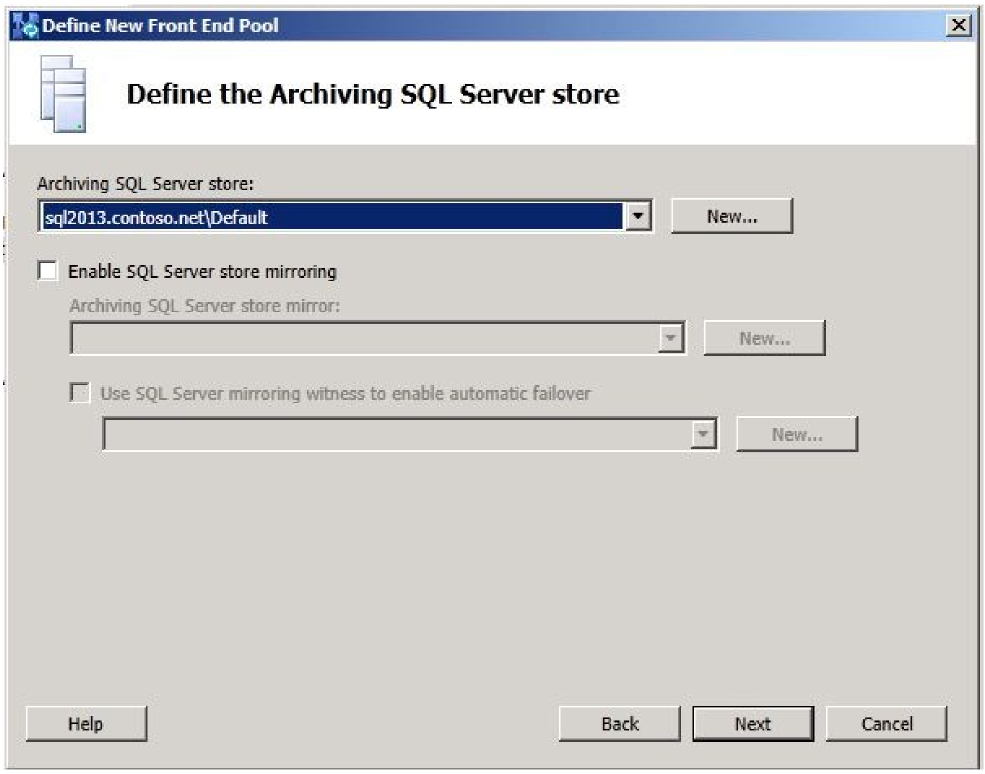
webapp2013.contoso.net

Office Web Apps Server discovery URL: *

https://webapp2013.contoso.net/hosting/discovery/

☐ Office Web Apps Server is deployed in an external network (that is, perimeter/Internet).

11.On the **Define the Archiving SQL Server store** page, select the SQL Server instance created earlier for Lync Server 2013.



Define New Front End Pool

Define the Archiving SQL Server store

Archiving SQL Server store: sql2013.contoso.net\Default

□ Enable SQL Server store mirroring

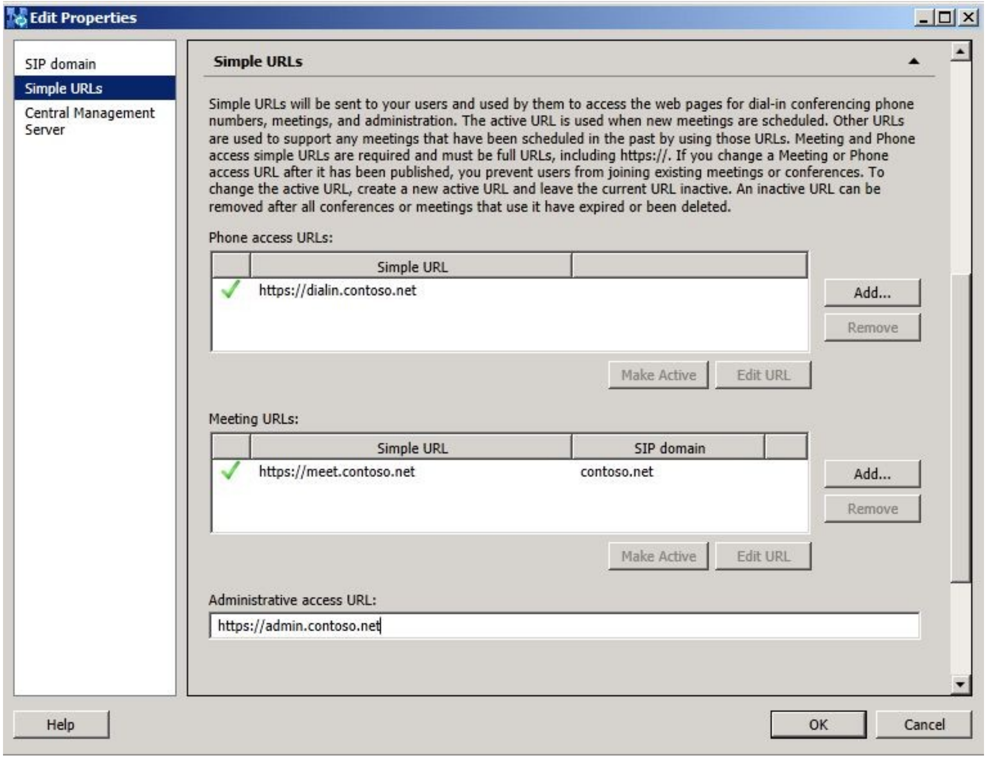
Archiving SQL Server store mirror:

□ Use SQL Server mirroring witness to enable automatic failover

12.On the **Define the Monitoring SQL Server store** page, select the SQL Server instance created earlier for Lync Server 2013. Click **Finish**.

13.From the top node of Topology Builder, right click **Lync Server** and click **Edit Properties.** Click **Simple URLs**.

14.Update the **Administrative access URL**.



Edit Properties

Simple URLs

Simple URLs will be sent to your users and used by them to access the web pages for dial-in conferencing phone numbers, meetings, and administration. The active URL is used when new meetings are scheduled. Other URLs are used to support any meetings that have been scheduled in the past by using those URLs. Meeting and Phone access simple URLs are required and must be full URLs, including https://. If you change a Meeting or Phone access URL after it has been published, you prevent users from joining existing meetings or conferences. To change the active URL, create a new active URL and leave the current URL inactive. An inactive URL can be removed after all conferences or meetings that use it have expired or been deleted.

Phone access URLs:

	Simple URL	
✓	https://dialin.contoso.net	

Meeting URLs:

	Simple URL	SIP domain
✓	https://meet.contoso.net	contoso.net

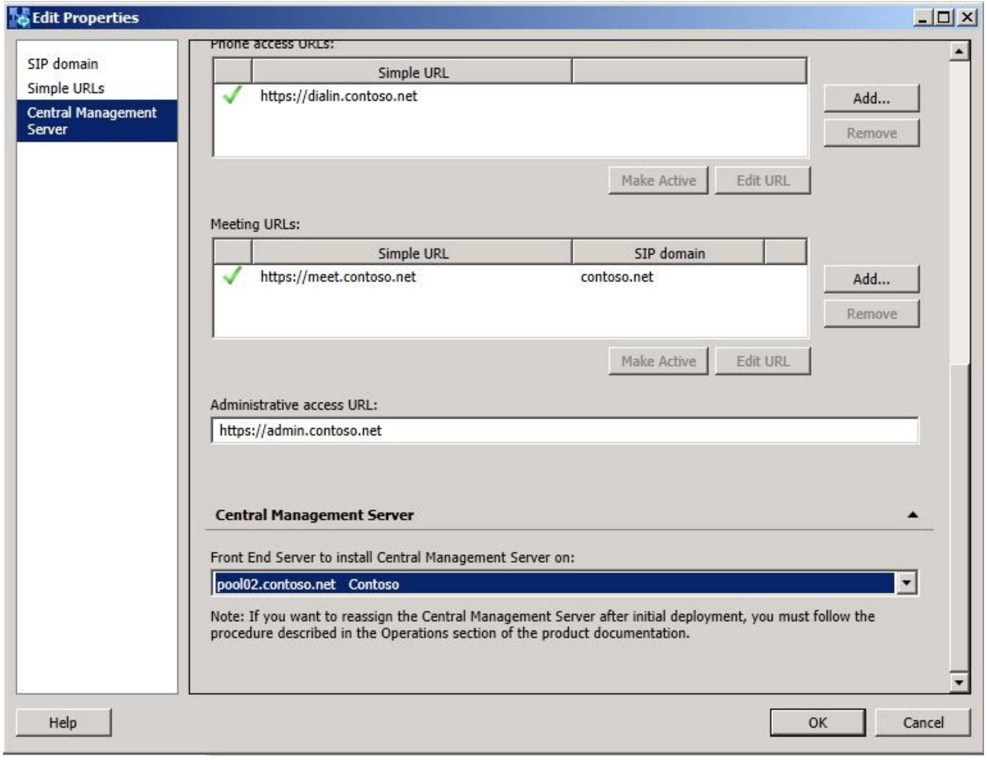
Administrative access URL: https://admin.contoso.net

For additional information on Simple URLs, see the topic Edit or Configure

Simple URLs in the Deployment documentation.

15.From the **Edit Properties**, click **Central Management Server**.

16.From the drop-down list, select the Lync Server 2013 pool.



Phone access URLs:

	Simple URL	
✓	https://dialin.contoso.net	

Meeting URLs:

	Simple URL	SIP domain
✓	https://meet.contoso.net	contoso.net

Administrative access URL:
https://admin.contoso.net

Central Management Server

Front End Server to install Central Management Server on:
pool02.contoso.net Contoso

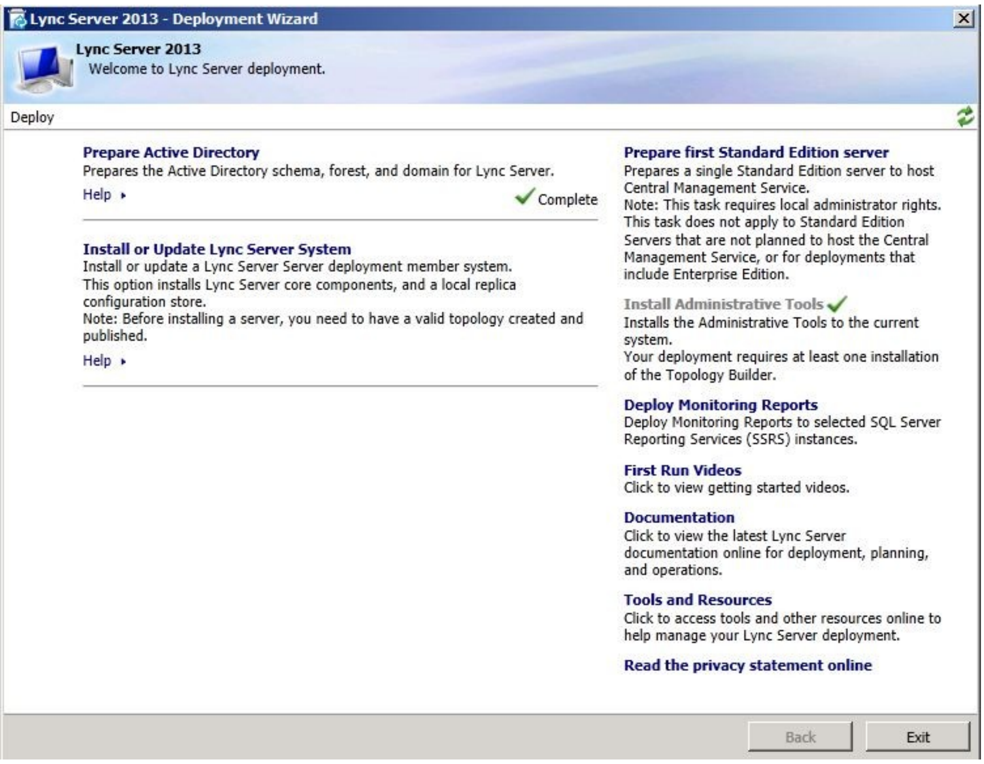
Note: If you want to reassign the Central Management Server after initial deployment, you must follow the procedure described in the Operations section of the product documentation.

17.Click OK to close **the Edit Properties** page.

18.From the **Action** menu, select **Publish Topology**.

19.When the publish process has completed, click **Finish**.

20.Returning to the Lync Server 2013 Deployment Wizard, click **Install or Update Lync Server System**.



Lync Server 2013 - Deployment Wizard

Lync Server 2013

Welcome to Lync Server deployment.

Deploy

Prepare Active Directory
Prepares the Active Directory schema, forest, and domain for Lync Server.

1.6.2.5 Phase 4: Merge Topologies

Phase 4: Merge Topologies

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-03-29*

The following topics outline the steps needed to merge your Microsoft Office Communications Server 2007 R2 pools to Microsoft Lync Server 2013 pools. First, you use the Topology Builder Merge wizard to merge topology information. This tool collects information about your Office Communications Server 2007 R2 environment, including Edge Server information, and publishes that information to a database shared with Lync Server 2013. After you publish the merged topology, Topology Builder is used to view the Office Communications Server 2007 R2 topology information and information about the newly deployed Lync Server 2013 topology. Finally, you use Lync Server Management Shell cmdlets to import policies and configuration settings.

In This Section

- Install WMI Backward Compatibility Package
- Merge Using Topology Builder Merge Wizard
- Import Policies and Settings
- Verify Topology Information

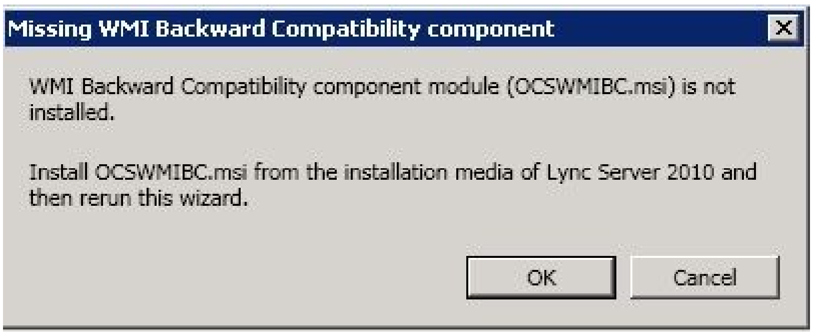
1.6.2.5.1 Install WMI Backward Compatibility Package

Install WMI Backward Compatibility Package

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 4: Merge Topologies >

Topic Last Modified: *2012-10-02*

If you attempt to run the Topology Builder Merge wizard without installing the WMI Backward Compatibility package, you will see the following error:

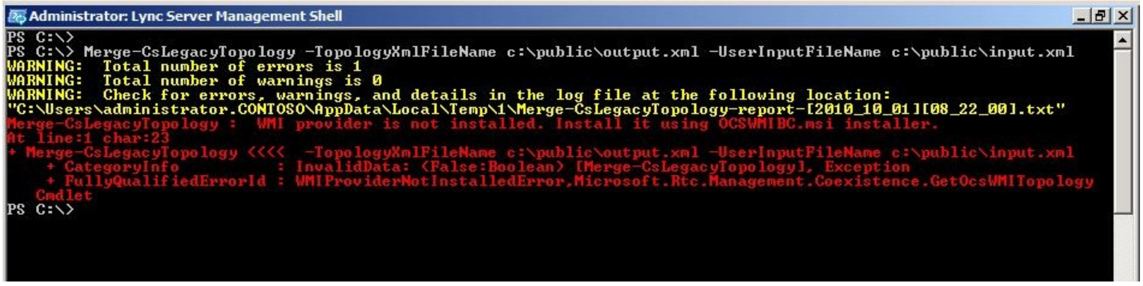


Missing WMI Backward Compatibility component

WMI Backward Compatibility component module (OCSWMIBC.msi) is not installed.

Install OCSWMIBC.msi from the installation media of Lync Server 2010 and then rerun this wizard.

If you attempt to run the **Merge-CsLegacytopology** cmdlet without installing the WMI Backward Compatibility package, you will see the following error:



```
PS C:\>
PS C:\> Merge-CsLegacyTopology -TopologyXmlFileName c:\public\output.xml -UserInputFileName c:\public\input.xml
WARNING:  Total number of errors is 1
WARNING:  Total number of warnings is 0
WARNING:  Check for errors, warnings, and details in the log file at the following location:
"C:\Users\administrator.CONTOSO\AppData\Local\Temp\1\Merge-CsLegacyTopology-report-[2010_10_01][08_22_00].txt"
Merge-CsLegacyTopology :  WMI provider is not installed. Install it using OCSWMIBC.msi installer.
At line:1 char:23
+ Merge-CsLegacyTopology <<<<  -TopologyXmlFileName c:\public\output.xml -UserInputFileName c:\public\input.xml
    + CategoryInfo          : InvalidData: (False:Boolean) [Merge-CsLegacyTopology], Exception
    + FullyQualifiedErrorId : WMIProviderNotInstalledError,Microsoft.Rtc.Management.Coexistence.GetOcsWMITopology
   Cmdlet
PS C:\>
```

To install the WMI Backward Compatibility Package

1. From your installation media, navigate to \SETUP\AMD64\SETUP \OCSWMIBC.MSI.
2. Install OCSWMIBC.MSI.

Important:

OCSWMIBC.msi must be installed on the computer where the Topology Builder Merge wizard is run. However, we recommend installing OCSWMIBC.msi on all Front End servers in your topology.

Important:

OCSWMIBC.msi can be installed on any computer in the domain that has the Lync Server 2013 Core Components and the Lync Server 2013 Management Shell installed, and has access to the Office Communications Server 2007 R2 topology (WMI provider to Active Directory Domain Services (AD DS) and SQL Server).

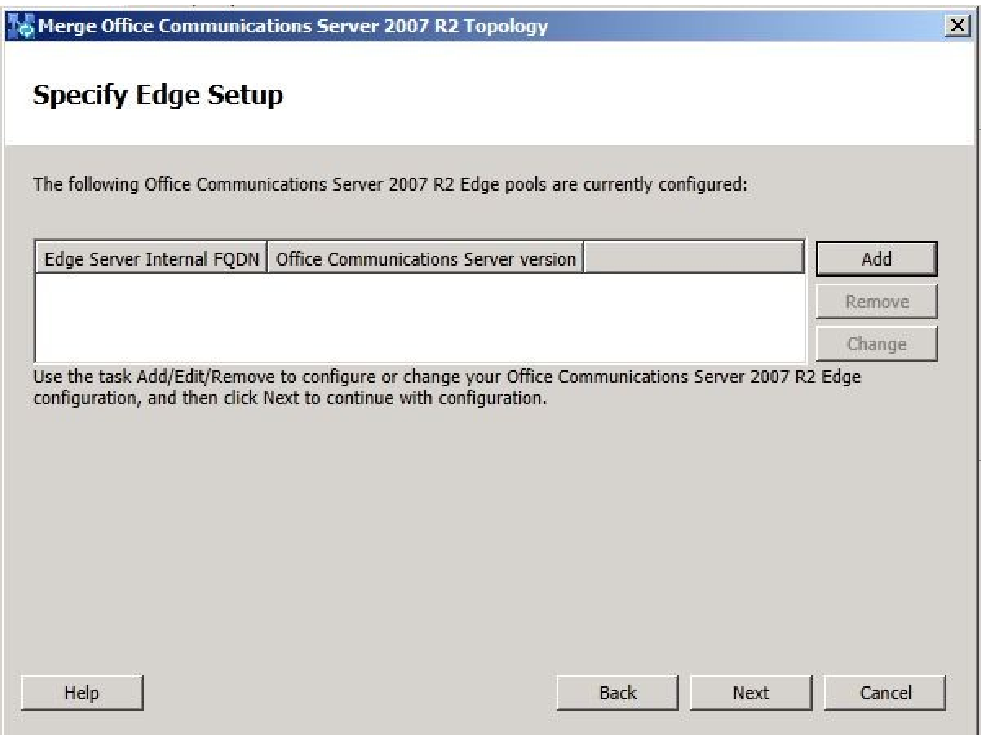
1.6.2.5.2 Merge Using Topology Builder Merge Wizard

Merge Using Topology Builder Merge Wizard

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 4: Merge Topologies >

Topic Last Modified: *2012-10-02*

1. Download the existing deployment using Topology Builder.
2. From the **Action** menu, select **Merge Office Communications Server 2007 R2**.
3. Click **Next**.
4. In **Specify Edge Setup**, click **Add**.



Specify Edge Setup

The following Office Communications Server 2007 R2 Edge pools are currently configured:

Edge Server Internal FQDN	Office Communications Server version	

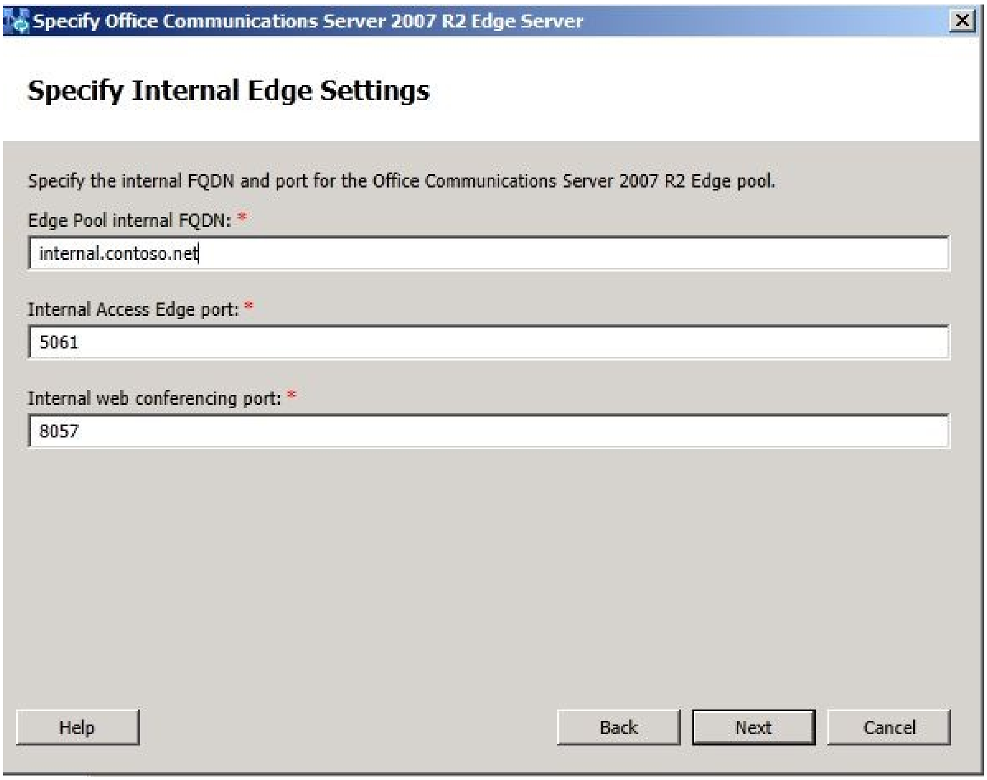
Use the task Add/Edit/Remove to configure or change your Office Communications Server 2007 R2 Edge configuration, and then click Next to continue with configuration.

5. In **Specify Edge Type**, enter the type of Edge Server configuration, and then click **Next**. This example uses the **Single Edge Server** option.

Important:

Expanded Edge deployment is not a supported configuration. An **Expanded Edge Server** must first be converted to a **Single Edge Server** or a **Load-balanced consolidated Edge** Server.

6. In **Specify Internal Edge Settings** , enter the relevant information for your Edge pool's internal FQDN and ports as needed, and then click **Next**.



Specify Internal Edge Settings

Specify the internal FQDN and port for the Office Communications Server 2007 R2 Edge pool.

Edge Pool internal FQDN: * internal.contoso.net

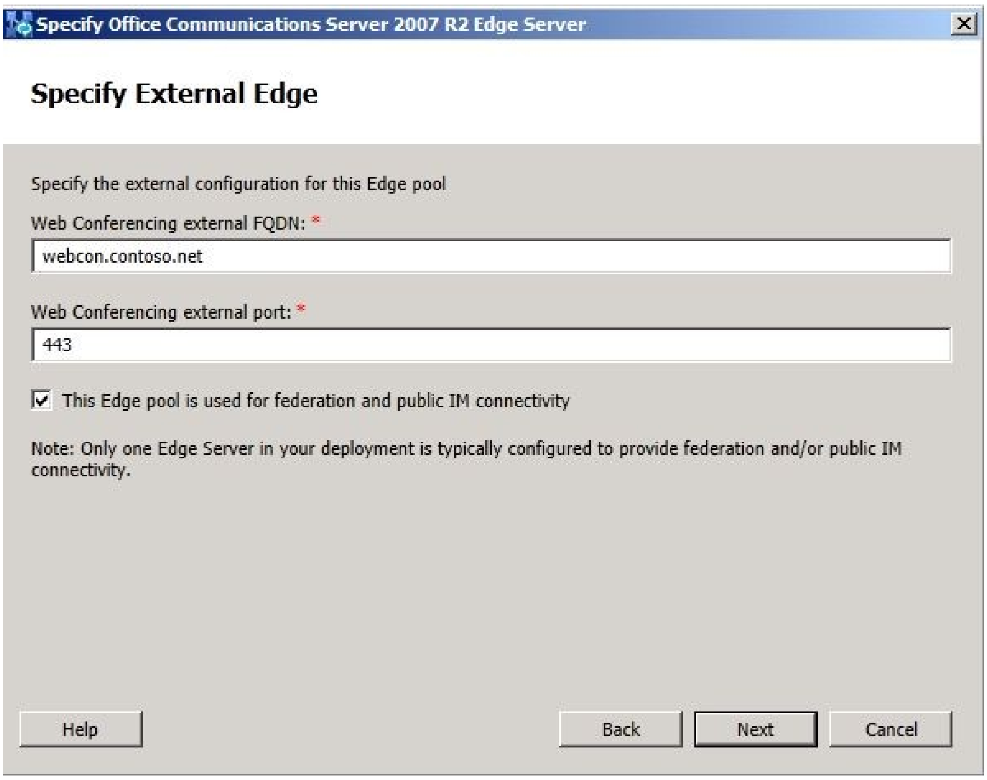
Internal Access Edge port: * 5061

Internal web conferencing port: * 8057

7. In **Specify External Edge**, enter the web conferencing FQDN information for your Edge Server.

> **Important:**
> Before you click **Next**, do the next step in this procedure. It is very important that you do not miss this step.

8. Check the **This Edge pool is used for federation and public IM connectivity** check box if you plan to use the legacy Office Communications Server 2007 R2 Edge Server for federation. If you have multiple Edge Servers deployed, only one of them will be enabled for federation. If you do not check this box and you decide later that you want to enable federation, you must run the Topology Builder Merge wizard and publish your topology again.



Specify Office Communications Server 2007 R2 Edge Server

Specify External Edge

Specify the external configuration for this Edge pool

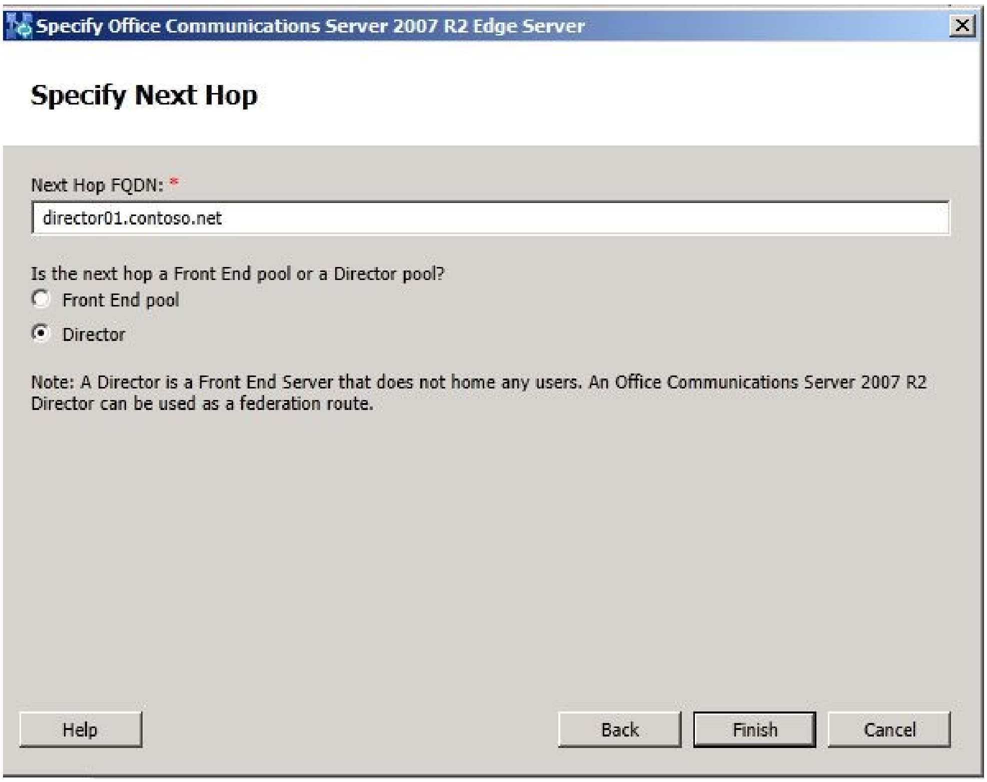
Web Conferencing external FQDN: *
webcon.contoso.net

Web Conferencing external port: *
443

☑ This Edge pool is used for federation and public IM connectivity

Note: Only one Edge Server in your deployment is typically configured to provide federation and/or public IM connectivity.

9. In **Specify Next Hop**, enter the fully qualified domain name (FQDN) of the next hop location in your environment. Click **Finish**.



Specify Office Communications Server 2007 R2 Edge Server

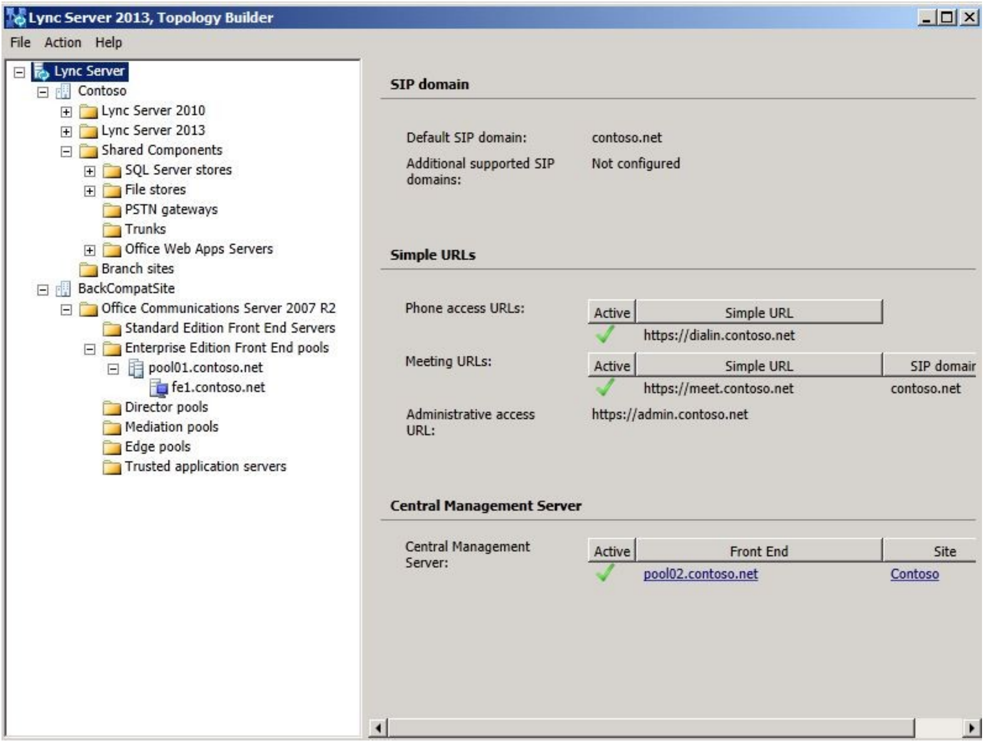
Specify Next Hop

Next Hop FQDN: *
director01.contoso.net

Is the next hop a Front End pool or a Director pool?
○ Front End pool
● Director

Note: A Director is a Front End Server that does not home any users. An Office Communications Server 2007 R2 Director can be used as a federation route.

10. In **Specify Edge Setup**, if all your Office Communications Server 2007 R2 Edge Servers have been added, click **Next**. If you have more Office Communications Server 2007 R2 Edge Servers to add, repeat this procedure starting at step 4.
11. In **Specify Internal SIP port** , select the default setting (that is, if you did not modify the default SIP port). Change as appropriate if you are not using a default port of 5061, and then click **Next**.
12. In **Summary**, click **Next** to begin merging the topologies.
13. The wizard page verifies that the merging of the topologies was successful.
14. In the **Status** column, verify that the value is **Success**, and then click **Finish**.
15. In the left pane of Topology Builder, you should now see the **BackCompatSite**, which indicates that your Office Communications Server 2007 R2 environment has been merged with Lync Server 2013.



SIP domain

Default SIP domain: contoso.net

Additional supported SIP domains: Not configured

Simple URLs

Phone access URLs:

Active	Simple URL
✓	https://dialin.contoso.net

Meeting URLs:

Active	Simple URL	SIP domair
✓	https://meet.contoso.net	contoso.net

Administrative access URL: https://admin.contoso.net

Central Management Server

Central Management Server:

Active	Front End	Site
✓	pool02.contoso.net	Contoso

16. From the **Action** menu, click **Publish Topology**, and then click **Next**.
17. When the **Publishing wizard** completes, click **Finish**.

> **Note:**
> It’s important that you complete the next topic, Import Policies and Settings, to ensure that the legacy policy settings are imported into Lync Server 2013.

1.6.2.5.3 Import Policies and Settings

Import Policies and Settings

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 4: Merge Topologies >

Topic Last Modified: *2012-09-28*

After you merge your Office Communications Server 2007 R2 topology information with your Lync Server 2013 pilot pool, you need to run a Lync Server 2013 Management Shell cmdlet to migrate your Office Communications Server 2007 R2 policies and configuration settings to your Lync Server 2013 pilot pool.

The **Import-CsLegacyConfiguration** cmdlet imports policies, voice routes, dial plans, Communicator Web Access URLs, and dial-in access numbers to Lync Server 2013.

To migrate policies and settings

1. On the Lync Server 2013 Front End server, start the Lync Server Management Shell.
2. At the command line, type the following:

   ```
   Import-CsLegacyConfiguration
   ```

   After the policies are imported, use the procedure that follows to see the imported policies in the Lync Server Control Panel .

To view imported policies

1. Open Lync Server 2013 Control Panel.
2. Click **Voice Routing** and view the imported policies.
3. Click **Conferencing** and view the imported policies.
4. Click **Federation and External Access** and view the imported policies.
5. Click **Monitoring and Archiving** and view the imported policies.

1.6.2.5.4 Verify Topology Information

Verify Topology Information

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 4: Merge Topologies >

Topic Last Modified: *2012-09-26*

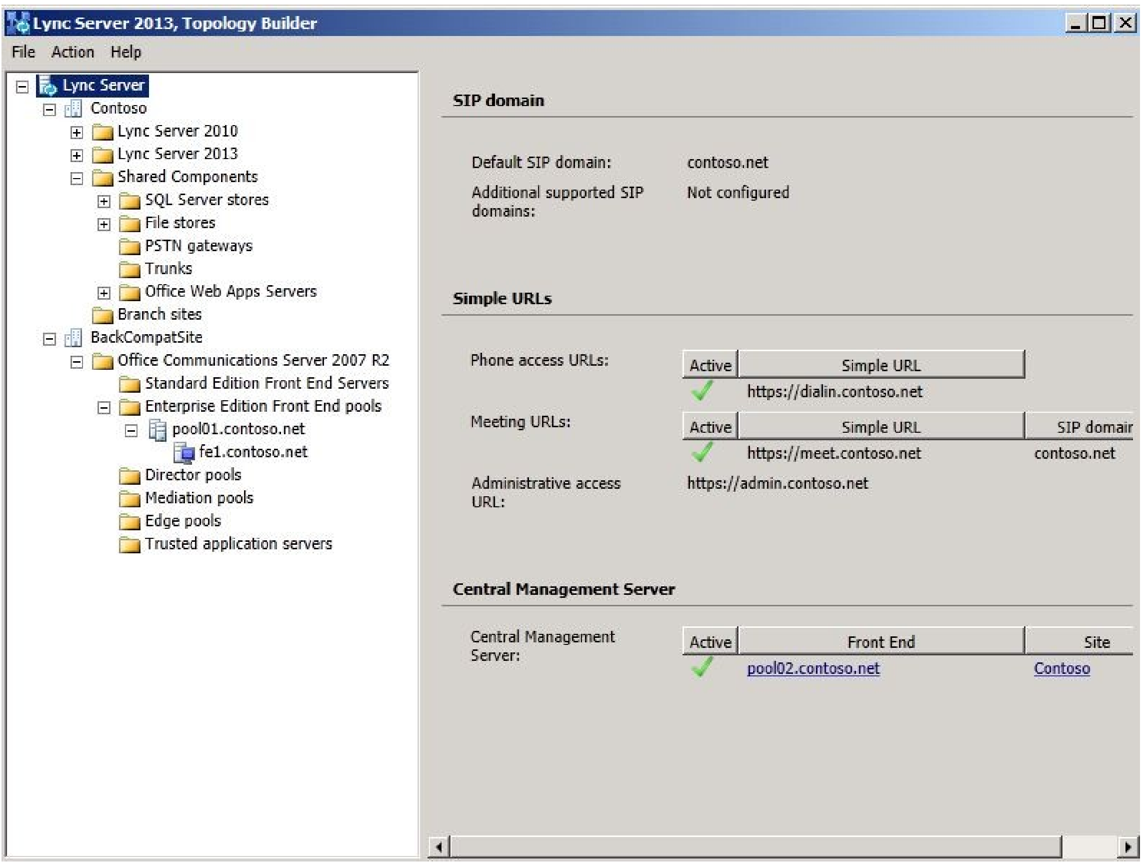
The first step in verifying the merge completed successfully is to view the Office Communications Server 2007 R2 topology information that you merged with Lync Server 2013. In Topology Builder, the **BackCompatSite** node displays the fully qualified domain name (FQDN) of each Office Communications Server 2007 R2 pool and server that you merged.

To view BackCompatSite in Topology Builder

1. In your Office Communications Server 2007 R2 environment, open the Office Communications Server 2007 R2 administrative tool and note the FQDNs of the legacy pools and servers.
2. In your Lync Server 2013 environment, open Topology Builder and then expand the **BackCompatSite** node.
3. Verify that the FQDNs for the pools and servers that you merge are displayed.

Note:

You do not see any information in **BackCompatSite** for server roles that are collocated on a Front End Server or Standard Edition server. Only server roles that are required for interoperability between Office Communications Server 2007 R2 and Lync Server 2013 are shown.



SIP domain

Default SIP domain: contoso.net

Additional supported SIP domains: Not configured

Simple URLs

Phone access URLs:

Active	Simple URL
✓	https://dialin.contoso.net

Meeting URLs:

Active	Simple URL	SIP domair
✓	https://meet.contoso.net	contoso.net

Administrative access URL: https://admin.contoso.net

Central Management Server

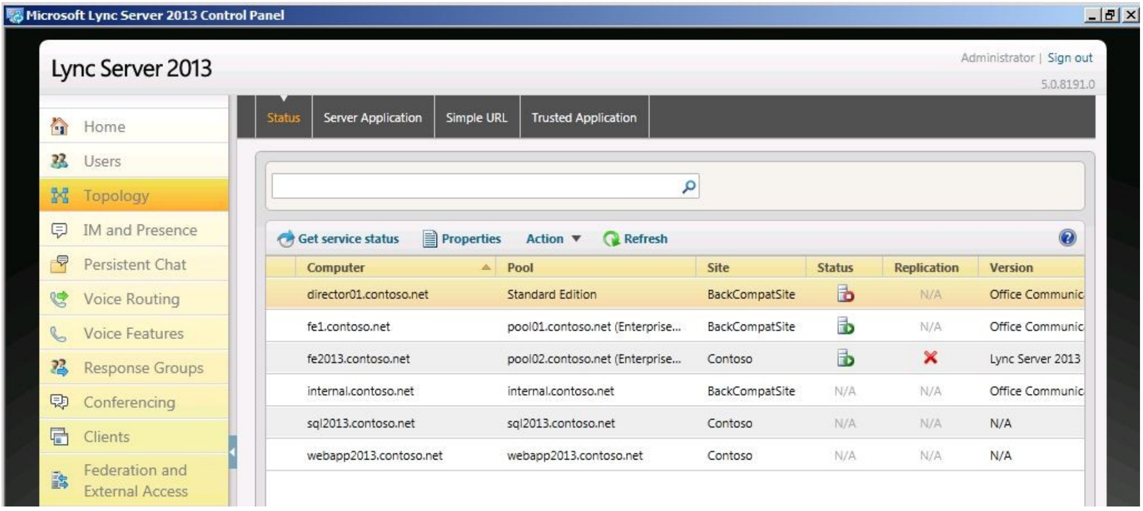
Central Management Server:

Active	Front End	Site
✓	pool02.contoso.net	Contoso

You can also use Lync Server 2013 Control Panel to view your merged topology. In Lync Server 2013 Control Panel, you can see each server FQDN, pool FQDN, and site name for your merged topology. Merged servers have a **Site** name of **BackCompatSite**.

To view the merged topology in Lync Server 2013 Control Panel

1. Open Lync Server 2013 Control Panel.
2. Click **Topology**.
3. On the **Status** tab, verify that servers and pools you merged appear by looking for **BackCompatSite** in the **Site** column.



Computer	Pool	Site	Status	Replication	Version
director01.contoso.net	Standard Edition	BackCompatSite		N/A	Office Communic
fe1.contoso.net	pool01.contoso.net (Enterprise...	BackCompatSite		N/A	Office Communic
fe2013.contoso.net	pool02.contoso.net (Enterprise...	Contoso		✗	Lync Server 2013
internal.contoso.net	internal.contoso.net	BackCompatSite	N/A	N/A	Office Communic
sql2013.contoso.net	sql2013.contoso.net	Contoso	N/A	N/A	N/A
webapp2013.contoso.net	webapp2013.contoso.net	Contoso	N/A	N/A	N/A

To see more detail about a merged pool, use the **Get-CsPool** cmdlet. In addition to the information that is available in Topology Builder and Lync Server 2013 Control Panel, this cmdlet displays the services that run on the Lync Server 2013 pool.

> **Note:**
> When you publish the topology after running the Merge wizard in Topology Builder, conference directories are merged to Lync Server 2013. Conference directories can be verified by running the **Get-CsConferenceDirectory** cmdlet.

To view services on a merged pool

1. Open the Lync Server 2013 Management Shell.
2. At the command line, type the following:

```
Get-CsPool [-Identity <FQDN of the pool>]
```

For example:

```
Get-CsPool -Identity pool02.contoso.net
```

To verify conference directories merged

1. Open the Lync Server 2013 Management Shell.
2. At the command line, type the following:

```
Get-CsConferenceDirectory
```

3. Verify that all the conference directories for the pool or server you are merging are now in Lync Server 2013.

1.6.2.6 Phase 5: Configure the Pilot Pool

Phase 5: Configure the Pilot Pool

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-10-19*

Now that the pilot pool has been created and legacy deployment information has been merged with Lync Server 2013, this section identifies a few configurations that must be made to the pilot pool.

In This Section

1.6.2.6.1 Connect Pilot Pool to Legacy Edge Servers

Connect Pilot Pool to Legacy Edge Servers

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 5: Configure the Pilot Pool >

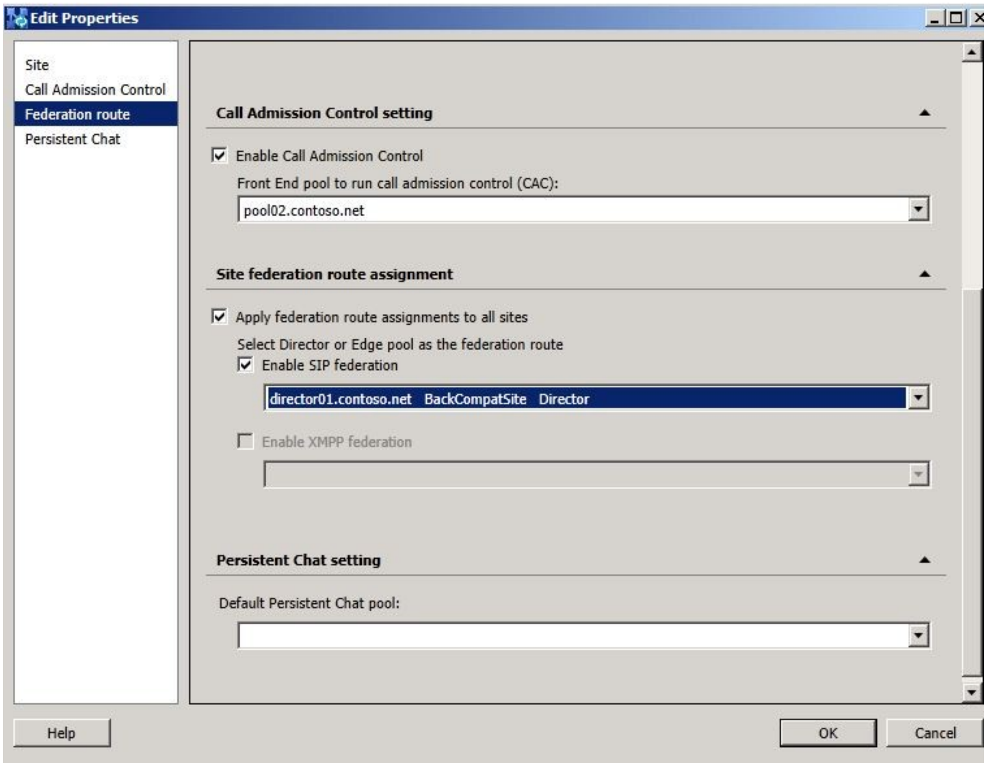
Topic Last Modified: *2012-10-02*

After deploying Lync Server 2013, a federation route for this site is not configured. In order to use the federated route that is being used by Office Communications Server 2007 R2, Lync Server 2013 must be configured to use this route.

To enable the Lync Server 2013 site to use the Director and Edge Server of the BackCompatSite, use Topology Builder to associate the legacy Edge pool.

To associate the legacy Edge pool by using Topology Builder

1. Open the pilot pool topology in Topology Builder.
2. Select your Lync Server 2013 site.
3. On the **Action** menu, click **Edit Properties**.
4. Under **Site federation route assignment**, select **Enable SIP federation**, and then select the Office Communications Server 2007 R2 Director, or the Office Communications Server 2007 R2 Edge Server if no Director is listed.



Call Admission Control setting

☑ Enable Call Admission Control

Front End pool to run call admission control (CAC): pool02.contoso.net

Site federation route assignment

☑ Apply federation route assignments to all sites

Select Director or Edge pool as the federation route

☑ Enable SIP federation

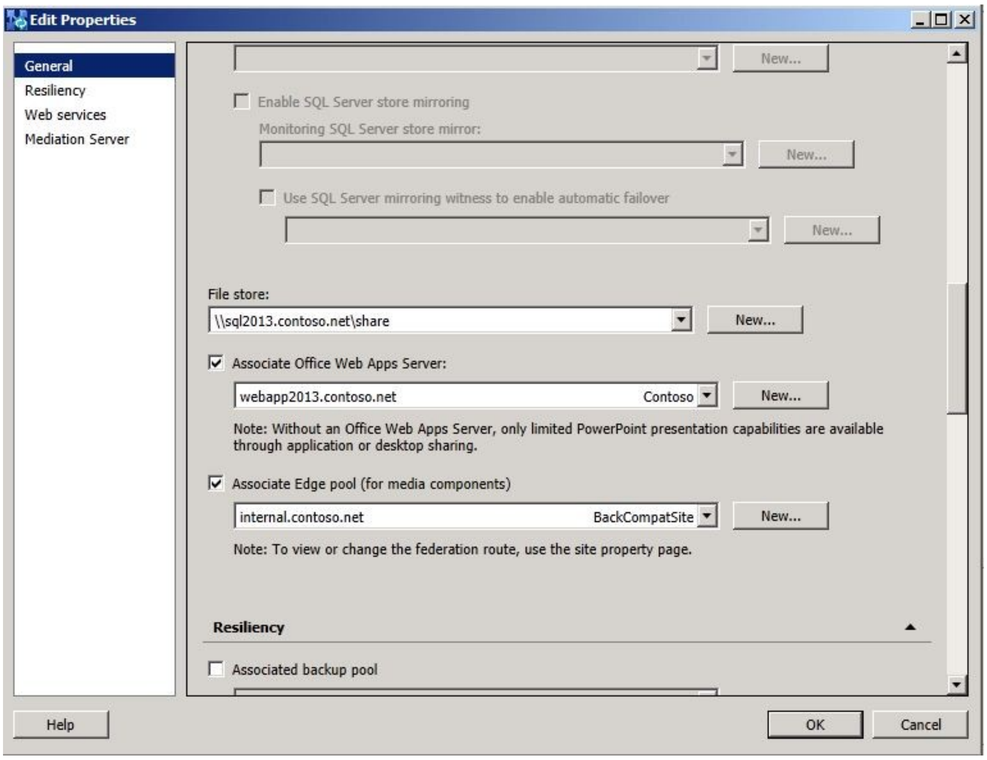
director01.contoso.net BackCompatSite Director

☐ Enable XMPP federation

Persistent Chat setting

Default Persistent Chat pool:

5. Click **OK** to close the **Edit Properties** page.
6. In Topology Builder, under the Lync Server 2013 node, navigate to the **Standard Edition server** or **Enterprise Edition Front End pools**, right-click the pool, and then click **Edit Properties**.
7. Under **Associations**, select the check box next to **Associate Edge pool (for media components)**.
8. From the list, select the Edge Server interface for the BackCompatSite.



☐ Enable SQL Server store mirroring

Monitoring SQL Server store mirror:

☐ Use SQL Server mirroring witness to enable automatic failover

File store:
\\sql2013.contoso.net\share

☑ Associate Office Web Apps Server:
webapp2013.contoso.net Contoso

Note: Without an Office Web Apps Server, only limited PowerPoint presentation capabilities are available through application or desktop sharing.

☑ Associate Edge pool (for media components)
internal.contoso.net BackCompatSite

Note: To view or change the federation route, use the site property page.

Resiliency

☐ Associated backup pool

9. Click **OK** to close the **Edit Properties** page.
10. In **Topology Builder**, select the top-most node, **Lync Server**.
11. From the **Action** menu, click **Publish Topology**, and then click **Next**.
12. When the **Publishing wizard** completes, click **Finish**.

1.6.2.6.2 Authorize Connection to Office Communications Server 2007 R2 Edge Server

Authorize Connection to Office Communications Server 2007 R2 Edge Server

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 5: Configure the Pilot Pool >

Topic Last Modified: *2012-09-28*

For each Lync Server 2013 Front End Server or Standard Edition server in your pilot pool, you must update the list of internal servers that are authorized to connect to the Office Communications Server 2007 R2 Edge Server. Without these updates, external audio/visual (A/V) conferencing for users joining by using the legacy Edge Server will not work.

To Authorize Connection to Office Communications Server 2007 R2 Edge Server

1. From the Office Communications Server 2007 R2 Edge Server, from the **Administrative Tools** group, open the **Computer Management** snap-in.
2. In the console tree, expand **Services and Applications**.
3. Right-click **Office Communications Server 2007 R2**, and then click

Properties.

4. Click the **Internal** tab.
5. Under **Add Server**, click **Add**.
6. In the **Add Office Communications Server** dialog box, enter the appropriate information:

   - Specify the fully qualified domain name (FQDN) of each Lync Server 2013 Front End Server or Standard Edition server, and Lync Server 2013 pool.

   - Specify the FQDN of the Lync Server 2013 Director if you configured a static route on the pool that specifies the next hop computer by its FQDN.

7. After you have added an entry for each Lync Server 2013, Front End Server, Standard Edition server, pool, and Director, click **Apply** and then click **OK** to close the Properties page.

1.6.2.6.3 Verify Configuration Settings

Verify Configuration Settings

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 5: Configure the Pilot Pool >

Topic Last Modified: *2012-09-28*

After you merge the topology and run the **Import-CsLegacyConfiguration** cmdlet, verify that your Office Communications Server 2007 R2 policies and settings were imported to Lync Server 2013. The following table lists the policies and settings that you should verify.

Policies and Settings to Verify after Migration

If you use this workload:	Verify these policies and settings:
Instant messaging (IM) and conferencing	Presence policy Conferencing policy
Dial-in conferencing	Dial-in access numbers Dial plans
Enterprise Voice	Voice policy Voice routes Dial plans PSTN usage settings
Communicator Web Access	Simple URLs
External users	External access policies
Archiving	Archiving policy

To verify policies and settings

1. In your Office Communications Server 2007 R2 environment, make note of the names of dial plans (formerly known as location profiles), dial-in access numbers (Conferencing Attendant access phone numbers and regions), voice routes, and the policies listed in the preceding table, in addition to the URLs used for Communicator Web Access.
2. On the Lync Server 2013 Front End server, open Lync Server Control Panel.
3. To verify imported conferencing policies, in the left pane, click **Conferencing**, click **Conferencing Policy**, and then verify that all the conferencing policies in your Office Communications Server 2007 R2 environment are included in the list.

   > **Note:**
   > The **Meeting** policy from previous versions of Office Communications Server is now known as the conferencing policy in Lync Server 2013. Additionally, the **Anonymous Particpants** setting from previous versions of Office Communications Server is now a setting in the Lync Server 2013 conferencing policy.

   > **Note:**
   > In Office Communications Server 2007 R2, if the conferencing policy is not set to **use per user**, only global policy settings are imported. No other conference policies are imported in this situation.

   > **Note:**
   > If **Anonymous Participants** is set to **Enforce per user** in your Office Communications Server 2007 R2 conferencing policy, two conferencing policies are created during migration: one with **AllowAnonymousParticipantsInMeetings** set to **True** and one with **AllowAnonymousParticipantsInMeetings** set to **False**.

4. To verify imported dial plans, click **Voice Routing**, click **Dial Plan**, and then verify that all the dial plans in your Office Communicator 2007 R2 environment are included in the list.

   > **Note:**
   > In Lync Server 2013, **location profiles** are now referred to as **dial-plans**.

5. To verify imported voice policies, click **Voice Routing**, click **Voice Policy**, and then verify that all the voice policies in your Office Communicator 2007 R2 environment are included in the list.

   > **Note:**
   > If voice policy is not set to **use per user** in your Office Communications Server 2007 R2 environment, only global policy settings are imported. No other voice policies are imported in this situation.

6. To verify imported voice routes, click **Voice Routing**, click **Route**, and then verify that all the voice routes in your Office Communicator 2007 R2 environment are included in the list.
7. To verify imported PSTN usage settings, click **Voice Routing**, click **PSTN Usage**, and then verify that the PSTN Usage settings from your Office Communicator 2007 R2 environment are included in the list.
8. To verify imported external access policies, click **Federation and External Access**, click **External Access Policy**, and then verify that all the external access policies in your Office Communicator 2007 R2 environment are included in the list.
9. To verify archiving policies, click **Monitoring and Archiving**, click **Archiving Policy**, and then verify that all the archiving policies in your Office Communications Server 2007 R2 environment are included in the list.
10. Open the Lync Server Management Shell.

11. To verify presence policies, at the command line, type the following:

    ```
    Get-CsPresencePolicy
    ```

    By looking at the name in the **Identity** parameter, verify that all the presence policies in your Office Communications Server 2007 R2 environment were imported.

To verify policies and settings by using cmdlets

1. Open the Lync Server Management Shell.
2. Run the cmdlets in the following table to verify policies and settings.

   The syntax of these cmdlets is like the following example:

   ```
   Get-CsConferencingPolicy
   ```

   For details about these cmdlets, run:

   ```
   Get-Help <cmdlet name> -Detailed
   ```

For this policy or setting:	Use this cmdlet:
Presence policy	**Get-CsPresencePolicy**
Conferencing policy	**Get-CsConferencingPolicy**
Dial-in access numbers	**Get-CsDialInConferencingAccessNumber**
Dial plans	**Get-CsDialPlan**
Voice policy	**Get-CsVoicePolicy**
Voice routes	**Get-CsVoiceRoute**
PSTN Usage	**Get-CsPstnUsage**
URLs	**Get-CsSimpleUrlConfiguration**
External access policies	**Get-CsExternalAccessPolicy**
Archiving policy	**Get-CsArchivingPolicy**

1.6.2.6.4 Configure XMPP Gateway Access Policies and Certificates

Configure XMPP Gateway Access Policies and Certificates

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 5: Configure the Pilot Pool >

***Topic Last Modified:** 2012-10-15*

XMPP federation defines an external deployment based on the eXtensible Messaging and Presence Protocol (XMPP). An XMPP configuration allows Lync users access to XMPP domain users by:

- IM and Presence – person to person only
- Creation of XMPP federated contacts in the Lync client

When you configure policies for support of extensible messaging and presence protocol

(XMPP) federated partners, the policies apply to users of XMPP federated domains, but not to users of session initiation protocol (SIP) instant messaging (IM) service providers (for example, Windows Live), or SIP federated domains. You configure an XMPP Federated Partner for each XMPP federated domain that you want to allow your users to add contacts and communicate with. Once the policies are in place, you need to configure the XMPP Gateway certificates.

Note:

To begin the XMPP Gateway migration, you need to deploy the Lync Server 2013 XMPP Gateway, and configure access policies to enable users for Lync Server 2013 XMPP Gateway. All users must be moved to the Lync Server 2013 deployment before you perform these steps. For details, see Configure XMPP Gateway on Lync Server 2013.

⊟Configure an External Access Policy to Enable Users for Lync Server 2013 XMPP Gateway

1. Open Lync Server Control Panel.
2. In the left navigation bar, click **Federation and External Access**, and then click **External Access Policy**.
3. Click **New** and then click **User policy**.
4. Enter a name for the external access user policy.
5. Provide a description for external access user policy.
6. Select **Enable communications with federated users**.
7. Select **Enable communications with XMPP federated users**.
8. Click **Commit** to save your changes to the site or user policy.

1.6.2.7 Phase 6: Move users to the Pilot Pool

Phase 6: Move users to the Pilot Pool

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-10-16*

You can move a single user or groups of users to the new Lync Server 2013 deployment using the following two methods: Lync Server Control Panel and Lync Server Management Shell. The topics in this section describe tasks you must complete during pilot deployment, as well as prior to moving your deployment of Lync Server 2013 from a pilot deployment to a production-level deployment.

In This Section

- Verify User Replication Has Completed
- Move a Single User to the Pilot Pool
- Move Multiple Users to the Pilot Pool

1.6.2.7.1 Verify User Replication Has Completed

Verify User Replication Has Completed

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 6: Move users to the Pilot Pool >

Topic Last Modified: *2012-09-28*

When running the **Move-CsLegacyUser** cmdlet, you may experience a failure due to user information between Active Directory Domain Services (AD DS) and the Lync Server 2013 databases being out of sync because the initial replication is incomplete. The time it takes for the successful completion of the Lync Server 2013 User Replicator service's initial synchronization depends on the number of domain controllers that are hosted in the Active Directory forest that hosts the Lync Server 2013 pool. The Lync Server 2013 User Replicator service initial synchronization process occurs when the Lync Server 2013 Front End Server is started for the first time. After that, the synchronization is then based on the User Replicator interval. Complete the following steps to verify user replication has completed before running the **Move-CsLegacyUser** cmdlet.

To verify that user replication has completed

1. From the Lync Server 2013 Front End server, click the **Start** menu, and then click **Run**.
2. Enter **eventvwr.exe** and then click **OK**.
3. In Event Viewer, click **Applications and Services logs** to expand it, and then select Lync Server.
4. In the **Actions** pane click **Filter Current Log**.
5. From the **Event sources** list, click **LS User Replicator**.
6. In **<All Event IDs>** enter **30024** and then click **OK**.
7. In the filtered events list, on the **General** tab, look for an entry that states user replication has completed successfully.

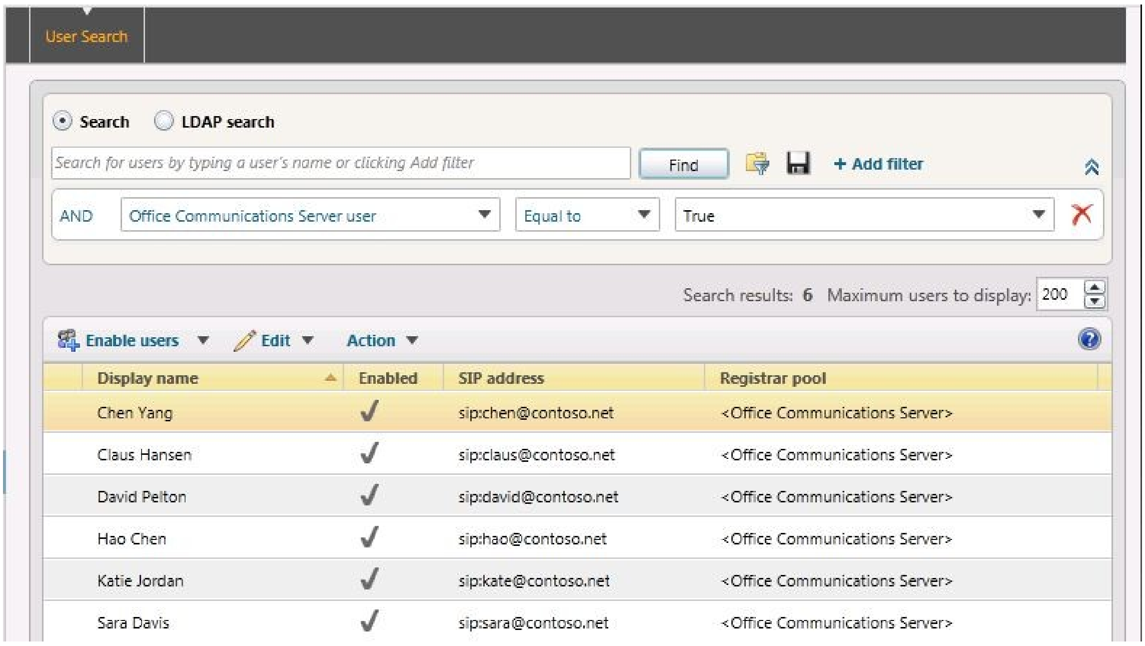
1.6.2.7.2 Move a Single User to the Pilot Pool

Move a Single User to the Pilot Pool

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 6: Move users to the Pilot Pool >

Topic Last Modified: *2012-09-28*

You can move a user from your Office Communications Server 2007 R2 pool to your Lync Server 2013 pilot pool using Lync Server 2013 Control Panel or Lync Server 2013 Management Shell. In the example below, in the Registrar pool column, **<Office Communications Server>** is the Office Communications Server 2007 R2 pool, and all six of these users are connected to this pool. Use the following procedures to move a user to your Lync Server 2013 pool using Lync Server 2013 Control Panel and Lync Server Management Shell.



User Search
● Search ○ LDAP search
Search for users by typing a user's name or clicking Add filter
Find
+ Add filter

AND | Office Communications Server user | Equal to | True

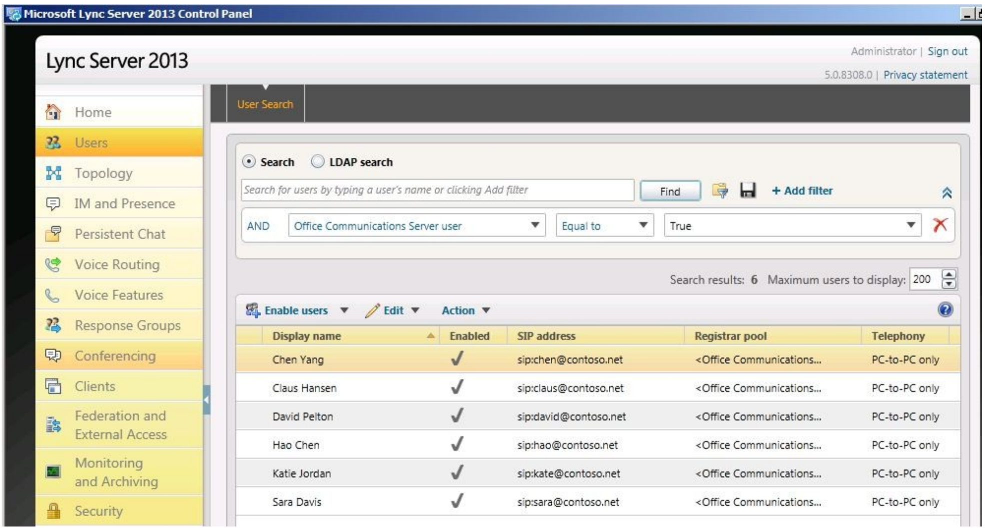
Search results: 6 Maximum users to display: 200

Enable users ▼ Edit ▼ Action ▼

Display name	Enabled	SIP address	Registrar pool
Chen Yang	✓	sip:chen@contoso.net	<Office Communications Server>
Claus Hansen	✓	sip:claus@contoso.net	<Office Communications Server>
David Pelton	✓	sip:david@contoso.net	<Office Communications Server>
Hao Chen	✓	sip:hao@contoso.net	<Office Communications Server>
Katie Jordan	✓	sip:kate@contoso.net	<Office Communications Server>
Sara Davis	✓	sip:sara@contoso.net	<Office Communications Server>

To move a user by using the Lync Server 2013 Control Panel

1. Log on to the Front End Server with an account that is a member of the RTCUniversalServerAdmins group or a member of the CsAdministrator or CsUserAdministrator administrative role.
2. Open Lync Server Control Panel.
3. Click **Users**.
4. From the **User Search** tab, click the **Search** button.
5. Next, click **Add Filter**.
6. Create a filter where **Office Communications Server user** is equal to **True**.
7. Click **Find** to search for legacy Office Communications Server 2007 R2 users.



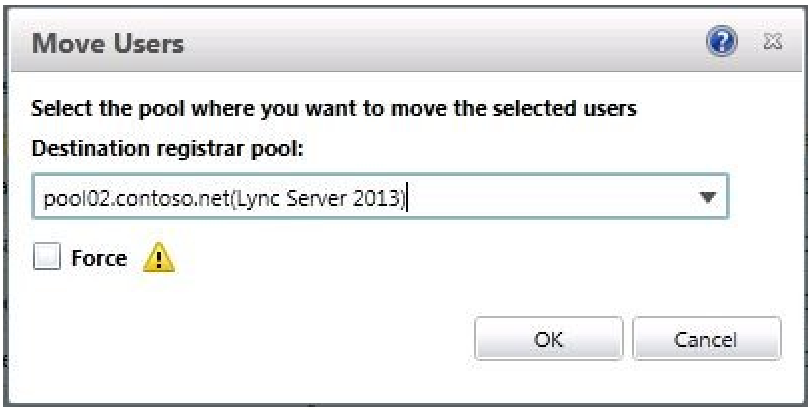
AND | Office Communications Server user | Equal to | True

Search results: 6 Maximum users to display: 200

Display name	Enabled	SIP address	Registrar pool	Telephony
Chen Yang	✓	sip:chen@contoso.net	<Office Communications...	PC-to-PC only
Claus Hansen	✓	sip:claus@contoso.net	<Office Communications...	PC-to-PC only
David Pelton	✓	sip:david@contoso.net	<Office Communications...	PC-to-PC only
Hao Chen	✓	sip:hao@contoso.net	<Office Communications...	PC-to-PC only
Katie Jordan	✓	sip:kate@contoso.net	<Office Communications...	PC-to-PC only
Sara Davis	✓	sip:sara@contoso.net	<Office Communications...	PC-to-PC only

8. Select a user that you want to move to the Lync Server 2013 pool. In this example, we will move user Sara Davis.

9. On the **Action** menu, select **Move selected users to pool**.
10. From the drop-down list, select the Lync Server 2013 pool.
11. Click **Action** and then click **Move selected users to pool**. Click **OK**.



Move Users

Select the pool where you want to move the selected users

Destination registrar pool: pool02.contoso.net(Lync Server 2013)

12. Verify that the **Registrar pool** column for the user now contains the Lync Server 2013 pool, which indicates that the user has been successfully moved

To move a user by using the Lync Server 2013 Management Shell

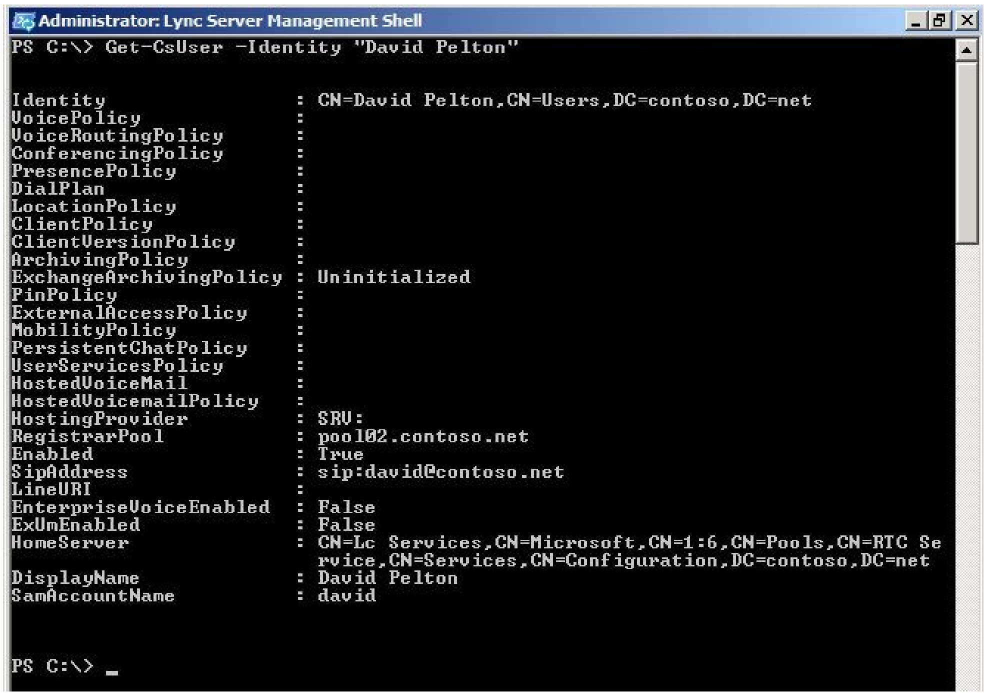
1. Open the Lync Server Management Shell.
2. At the command line, type the following:

```
Move-CsLegacyUser -Identity "David Pelton" -Target "pool02.contoso.net
```

3. Next, at the command line, type the following:

```
Get-CsUser -Identity "David Pelton"
```

4. The **RegistrarPool** identity now points to the Lync Server 2013 pool. The presence of this identity confirms that the user has been successfully moved.



Administrator: Lync Server Management Shell

```
PS C:\> Get-CsUser -Identity "David Pelton"

Identity                  : CN=David Pelton,CN=Users,DC=contoso,DC=net

PS C:\> _
```

Note:
For details about the **Get-CsUser** cmdlet, run: **Get-Help Get-CsUser –Detailed**

1.6.2.7.3 Move Multiple Users to the Pilot Pool

Move Multiple Users to the Pilot Pool

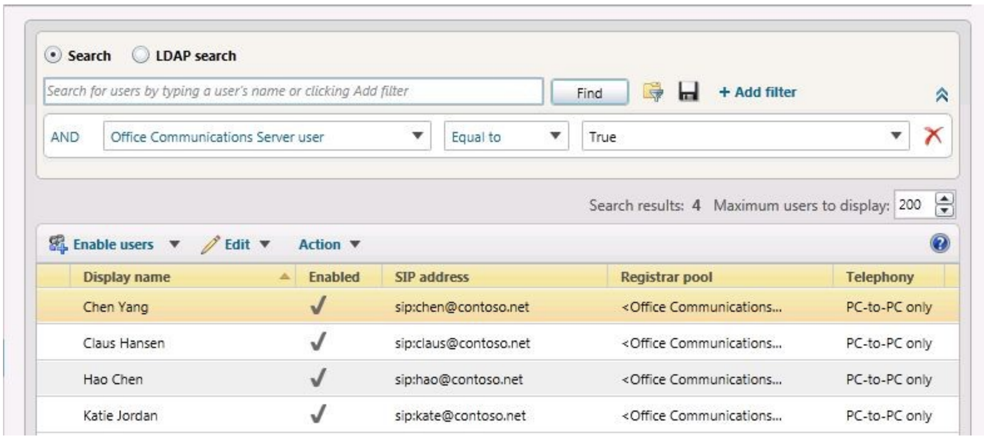
Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 6: Move users to the Pilot Pool >

Topic Last Modified: *2012-10-02*

You can move multiple users from your Office Communications Server 2007 R2 pool to your Lync Server 2013 pilot pool using Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

To move multiple users by using the Lync Server 2013 Control Panel

1. Open **Lync Server Control Panel**.
2. From the **User Search** tab, click the **Search** button.
3. Next, click **Add Filter**.
4. Create a filter where **Office Communications Server user** is equal to **True**.
5. Click **Find** to search for legacy Office Communications Server 2007 R2 users.
6. Select two users that you want to move to the Lync Server 2013 pool. In this example, we will move users Chen Yang and Claus Hansen.

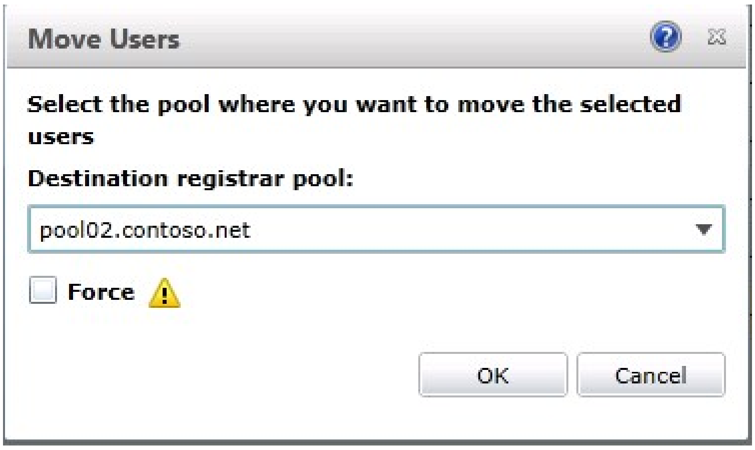


AND | Office Communications Server user ▼ | Equal to ▼ | True ▼

Search results: 4 Maximum users to display: 200

Display name	Enabled	SIP address	Registrar pool	Telephony
Chen Yang	✓	sip:chen@contoso.net	<Office Communications...	PC-to-PC only
Claus Hansen	✓	sip:claus@contoso.net	<Office Communications...	PC-to-PC only
Hao Chen	✓	sip:hao@contoso.net	<Office Communications...	PC-to-PC only
Katie Jordan	✓	sip:kate@contoso.net	<Office Communications...	PC-to-PC only

7. From the **Action** menu, select **Move selected users to pool**.
8. From the drop-down list, select the Lync Server 2013 pool.
9. Click **Action** and then click **Move selected users to pool**. Click OK.



Move Users

Select the pool where you want to move the selected users

Destination registrar pool:

pool02.contoso.net

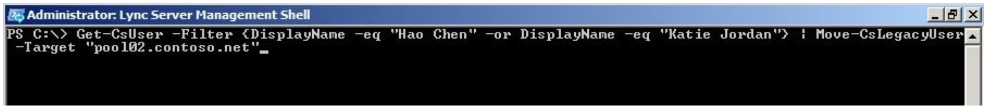
□ Force

10. Verify that the **Registrar pool** column for the users now contains the Lync Server 2013 pool, which indicates that the users have been successfully moved.

To move multiple users by using the Lync Server 2013 Management Shell

1. Open the Lync Server 2013 Management Shell.
2. At the command line, type the following and replace **User1** and **User2** with specific user names you want to move and replace **pool_FQDN** with the name of the destination pool. In this example we will move users Hao Chen and Katie Jordan.

```
Get-CsUser -Filter {DisplayName -eq "User1" -or DisplayName - eq "User
```

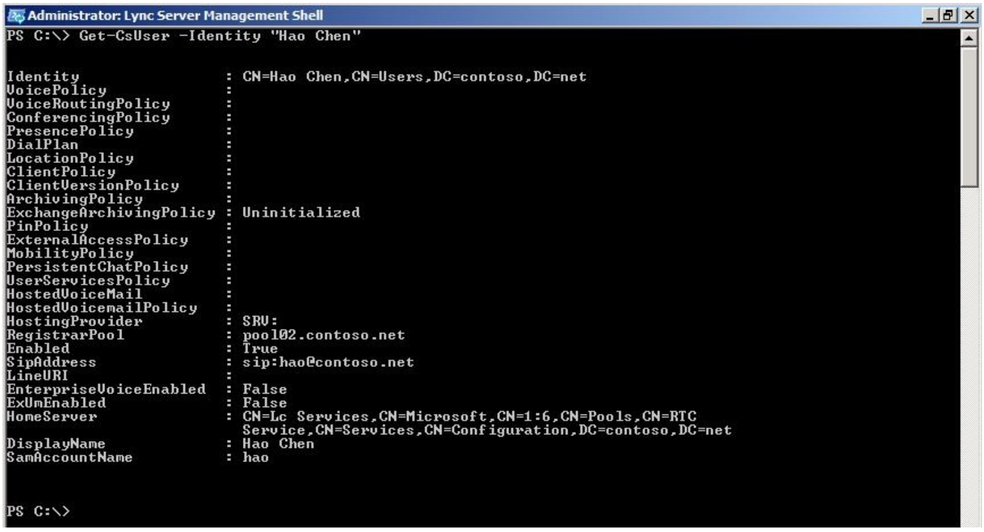


```
PS C:\> Get-CsUser -Filter {DisplayName -eq "Hao Chen" -or DisplayName -eq "Katie Jordan"} | Move-CsLegacyUser
 -Target "pool02.contoso.net"_
```

3. At the command line, type the following

```
Get-CsUser -Identity "User1"
```

4. The **Registrar Pool** identity should now point to the pool you specified as **pool_FQDN** in the previous step. The presence of this identity confirms that the user has been successfully moved. Repeat step to verify **User2** has been moved.



```
PS C:\> Get-CsUser -Identity "Hao Chen"

Identity                  : CN=Hao Chen,CN=Users,DC=contoso,DC=net
VoicePolicy               :
VoiceRoutingPolicy        :
ConferencingPolicy        :
PresencePolicy            :
DialPlan                  :

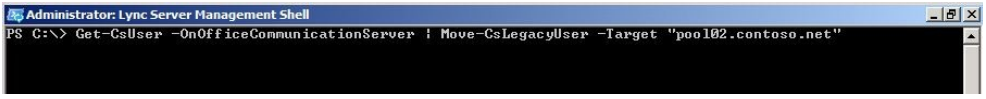
To move all users at the same time by using the Lync Server 2013 Management Shell

In this example, all users have been returned to the Office Communications Server 2007 R2 pool (pool01.contoso.net). Using the Lync Server 2013 Management Shell, we will move all users at the same time to the Lync Server 2013 pool (pool02.contoso.net).

1. Open the **Lync Server 2013 Management Shell**.
2. At the command line, type the following:

```
Get-CsUser -OnOfficeCommunicationServer | Move-CsLegacyUser -Target "p
```



```
PS C:\> Get-CsUser -OnOfficeCommunicationServer | Move-CsLegacyUser -Target "pool02.contoso.net"
```

3. Next, run **Get-CsUser** for one of the pilot users.

```
Get-CsUser -Identity "Hao Chen"
```

4. The **Registrar Pool** identity for each user now points to the pool you specified as "pool_FQDN" in the previous step. The presence of this identity confirms that the user has been successfully moved.
5. Additionally, we can view the list of users in the Lync Server 2013 Control Panel and verify that the Registrar Pool value now points to the Lync Server 2013 pool.

1.6.2.8 Phase 7: Add Lync Server 2013 Edge Server to Pilot Pool

Phase 7: Add Lync Server 2013 Edge Server to Pilot Pool

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-09-26*

The topics in this section explain how to add a Lync Server 2013 Edge Server to the pilot pool deployment. The topics provide configuration and verification guidance when running the **Deploy New Edge pool** wizards.

In This Section

- Deploy Pilot Edge Server
- Validate Replication of Configuration Settings

1.6.2.8.1 Deploy Pilot Edge Server

Deploy Pilot Edge Server

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 7: Add Lync Server 2013 Edge Server to Pilot Pool >

Topic Last Modified: *2012-10-19*

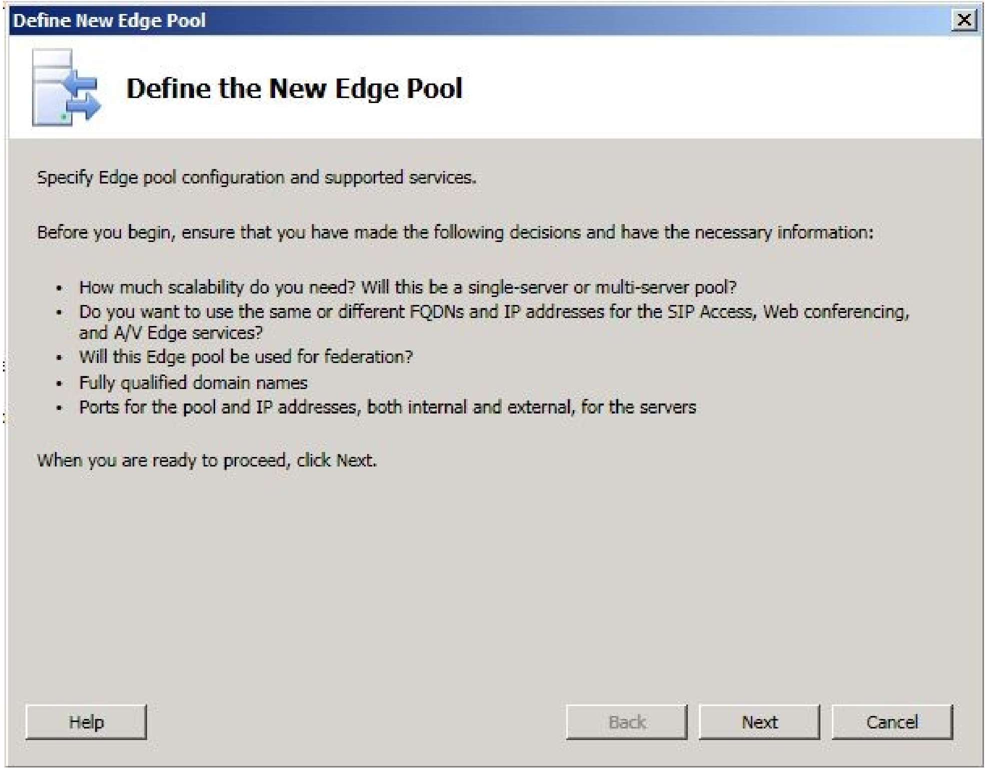
This topic highlights configuration settings you should be aware of prior to deploying your Lync Server 2013 Edge Server. This section only highlights key points you should consider as part of your pilot Edge pool deployment. For detailed steps, see Deploying External User Access in the Deployment documentation, which describes the deployment process and also gives configuration information for external user access.

As you navigate through the **Define New Edge Pool** wizard, review the key configuration settings shown in the following steps. Note that only a few pages of the **Define New Edge Pool** wizard are shown.

Define an Edge Pool

1. Open the pilot pool topology using Topology Builder.
2. Navigate to the Lync Server 2013 node. Right-click **Edge pools**, and click **New**

Edge pool.



Define the New Edge Pool

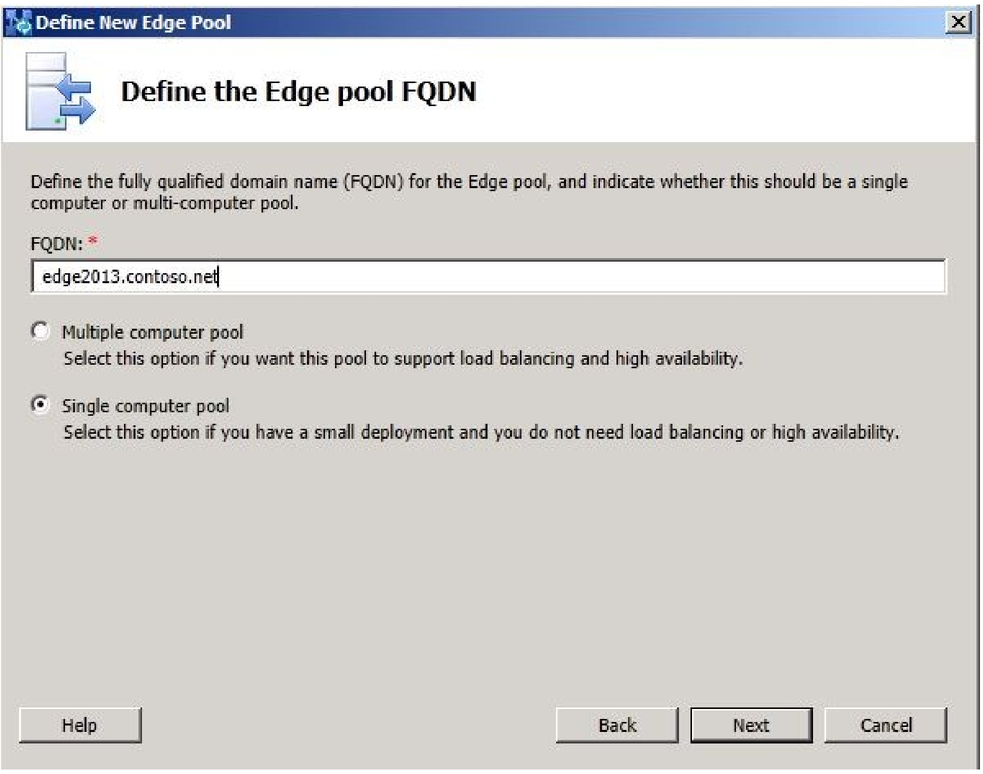
Specify Edge pool configuration and supported services.

Before you begin, ensure that you have made the following decisions and have the necessary information:

- How much scalability do you need? Will this be a single-server or multi-server pool?
- Do you want to use the same or different FQDNs and IP addresses for the SIP Access, Web conferencing, and A/V Edge services?
- Will this Edge pool be used for federation?
- Fully qualified domain names
- Ports for the pool and IP addresses, both internal and external, for the servers

When you are ready to proceed, click Next.

3. An Edge pool can be a **Multiple computer pool** or **Single computer pool**.



Define the Edge pool FQDN

Define the fully qualified domain name (FQDN) for the Edge pool, and indicate whether this should be a single computer or multi-computer pool.

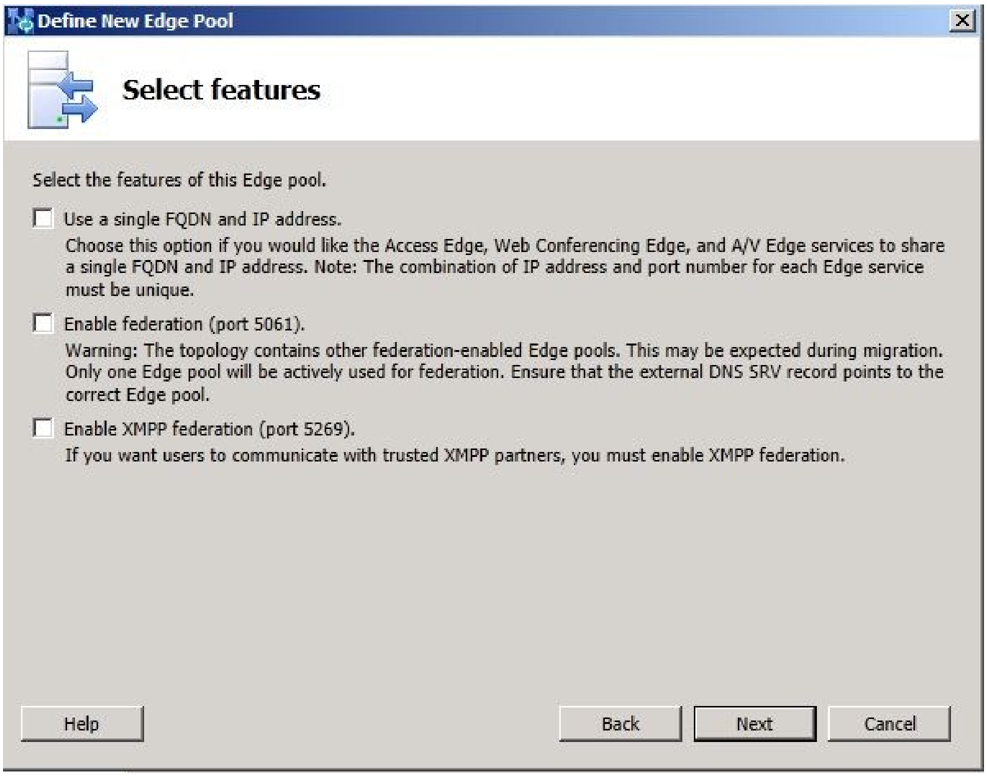
FQDN: *

edge2013.contoso.net

○ Multiple computer pool
Select this option if you want this pool to support load balancing and high availability.

● Single computer pool
Select this option if you have a small deployment and you do not need load balancing or high availability.

4. On the **Select features** page, do not enable federation or XMPP federation. Federation and XMPP federation are currently routed through the legacy Office Communications Server 2007 R2 Edge Server. These features will be configured in a later phase of migration.



Select features

Select the features of this Edge pool.

☐ Use a single FQDN and IP address.

Choose this option if you would like the Access Edge, Web Conferencing Edge, and A/V Edge services to share a single FQDN and IP address. Note: The combination of IP address and port number for each Edge service must be unique.

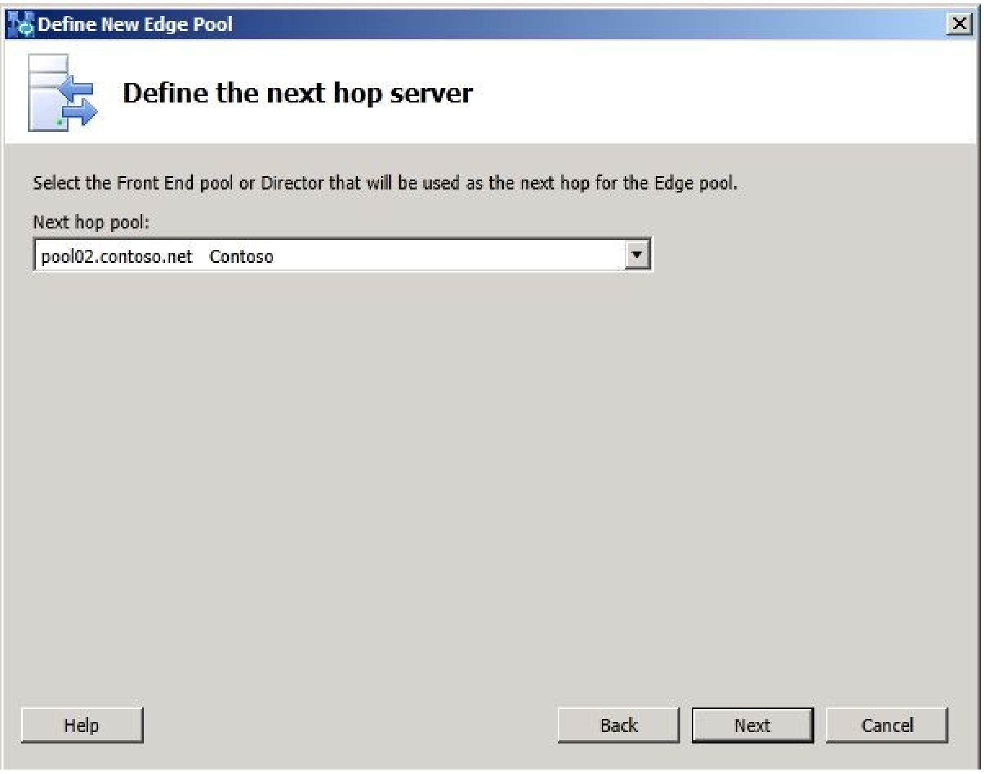
☐ Enable federation (port 5061).

Warning: The topology contains other federation-enabled Edge pools. This may be expected during migration. Only one Edge pool will be actively used for federation. Ensure that the external DNS SRV record points to the correct Edge pool.

☐ Enable XMPP federation (port 5269).

If you want users to communicate with trusted XMPP partners, you must enable XMPP federation.

5. Next, continue completing the following wizard pages: **Select IP options**, **External FQDNs**, **Define the internal IP address**, and **Define the external IP address**.
6. On the **Define the next hop** page, select the Director for the next hop of the Lync Server 2013 Edge pool.



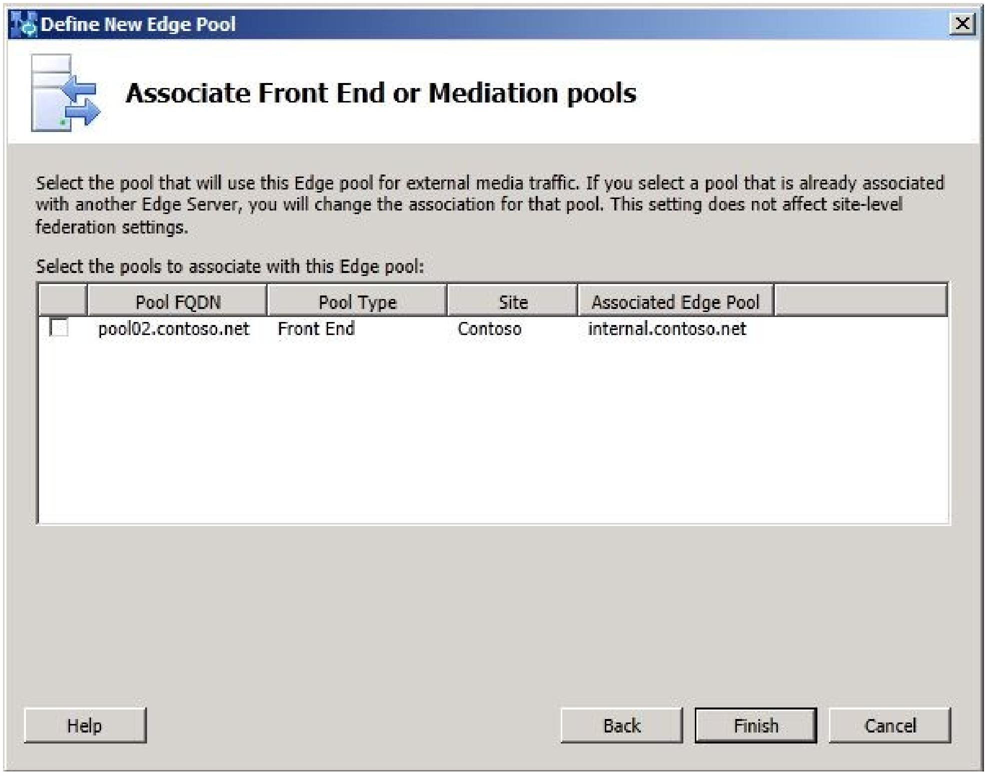
Define the next hop server

Select the Front End pool or Director that will be used as the next hop for the Edge pool.

Next hop pool:

pool02.contoso.net Contoso

7. On the **Associate Front End pools** page, do not associate a pool with this Edge pool at this time. External media traffic is currently routed through the legacy Office Communications Server 2007 R2 Edge Server. This setting will be configured in a later phase of migration.



Define New Edge Pool

Associate Front End or Mediation pools

Select the pool that will use this Edge pool for external media traffic. If you select a pool that is already associated with another Edge Server, you will change the association for that pool. This setting does not affect site-level federation settings.

Select the pools to associate with this Edge pool:

	Pool FQDN	Pool Type	Site	Associated Edge Pool
□	pool02.contoso.net	Front End	Contoso	internal.contoso.net

8. Click **Finish** and then **Publish** the topology.
9. Follow the steps in Install Edge Servers in the Deployment documentation to install the files on the new Edge Server, configure certificates, and start the services.

It’s very important that you follow the guidelines in the topics Deploying External User Access in the Deployment documentation. This section merely provided some guidance on configuration settings when installing these server roles.

You should now have a legacy Office Communications Server 2007 R2 Edge server deployment, indicated by the presence of the BackCompatSite, in parallel with a Lync Server 2013 Edge server deployment. Federation is configured to use the Office Communications Server 2007 R2 Director. Verify that both deployments are running properly, services are started, and you can administer each deployment prior to moving to the next phase.

1.6.2.8.2 Validate Replication of Configuration Settings

Validate Replication of Configuration Settings

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 7: Add Lync Server 2013 Edge Server to Pilot Pool >

Topic Last Modified: *2012-10-19*

You can validate the replication of configuration information to the Edge Server by running the Lync Server 2013 **Get-CsManagementStoreReplicationStatus** cmdlet on the internal computer on which the Central Management store is located or any domain joined computer on which Lync Server 2013 Core Components is installed.

Initial results may indicate the status as "False" instead of "True" for replication. If so, run the **Invoke-CsManagementStoreReplication** cmdlet and allow time for the replication to complete before running the **Get-CsManagementStoreReplicationStatus** cmdlet again.

1.6.2.9 Phase 8: Move from Pilot Deployment into Production

Phase 8: Move from Pilot Deployment into Production

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-10-15*

The topics in this section describe tasks you must complete prior to moving your deployment of Lync Server 2013 from a pilot deployment to a production-level deployment.

- Configure Federation Routes and Media Traffic
- Move Remaining Users to Lync Server 2013
- Configure XMPP Gateway on Lync Server 2013

1.6.2.9.1 Configure Federation Routes and Media Traffic

Configure Federation Routes and Media Traffic

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 8: Move from Pilot Deployment into Production >

Topic Last Modified: *2012-10-16*

Federation is a trust relationship between two or more SIP domains that permits users in separate organizations to communicate across network boundaries. After you migrate to your Lync Server 2013 pilot pool, you need to transition from the federation route of your Microsoft Office Communications Server 2007 R2 Edge Servers to the federation route of your Lync Server 2013 Edge Servers.

Use the procedures that follow to transition the federation route and the media traffic route from your Office Communications Server 2007 R2 Edge Server and Director to your Lync Server 2013 Edge Server, for a single-site deployment.

Important:

Changing the federation route and media traffic route requires that you schedule maintenance downtime for the Lync Server 2013 and Office Communications Server 2007 R2 Edge Servers. This entire transition process also means that federated access will be unavailable for the duration of the outage. You should schedule the downtime for a time when you expect minimal user activity. You should also provide sufficient notification to your end users. Plan accordingly for this outage and set appropriate expectations within your organization.

Important:

If your legacy Office Communications Server 2007 R2 Edge Server is configured to use the same FQDN for the Access Edge service, Web Conferencing Edge service, and the A/V Edge service, the procedures in this section to transition the federation setting to a Lync Server 2013 Edge Server are not supported. If the legacy Edge services are configured to use the same FQDN, you must first migrate all your users from Office Communications Server 2007 R2 to Lync Server 2013, then decommission the Office Communications Server 2007 R2 Edge Server before enabling federation on the Lync Server 2013 Edge Server. For details, see the following topics:

- Move Remaining Users to Lync Server 2013
- "Remove Servers and Server Roles" at http://go.microsoft.com/fwlink/p/?LinkId=268790

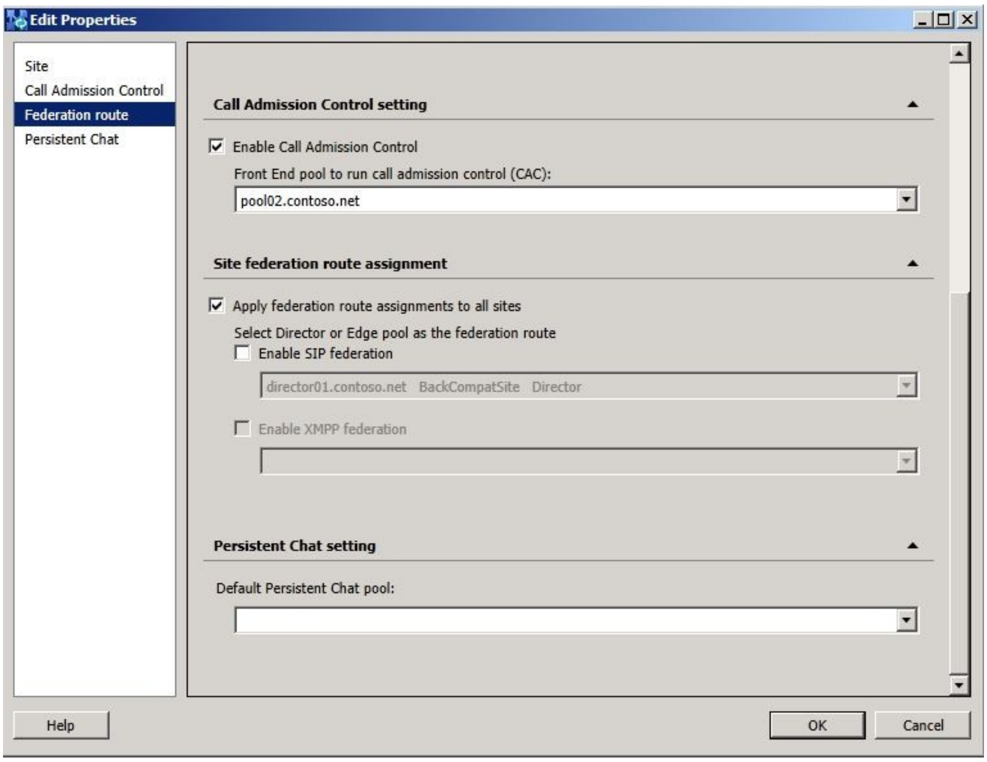
Important:

If your XMPP federation is routed through a Lync Server 2013 Edge Server, legacy Office Communications Server 2007 R2 users will not be able to communicate with the XMPP federated partner until all users have been moved to Lync Server 2013, XMPP policies and certificates have been configured, the XMPP federated partner has been configured on Lync Server 2013, and lastly the DNS entries have been updated.

To successfully publish, enable, or disable a topology when adding or removing a server role, you should be logged in as a user who is a member of the RTCUniversalServerAdmins and Domain Admins groups. It is also possible to delegate the proper user rights and permissions for adding server roles. For details, see Delegate Setup Permissions in the Standard Edition server or Enterprise Edition server Deployment documentation. For other configuration changes, only membership in the RTCUniversalServerAdmins group is required.

⊟To remove the legacy federation association from Lync Server 2013 sites

1. Open the pilot pool topology using Topology Builder.
2. In the left pane, navigate to the site node.
3. Right-click the site, and then click **Edit Properties**.
4. Select **Federation route** in the left pane.
5. Under Site federation route assignment, clear the check box next to **Enable SIP federation** to disable the federation route through the **BackCompatSite**.



Call Admission Control setting

☑ Enable Call Admission Control

Front End pool to run call admission control (CAC): pool02.contoso.net

Site federation route assignment

☑ Apply federation route assignments to all sites

Select Director or Edge pool as the federation route

☐ Enable SIP federation

director01.contoso.net BackCompatSite Director

☐ Enable XMPP federation

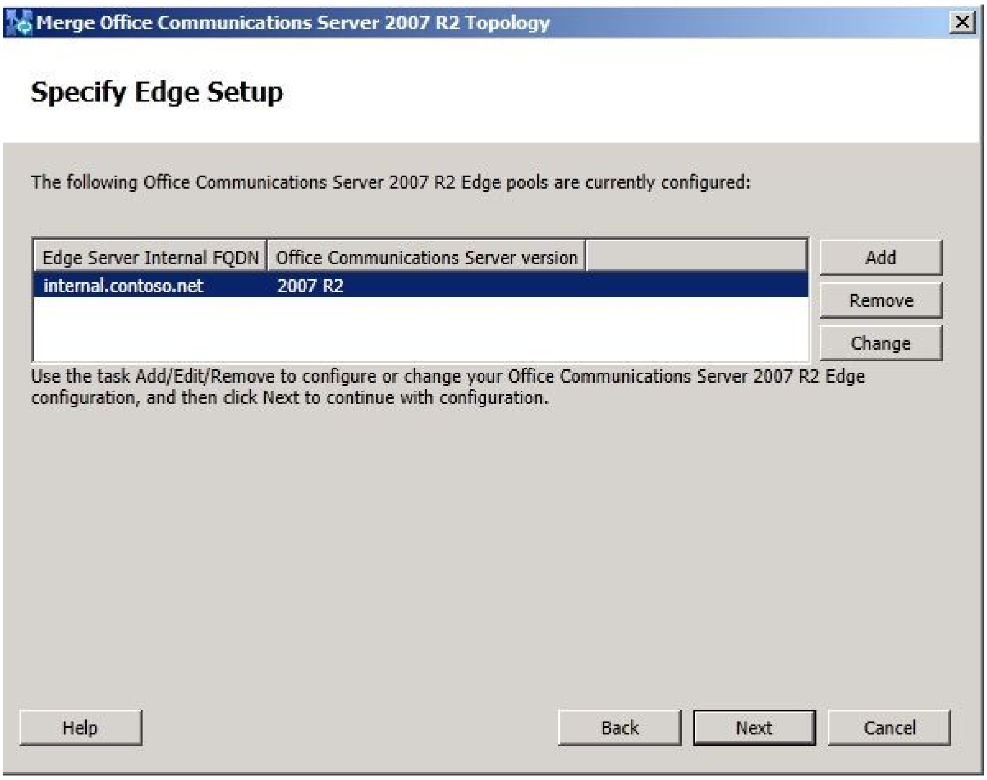
Persistent Chat setting

Default Persistent Chat pool:

6. Click **OK** to close the Edit Properties page.
7. From **Topology Builder**, select the top node **Lync Server**.
8. From the **Action** menu, click **Publish Topology** and complete the wizard.

⊟To configure the legacy Edge Server as a non-federating Edge Server

1. From **Topology Builder**, from the **Action** menu click **Merge Office Communications Server 2007 R2 Topology**.
2. Click **Next** to continue.
3. On the **Specify Edge Setup**, select the **Edge Server Internal FQDN** that is currently configured for federation, and then click **Change**.



Merge Office Communications Server 2007 R2 Topology

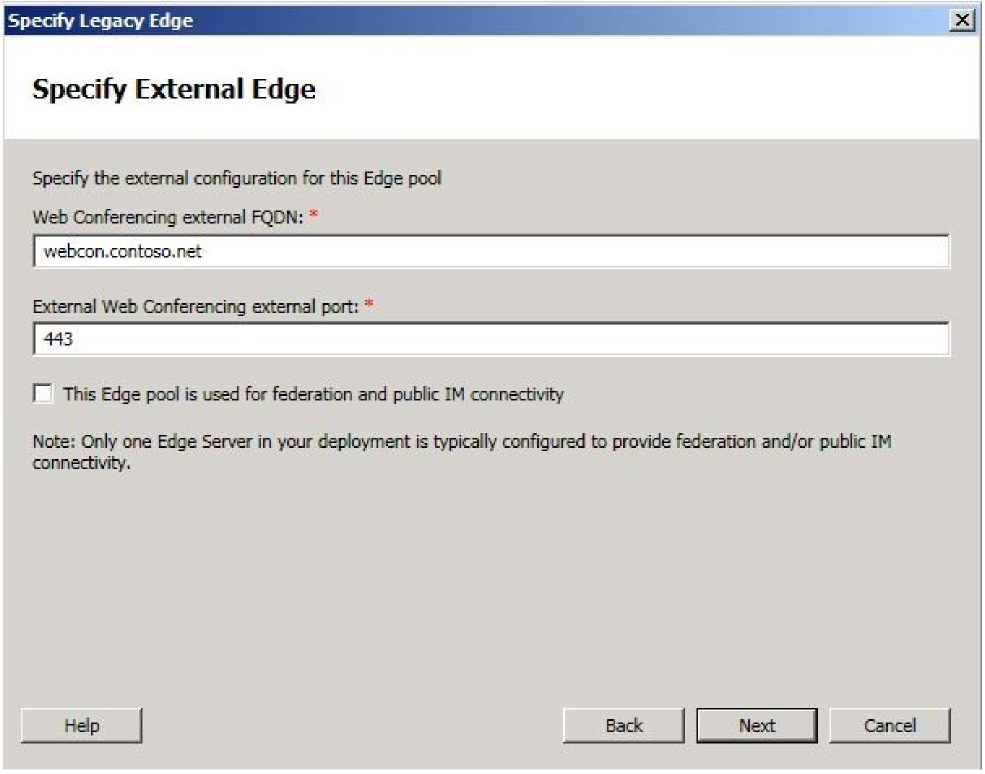
Specify Edge Setup

The following Office Communications Server 2007 R2 Edge pools are currently configured:

Edge Server Internal FQDN	Office Communications Server version
internal.contoso.net	2007 R2

Use the task Add/Edit/Remove to configure or change your Office Communications Server 2007 R2 Edge configuration, and then click Next to continue with configuration.

4. Click **Next** and accept the default settings until you get to the **Specify External Edge** page:



Specify Legacy Edge

Specify External Edge

Specify the external configuration for this Edge pool

Web Conferencing external FQDN: *
webcon.contoso.net

External Web Conferencing external port: *
443

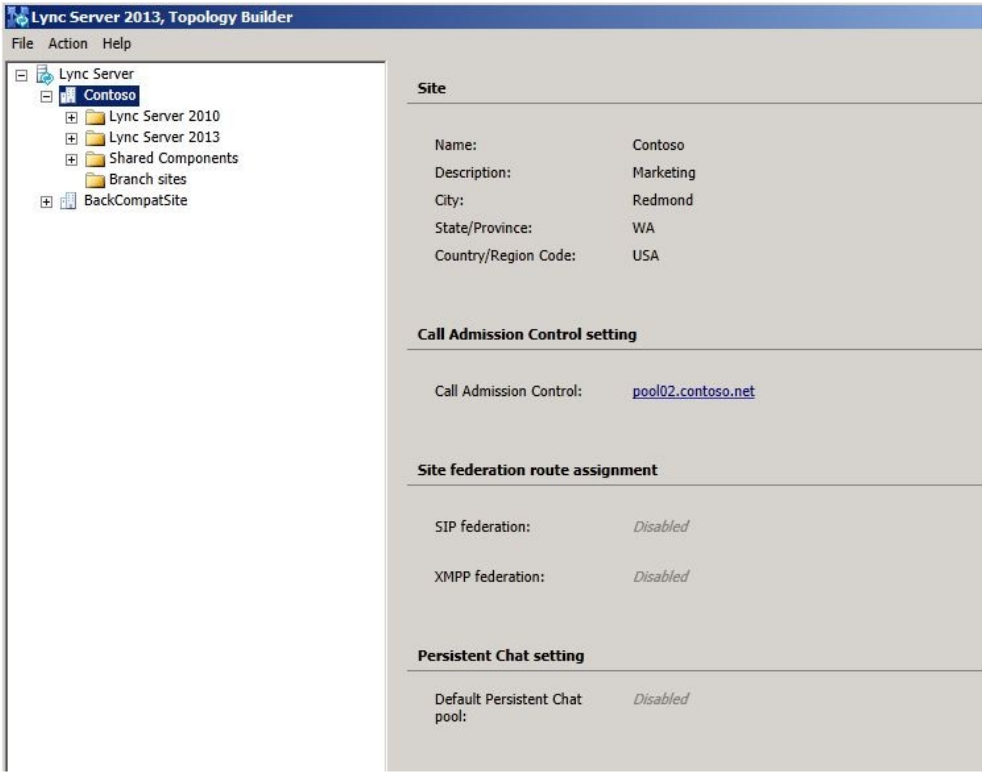
☐ This Edge pool is used for federation and public IM connectivity

Note: Only one Edge Server in your deployment is typically configured to provide federation and/or public IM connectivity.

5. In **Specify External Edge**, clear the **This Edge pool is used for federation and public IM connectivity** check box. This will remove the federation association with the BackCompatSite.

Important:
This step is important. You must clear this option to remove the legacy federation association.

6. Click **Next** and accept the default settings of the remaining pages of the wizard.
7. In **Summary**, click **Next** to begin merging the topologies.
8. In the **Status** column, verify that the value is **Success**, and then click **Finish** to close the wizard.
9. From the **Action** menu, select **Publish Topology**, and then click **Next**.
10. When the **Publishing wizard** completes, click **Finish** to close the wizard.



Site

Name: Contoso
Description: Marketing
City: Redmond
State/Province: WA
Country/Region Code: USA

Call Admission Control setting

Call Admission Control: pool02.contoso.net

Site federation route assignment

SIP federation: *Disabled*

XMPP federation: *Disabled*

Persistent Chat setting

Default Persistent Chat pool: *Disabled*

As shown in the previous figure, the **SIP federation** located under **Site federation route assignment** is set to **Disabled**.

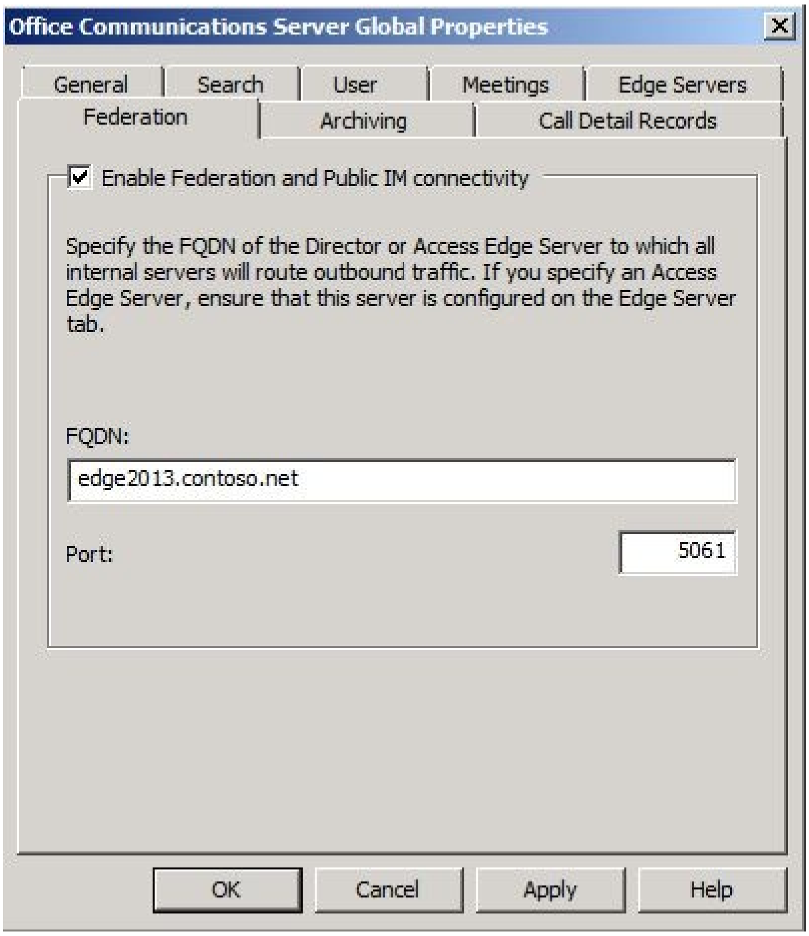
To configure certificates on the Lync Server 2013 Edge Server

1. Export the external Access Proxy certificate, with the private key, from the legacy Office Communications Server 2007 R2 Edge Server.
2. On the Lync Server 2013 Edge Server, import the Access Proxy external certificate from the previous step.
3. Assign the Access Proxy external certificate to the Lync Server 2013 external interface of the Edge Server.
4. The internal interface certificate of the Lync Server 2013 Edge Server should not be changed.

To change Office Communications Server 2007 R2 federation route to use Lync Server 2013 Edge Server

1. On the Office Communications Server 2007 R2 Standard Edition server or Front End Server, open the Office Communications Server 2007 R2 Administrative tool.
2. In the left pane, expand the top node, and then right-click the **Forest** node. Select **Properties**, and then click **Global Properties**.
3. Click the **Federation** tab.

4. Select the check box to enable federation and Public IM connectivity.
5. Enter the FQDN of the Lync Server 2013 Edge Server, and then click **OK**.



Office Communications Server Global Properties

☑ Enable Federation and Public IM connectivity

Specify the FQDN of the Director or Access Edge Server to which all internal servers will route outbound traffic. If you specify an Access Edge Server, ensure that this server is configured on the Edge Server tab.

FQDN: edge2013.contoso.net

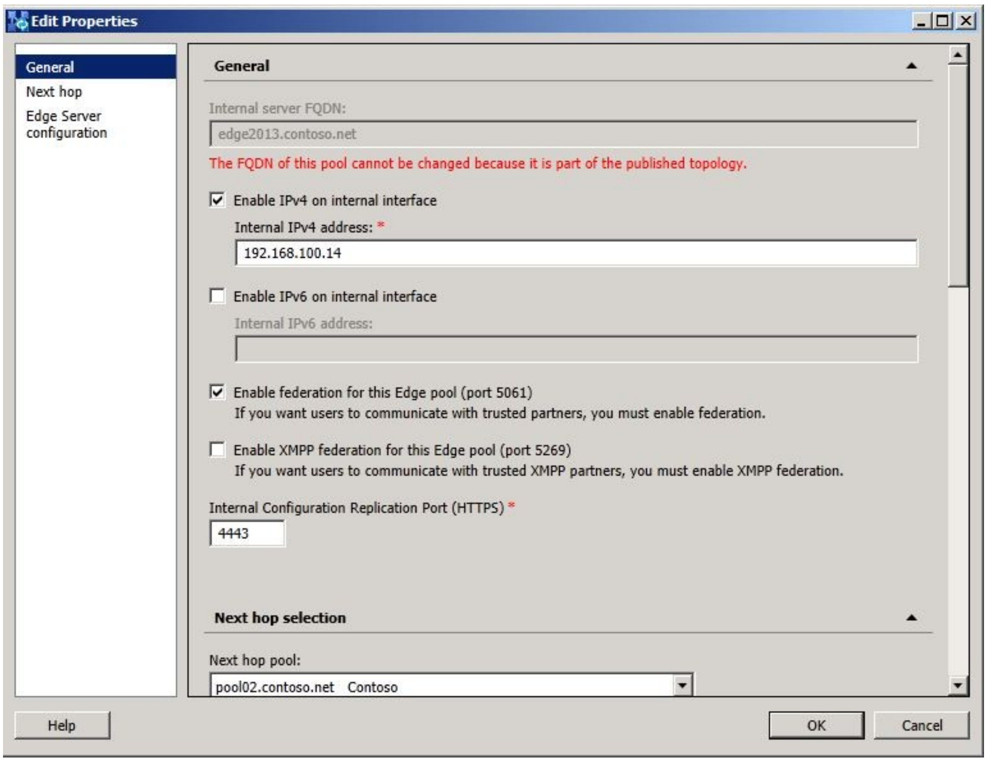
Port: 5061

⊟To turn on Lync Server 2013 Edge Server federation

1. From Topology Builder, in the left pane, navigate to the Lync Server 2013 **Edge pools** node.
2. Expand the node, right-click the Edge Server listed, and then click **Edit Properties**.

Note:
Federation can only be enabled for a single Edge pool. If you have multiple Edge pools, select one to use as the federating Edge pool.

3. On the **General** page, select the **Enable federation for this Edge pool (Port 5061)** check box.



Edit Properties

General

Internal server FQDN:
edge2013.contoso.net

The FQDN of this pool cannot be changed because it is part of the published topology.

☑ Enable IPv4 on internal interface

Internal IPv4 address: *
192.168.100.14

□ Enable IPv6 on internal interface

Internal IPv6 address:

☑ Enable federation for this Edge pool (port 5061)

If you want users to communicate with trusted partners, you must enable federation.

□ Enable XMPP federation for this Edge pool (port 5269)

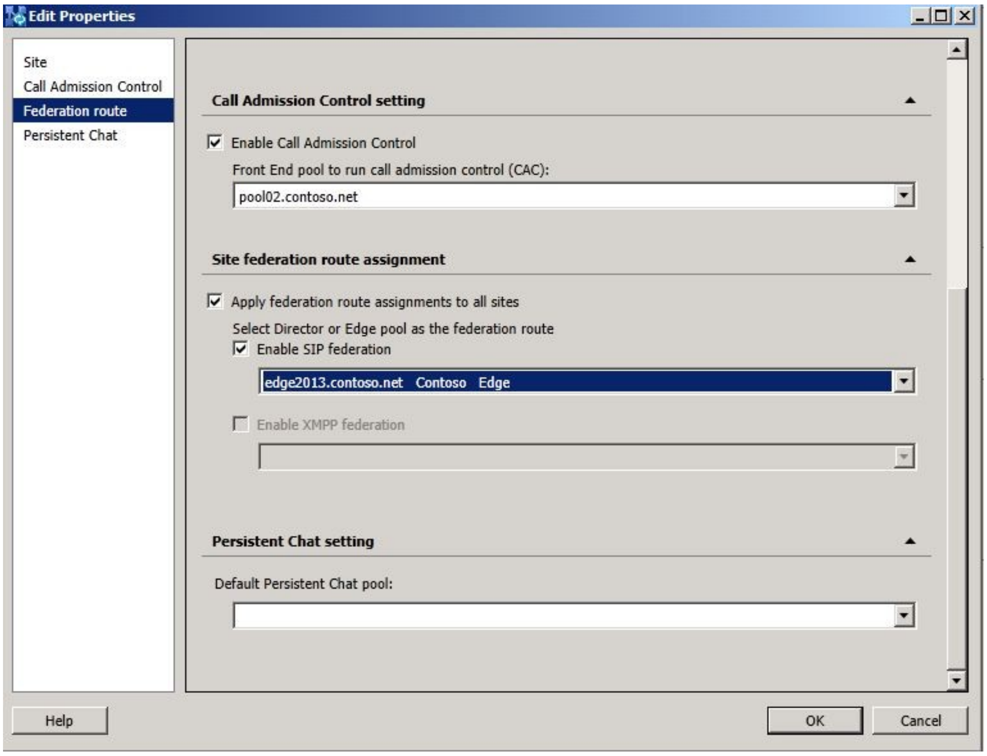
If you want users to communicate with trusted XMPP partners, you must enable XMPP federation.

Internal Configuration Replication Port (HTTPS) *
4443

Next hop selection

Next hop pool:
pool02.contoso.net Contoso

4. Click **OK** to close the Edit Properties page.
5. Next, navigate to the site node.
6. Right-click the site, and then click **Edit Properties**.
7. In the left pane, click **Federation route**.
8. Under **Site federation route assignment**, select **Enable SIP federation**, and then from the list select the Lync Server 2013 Edge Server listed.
9. Click **OK** to close the **Edit Properties** page.



Edit Properties

Call Admission Control setting

☑ Enable Call Admission Control

Front End pool to run call admission control (CAC):
pool02.contoso.net

Site federation route assignment

☑ Apply federation route assignments to all sites

Select Director or Edge pool as the federation route

☑ Enable SIP federation

edge2013.contoso.net Contoso Edge

□ Enable XMPP federation

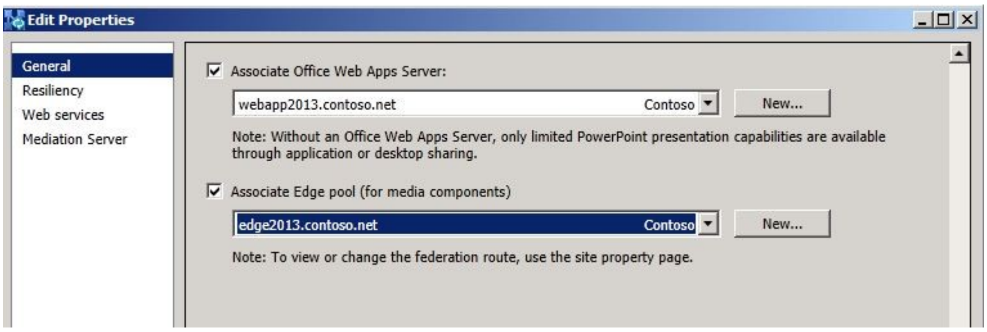
Persistent Chat setting

Default Persistent Chat pool:

For multi-site deployments, complete this procedure at each site.

To configure Lync Server 2013 Edge Server outbound media path

1. From **Topology Builder**, navigate to the Lync Server 2013 pool below **Standard Edition Front End Servers** or **Enterprise Edition Front End pools**.
2. Right-click the pool, and then click **Edit Properties**.
3. In the **Associations** section, select the **Associate Edge pool (for media components)** check box.
4. From the drop down box, select the Lync Server 2013 Edge Server.



☑ Associate Office Web Apps Server:

webapp2013.contoso.net Contoso

Note: Without an Office Web Apps Server, only limited PowerPoint presentation capabilities are available through application or desktop sharing.

☑ Associate Edge pool (for media components)

edge2013.contoso.net Contoso

Note: To view or change the federation route, use the site property page.

5. Click **OK** to close the **Edit Properties** page.

To publish Edge Server configuration changes

1. From **Topology Builder**, select the top node **Lync Server**.
2. From the **Action** menu, select **Publish Topology** and complete the wizard.
3. Wait for Active Directory replication to occur to all pools in the deployment.

> **Note:**
>
> You may see the following message:
> **Warning: The topology contains more than one Federated Edge Server. This can occur during migration to a more recent version of the product. In that case, only one Edge Server would be actively used for federation. Verify that the external DNS SRV record points to the correct Edge Server. If you want to deploy multiple federation Edge Server to be active concurrently (that is, not a migration scenario), verify that all federated partners are using Office Communications Server 2007 R2 or Lync Server. Verify that the external DNS SRV record lists all federation enabled Edge Servers.**
> This warning is expected and can be safely ignored.

To verify federation and remote access for external users

1. From the Lync Server 2013 Front End Server, open the Lync Server Management Shell.
2. To verify the status of federation and remote access, from the command line, type the following:

```
Get-CsAccessEdgeConfiguration
```

3. To enable federation and remote access, from the command line, type the following:

```
Set-CsAccessEdgeConfiguration
```

   For more information on these cmdlets, see the following topics: Get-CsAccessEdgeConfiguration and Set-CsAccessEdgeConfiguration.
4. Wait until replication has completed before bringing the Lync Server 2013 Edge servers online, and testing federation and external access.

To configure Lync Server 2013 Edge Server

1. Bring all of the Lync Server 2013 Edge Servers online.

2. Update the external firewall routing rules or the hardware load balancer settings to send SIP traffic for external access (usually port 443) and federation (usually port 5061) to the Lync Server 2013 Edge Server, instead of the legacy Edge Server.

Note:
If you do not have a hardware load balancer, you need to update the DNS A record for federation to resolve the new Lync Server Access Edge server. To accomplish this with minimum disruption, reduce the TTL value for the external Lync Server Access Edge FQDN so that when DNS is updated to point to the new Lync Server Access Edge server, federation and remote access will be updated quickly.

3. Next, stop the **Lync Server Server Access Edge** from each Edge Server computer.
4. From each legacy Edge Server computer, open the **Services** applet from the **Administrative Tools**.
5. In the services list, find **Office Communications Server Access Edge**.
6. Right-click the services name, and then select **Stop** to stop the service.
7. Set the Startup type to **Disabled**.
8. Click **OK** to close the **Properties** window.

⊟To Test Connectivity of External Users and External access

- Users from at least one federated domain, an internal user on Lync Server 2013 and a user on Office Communications Server 2007 R2. Test instant messaging (IM), presence, audio/video (A/V), and desktop sharing.
- Users of each public IM service provider that your organization supports (and for which provisioning has been completed) communicating with a user on Lync Server 2013 and a user on Office Communications Server 2007 R2.
- Verify anonymous users are able to join conferences.
- A user hosted on Office Communications Server 2007 R2 using remote user access (logging into Office Communications Server 2007 R2 from outside the intranet but without VPN) with a user on Lync Server 2013, and a user on Office Communications Server 2007 R2. Test IM, presence, A/V, and desktop sharing.
- A user hosted on Lync Server 2013 using remote user access (logging into Lync Server 2013 from outside the intranet but without VPN) with a user on Lync Server 2013, and a user on Office Communications Server 2007 R2. Test IM, presence, A/V, and desktop sharing.

1.6.2.9.2 Move Remaining Users to Lync Server 2013

Move Remaining Users to Lync Server 2013

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 8: Move from Pilot Deployment into Production >

Topic Last Modified: *2012-09-26*

You can move users to the new Lync Server 2013 deployment by using either Lync Server Control Panel or Lync Server Management Shell. You must meet some requirements to ensure a smooth transition to Lync Server 2013. For details about prerequisites to completing the procedures in this topic, see Configure Clients for Migration. For detailed steps about moving users, see Phase 6: Move users to the Pilot Pool.

Important:
You cannot use the Active Directory Users and Computers snap-in or the Microsoft Office Communications Server 2007 R2 administrative tools to move users from your legacy environment to Lync Server 2013.

Important:

The **Move-CsLegacyUser** cmdlet requires that user names are properly formed and do not have leading or trailing spaces. You cannot move a user account using the **Move-CsLegacyUser** cmdlet if it contains leading or trailing spaces.

When you move a user to an Lync Server 2013 pool, the data for the user is moved to the back-end database that is associated with the new pool.

Important:

This includes the active meetings created by the legacy user. For example, if a legacy user has configured a **my meeting** conference, that conference will still be available in the new Lync Server 2013 pool, after the user has been moved. The details to access that meeting will still be the same **conference URL and conference ID**. The only difference is that the conference is now hosted in the Lync Server 2013 pool, and not in Office Communications Server 2007 R2 pool.

Note:

Homing users on Lync Server 2013 does not require that you deploy upgraded clients at the same time. New functionality will be available to users only when they have upgraded to the new client software.

⊟Post Migration Task

1. After you move users, verify the conferencing policy that is assigned to them.
2. To ensure that meetings organized by users homed on Lync Server 2013 work seamlessly with federated users who are homed on Office Communications Server 2007 R2, the conferencing policy assigned to the migrated users should allow anonymous participants.
3. Conferencing policies that allow anonymous participants have **Allow participants to invite anonymous users** selected in Lync Server 2013 Control Panel and have **AllowAnonymousParticipantsInMeetings** set to **True** in the output from the **Get-CsConferencingPolicy** cmdlet in the Lync Server Management Shell.
4. For details about configuring conferencing policy by using Lync Server Management Shell, see Set-CsConferencingPolicy in the Lync Server Management Shell documentation.

1.6.2.9.3 Configure XMPP Gateway on Lync Server 2013

Configure XMPP Gateway on Lync Server 2013

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 8: Move from Pilot Deployment into Production >

Topic Last Modified: *2012-10-19*

When you configure policies for support of extensible messaging and presence protocol (XMPP) federated partners, the policies apply to users of XMPP federated domains, but not to users of session initiation protocol (SIP) instant messaging (IM) service providers (for example, Windows Live), or SIP federated domains. You configure an XMPP Federated Partner for each XMPP federated domain that you want to allow your users to add contacts and communicate with. Once the policies are in place, additional tasks include configuring the XMPP Gateway certificates, deploying the Lync Server 2013 XMPP Gateway, and finally updating the DNS records for the XMPP Gateway.

⊟Configure XMPP Gateway Certificates on the Lync Server 2013 Edge Server

1. On the Edge Server, in the Deployment Wizard, next to **Step 3: Request, Install, or Assign Certificates**, click **Run again**.

Tip:
If you are deploying the Edge Server for the first time, you will see Run instead of Run Again.

2. On the **Available Certificate Tasks** page, click **Create a new certificate request**.
3. On the **Certificate Request** page, click **External Edge Certificate**.
4. On the **Delayed or Immediate Request** page, select the **Prepare the request now, but send it later** check box.
5. On the **Certificate Request File** page, type the full path and file name of the file to which the request is to be saved (for example, c:\cert_exernal_edge.cer).
6. On the **Specify Alternate Certificate Template** page, to use a template other than the default WebServer template, select the **Use alternative certificate template for the selected certification authority** check box.
7. On the **Name and Security Settings** page, do the following:
   7.a. In **Friendly name**, type a display name for the certificate.
   7.b. In **Bit length**, specify the bit length (typically, the default of 2048).
   7.c. Verify that the **Mark certificate private key as exportable** check box is selected.
8. On the **Organization Information** page, type the name for the organization and the organizational unit (for example, a division or department).
9. On the **Geographical Information** page, specify the location information.
10. On the **Subject Name/Subject Alternate Names** page, the information to be automatically populated by the wizard is displayed. If additional subject alternative names are needed, you specify them in the next two steps.
11. On the **SIP Domain Setting on Subject Alternate Names (SANs)** page, select the domain check box to add a sip.<sipdomain> entry to the subject alternative names list.
12. On the **Configure Additional Subject Alternate Names** page, specify any additional subject alternative names that are required.

Tip:
If the XMPP proxy is installed, by default the domain name (such as contoso.com) is populated in the SAN entries. If you require more entries, add them in this step.

13. On the **Request Summary** page, review the certificate information to be used to generate the request.
14. After the commands finish running, you can **View Log**, or click **Next** to continue.
15. On the **Certificate Request File** page, you can view the generated certificate signing request (CSR) file by clicking View or exit the Certificate Wizard by clicking **Finish**.
16. Copy the request file and submit to your public certification authority.
17. After receiving, importing and assigning the public certificate, you must stop and restart the Edge Server services. You do this by typing in the Lync Server Management console:

```
Stop-CsWindowsService
```

```
Start-CsWindowsService
```

⊟Configure a new Lync Server 2013 XMPP Gateway

1. Open Lync Server Control Panel.
2. In the left navigation bar, click **Federation and External Access** and then click **XMPP Federated Partners**.
3. To create a new configuration, click **New**.
4. Define the following settings:
5. **Primary domain** (Required). The primary domain is the base domain of the XMPP partner. For example, you would enter **fabrikam.com** for the XMPP partner domain name. This is a required entry.

6. **Description** The description is for notes or other identifying information for this particular configuration. This entry is optional.
7. **Additional domains** Additional domains are domains that are a part of your XMPP partner's domain that should be included as part of the allowed XMPP communication. For example, if the primary domain is **fabrikam.com**, then you would list all other domains that are under fabrikam.com that you will communicate with by way of XMPP.
8. **Partner type** The **Partner type** is a required setting. You must choose one of the following to describe and enforce what contacts can be added. You can select from:
   - **Federated** A **Federated** partner type represents a high level of trust between the Lync Server deployment and the XMPP partner. This partner type is recommended for federating with XMPP servers within the same enterprise or where there is an established business relationship. XMPP contacts in Federated partners can:
     8..a.Add Lync contacts and view their presence without express authorization from the Lync user.
     8..b.Send instant messages to Lync contacts whether or not the Lync user has added them into their contact list.
     8..c.See a Lync user's status notes.
   - **Public verified** A **Public verified** partner is a public XMPP provider that is trusted to verify the identity of its users. XMPP contacts in Public Verified networks can add Lync contacts and view their presence and send instant messages to them without express authorization from the Lync users. XMPP contacts in public verified networks never see a Lync users' status notes. This setting is not recommended.
   - **Public unverified** A **Public unverified** partner is a public XMPP provider that is not trusted to verify the identity of its users. XMPP users on Public Unverified networks cannot communicate with Lync users unless the Lync user has expressly authorized them by adding them to the contact list. XMPP users on public unverified networks never see Lync users' status notes. This setting is recommended for any federation with public XMPP providers such as Google Talk.
9. **Connection Type:** Defines the various rules and dialback settings.
   - **TLS Negotiation** Defines the TLS negotiation rules. An XMPP service can require TLS, can make TLS optional, or you define that TLS is not supported. Choosing Optional leaves the requirement up to the XMPP service for a mandatory-to-negotiate decision. To view all possible settings and details for SASL, TLS and Dialback negotiation – including not valid and known error configurations - see Negotiation Settings for XMPP Federated Partners
     9..a.**Required** The XMPP service requires TLS negotiation.
     9..b.**Optional** The XMPP service indicates that TLS is mandatory-to-negotiate.
     9..c.**Not Supported** The XMPP service does not support TLS.

   - **SASL negotiation** Defines the SASL negotiation rules. An XMPP service can require SASL, can make SASL optional, or you define that SASL is not supported. Choosing Optional leaves the requirement up to the partner XMPP service for a mandatory-to-negotiate decision.
     9..a.**Required** The XMPP service requires SASL negotiation.
     9..b.**Optional** The XMPP service indicates that SASL is mandatory-to-negotiate.
     9..c.**Not Supported** The XMPP service does not support SASL.

   - **Support server dialback negotiation** The support server dialback negotiation process uses the domain name system (DNS) and an authoritative server to verify that the request came from a valid XMPP partner. To do this, the originating server creates a message of a specific type with a generated dialback key and looks up the receiving server in

DNS. The originating server sends the key in an XML stream to the resulting DNS lookup, presumably the receiving server. On receipt of the key over the XML stream, the receiving server does not respond to the originating server, but sends the key to a known authoritative server. The authoritative server verifies that the key is either valid or not valid. If not valid, the receiving server does not respond to the originating server. If the key is valid, the receiving server informs the originating server that the identity and key is valid and the conversation can commence.

There are two valid states for **Dialback negotiation**:

9..a.**True** The XMPP server is configured to use Dialback negotiation if a request should be received from an originating server.

9..b.**False** The XMPP server is not configured to use Dialback negotiation and if a request should be received from an originating server, it will be ignored.

10.Click **Commit** to save your changes to the site or user policy.

⊟Update DNS Records for Lync Server 2013 XMPP Gateway

1. To configure DNS for XMPP federation, you add the following SRV record to your external DNS:_xmpp-server._tcp.<domain name> The SRV record will resolve to the Access Edge FQDN of the Edge server, with a port value of 5269.

1.6.2.10 Phase 9: Complete Post-Migration Tasks

Phase 9: Complete Post-Migration Tasks

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-10-15*

The topics in this section describe tasks that you will need to perform after you have completed your migration to Lync Server 2013.

In This Section

- Migrate Response Groups
- Migrate Dial-in Access Numbers
- Enable Exchange 2013 Outlook Web App and IM Integration
- Migrate Address Book
- Enable Remote Call Control
- Remove Legacy Archiving and Monitoring Servers
- Migrate Mediation Server
- Configure Trusted Application Servers
- Configure the Meeting Join Page
- Deploy Lync Server 2013 Clients
- Move Exchange Unified Messaging Contact Objects
- Verify that all Exchange UM Contact Objects are Removed from the Legacy Pool

1.6.2.10.1 Migrate Response Groups

Migrate Response Groups

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-19*

After your users are moved to Lync Server 2013 pools, you can migrate your response groups. Migrating response groups includes copying agent groups, queues, workflows, and audio files, and moving Response Group contact objects from the legacy deployment to the Lync Server 2013 pool. After you migrate your legacy response groups, calls to the response groups are handled by the Response Group application in the Lync Server 2013 pool. Calls to response groups are no longer handled by the legacy pool.

Note:

Although you can migrate response groups before you move all users to the Lync Server 2013 pool, we recommend that you move all users first. In particular, users who are response group agents will not have full functionality of new features until they are moved to the Lync Server 2013 pool.

Before you migrate response groups, you must have deployed a Lync Server 2013 pool that includes the Response Group application. The Response Group application is installed and activated by default when you deploy Enterprise Voice. You can ensure that the Response Group application is installed by running the **Get-CsService–ApplicationServer** cmdlet.

Note:

You can create new Lync Server 2013 response groups in the Lync Server 2013 pool before you migrate your legacy response groups.

To migrate response groups from a legacy pool to the Lync Server 2013, you run the **Move-CsRgsConfiguration** cmdlet. Before you can run **Move-CsRgsConfiguration**, you must first install the Windows Management Instrumentation (WMI) Backward Compatibility interfaces package. Install this application by running OCSWMIBC.msi. You can find OCSWMIBC.msi on the installation media in the Setup folder.

Important:

The Response Group migration cmdlet moves the Response Group configuration for the entire pool. You cannot select specific groups, queues, or workflows to migrate.

After you migrate the response groups, you need to update the URL that formal agents use to sign into and out of their response groups, and use Lync Server Control Panel or Lync Server Management Shell cmdlets to verify that all agent groups, queues, and workflows moved successfully.

Caution:

When you migrate response groups, the Office Communications Server 2007 R2 response groups are not removed. Do not remove Office Communications Server 2007 R2 response groups. If you remove an Office Communications Server 2007 R2 response group, the response groups in Lync Server 2013 stop working.

Important:

We recommend that you do not remove any data from your previous deployment until you decommission the pool. In addition, we strongly recommend that you export response groups immediately after you migrate. If an Office Communications Server 2007 R2 response group gets removed, you can then restore your response groups from the backup to get Lync Server 2013 response groups running again.

When you run the **Move-CsRgsConfiguration** cmdlet, the agent groups, queues, workflows, and audio files remain in the legacy pool for rollback purposes. If you do need to roll back to the legacy pool, however, you need to run the **Move-CsApplicationEndpoint** cmdlet to move contact objects back to the legacy pool.

Important:

We recommend that you don't delete any response group data from the legacy pool until you decommission the pool.

The procedure that follows for migrating Response Group configurations assumes that you have a one-to-one relationship between your legacy pools and the Lync Server 2013 pools. If you plan to consolidate or split up pools during your migration and deployment, you need to plan which legacy pool maps to which Lync Server 2013 pool.

To Migrate Response Group Configurations

1. Locate OCSWMIBC.msi in the Setup folder of the installation media and install it.
2. Log on to the computer with an account that is a member of the RTCUniversalServerAdmins group or has equivalent administrator rights and permissions.
3. Open the Lync Server Management Shell.
4. At the command line, type the following:

   ```
   Move-CsRgsConfiguration -Source <source pool FQDN> -Destination <desti
   ```

   For example:

   ```
   Move-CsRgsConfiguration -Source pool01.contoso.net -Destination pool02
   ```

5. If you deployed the Response Group tab for Microsoft Office Communicator 2007 R2 in your Office Communications Server 2007 R2 environment, remove the tab from the Office Communicator 2007 R2 tabs.xml file.

   Note:
   Formal agents used the Response Group tab to sign in to their response groups before they could receive calls. If you deployed the Response Group tab, you chose the location for the Office Communicator 2007 R2 tabs.xml file when you deployed it.

6. Provide users with the updated URL that agents need to sign into and out of their response groups.

   Note:
   The URL is typically https://webpoolFQDN/RgsClients/Tab.aspx, where *webpoolFQDN* is the fully qualified domain name (FQDN) of the web pool that is associated with the pool that you just migrated to Lync Server 2013.

   Note:
   This step is not required after users upgrade to Lync 2013 because the URL is available from the **Tools** menu in Lync.

To Verify Response Group Migration by Using Lync Server Control Panel

1. Open the Lync Server Control Panel.
2. In the left navigation pane, click **Response Groups**.
3. On the **Workflow** tab, verify that all the workflows in your Office Communications Server 2007 R2 environment are included in the list.
4. Click the **Queue** tab, and verify that all the queues in your Office Communications Server 2007 R2 environment are included in the list.
5. Click the **Group** tab, and verify that all the agent groups in your Office Communications Server 2007 R2 environment are included in the list.

To Verify Response Group Migration by Using Cmdlets

1. Open the Lync Server Management Shell.

   For details about the following cmdlets, run:

   ```
   Get-Help <cmdlet name> -Detailed
   ```

2. At the command line, type the following:

```
Get-CsRgsAgentGroup
```

3. Verify that all the agent groups in your Office Communications Server 2007 R2 environment are included in the list.
4. At the command line, type the following:

```
Get-CsRgsQueue
```

5. Verify that all the queues in your Office Communications Server 2007 R2 environment are included in the list.
6. At the command line, type the following:

```
Get-CsRgsWorkflow
```

7. Verify that all the workflows in your Office Communications Server 2007 R2 environment are included in the list.

1.6.2.10.2 Migrate Dial-in Access Numbers

Migrate Dial-in Access Numbers

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-09-26*

Migrating dial-in access numbers requires two steps: running the **Import-CsLegacyConfiguration** cmdlet (completed earlier in Import Policies and Settings) to migrate dial plans and other dial-in access number settings, and running the **Move-CsApplicationEndpoint** cmdlet to migrate the contact objects.

To migrate dial-in access numbers

1. Open the Office Communications Server 2007 R2 administrative tool.
2. In the console tree, right-click the forest node, click **Properties**, and then click **Conferencing Attendant Properties**.
3. On the **Access Phone Numbers** tab, click **Serviced by Pool** to sort the access phone numbers by their associated pool, and identify all the access numbers for the pool from which you are migrating.
4. To identify the SIP URI for each access number, double-click the access number to open the **Edit Conferencing Attendant Number** dialog box, and look under **SIP URI**.
5. Open the Lync Server Management Shell.
6. To move each dial-in access number to a pool hosted on Lync Server 2013, run:

```
Move-CsApplicationEndpoint -Identity <SIP URI of the access number to
```

7. In the Office Communications Server 2007 R2 Administrative tool, on the **Access Phone Numbers** tab, verify that no dial-in access numbers remain for the Office Communications Server 2007 R2 pool from which you are migrating.

1.6.2.10.3 Enable Exchange 2013 Outlook Web App and IM Integration

Enable Exchange 2013 Outlook Web App and IM Integration

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-19*

To enable Exchange 2013 Outlook Web Access (OWA) and instant messaging (IM) integration with Lync Server 2013, you must add the Exchange 2013 Client Access Server

(CAS) server to the Lync Server 2013 topology as a trusted application server.

To create a trusted application pool

1. Start the Lync Server 2013 Management Shell.
2. Run the following cmdlet:

   ```
   Get-CsSite
   ```

   This returns the siteID for the siteName in which you are creating the pool. For details, see Get-CsSite in the Lync Server 2013 Management Shell documentation.
3. Run the following cmdlet:

   ```
   New-CsTrustedApplicationPool -Identity <E14 CAS FQDN> -ThrottleAsServe
   ```

   For details, see New-CsTrustedApplicationPool in the Lync Server 2013 Management Shell documentation.

   The Exchange Server FQDN should be configured as the Exchange OWA certificate Subject Name (SN), or the Subject Alternate Name (SAN).

   In Exchange OWA, verify that the pool's FQDN is trusted as well.

   > **Important:**
   >
   > If your CAS server is *not* collocated on the same server that is running Exchange 2013 Unified Messaging (UM), skip the remaining steps in this procedure and perform the "Create a trusted application for the Exchange 2013 CAS server" procedure later in this topic. If your CAS server is collocated on the same server that is running Exchange 2013 Unified Messaging (UM), complete the steps in this procedure and do not perform the "Create a trusted application for the Exchange 2013 CAS server" procedure later in this topic.
4. Run **Enable-CsTopology**.
5. Open Topology Builder and download the existing topology.
6. In the left pane, expand the tree until you reach **Trusted application servers**.
7. Expand the **Trusted application servers** node.
8. You should now see the Exchange 2013 CAS server listed as a trusted application server.

To create a trusted application for the Exchange 2013 CAS server

1. Start the Lync Server 2013 Management Shell.
2. If your CAS server is *not* collocated on the same server that is running Exchange 2013 Unified Messaging (UM), run the following cmdlet:

   ```
   New-CsTrustedApplication -ApplicationId <AppID String> -TrustedApplica
   ```

   For details, see the topic New-CsTrustedApplication in the Lync Server 2013 Management Shell documentation.
3. Run **Enable-CsTopology**.
4. From Topology Builder, in the left pane, expand the tree until you reach **Trusted application servers**.
5. Expand the **Trusted application servers** node.
6. You should now see the Exchange 2013 CAS server listed as a trusted application server.

1.6.2.10.4 Migrate Address Book

Migrate Address Book

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-02*

To migrate Address Book customized normalization rules

1. Find the Company_Phone_Number_Normalization_Rules.txt file in the root of the Address Book shared folder, and copy it to the root of the Address Book shared folder in your Lync Server 2013 pilot pool.

   Note:

   The sample Address Book normalization rules have been installed in your ABS Web component file directory. The path is **$installedDriveLetter:\Program Files\Microsoft Lync Server 2013\Web Components\Address Book Files\Files\ Sample_Company_Phone_Number_Normalization_Rules.txt,**. This file can be copied and renamed as **Company_Phone_Number_Normalization_Rules.txt** to the address book shared folder's root directory. For example, the address book shared in **$serverX**, the path will be similar to: **\\$serverX \LyncFileShare\2-WebServices-1\ABFiles**.

2. Use a text editor, such as Notepad, to open the Company_Phone_Number_Normalization_Rules.txt file.
3. Certain types of entries will not work correctly in Lync Server 2013. Look through the file for the types of entries described in this step, edit them as necessary, and save the changes to the Address Book shared folder in your pilot pool.

   Strings that include required whitespace or punctuation cause normalization rules to fail because these characters are stripped out of the string that is input to the normalization rules. If you have strings that include required whitespace or punctuation, you need to modify the strings. For example, the following string would cause the normalization rule to fail:

   ```
   \s*\(\s*\d\d\d\s*\)\s*\-\s*\d\d\d\s*\-\s*\d\d\d\d
   ```

   The following string would not cause the normalization rule to fail:

   ```

   \s*\(?\s*\d\d\d\s*\)?\s*\-?\s*\d\d\d\s*\-?\s*\d\d\d\d
   ```

1.6.2.10.5 Enable Remote Call Control

Enable Remote Call Control

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-02*

Remote call control enables users to control their desktop private branch exchange (PBX) phones by using Lync Server 2013. If you deployed remote call control in your legacy environment and want to migrate it Lync Server 2013, you need to perform the following tasks:

1. Install a SIP/CSTA gateway and configure it to communicate with your PBX. You need to do this step when you deploy your Lync Server 2013 pilot pool.
2. After you merge your topology and migrate your policies and settings, configure Lync Server 2013 to route CSTA requests to the SIP/CSTA gateway. This step is a manual step that follows the automated migration. To configure

routing for CSTA requests, do the following:

- Remove legacy authorized host entries (known as *trusted server entries* in Lync Server 2013). If you are migrating users from your legacy deployment, ensure that you remove all existing authorized host entries that you created for the SIP/CSTA gateway before you configure new trusted application entries on the Lync Server 2013 pilot pool. For details about how to remove legacy authorized host entries, see Remove an Authorized Host Entry.
- Configure a static route for remote call control. You can configure a static route for individual pools that you want to support remote call control, or you can configure a global static route so that each pool that is not configured with a pool-level static route uses the global static route. For details about how to configure the static route, see Configure a Static Route for Remote Call Control in the Deployment documentation.
- Configure a trusted application entry for remote call control on each pool for which you want to support remote call control. For details about how to configure a trusted application entry, see Configure a Trusted Application Entry for Remote Call Control in the Deployment documentation.

3. If you deployed a SIP/CSTA gateway that uses Transmission Control Protocol (TCP) to connect to Lync Server 2013, define the IP address of the gateway in Topology Builder. For details about defining the IP address, see Define a SIP/CSTA Gateway IP Address in the Deployment documentation.
4. Configure Lync 2013 users for remote call control by enabling remote call control and assigning a line server Uniform Resource Identifier (URI) and a line URI. When you migrate users from your legacy deployment to Lync Server 2013, the remote call control settings are migrated along with the other user settings.
5. If you customized Address Book phone number normalization rules in your legacy deployment, you need to perform some manual tasks after the automated migration of policies and settings is complete to migrate the customized normalization rules. If you did not customize normalization rules, Address Book is migrated along with the rest of your topology. For details about manually migrating customized normalization rules, see Migrate Address Book.

1.6.2.10.5.1 Remove an Authorized Host Entry

Remove an Authorized Host Entry

Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks > Enable Remote Call Control >

Topic Last Modified: *2012-09-26*

This topic describes how to remove a legacy authorized host entry (known as a *trusted application entry* in Lync Server 2013). You must remove existing authorized host entries for any SIP/CSTA gateways in your Office Communications Server 2007 R2 deployment when you migrate remote call control to a Lync Server 2013 deployment. You must use the administrative tools included with Office Communications Server 2007 R2 to remove the existing authorized host entries.

To remove an authorized host entry in an Office Communications Server 2007 R2 deployment

1. Open the Office Communications Server 2007 R2 administrative console.

2. Expand the tree and right-click the pool where the authorized host was created.
3. Click **Properties**, and then click **Front End Properties**.
4. Click the **Host Authorization** tab.
5. Select a server, and then click **Remove**.
6. In **Properties**, click **OK**.

1.6.2.10.6 Remove Legacy Archiving and Monitoring Servers

Remove Legacy Archiving and Monitoring Servers

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-09-26*

If your Office Communications Server 2007 R2 deployment contained an Archiving Server or a Monitoring Server, after migrating to Lync Server 2013, those servers can be removed from the legacy environment provided all users have been removed from any remaining Office Communications Server 2007 R2 pools. You can remove the Archiving Server or Monitoring Server in any sequence. The key requirement is that all users have been removed from any remaining Office Communications Server 2007 R2 pools.

You can move users from Office Communications Server 2007 R2 to Lync Server 2013 by following the procedures outlined in Phase 6: Move users to the Pilot Pool.

After you have confirmed that all users have been removed from any remaining pools, follow the procedure in "Removing Servers and Server Roles" at http://go.microsoft.com/fwlink/p/?linkId=205887.

1.6.2.10.7 Migrate Mediation Server

Migrate Mediation Server

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-09-28*

Your Mediation Server is merged into your Lync Server 2013 pilot topology when you run the Merge wizard. You configure the Lync Server 2013 Mediation Server, however, after all users are migrated because an Office Communications Server 2007 R2 pool cannot communicate with a Lync Server 2013 Mediation Server. During the side-by-side migration, the Lync Server 2013 pool communicates with the Office Communications Server 2007 R2 Mediation Server.

When you configure your Lync Server 2013 Mediation Server, you must also upgrade or replace your Office Communications Server 2007 R2 gateways. Office Communications Server 2007 R2 gateways do not support Lync Server 2013 Mediation Server. You need to deploy gateways that are certified for Lync Server 2013 and associate them with the Lync Server 2013 Mediation Server. This step is required before you can completely decommission your Office Communications Server 2007 R2 deployment.

The topics in this section describe configuration tasks that you need to perform after you have completed your migration of Lync Server 2013 Mediation Server. Transitioning the collocated Mediation Server to a stand-alone Mediation Server is an optional task.

- Configure Mediation Server
- Change Voice Routes to use the new Lync Server 2013 Mediation Server

- Transition a collocated Mediation Server to a Stand-Alone Mediation Server (optional)

1.6.2.10.7.1 Configure Mediation Server

Configure Mediation Server

Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks > Migrate Mediation Server >

Topic Last Modified: *2012-09-28*

This procedure details the steps to configure the Lync Server 2013 pool to use the Lync Server 2013 Mediation Server, instead of the legacy Office Communications Server 2007 R2 Mediation Server.

To successfully publish, enable, or disable a topology when adding or removing a server role, you should be logged in as a user who is a member of the RTCUniversalServerAdmins and Domain Admins groups. It is also possible to delegate the proper administrator rights and permissions for adding server roles. For details, see Delegate Setup Permissions in the Standard Edition server or Enterprise Edition server Deployment documentation. For other configuration changes, only membership in the RTCUniversalServerAdmins group is required.

Note:

For the latest information on finding qualified PSTN gateways, IP-PBXs, and SIP trunking services that work with Lync Server 2013, see "Microsoft Unified Communications Open Interoperability Program" at http://go.microsoft.com/fwlink/p/?linkId=206015.

To configure Mediation Server Using Topology Builder

1. Open an existing topology from Topology Builder.
2. In the left pane, navigate to **PSTN gateways**.
3. Right-click **PSTN gateways**, and then click **New IP/PSTN Gateway**.
4. Complete the **Define New IP/PSTN Gateway** page with the following information:
   - Enter the gateway FQDN or IP address. The FQDN of the gateway is required if the gateway uses the TLS protocol.
   - Accept the default value of the **Listening port for IP/PSTN gateway** or enter the new listening port if it was modified.
   - Set the **Sip Transport Protocol**.
5. In the left pane, navigate to the **Enterprise Edition Front End pool** or the **Standard Edition Server**.
6. Right-click the pool, and then click **Edit Properties**.
7. Under **Mediation Server**, set the **Listening ports**.
8. Next, associate the newly created PSTN gateway by selecting it and clicking **Add**.
9. In **Topology Builder**, select the top-most node **Lync Server**.
10. From the **Action** menu, select **Publish Topology** and then click **Next**.
11. When the **Publishing wizard** completes, click **Finish** to close the wizard.

Note:

It is important that you complete the next topic, Change Voice Routes to use the new Lync Server 2013 Mediation Server to ensure that the voice routes are pointing to the correct Mediation Server.

1.6.2.10.7.2 Change Voice Routes to use the new Lync Server 2013 Mediation Server

Change Voice Routes to use the new Lync Server 2013 Mediation Server

Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks > Migrate Mediation Server >

Topic Last Modified: *2012-09-28*

This procedure changes the voice routes to use the Lync Server 2013 Mediation Server, instead of the legacy Office Communications Server 2007 R2 Mediation Server.

To change the voice routes to use the new Mediation Server

1. Lync Server 2013 Control Panel
2. In the left pane, select **Voice Routing** and then **Route**.
3. Click **New** to create a New Voice Route.
4. Fill in the following fields:
   - **Name**: Type a descriptive name of the voice route. For this document we will use **W15PSTNRoute**.
   - **Description**: Type a short description of the voice route.
5. Skip all remaining sections until you reach **Associated gateways**. Click **Add**. Select the new default gateway and click **OK**.
6. Under **Associated PSTN Usages**, click **Select**.
7. From the **Select PSTN Usage Record** page, select a record name and then click **OK**.
8. From the **New Voice Route** page, click **OK** to create the **Voice Route**.
9. From the **Voice Routing** page, select **Route**.
10. Move the newly created route to the top of the list and then select **Commit**.

1.6.2.10.7.3 Transition a collocated Mediation Server to a Stand-Alone Mediation Server (optional)

Transition a collocated Mediation Server to a Stand-Alone Mediation Server (optional)

Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks > Migrate Mediation Server >

Topic Last Modified: *2012-10-19*

Use the procedure that follows to transition your Mediation Server, collocated on your Standard Edition server or Front End pool, to a stand-alone Mediation Server for a single-site deployment.

To transition a collocated Mediation Server to a stand-alone Mediation Server

1. Open an existing topology from Topology Builder.
2. In the left pane, navigate to **Mediation pools**.
3. Right-click **Mediation pools** and select **New Mediation Server**.
4. On the **Define New Mediation Pool** page, provide the FQDN of the new

Mediation Server pool. Also, select whether this pool will be a single-server or multiple-server pool, and then click **Next**.
5. Select the next hop Front End server pool to which the new Mediation Server will route inbound calls, and then click **Next**.
6. Select the Edge pool to be used by the Mediation Server and then click **Next**.
7. On the **Specify PSTN gateways** page, associate the previous PSTN gateway with the Mediation Server. Select the gateway and then click **Add**.
8. Click **Finish** to close the **Define New Mediation Pool** wizard.
9. From **Topology Builder**, select the top node **Lync Server 2013**.
10. From the **Actions** pane, select **Publish Topology** and complete the wizard.
11. Follow the steps in Install the Files for Mediation Server in the Deployment documentation to install the files on the new Mediation Server.
12. After the files are installed on the Mediation Server, return to Topology Builder, and in the left pane navigate to the pool.
13. Right-click the pool and select **Edit Properties**.
14. Under **Mediation Server**, clear the check box **Collocated Mediation Server enabled** and then click **OK**.
15. From **Topology Builder**, select the top node **Lync Server 2013**.
16. From the **Action** menu, select **Publish Topology** and complete the wizard.

1.6.2.10.8 Configure Trusted Application Servers

Configure Trusted Application Servers

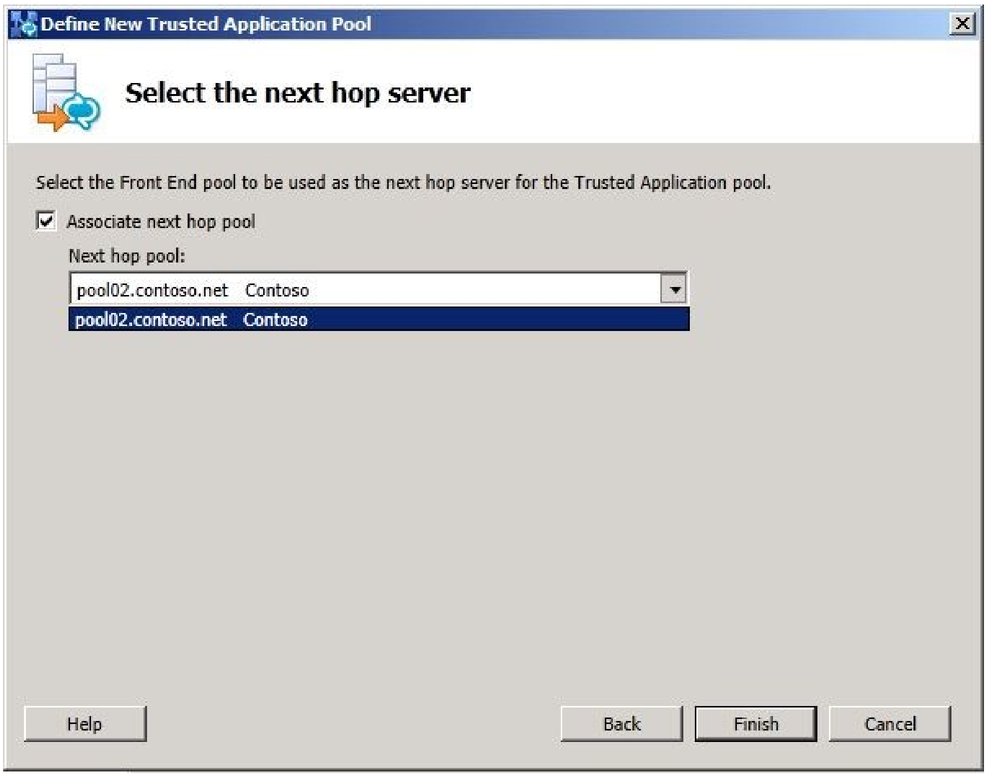
Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-04*

In a mixed environment, if you create a new trusted application server after merging the legacy Office Communications Server topology with Lync Server 2013, and you define a new trusted application server using Topology Builder, you must set the next hop pool to be a Lync Server 2013 pool. In a merged environment, both the legacy Office Communications Server pool and the Lync Server 2013 pool appear in the drop down list. Selecting the legacy pool is *not* supported.

To select Lync Server 2013 as next hop when creating a Trusted application server

1. Open an existing topology in Topology Builder.
2. In the left pane, right click **Trusted application servers** and click **New Trusted Application Pool**.
3. Enter the **Pool FQDN** of the trusted application pool and select whether it will be a single-server or multiple-server deployment.
4. Click **Next**.
5. On the **Select the next hop** page, from the list, select the Lync Server 2013 Front End pool.



Define New Trusted Application Pool

Select the next hop server

Select the Front End pool to be used as the next hop server for the Trusted Application pool.

☑ Associate next hop pool

Next hop pool:

pool02.contoso.net Contoso

6. Click **Finish**.
7. Select the top node **Lync Server** and from the **Actions** pane, select **Publish**.
8. Verify the **Trusted Application Pool** was created successfully and is associated with the correct Front End pool.

1.6.2.10.9 Configure the Meeting Join Page

Configure the Meeting Join Page

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-12-14*

When a user clicks a meeting link in a meeting request, the meeting join page detects whether a Lync 2013 client is already installed on the user's computer. If a client is already installed, that client opens and joins the meeting. If a client is not installed, by default the 2013 version of Microsoft Lync Web App opens.

You can modify the behavior of the meeting join page if you want to allow users to join meetings with Office Communicator 2007 R2 or Lync 2010 Attendant. These configuration options have been removed from the Lync Server 2013 Control Panel, but you configure them by using the CsWebServiceConfiguration cmdlet.

Meeting Join Page CsWebServiceConfiguration Parameters

CsWebServiceConfiguration Parameter	Description
ShowJoinUsingLegacyClientLink	If set to True, users joining a meeting by using a client application other than Lync will be given the opportunity to join the meeting

	by using Office Communicator 2007 R2. The default value is False.
ShowAlternateJoinOptionsExpanded	When set to True then alternate options for joining an online conference (such as Office Communicator 2007 R2) will automatically be expanded and shown to users. When set to False (the default value) these options will be available, but the user will have to display the list of options for themselves.

To configure the meeting join page by using Lync Server 2013 Management Shell

1. Start the Lync Server 2013 Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Run the following cmdlet:

   ```
   Get-CsWebServiceConfiguration
   ```

   This cmdlet returns the web service configuration settings.
3. Run the following command, with the parameters set to True or False, depending on your preference (for details about the parameters for this cmdlet, see the Lync Server 2013 Management Shell documentation):

   ```
   Set-CsWebServiceConfiguration -Identity global -ShowJoinUsingLegacyCli
   ```

1.6.2.10.10 Deploy Lync Server 2013 Clients

Deploy Lync Server 2013 Clients

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-19*

After you migrate users to Lync Server 2013, do the following:

1. Use the Client Version Filter on the new Lync Server 2013 server to only allow clients with the most current updates installed to sign in.
2. If necessary, configure the Group Policy settings that are required for client bootstrapping. For details, see Configuring Client Bootstrapping Policies in the Deployment documentation. Configuration of these settings is only necessary if you want to change existing client bootstrapping policies or if you want to set new client bootstrapping policies. If you do not plan to configure client bootstrapping policies, or you want legacy client bootstrapping policies to remain in effect, no action is necessary.
3. Configure other user and client policies for specific users or groups of users by using Lync Server 2013 Control Panel, Lync Server 2013 Management Shell, or both. For details, see New and Changed Settings for Lync 2013 in the Planning documentation.
4. Deploy the latest version of Lync Server 2013 clients along with the latest cumulative updates. For details, see Deploying Clients and Devices in the Deployment documentation.
5. (Optional) If your organization requires Lync Server 2013 enhanced presence privacy mode, after migration is complete, define a Client Version Policy Rule to prevent earlier client versions from signing in. Then, enable enhanced

presence privacy mode.

Important:
Do not enable Lync 2013 enhanced presence privacy mode until every user on a given server pool has the most current client versions installed.

1.6.2.10.11 Move Exchange Unified Messaging Contact Objects

Move Exchange Unified Messaging Contact Objects

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-10-19*

To migrate Auto Attendant (AA) and Subscriber Access (SA) contact objects to the new Lync Server 2013 deployment, you first move the objects from the legacy Office Communications Server 2007 R2 deployment to the new the Lync Server 2013 deployment using the **Get-CsExUmContact** and **Move-CsExUmContact** cmdlets. On the Exchange Server, you then run the **ExchUCUtil** Windows PowerShell script to do the following for the newly deployed Lync pool:

- Add it to the Unified Messaging IP gateways.
- Add it to the Unified Messaging hunt groups.

Note:
In order to use the **Get-CsExUmContact** and **Move-CsExUmContact** cmdlets, you must be a member of the RTCUniversalUserAdmins group and have organizational unit (OU) permission to the OU where the contacts objects are stored. OU permission can be granted using the **Grant-OUPermission** cmdlet.

⊟To move contact objects by using the Lync Server Management Shell

1. Open the Lync Server Management Shell.
2. For each pool registered with Exchange UM (where pool1.contoso.net is a pool from the Office Communications Server 2007 R2 deployment and pool2.contoso.net is the pool from the Lync Server 2013 deployment) at the command line, type the following:

```
Get-CsExUmContact -Filter {RegistrarPool -eq "pool01.contoso.net"} | M
```

   To verify that the contact objects are moved, run the **Get-CsExumContact** cmdlet and confirm that **RegistrarPool** is now pointing to the new pool.

⊟To run the ExchUCUtil Windows PowerShell script

1. Log on to the Exchange UM Server as a user with Exchange Organization Administrator privileges.
2. Navigate to the ExchUCUtil Windows PowerShell script.
   In Exchange 2007, ExchUCUtil.ps1 is located at: **%Program Files%\Microsoft\Exchange Server\Scripts\ExchUCUtil.ps1**
   In Exchange 2010, ExchUCUtil.ps1 is located at: **%Program Files%\Microsoft\Exchange Server\V14\Scripts\ExchUCUtil.ps1**
3. If Exchange is deployed in a single forest, type:

```
exchucutil.ps1
```

   Or, if Exchange is deployed in multiple forests, type:

```
exchucutil.ps1 -Forest:" <forest FQDN>"
```

   where *forest FQDN* specifies the forest in which Lync Server 2013 is deployed.

Important:

Be sure to restart the **Lync Server Front-End** service (rtcsrv.exe) *after* you run exchucutil.ps1. Otherwise, Lync Server 2013 will not detect Unified Messaging in the topology.

1.6.2.10.12 Verify that all Exchange UM Contact Objects are Removed from the Legacy Pool

Verify that all Exchange UM Contact Objects are Removed from the Legacy Pool

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 9: Complete Post-Migration Tasks >

Topic Last Modified: *2012-09-26*

Use either the **OCSUmUtil** tool or the **Get-CsExumContact** cmdlet to verify that Exchange UM contact objects have been removed from the legacy Office Communications Server 2007 R2 pool. **OCSUmUtil** is located in the following folder:

%Program Files%\Common Files\Lync Server 2013\Support\OcsUMUtil.exe

OCSUmUtil must be run from a user account that has:

- Membership in the RTCUniversalServerAdmins and RTCUniversalUserAdmins group (which includes rights to read Exchange Server Unified Messaging settings)
- Domain rights to create contact objects in the specified organizational unit (OU) container

For details about using the **Get-CsExumContact** cmdlet, see Get-CsExUmContact in the Lync Server Management Shell documentation.

1.6.2.11 Phase 10: Decommission Legacy Site

Phase 10: Decommission Legacy Site

Microsoft Lync Server 2013 > Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 >

Topic Last Modified: *2012-10-16*

The following topics provide guidance in decommissioning pools, and deactivating and removing servers and pools from a legacy deployment of Office Communications Server 2007 R2. Not all of the procedures listed in this section are required. Read the information in each of these topics to determine which decommissioning procedure to use.

Caution:

If you imported conference directories for dial-in conferencing to Lync Server 2013, it is important to transition conference directory ownership to Lync Server 2013 before you begin to decommission your pools. If you decommission a pool without first transitioning conference directory ownership, the dial-in feature for all migrated meetings will no longer work. You must perform the step to transition ownership once for each conference directory in your legacy pool.

Important:

For information on migrating and upgrading Microsoft Unified Communications Managed API (UCMA) applications, prior to decommissioning your legacy environment, see http://

go.microsoft.com/fwlink/p/?LinkId=269555

In This Section

- Move Conference Directories
- Update DNS SRV Records
- Decommissioning Servers and Pools
- Remove BackCompatSite

1.6.2.11.1 Move Conference Directories

Move Conference Directories

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 10: Decommission Legacy Site >

Topic Last Modified: *2012-10-04*

Before decommissioning a pool, you need to perform the following procedure for each conference directory in your Office Communications Server 2007 R2 pool.

To move a conference directory to Lync Server 2013

1. Open the Lync Server Management Shell.
2. To obtain the identity of the conference directories in your organization, run the following commands:

   ```
   Get-CsConferenceDirectory
   ```

   Because this cmdlet returns all the conference directories in your organization, you may want to limit the results to only the pool you want to decommission. For example, if you want to decommission a pool with the fully qualified domain name (FQDN) pool01.contoso.net:

   ```
   Get-CsConferenceDirectory | Where-Object {$_.ServiceID -match "pool01.
   ```

   This cmdlet returns all the conference directories where service ID contains the FQDN pool01.contoso.net.
3. To move conference directories, run the following for each conference directory in the pool:

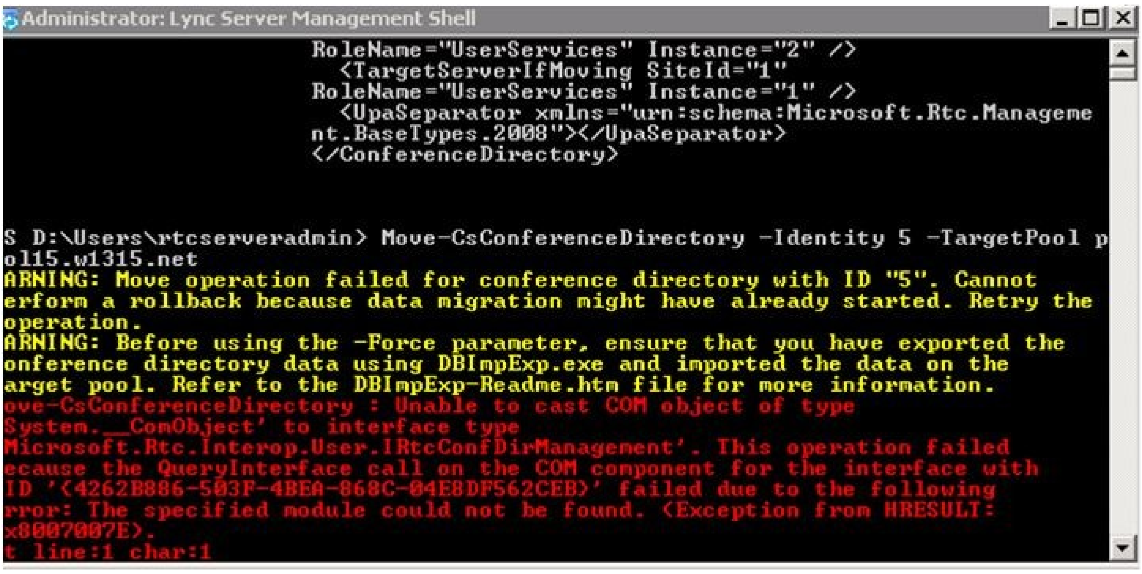
   ```
   Move-CsConferenceDirectory -Identity <Numeric identity of conference d
   ```

   For example:

   ```
   Move-CsConferenceDirectory -Identity 3 -TargetPool pool02.contoso.net
   ```

Note:

You may experience an error, shown below, that is caused by the Lync Server Management Shell requiring an updated set of permissions from Active Directory. To resolve the error, closed the current window and open a new Lync Server Management Shell and run the command again.



```
                     RoleName="UserServices" Instance="2" />
                       <TargetServerIfMoving SiteId="1"
                     RoleName="UserServices" Instance="1" />
                       <UpaSeparator xmlns="urn:schema:Microsoft.Rtc.Manageme
                     nt.BaseTypes.2008"></UpaSeparator>
                     </ConferenceDirectory>

S D:\Users\rtcserveradmin> Move-CsConferenceDirectory -Identity 5 -TargetPool p
ol15.w1315.net
ARNING: Move operation failed for conference directory with ID "5". Cannot
erform a rollback because data migration might have already started. Retry the
operation.
ARNING: Before using the -Force parameter, ensure that you have exported the
onference directory data using DBImpExp.exe and imported the data on the
arget pool. Refer to the DBImpExp-Readme.htm file for more information.
ove-CsConferenceDirectory : Unable to cast COM object of type
System.__ComObject' to interface type
Microsoft.Rtc.Interop.User.IRtcConfDirManagement'. This operation failed
ecause the QueryInterface call on the COM component for the interface with
ID '{4262B886-503F-4BEA-868C-04E8DF562CEB}' failed due to the following
rror: The specified module could not be found. (Exception from HRESULT:

t line:1 char:1
```

1.6.2.11.2 Update DNS SRV Records

Update DNS SRV Records

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 10: Decommission Legacy Site >

Topic Last Modified: *2012-09-29*

To successfully complete this procedure, you should be logged on to the server or domain as a member of the Domain Admins group or a member of the DnsAdmins group.

This topic describes how to update the Domain Name System (DNS) records after migrating to Lync Server 2013. After all users have been moved to Lync Server 2013, but before the legacy Office Communications Server 2007 R2 pool or Director is decommissioned, you must update the DNS SRV records in your internal DNS for every SIP domain. This procedure assumes that your internal DNS has zones for your SIP user domains.

To configure a DNS SRV record

1. On the DNS server, click **Start**, click **Administrative Tools**, and then click **DNS**.
2. In the console tree for your SIP domain, expand **Forward Lookup Zones**, expand the SIP domain in which Lync Server 2013 is installed, and navigate to the **_tcp** setting.
3. In the right pane, right click **_sipinternaltls** and select **Properties**.
4. In **Host offering this service**, update the host FQDN to point to the Lync Server 2013 pool.
5. Click **OK**.

To verify that the FQDN of the Front End pool or Standard Edition server can be resolved

1. Log on to a client computer in the domain.
2. Click **Start**, and then click **Run**.
3. In the **Open** box, type **cmd**, and then click **OK**.
4. At the command prompt, type **nslookup** *<FQDN of the Front End pool>* or *<FQDN of the Standard Edition server>*, and then press ENTER.
5. Verify that you receive a reply that resolves to the appropriate IP address for the FQDN.

1.6.2.11.3 Decommissioning Servers and Pools

Decommissioning Servers and Pools

Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 10: Decommission Legacy Site >

Topic Last Modified: *2012-09-26*

The following webpages contain details about decommissioning Office Communications Server 2007 R2 Standard Edition or Enterprise Edition servers and pools.

- Decommissioning Standard Edition at http://go.microsoft.com/fwlink/p/?linkId=205889
- Removing Servers and Server Roles at http://go.microsoft.com/fwlink/p/?linkId=205887
- Removing an Enterprise Pool at http://go.microsoft.com/fwlink/p/?linkId=205888

1.6.2.11.4 Remove BackCompatSite

Remove BackCompatSite

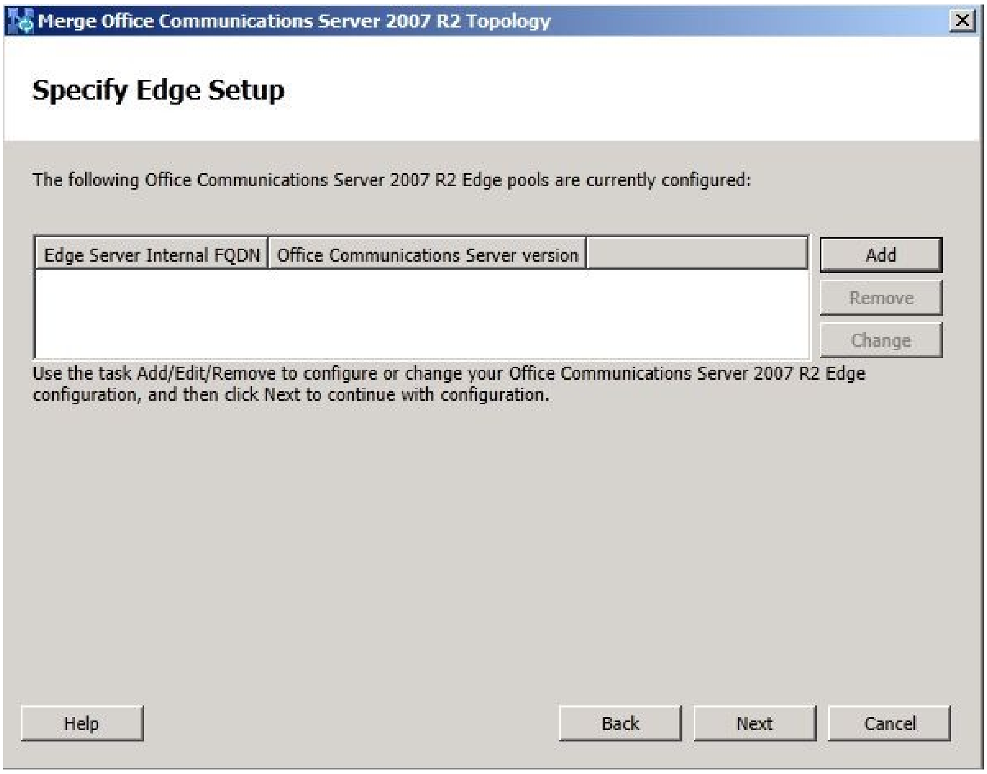
Migration > Migration from Office Communications Server 2007 R2 to Lync Server 2013 > Phase 10: Decommission Legacy Site >

Topic Last Modified: *2012-09-28*

After all pools are deactivated and all Edge Servers have been uninstalled, run the Topology Builder Merge wizard to remove the **BackCompatSite**.

To remove BackCompat site from Topology Builder

1. Open an existing deployment from Topology Builder.
2. In the **Action** menu, click **Merge 2007 R2 Topology**.
3. Click **Next** to continue.
4. On the **Specify Legacy Edge** page, ensure that list of Edge Servers is empty. If the list is not empty, use the **Remove** button to remove all the legacy Edge Servers, and then click **Next**.



Merge Office Communications Server 2007 R2 Topology
Specify Edge Setup
Edge Server Internal FQDN
Office Communications Server version
Add
Remove
Change
Help
Back
Next
Cancel

The following Office Communications Server 2007 R2 Edge pools are currently configured:

Use the task Add/Edit/Remove to configure or change your Office Communications Server 2007 R2 Edge configuration, and then click Next to continue with configuration.

5. On the **Specify Internal SIP port setting** page, click **Next**.
6. On the **Summary** page, click **Next** to begin merging the topologies to remove the legacy site.
7. In the **Status** column, verify that the value is **Success** and then click **Finish** to close the wizard.
8. In the left pane of Topology Builder, expand the BackCompatSite and ensure no servers are listed.
9. Right-click the **BackCompatSite**, and then click **Delete**.
10. In **Topology Builder**, select the top-most node **Lync Server**.
11. From the **Action** menu, select **Publish Topology** and then click **Next**.
12. When the **Publishing wizard** completes, click **Finish** to close the wizard.

1.6.3 Migration from Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013, Persistent Chat Server

Migration from Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013, Persistent Chat Server

Microsoft Lync Server 2013 > Migration >

Topic Last Modified: *2012-10-06*

The topics in this section guide you through the process of migrating either Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013, Persistent Chat Server. If you intend for your Lync Server 2013, Persistent Chat Server deployment to coexist with a Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat deployment, this guide also includes some essential information for operating in this mixed environment. This guide primarily focuses on data migration for Persistent Chat Server. For users who are migrating from legacy versions of Lync Server to Lync Server 2013, see Migration from Lync Server 2010 to Lync Server 2013 and Migration from Office Communications Server 2007 R2 to Lync Server 2013.

◆Important:
This topic assumes that you have already installed Lync Server 2013 in coexistence with Lync Server 2010 or Office Communications Server 2007 R2.

◆Important:
This guide describes the steps generally required to accomplish each phase of migration. It does not address every possible legacy deployment topology or every possible migration scenario. Therefore, you may not need to perform every step that is described, or you may need to perform additional steps, depending on your deployment. The guide also provides examples of verification steps. These verification steps are provided to help you understand what you need to look for to be sure that each phase completes successfully as you progress through your migration. You can modify these verification steps to your specific migration process.

This guide provides information specific to upgrading your existing deployment. It does not explain how to change your existing topology. This guide does not cover the implementation of new features. When a detailed procedure is documented elsewhere, this guide directs you to the appropriate document or document section.

This document defines terms as specified in the following list.

migration

Moving your deployment from a previous version of Persistent Chat Server, formerly known as Group Chat Server, to Lync Server 2013, Persistent Chat Server.

upgrade

Installing a newer version of software on a server or client computer.

coexistence

The temporary environment that exists during migration, when some functionality has been migrated to Lync Server 2013, Persistent Chat Server, and other functionality still remains on a prior version of Group Chat Server.

Persistent Chat Server is an extension of the Lync Server 2013 infrastructure. Depending on your topology, you can migrate Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013 Persistent Chat Server. For details about available topologies and the technical and software requirements for migrating Group Chat Server, see Planning for Persistent Chat Server in the Planning documentation.

If your organization requires compliance support, it is now automatically installed with each Persistent Chat Server. A separate server is no longer needed for compliance.

◆Important:
Persistent Chat Server must be installed on an NTFS file system to help enforce file system security. FAT32 is not a supported file system for Persistent Chat Server.
If your organization requires compliance support, it is now automatically installed with each Persistent Chat Server. A separate server is no longer needed for compliance. For more details about changes in Lync Server 2013 Persistent Chat Server, see New Persistent Chat Server Features in the Getting Started documentation.

In This Section

- Standard Migration Scenario - High-Level

- Migration Process - Details
- Coexistence Considerations

1.6.3.1 Standard Migration Scenario - High-Level

Standard Migration Scenario - High-Level

Microsoft Lync Server 2013 > Migration > Migration from Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013, Persistent Chat Server >

Topic Last Modified: *2013-01-30*

Use the following items as a starting point when migrating Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013, Persistent Chat Server. The standard Lync Server 2013 migration path is as follows:

- Your organization has previously deployed Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat, and you want to deploy Lync Server 2013, Persistent Chat Server.
- Deploy Lync Server 2013, and then deploy Persistent Chat Server pool(s).
- Prepare and plan for migration of your Persistent Chat rooms, and determine an appropriate time to shut down the system for migration.
- Run the Windows PowerShell cmdlets for migration (**Export-CsPersistentChatData** and **Import-CsPersistentChatData**) to move content to Persistent Chat Server.
- Verify that migration has succeeded.
- Decommission your legacy deployment.
- Configure Persistent Chat Server so that legacy clients can connect to Lync Server 2013, Persistent Chat Server. This is necessary because it takes time to deploy new clients, and you want to enable existing users with legacy clients to have access to their chat rooms as soon as possible.
- Deploy new clients, while continuing to help ensure that workers with legacy Group Chat (clients) can get to their chat rooms.

1.6.3.2 Migration Process - Details

Migration Process - Details

Microsoft Lync Server 2013 > Migration > Migration from Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013, Persistent Chat Server >

Topic Last Modified: *2012-10-19*

Use the following prerequisites and detailed steps to migrate either Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013, Persistent Chat Server.

Prerequisites for Migration

Be sure that you’ve met the following prerequisites before migrating either Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013, Persistent Chat Server.

1. Deploy at least one Lync Server 2013 pool. If you have multiple Lync Server 2013 pools, decide which Lync Server 2013 pool will be the home pool for the new Lync Server 2013 Persistent Chat Server pool.
2. Install the Lync Server 2013, Persistent Chat Server pool. It will be empty (no categories, rooms, or add-ins). Before you migrate your legacy categories, rooms, or add-ins, you can create rooms, categories, or add-ins in your Lync Server 2013, Persistent Chat Server deployment.

Important:

Be aware that these newly created items may conflict with legacy items that you migrate. Avoid any naming conflicts; otherwise, they will be overwritten when the legacy data is migrated.

Preparing the Source Data for Migration

Perform the following steps to properly prepare your source data for migration.

1. Back up the source databases for either Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat. For details about backing up SQL Server, see "Backup Overview (SQL Server)" at http://go.microsoft.com/fwlink/p/?linkid=254851.

   Important:

   Active Directory Domain Services (AD DS) should be the same. As a condition for migration, you cannot migrate to a pool in a different deployment (specifically, in a different Active Directory forest).

2. Inspect your Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat chat rooms and category configuration. Any changes to categories, rooms, or add-ins in your existing legacy deployment will be done by the Group Chat Admin Tool.

   Tip:

   Any changes to categories, rooms, or add-ins in your Lync Server 2013, Persistent Chat Server deployment are performed by the Lync Server Control Panel or Windows PowerShell cmdlets.

   Follow these steps to prepare your legacy system for migration.

   2.a. Persistent Chat Server supports a single level of categories, unlike a deep hierarchical set of categories. After migration, the subcategories are prefixed with full parent category names. You might want to simplify and flatten your existing category structure so that the resulting structure meets your requirements.

   2.b. Verify the **Managers** at the root Category. If any Managers exist at this level, these users will be added as **Managers to all rooms** after migration. If this is not a requirement for your organization, you need to remove these Managers from the root Category.

   2.c. Verify the length of room names. After migration, due to simplified category structures, if the rooms exist under a child category, they are prefixed with full parent category names. The naming limit is 256 characters, including parent category names. You must verify the length of the room names and possibly shorten the length, if they are too long.

   2.d. In Lync Server 2013, if the category **invitations** settings are set to true, you can choose true or false for invitations to rooms under that category. However if the category invitations settings are set to false, rooms under that category have invitations turned off. Before migration, you must reset the invitation settings in your legacy Lync Server Group Chat Server version, if you want room(s) to exist under a specific category. Otherwise, during migration, Lync Server 2013 displays warnings and sets rooms to the default value of false.

   2.e. If you used files in chat rooms, you must XCOPY the files manually to the new Persistent Chat file store after migration. The tools don’t do this.

   2.f. If you had federated users and rooms with federated users, be aware that Persistent Chat Server does not support federation. Rooms with federated users will be migrated; however, the users themselves won’t be able to access the content, because federated access is not supported.

   2.g. Identify those rooms that you do not want to migrate, and mark them as disabled.

   2.h. Identify the date beyond which you want to migrate the chat room content. For example, you may not want to migrate messages earlier than

January 1, 2010, because these messages may be obsolete or not relevant for migration.

Performing the Migration

Perform the following steps to migrate your legacy Group Chat Server.

1. Shut down the Lync Server 2010, Group Chat, Office Communications Server 2007 R2 Group Chat or Lync Server 2013, Persistent Chat Server services. All services must be stopped, so plan to do this at a time when there is enough downtime. As previously described, make sure to back up your current Group Chat database.
2. Run the Windows PowerShell **Export-CsPersistentChatData** cmdlet as a member of the Persistent Chat administrator RBAC role (CsPersistentChatAdministrator). For details about the export/import cmdlets, see Troubleshooting Persistent Chat Server Configuration using Windows PowerShell Cmdlets.
   Inspect the exported contents.
3. Before you're ready to import, shut down Lync Server 2013, Persistent Chat Server services. All services need to be stopped, so plan to do this at a time when there is enough downtime.
4. Perform a backup of the Persistent Chat database if you had created any categories, rooms, or add-ins in your Lync Server 2013 deployment before the migration. The export/import process will be able to merge the legacy data into the Lync Server 2013 deployment, but you'll want to back up the database in case that content is inadvertently overwritten (for example, if naming conflicts still exist).
5. Run the Windows PowerShell **Import-CsPersistentChatData** cmdlet (import tool), with a **WhatIf** command to populate the Back End Server of the Persistent Chat Server pool with migrated data. Some conversions happen in the process to accommodate the simplified administration model. Fix any errors or warnings that appear.
6. Run the Persistent Chat Server Windows PowerShell **Import-CsPersistentChatData** cmdlet as a member of the Persistent Chat administrator RBAC role (CsPersistentChatAdministrator). For details about the export/import cmdlets, see Troubleshooting Persistent Chat Server Configuration using Windows PowerShell Cmdlets.
7. You must XCOPY all uploaded files (the entire folder) to the new Lync Server 2013, Persistent Chat file store.

Important:
The Lync 2013 (client) does not support uploading or viewing files in chat rooms. You can still use the legacy client to post and view files in the room.

8. Port the Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat Lookup Server URI to the Lync Server 2013, Persistent Chat Server contact object. The following steps are required if either your Lync 2010 Group Chat or Office Communicator 2007 R2 Group Chat clients need to connect to the latest Lync 2013, Persistent Chat (client) after migration without any client-side configuration changes:
   - Delete the ocschat@<*domainName*>.com Lookup Server user account. This was used to point to the Lookup Service in Lync Server 2010, Group Chat. You can uninstall the pool and remove trusted entries later.
   - Create a legacy endpoint (Persistent Chat Server contact object) by running the Windows PowerShell cmdlet, **New-CsPersistentChatEndpoint**, with the identical SIP URI so that the legacy client will work effectively when the service is restarted.

   The mandatory migration process is complete at this point. Lync 2010 Group Chat (clients) or Office Communicator 2007 R2 Group Chat (clients) can connect to the new Persistent Chat Server pool now, transparently.
   Follow these additional decommissioning steps for Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat.

9. Start the Persistent Chat Server services by turning on all computers in the new Persistent Chat Server pool.
10. Use the Lync Server Control Panel and Windows PowerShell cmdlets to verify that the data has migrated successfully.
11. Uninstall Lync 2010 Group Chat or Office Communicator 2007 R2 Group Chat from the computers in the Group Chat Server pool.
12. Delete the trusted application and trusted application pool using Windows PowerShell cmdlets. This deletes these items from the Central Management store and the associated Trusted Service Entries (TSEs) from the Active Directory. Alternatively, this step works by using the Topology Builder (the trusted applications/pools have a dedicated node there, also).
13. You can now begin to enable Persistent Chat Server functionality through the new clients. For details about enabling Persistent Chat Server, see Deploying Persistent Chat Server.

Important:
Lync Server 2013 supports multiple Persistent Chat Server pools. However, we support migrating a Lync 2010 Group Chat or Office Communications Server 2007 R2 Group Chat pool to a single Lync Server 2013, Persistent Chat Server pool. You can add additional new Persistent Chat Server pools in your deployment to meet the regulatory needs (for example, keeping data within a given geography).

1.6.3.3 Coexistence Considerations

Coexistence Considerations

Microsoft Lync Server 2013 > Migration > Migration from Lync Server 2010, Group Chat or Office Communications Server 2007 R2 Group Chat to Lync Server 2013, Persistent Chat Server >

Topic Last Modified: *2012-10-06*

After migration, only a Lync Server 2013, Persistent Chat Server pool will exist, and you can decommission your legacy deployment.

Before migration completes and before you have decommissioned your current Group

Chat Server deployment completely, you may have any of the following deployments:

- Lync Server 2013, Persistent Chat Server pool, which must be homed on a Lync Server 2013 pool.
- Lync Server 2010, Group Chat pool, which must be homed on a Lync Server 2010 pool.
- Office Communications Server 2007 R2 Group Chat pool, which must be homed on an Office Communications Server 2007 R2 pool.

These deployments can exist side by side. However the categories, rooms, and add-ins in one deployment do not interact with those in the accompanying deployment.

Using manual configuration, a legacy client (Group Chat client) can connect to one pool at a time for Office Communications Server 2007 R2, Lync Server 2010, Group Chat, or Lync Server 2013.

The Lync 2013 (client) can interact only with the Lync Server 2013, Persistent Chat Server pool, not with legacy Group Chat Server pools. To use Persistent Chat in a Lync 2013 (client), the user must be homed on Lync 2013 and enabled by policy.

1.7.1 Lync Server Administrative Tools

Lync Server Administrative Tools

See Also

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2013-02-21*

This topic describes the administrative tools for Lync Server 2013.

The administrative tools are installed by default on each Lync Server server. Additionally, you can install the administrative tools on other computers, such as dedicated administrative consoles. For procedures to install the administrative tools, see Install Lync Server Administrative Tools. For procedures to open the tools to perform management tasks, see Open Lync Server Administrative Tools.

Ensure that you review infrastructure, operating system, software, and administrator rights requirements before you install or use the Lync Server administrative tools. For details about infrastructure requirements, see Administrative Tools Infrastructure Requirements. For details about operating system and software requirements to install the Lync Server administrative tools, see Server and Tools Operating System Support, Additional Software Requirements, and Additional Server Support and Requirements. The user rights and permissions required to install and use the tools are described in Administrator Rights and Permissions Required for Setup and Administration.

The administrative tools consist of the following:

- **Lync Server Deployment Wizard** Use to deploy Lync Server and to install all administrative tools.
- **Lync Server Topology Builder** Use to define components in your deployment.
- **Lync Server Control Panel** Use for ongoing management of your deployment by using a web-based interface.
- **Lync Server Management Shell** Use for ongoing management of your deployment by using the command line.
- **Lync Server Logging tool** Use to troubleshoot problems in your deployment.
- **Centralized Logging Service** Collect logs and trace files from one computer, pool, site or global. Select and define scenarios that contain providers, flags and trace levels. Logging is collected, aggregated and displayed with tools such as any text-based tool or Snooper.exe.

You can manage your deployment by primarily using Topology Builder and Lync Server Control Panel.

Deployment Wizard

You must use the Lync Server Deployment Wizard included on the installation media to install all administrative tools onto a computer on which you have not already installed Lync Server. During the administrative tools installation process, the Lync Server Deployment Wizard is installed locally along with the other tools so that you can later use it to install files for additional components or remove files for components that you do not want on the computer.

For details about how to run the Lync Server Deployment Wizard for the first time from the Lync Server installation media, see Install Lync Server Administrative Tools.

Topology Builder

For details about deployment tasks that you can you perform by using Topology Builder, see the Deployment documentation for each server role.

Lync Server Control Panel

You can use Lync Server 2013 Control Panel to perform most of the administrative tasks required to manage and maintain Lync Server 2013. Lync Server Control Panel provides you with a graphical user interface (GUI) to manage the configuration of the servers running Lync Server, in addition to the users, clients, and devices in your organization. Lync Server Management Shell uses Lync Server Control Panel as the underlying mechanism to perform Lync Server configuration.

Lync Server Control Panel is automatically installed on every Lync Server Front End Server or Standard Edition server. In this release, you administer Edge Servers remotely. You can also install Lync Server Control Panel on another computer, such as a management console from which you want to centrally manage Lync Server. For details, see Install Lync Server Administrative Tools.

Important:

- To configure settings using Lync Server Control Panel, you must be logged in using an account that is assigned to the CsAdministrator role. For details about the predefined administrative roles available in Lync Server 2013, see Planning for Role-Based Access Control.
- To configure settings using Lync Server Control Panel, you must also use a computer with a minimum screen resolution of 1024 x 768.

Lync Server Management Shell

In Lync Server, the Lync Server Management Shell provides a new method for administration and management. Lync Server Management Shell is a powerful management interface, built on the Windows PowerShell command-line interface, that includes a comprehensive set of cmdlets that are specific to Lync Server. With Lync Server Management Shell, you gain a rich set of configuration and automation controls. Topology Builder and Lync Server Control Panel both implement subsets of these cmdlets to support management of Lync Server. The Lync Server Management Shell includes cmdlets for all Lync Server administration tasks, and you can use the cmdlets individually to manage your deployment. For details, see Lync Server Management Shell documentation or the command-line help for each cmdlet.

Logging Tool

The Lync Server Logging Tool facilitates troubleshooting by capturing logging and tracing information from the product while the product is running. You can use the tool to run debug sessions on any Lync Server server role. For details about the Logging Tool, see the Lync Server 2010 Logging Tool documentation on the TechNet Library at http://go.microsoft.com/fwlink/p/?linkId=199265.

Important:

The Centralized Logging Service is recommended for all logging collection over the Lync Server Logging Tool in all circumstances. The Lync Server Logging Tool will still work, but it will interfere or be rendered mostly ineffective if the Centralized Logging Service is already running. You should use only the Centralized Logging Service or the Lync Server Logging Tool, but never both concurrently. For more information on the Centralized Logging Service and why you should use it exclusively, see Using the Centralized Logging Service.

Deploying Lync Server 2013 > System Requirements > System Requirements for Administration Tools >

Topic Last Modified: *2013-02-21*

This topic describes the infrastructure and software requirements that are specific to publishing a topology, whether by using Topology Builder or the Lync Server 2013 Management Shell command-line interface. These requirements are in addition to the general operating system, software, and permissions requirements applicable to all Lync Server 2013 administrative tools. Make sure that you satisfy all administrative tools requirements before you publish a topology.

- You must run Topology Builder on a computer that is joined to the same domain or forest of the Lync Server 2013 deployment you are creating so that Active Directory Domain Services (AD DS) preparation steps are already completed, enabling you to use the administrative tools on that computer to successfully publish your topology.
- The computers defined in the topology must be joined to the domain, except for Edge Servers, and in AD DS. However, the computers do not need to be online when you publish the topology.
- The file share for the pool must be created and available to remote users.
- In order to publish an Enterprise Edition Front End pool, the SQL Server-based Back End Server must be joined to the domain in which you are deploying the servers, online, and configured with the appropriate firewall rules to make it available to remote users. For details about specifying firewall exceptions, see Understanding Firewall Requirements for SQL Server. For other details about configuring SQL Server, see Configure SQL Server for Lync Server 2013.

Note:

Standard Edition server has a collocated database that will accept the published configuration. You must first run the **Prepare first Standard Edition server** setup task in the Lync Server Deployment Wizard.

1.7.1.1.2 Planning for Simple URLs

Planning for Simple URLs

See Also

Microsoft Lync Server 2013 > Planning > Planning for Manageability and Virtualization >

Topic Last Modified: *2013-02-21*

Simple URLs make joining meetings easier for your users, and make getting to Lync Server administrative tools easier for your administrators.

Lync Server supports three simple URLs:

- **Meet** is used as the base URL for all conferences in the site or organization. An example of a Meet simple URL is https://meet.contoso.com. A URL for a particular meeting might be https://meet.contoso.com/*username*/7322994. With the Meet simple URL, links to join meetings are easy to comprehend, and easy to communicate and distribute.

- **Dial-in** enables access to the Dial-in Conferencing Settings webpage. This page displays conference dial-in numbers with their available languages, assigned conference information (that is, for meetings that do not need to be scheduled), and in-conference DTMF controls, and supports management of personal identification number (PIN) and assigned conferencing information. The Dial-in simple URL is included in all meeting invitations so that users who want to dial in to the meeting can access the necessary phone number and PIN information. An example of the Dial-in simple URL is https://dialin.contoso.com.
- **Admin** enables quick access to the Lync Server Control Panel. From any computer within your organization's firewalls, an admin can open the Lync Server Control Panel by typing the Admin simple URL into a browser. The Admin simple URL is internal to your organization. An example of the Admin simple URL is https://admin.contoso.com

Simple URL Scope

You can configure your simple URLs to have global scope, or you can specify different simple URLs for each central site in your organization. If both a global simple URL and a site simple URL are specified, the site simple URL has precedence.

In most cases, we recommend that you set simple URLs only at the global level, so that a user's Meet simple URL does not change if they move from one site to another. The exception would be organizations that need to use different telephone numbers for dial-in users at different sites. Note that if you set one simple URL (such as the Dial-in simple URL) at a site to be a site-level simple URL, you must also set the other simple URLs at that site to be site-level as well.

You can set global simple URLs in Topology Builder. To set a simple URL at the site level, you must use the Set-CsSimpleURLConfiguration cmdlet.

Naming Your Simple URLs

There are three recommended options for naming your simple URLs. Which option you choose has implications for how you set up your DNS A records and certificates which support simple URLs. In each option, you must configure one Meet simple URL for each SIP domain in your organization.

You always need just one simple URL in your whole organization for Dial-in, and one for Admin, no matter how many SIP domains you have.

For details about the necessary DNS A records and certificates, see DNS Requirements for Simple URLs and Certificate Requirements for Internal Servers in the Planning documentation.

In Option 1, you create a new SIP domain name for each simple URL.

If you use this option, you need a separate DNS A record for each simple URL, and each Meet simple URL must be named in your certificates.

Simple URL Naming Option 1

Simple URL	**Example**
Meet	https://meet.contoso.com, https://meet.fabrikam.com, and so on (one for each SIP domain in your organization)
Dial-in	https://dialin.contoso.com

Admin	https://admin.contoso.com

With Option 2, simple URLs are based on the domain name lync.contoso.com. Therefore, you need only one DNS A record which enables all three types of simple URLs. This DNS A record references lync.contoso.com. Additionally, you still need separate DNS A records for other SIP domains in your organization.

Simple URL Naming Option 2

Simple URL	Example
Meet	https://lync.contoso.com/Meet, https://lync.fabrikam.com/Meet, and so on (one for each SIP domain in your organization)
Dial-in	https://lync.contoso.com/Dialin
Admin	https://lync.contoso.com/Admin

Option 3 is most useful if you have many SIP domains, and you want them to have separate Meet simple URLs but want to minimize the DNS record and certificate requirements for these simple URLs.

Simple URL Naming Option 3

Simple URL	Example
Meet	https://lync.contoso.com/contosoSIPdomain/Meet https://lync.contoso.com/fabrikamSIPdomain/Meet
Dial-in	https://lync.contoso.com/Dialin
Admin	https://lync.contoso.com/Admin

Simple URL Naming and Validation Rules

Topology Builder and the Lync Server Management Shell cmdlets enforce several validation rules for your simple URLs. You are required to set simple URLs for Meet and Dialin, but setting one for Admin is optional. Each SIP domain must have a separate Meet simple URL, but you need only one Dialin simple URL and one Admin simple URL for your whole organization.

Each simple URL in your organization must have a unique name, and cannot be a prefix of another simple URL (for example, you could not set lync.contoso.com/Meet as your Meet simple URL and lync.contoso.com/Meet/Dialin as your Dialin simple URL). Simple URL names cannot contain the FQDN of any of your pools, or any port information (for example, https://FQDN:88/meet is not allowed). All simple URLs must start with the https:// prefix.

Simple URLs can contain only alphanumeric characters (that is, a-z, A-Z, 0-9, and the period (.). If you use other characters, the simple URLs might not work as expected.

Changing Simple URLs after Deployment

If you change a simple URL after initial deployment, you must be aware of how the change impacts your DNS records and certificates for simple URLs. If the base of a simple URL changes, then you must change the DNS records and certificates as well. For example, changing from https://lync.contoso.com/Meet to https://meet.contoso.com changes the base URL from lync.contoso.com to meet.contoso.com, so you would need to change the DNS records and certificates to refer to meet.contoso.com. If you changed the simple URL from https://lync.contoso.com/Meet to https://lync.contoso.com/Meetings, the base URL of lync.contoso.com stays the same, so no DNS or certificate changes are needed.

Whenever you change a simple URL name, however, you must run **Enable-CsComputer** on each Director and Front End Server to register the change.

Concepts

DNS Requirements for Simple URLs

1.7.1.1.3 DNS Requirements for Simple URLs

DNS Requirements for Simple URLs

Planning > Network Planning for Lync Server > Domain Name System (DNS) Requirements >

Topic Last Modified: *2013-02-22*

Lync Server 2013 supports simple URLs, which make joining meetings easier for your users, and make getting to Lync Server administrative tools easier for your administrators. For details about simple URLs, see Planning for Simple URLs.

Lync Server supports the following three simple URLs: Meet, Dial-In, and Admin. You are required to set up simple URLs for Meet and Dial-In, and the Admin simple URL is optional. The Domain Name System (DNS) records that you need to support simple URLs depend on how you have defined these simple URLs, and whether you want to support disaster recovery for Simple URLs.

Simple URL Option 1

In Option 1, you create a new base URL for each simple URL.

Note:

When a user clicks a simple URL meeting link, the server that the DNS A record resolves to determines the correct client software to start. After the client software is started, it automatically communicates with the pool where the conference is hosted. This way, users are directed to the appropriate server for meeting content no matter which server or pool the simple URL DNS A records resolve to.

Simple URL Option 1

Simple URL	Example
Meet	https://meet.contoso.com, https://meet.fabrikam.com, and so on (one for each SIP domain in your organization)
Dial-in	https://dialin.contoso.com
Admin	https://admin.contoso.com

If you use Option 1, you must define the following:

- For each Meet simple URL, you need a DNS A record that resolves the URL to the IP address of the Director, if you have one deployed. Otherwise, it should resolve to the IP address of the load balancer of a Front End pool. If you have not deployed a pool and are using a Standard Edition server deployment, the

DNS A record must resolve to the IP address of one Standard Edition server in your organization.

If you have more than one SIP domain in your organization and you use this option, you must create Meet simple URLs for each SIP domain and you need a DNS A record for each Meet simple URL. For example, if you have both contoso.com and fabrikam.com, you will create DNS A records for both https://meet.contoso.com and https://meet.fabrikam.com.

Alternatively, if you have multiple SIP domains and you want to minimize the DNS record and certificate requirements for these simple URLs, use Option 3 as described later in this topic.

- For the Dial-in simple URL, you need a DNS A record that resolves the URL to the IP address of the Director, if you have one deployed. Otherwise, it should resolve to the IP address of the load balancer of a Front End pool. If you have not deployed a pool and are using a Standard Edition server deployment, the DNS A record must resolve to the IP address of one Standard Edition server in your organization.
- The Admin simple URL is internal only. It requires a DNS A record that resolves the URL to the IP address of the Director, if you have one deployed. Otherwise, it should resolve to the IP address of the load balancer of a Front End pool. If you have not deployed a pool and are using a Standard Edition server deployment, the DNS A record must resolve to the IP address of one Standard Edition server in your organization.

Simple URL Option 2

With Option 2, the Meet, Dial-in, and Admin simple URLs all have a common base URL, such as lync.contoso.com. Therefore, you need only one DNS A record for these simple URLs, which resolves lync.contoso.com to the IP address of a Director pool or Front End pool. If you have not deployed a pool and are using a Standard Edition server deployment, the DNS A record must resolve to the IP address of one Standard Edition server in your organization.

Note that if you have more than one SIP domain in your organization, you must still create Meet simple URLs for each SIP domain and you need a DNS A record for each Meet simple URL. In this example, while three simple URLs are all based on lync.contoso.com, an additional Meet simple URL for fabrikam.com is set up with a different base URL. In this example, you must create DNS A records for both https://lync.contoso.com and https://lync.fabrikam.com. Simple URL Option 3 shows another way to handle naming and DNS A records if you have multiple SIP domains.

Simple URL Option 2

Simple URL	Example
Meet	https://lync.contoso.com/Meet, https://lync.fabrikam.com/Meet, and so on (one for each SIP domain in your organization)
Dial-in	https://lync.contoso.com/Dialin
Admin	https://lync.contoso.com/Admin

Simple URL Option 3

Option 3 is most useful if you have many SIP domains, and you want them to have separate simple URLs but want to minimize the DNS record and certificate requirements for these simple URLs. In this example, you need only one DNS A record, which resolves lync.contoso.com to the IP address of a Director pool or Front End pool.

Simple URL Option 3

Simple URL	Example
Meet	https://lync.contoso.com/contosoSIPdomain/Meet https://lync.contoso.com/fabrikamSIPdomain/Meet
Dial-in	https://lync.contoso.com/contosoSIPdomain/Dialin
Admin	https://lync.contoso.com/contosoSIPdomain/Admin

Disaster Recovery Option for Simple URLs

If you have multiple sites that contain Front End pools and your DNS provider supports GeoDNS, you can set up your DNS records for Simple URLs to support disaster recovery, so that Simple URL functionality continues even if one entire Front End pool goes down. This disaster recovery feature supports the Meet and Dial-In simple URLs.

To configure this, create two GeoDNS addresses. Each address has two DNS A or CNAME records that resolve to two pools which are paired together for disaster recovery purposes. One GeoDNS address is used for internal access, and resolves to the internal web FQDN or load balancer IP address for the two pools. The other GeoDNS address is used for external access and resolves to the external web FQDN or load balancer IP address for the two pools. The following is an example for the Meet simple URL, using the FQDNs for the pools.

```
Meet-int.geolb.contoso.com
     Pool1InternalWebFQDN.contoso.com
     Pool2InternalWebFQDN.contoso.com
```

```
Meet-ext.geolb.contoso.com
     Pool1ExternalWebFQDN.contoso.com
     Pool2ExternalWebFQDN.contoso.com
```

Then create CNAME records that resolve your Meet simple URL (such as meet.contoso.com) to the two GeoDNS addresses.

Note:

If your network uses *hairpinning* (routing all your Simple URL traffic through the external link, including traffic that comes from within your organization), then you can just configure the external GeoDNS address and resolve your Meet simple URL to only that external address.

When you use this method, you can configure each GeoDNS address to use either a round robin method to distribute requests to the two pools, or to connect primarily to one pool (such as the pool located geographically closer) and use the other pool only in case of connectivity failure.

You can set up the same configuration for the Dial-In simple URL. To do so, create additional records like those in the previous example, substituting `dialin` for `meet` in the DNS records. For the Admin simple URL, use one of the three options listed earlier in this section.

Once this configuration is set up, you must use a monitoring application to set up HTTP monitoring to watch for failures. For external access, monitor to make sure that HTTPS

GET autodiscovery requests to the the external web FQDN or load balancer IP address for the two pools are successful. For example, the following requests must not contain any **ACCEPT** header and must return **200 OK**.

```
HTTPS GET Pool1ExternalWebFQDN.contoso.com/autodiscover/autodiscoverservice.svc/r
HTTPS GET Pool2ExternalWebFQDN.contoso.com/autodiscover/autodiscoverservice.svc/r
```

For internal access, you must monitor port 5061 on the internal web FQDN or load balancer IP address for the two pools. If any connectivity failures are detected, the VIP for these pools must close ports 80, 443 and 444.

1.7.1.1.4 Edit or Configure Simple URLs

Edit or Configure Simple URLs

See Also

Deployment > Deploying Lync Server 2013 > Defining and Configuring the Topology >

Topic Last Modified: *2013-02-21*

This procedure does not require membership in a local administrator or privileged domain group. You should log on to a computer as a standard user.

Lync Server 2013 uses simple URLs to direct internal and external calls to services on the Front End Server or on the Director, if one has been deployed. For more information about simple URLs, see Planning for Simple URLs in the Planning documentation. You can select the format for your simple URLs from several options. For details about these options, see DNS Requirements for Simple URLs in the Planning documentation.

By default, simple URLs will be configured in the form of (for example, the dial-in simple URL): https://dialin.<SIP Domain>

To configure simple URLs

1. In Topology Builder, right-click the **Lync Server 2013** node, and then click **Edit Properties**.
2. In the **Simple URLs** pane, select either **Phone access URLs:** (Dial-in) or **Meeting URLs:** (Meet) to edit, and then click **Edit URL**.
3. Update the URL to the value you want, and then click **OK** to save the edited URL. The example shown here has modified the Dial-in URL to https://pool01.contoso.net/dialin.
4. Edit the Meet URL by using the same steps, if necessary.

To define the optional Admin simple URL

1. In Topology Builder, right-click the **Lync Server 2013** node, and then click **Edit Properties**.
2. In the **Administrative access URL** box, enter the simple URL you want for administrative access to Lync Server 2013 Control Panel, and then click **OK**.

Tip:

We recommend using the simplest possible URL for the Admin URL. The simplest option is **https://admin.***<domain>*.

Important:

If you change a simple URL after initial deployment, you must be aware of what changes impact your Domain Name System (DNS) records and certificates for simple URLs. If the change impacts the base of a simple URL, then you must change the DNS records and certificates as well. For example, changing from https://lync.contoso.com/Meet to https://meet.contoso.com changes the base URL from lync.contoso.com to meet.contoso.com, so you would need to change the DNS records and certificates to refer to meet.contoso.com. If you changed the simple URL from https://lync.contoso.com/Meet to https://lync.contoso.com/Meetings, the base URL of lync.contoso.com stays the same, so no DNS or certificate changes are needed. Whenever you change a simple URL name, however, you must run the **Enable-CsComputer** cmdlet on each Director and Front End Server to register the change.

Concepts

Planning for Simple URLs

1.7.1.2 Server and Tools Operating System Support

Server and Tools Operating System Support

Microsoft Lync Server 2013 > Supportability > Server Software and Infrastructure Support >

Topic Last Modified: *2012-10-22*

All server roles support the same Windows Server operating systems. The required operating system support for other server roles, such as database servers, depends on what software you install on those servers.

Lync Server 2013 administrative tools are installed by default on the server running Lync Server 2013, but you can install administrative tools separately on other computers running Windows operating systems. For example, you can use a client computer running Windows 7 with Service Pack 1 (SP1) as an administrative console for planning purposes.

Important:

Lync Server 2013 is available only in 64-bit, which requires 64-bit hardware and 64-bit editions of Windows Server. This means that all server roles and computers running Lync Server 2013 administrative tools run a 64-bit edition operating system.

Operating Systems for Server Roles

Lync Server 2013 supports the 64-bit editions of the following operating systems:

- The Windows Server 2008 R2 with Service Pack 1 (SP1) Standard operating system (required) or latest service pack (recommended)
- The Windows Server 2008 R2 with SP1 Enterprise operating system (required) or latest service pack (recommended)
- The Windows Server 2008 R2 with SP1 Datacenter operating system (required) or latest service pack (recommended)
- The Windows Server 2012 Standard operating system
- The Windows Server 2012 Datacenter operating system

Lync Server 2013 is not supported on the following:

- The Server Core installation option of Windows Server 2008 R2 or Windows Server 2012
- The Windows Web Server 2008 R2 operating system or the Windows Web Server 2012 operating system
- Windows Server 2008 R2 HPC Edition or Windows Server 2012 HPC Edition

Operating Systems for Other Servers

Operating system support for servers other than those on which you deploy Lync Server

2013 server roles depends on the software that you plan to install on those servers. For details about requirements for Back End Servers and other database servers, see Database Software Support in the Supportability documentation. For details about requirements for reverse proxy servers (for Edge deployment), see Internet Information Services (IIS) Support in the Supportability documentation. For details about other software requirements, including infrastructure and virtualization support, see the other topics in the Server Software and Infrastructure Support section of the Supportability documentation.

Additional Operating Systems for Administrative Tools

Lync Server 2013 supports installation of the administrative tools, which includes the Topology Builder, on computers running any of the 64-bit editions of the operating systems supported for deployment of server roles (as described in the previous section). Additionally, you can install administrative tools on the 64-bit editions of the following operating systems:

- The Windows 7 operating system with SP1 operating system (required) or latest service pack (recommended)
- The Windows 8 operating or latest service pack (recommended)

1.7.1.3 Administrative Tools Software Requirements

Administrative Tools Software Requirements

Deploying Lync Server 2013 > System Requirements > System Requirements for Administration Tools >

Topic Last Modified: *2013-02-21*

This topic describes the software required to install and use Lync Server 2013 administrative tools in addition to the operating system requirements.

Microsoft .NET Framework 4.5

The 64-bit edition of Microsoft .NET Framework 4.5 is required for Lync Server 2013.

Windows PowerShell 3.0

Windows PowerShell 3.0 is required for running any component of Microsoft Lync Server 2013. For more information, see Installing Windows PowerShell 3.0.

Windows Installer Version 4.5

Lync Server 2013 uses Windows Installer technology to install, uninstall, and maintain various server roles. Windows Installer version 4.5 is available as a redistributable component for the Windows Server operating system. Windows Installer 4.5 ships with Windows Server 2012 and Windows Server 2008 R2, meaning that you do not need to download the utility for any computer that is running Lync Server 2013. (Lync Server 2013 can only be installed on computers running Windows Server 2012 or Windows Server 2008 R2.)

However, if you want to install Lync Server Management Shell or Lync Server Topology

Builder on an administrator workstation you might need to download Windows Installer 4.5. That utility ships with Windows 7 and Windows 2008 R2 but not with any previous versions of the Windows operating system. You can download Windows Installer 4.5 from the Microsoft Download Center at http://go.microsoft.com/fwlink/p/?linkid=197395.

Microsoft Silverlight 5 browser plug-in

Lync Server 2013 Control Panel is a web-based tool and requires that you install the latest version of Microsoft Silverlight 5 browser plug-in. When you start Lync Server 2013 Control Panel, if this software is not installed or if an earlier version is installed, Lync Server 2013 Control Panel prompts you to install the required version.

Administrative Tools Infrastructure Requirements
Administrator Rights and Permissions Required for Setup and Administration

1.7.1.4 Administrator Rights and Permissions Required for Setup and Administration

Administrator Rights and Permissions Required for Setup and Administration

Deployment > Deploying Lync Server 2013 > System Requirements >

Topic Last Modified: *2012-06-29*

Setup and deployment of Lync Server 2013 requires that the person installing and deploying the software be a member of local or domain-level groups. Administrative tools for Lync Server 2013 can require additional permissions.

- Group Membership Requirements
- Delegate Setup Permissions

1.7.1.4.1 Group Membership Requirements

Group Membership Requirements

Deploying Lync Server 2013 > System Requirements > Administrator Rights and Permissions Required for Setup and Administration >

Topic Last Modified: *2012-10-05*

The following table summarizes the group or groups that a person should belong to in order to successfully install, manage, and troubleshoot Lync Server 2013.

Lync Server 2013 Executable	Group Membership Required
Setup.exe – Executable that starts the installation of the Lync Server 2013 administrative tools.	Member of the Local Administrators group on the computer from which the executable is run. Member of Domain Users group to read information in Active Directory Domain Services (AD DS). This level of permission is required because the automatic installation of required MSI packages on

	the local computer requires privileges that allow reading from and writing to protected local computer resources such as Program Files directories, and protected registry such as the Local Machine hive. **Tip:** You can also delegate setup permissions to users or groups to whom you do not want to grant membership in the Domain Admins group. For details, see Granting Setup Permissions in the Deployment documentation.
Deploy.exe – Called by setup.exe, deploy.exe is responsible for the deployment of the software components for the server roles.	Member of the Local Administrators group on the computer from which the executable is run. Member of Domain Users group to read information in AD DS. This level of permission is required because the automatic installation of required MSI packages on the local computer requires privileges that allow reading from and writing to protected local computer resources such as Program Files directories, and protected registry such as the Local Machine hive. Membership in RtcUniversalReadOnlyAdmins group is necessary to read the Central Management store. **Note:** If you are running the Windows Vista operating system or Windows 7 operating system, you will be prompted by User Account Control (UAC) to proceed with installation. If you are logged on with a standard user account, you will need someone who is a member of the Local Administrators group to provide credentials when prompted for an account with permissions to install the software.
Bootstrapper.exe – Called by setup.exe, bootstrapper.exe is responsible for deployment and configuration of server roles.	Member of the Local Administrators group on the computer from which the executable is run. Member of the RTCUniversalServerAdmins group to run Bootstrapper.exe. Member of Domain Users group to read information in AD DS. This level of permission is required because the automatic installation of required MSI packages on the local computer requires privileges that allow reading from and writing to protected local computer resources such as Program Files directories, and protected registry such as the Local Machine hive.
TopologyBuilder – Wizard-driven user interface to create, view, adjust, and validate Lync Server 2013 topologies.	Member of the Local Administrators group on the computer from which the executable is run to view the topology. Member of the RTCUniversalServerAdmins group to change configuration settings. Member of the RTCUniversalServerAdmins group and Domain Admins group, or member of the RTCUniversalServerAdmins group (only if the group has been granted delegate setup permissions), to publish the topology. For details about delegating setup permissions to allow members of the RTCUniversalServerAdmins group to publish the

	topology without being members of the Domain Admins group, see Granting Setup Permissions in the Deployment documentation.
AdminUIHost – Web-based graphical user interface for managing Lync Server 2013.	Member of CsAdministrator group or member of another role-based access control (RBAC) role to which the specific administrative task is assigned. Lync Server 2013 Control Panel implements configuration changes by running Lync Server 2013 Management Shell cmdlets. For a list of predefined roles and the cmdlets members are permitted to run, see Planning for Role-Based Access Control in the Planning documentation.
PowerShell.exe with the Lync Server 2013 module loaded – Command-line administrative tool with cmdlets specific to management of Lync Server 2013.	Member of CsAdministrator group or member of another RBAC role to which the specific cmdlet has been assigned. For a list of predefined roles and the cmdlets members are permitted to run, see Planning for Role-Based Access Control in the Planning documentation. Or, member of one or more of the following groups, depending on the cmdlet: • RTCUniversalServerAdmins • RTCUniversalUserAdmins • RTCUniversalReadOnlyAdmins

1.7.1.4.2 Delegate Setup Permissions

Delegate Setup Permissions

Deploying Lync Server 2013 > System Requirements > Administrator Rights and Permissions Required for Setup and Administration >

Topic Last Modified: *2012-10-01*

If you do not want to grant membership in the Domain Admins group to users or groups who are deploying Lync Server 2013, you can enable members of the RTCUniversalServerAdmins group to run the **Enable-CsTopology** Windows PowerShell cmdlet on servers running Lync Server 2013. By default, members of the RTCUniversalServerAdmins group do not have the ability to run this cmdlet. You grant administrator rights and permissions to run **Enable-CsTopology** on servers running Lync Server by using the **Grant-CsSetupPermission** cmdlet and specifying an organizational unit (OU) where computer objects for the server running Lync Server 2013 are located.

Note:

Enable-CsTopology is the key cmdlet to allow the RTCUniversalServerAdmins group members to set up and deploy Lync Server 2013.

To add the ability to run Enable-CsTopology to the RTCUniversalServerAdmins group

1. Log on to a server as a member of the Domain Admins group for the domain on which the delegated user will run **Enable-CsTopology**.
2. Open the Lync Server 2013 Management Shell. The Lync Server 2013 Management Shell is automatically installed on each Front End Server or any computer where the Lync Server 2013 administrative tools have been installed. For details about the Lync Server 2013 Management Shell, see Lync

Server Management Shell in the Operations documentation.

3. Run the following cmdlet from the Lync Server 2013 Management Shell:

```
Grant-CsSetupPermission -ComputerOU <DN of the OU> -Domain <Domain FQD
```

Note:

If the OU is not top level, you must provide the full domain name.

In the following example, the OU is “Lync Servers,” which is in the contoso.com domain.

```
Grant-CsSetupPermission -ComputerOU "OU=Lync Servers" -Domain contoso.
```

1.7.1.5 Requirements to Publish a Topology

Requirements to Publish a Topology

See Also

Deploying Lync Server 2013 > System Requirements > System Requirements for Administration Tools >

Topic Last Modified: *2013-02-21*

This topic describes the infrastructure and software requirements that are specific to publishing a topology, whether by using Topology Builder or the Lync Server 2013 Management Shell command-line interface. These requirements are in addition to the general operating system, software, and permissions requirements applicable to all Lync Server 2013 administrative tools. Make sure that you satisfy all administrative tools requirements before you publish a topology.

- You must run Topology Builder on a computer that is joined to the same domain or forest of the Lync Server 2013 deployment you are creating so that Active Directory Domain Services (AD DS) preparation steps are already completed, enabling you to use the administrative tools on that computer to successfully publish your topology.
- The computers defined in the topology must be joined to the domain, except for Edge Servers, and in AD DS. However, the computers do not need to be online when you publish the topology.
- The file share for the pool must be created and available to remote users.
- In order to publish an Enterprise Edition Front End pool, the SQL Server-based Back End Server must be joined to the domain in which you are deploying the servers, online, and configured with the appropriate firewall rules to make it available to remote users. For details about specifying firewall exceptions, see Understanding Firewall Requirements for SQL Server. For other details about configuring SQL Server, see Configure SQL Server for Lync Server 2013.

Note:

Standard Edition server has a collocated database that will accept the published configuration. You must first run the **Prepare first Standard Edition server** setup task in the Lync Server Deployment Wizard.

Administrator Rights and Permissions Required for Setup and Administration

1.7.1.6 Install Lync Server Administrative Tools

Install Lync Server Administrative Tools

See Also

Deployment > Deploying Lync Server 2013 > Preparing the Infrastructure and Systems >

Topic Last Modified: *2013-02-21*

This topic describes how to install the administrative tools you need to use to deploy and manage Lync Server 2013. The administrative tools are installed by default on each server running Lync Server 2013. Additionally, you can install the administrative tools on other computers, such as dedicated administrative consoles. We strongly recommend that you install the administrative tools on a computer that is in the same domain or forest as the Lync Server 2013 deployment you are creating because by doing so you make sure that Active Directory Domain Services (AD DS) preparation steps are already complete, which enables you to use the administrative tools on that computer later to publish your topology.

Make sure that you review infrastructure, operating system, software, and administrator rights requirements before you install or use the Lync Server 2013 administrative tools. For details about infrastructure requirements, see Administrative Tools Infrastructure Requirements. For details about operating system and software requirements to install the Lync Server 2013 administrative tools, see Server and Tools Operating System Support, Additional Software Requirements, and Additional Server Support and Requirements. For details about the user rights and permissions required to install and use the tools, see Administrator Rights and Permissions Required for Setup and Administration.

> ◆**Important:**
>
> If your organization requires that you locate Internet Information Services (IIS) and all Web Services on a drive other than the system drive, you can change the installation location path for the Lync Server files in the Setup dialog box. If you install the Setup files to this path, including OCSCore.msi, the rest of the Lync Server 2013 files will be deployed to this drive as well.

⊟To install the Lync Server 2013 administrative tools

1. Log on as a local administrator (minimum requirement) to the computer where you want to install the administrative tools. If you are logged on as an a standard user on the Windows Vista or Windows 7 operating systems, and User Account Control (UAC) is enabled, you will be prompted for the local administrator or a domain equivalent user name and password.
2. Locate the installation media on your computer, and then double-click \Setup\amd64\Setup.exe.
3. If you are prompted to install the Microsoft Visual C++ 2008 distributable, click **Yes**.
4. On the **Microsoft Lync Server 2013 Installation Location** page, click **OK**. Change this path to another location or drive if you need to have the files installed to another location.

   > ◆**Important:**
   >
   > If your organization requires that you locate Internet Information Services (IIS) and all Web Services on a drive other than the system drive, you can change the installation location path for the Lync Server 2013 files in the Setup dialog box. If you install the Setup files to this path, including OCSCore.msi, the rest of the Lync Server 2013 files will be deployed to this drive too.

5. On the **End User License Agreement** page, review the license terms, click **I accept**, and then click **OK**. This step is required before you can continue.

6. On the **Microsoft Lync Server 2013 – Deployment Wizard** page, click **Install Administrator Tools**.
7. When the installation successfully completes, click **Exit**.

Open Lync Server Administrative Tools

Concepts

Lync Server Administrative Tools

1.7.1.7 Open Lync Server Administrative Tools

Open Lync Server Administrative Tools

See Also

Microsoft Lync Server 2013 > Operations > Lync Server Administrative Tools >

Topic Last Modified: *2012-06-28*

You can use the procedures in this topic to open administrative tools to deploy, configure, or troubleshoot your Lync Server 2013 topology.

- Deployment Wizard
- Topology Builder
- Lync Server Control Panel
- Lync Server Management Shell

Deployment Wizard

Use the following procedure to start the Deployment Wizard locally to add or remove Lync Server 2013 component files.

⊟To start Lync Server 2013 Deployment Wizard

1. Log on to the computer where the Lync Server Deployment Wizard is installed as a member of the Domain Admins group and the RTCUniversalServerAdmins group.
2. Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Deployment Wizard**.

Topology Builder

Use the following procedure to open the Topology Builder to define the servers that you want to deploy in your Lync Server 2013 topology.

⊟To open Lync Server 2013 Topology Builder to design the topology

1. Log on to the computer where Topology Builder is installed as a member of the Domain Admins group and the RTCUniversalServerAdmins group.

Note:
You can define a topology by using an account that is a member of the local Users group, but to read, publish, or enable a topology, which is required to install Lync Server 2013 on a server, you must use an account that is a member of the Domain Admins group and the RTCUniversalServerAdmins group, and that has full control permissions (that is, read, write, and modify) on the file share that you are going to use for the archiving file store so that Topology Builder can configure the required discretionary access control list (DACLs), or an account with equivalent user rights.

2. Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync**

Server 2013, and then click **Lync Server Topology Builder**.

Lync Server 2013 Control Panel

Use one of the following procedures to open Lync Server 2013 Control Panel to manage the configuration of servers, users, clients, and devices in your environment.

Note:

You can use a user account that is assigned to the CsAdministrator role to perform any task in Lync Server 2013 Control Panel. You can use other roles to log on to Lync Server 2013 Control Panel to perform specific administration tasks, dependent on the task you need to perform. For example, you can use CSArchivingAdministrator to administer Archiving in Lync Server 2013 Control Panel. For details about roles, see Planning for Role-Based Access Control in the Planning documentation. For details about the roles that you can use to perform a specific task, see the documentation for the task.

⊟To open Lync Server 2013 Control Panel from any computer inside your organization’s firewall

1. From a user account that is assigned to the CsAdministrator role or other role that has appropriate user rights and permissions for the task to be performed, log on to any computer in your internal deployment with a minimum screen resolution of 1024 x 768.

   Important:

   If you have configured an administration simple uniform resource locator (URL), you can access Lync Server 2013 Control Panel from an Internet browser that is running on any computer within your organization’s firewall. For details about configuring the administration simple URL, see Planning for Simple URLs in the Planning documentation and Edit or Configure Simple URLs in the Deployment documentation.

2. Open a browser window, and then enter the Admin URL configured for your organization.

⊟To open Lync Server 2013 Control Panel on a computer running Lync Server 2013

1. From a user account that is a member of the CsAdministrator role or other role that has appropriate user rights and permissions for the task to be performed, log on to a computer on which you have installed Lync Server 2013 or, at a minimum, the Lync Server 2013 administrative tools. To configure settings, the computer must have a minimum screen resolution of 1024 x 768.
2. Start Lync Server 2013 Control Panel: Click **Start**, click **All Programs**, point to **Administrative Tools**, point to **Microsoft Lync Server 2013**, and then click **Lync Server 2013 Control Panel**.

Lync Server 2013 Management Shell

Use the following procedure to open Lync Server 2013 Management Shell to administer servers, users, clients, and devices in your environment by using the command line.

Note:

You can use a user account that is assigned to the CsAdministrator role to perform any task in Lync Server 2013 Management Shell. You can log on using other roles to perform specific administration tasks, depending on the task you need to perform. For example, you can use CSArchivingAdministrator to run cmdlets related to Archiving administration. For details about roles, see Planning for Role-Based Access Control in the Planning documentation. For details about the roles that you can use to run a specific cmdlet, see the documentation for the cmdlet.

You can also run certain cmdlets by using a user account in the RTCUniversalServerAdmins, RTCUniversalUserAdmins, or RTCUniversalReadOnlyAdmins groups, depending on the cmdlet.

⊟To open the Lync Server 2013 Management Shell

- If you open a Windows PowerShell window rather than the Lync Server 2013 Management Shell, by default you cannot run the Lync Server 2013 cmdlets. To run the Lync Server 2013 cmdlets from within Windows PowerShell, type the following at the Windows PowerShell command prompt:
  ```
  Import-Module Lync
  ```
- Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.

Install Lync Server Administrative Tools

Concepts

Lync Server Administrative Tools

1.7.1.8 Troubleshooting Lync Server 2013 Control Panel

Troubleshooting Lync Server 2013 Control Panel

See Also

Microsoft Lync Server 2013 > Operations > Lync Server Administrative Tools >

***Topic Last Modified:** 2013-02-21*

This topic provides information and procedures that can help you troubleshoot access to Lync Server 2013 Control Panel.

Internet Browser Requirements

Lync Server Control Panel requires that Microsoft Silverlight browser plug-in version 4.0.50524.0 or latest version is installed. If Silverlight is not installed or if an earlier version is installed, follow the instructions in the message to install the required version.

Note:

Other software requirements for Lync Server Control Panel pertain to the operating system on which Lync Server Control Panel and all other Lync Server 2013 administrative tools can be installed. For details, see Server and Tools Operating System Support in the Supportability documentation.

If your Internet browser blocks installation of Silverlight due to security considerations, add the Uniform Resource Locator (URL) that opens Lync Server Control Panel to the list of trusted sites. In Internet Explorer security settings, ensure that **Run ActiveX controls and plug-ins** is set to **Enabled**. For details, see http://go.microsoft.com/fwlink/p/?linkId=214060. Furthermore, ensure that the browser is configured to use SSL 3.0.

If the Internet browser is configured to use a proxy server, verify that the browser is configured to bypass the proxy server for sites that are automatically detected as internal sites. Or, add the address to the browser's exception list in the proxy server configuration settings.

DNS Record and Certificate Requirements for the Administrative Access URL

If you configured a simple URL to access Lync Server Control Panel, ensure that you also configured the static Domain Name System (DNS) host (A) resource record and certificate necessary to use that administrative access URL. If you change the base URL at any time, ensure that the change is reflected in the appropriate DNS record and certificate and that you run the *Enable-CsComputer* on each Director and Front End Server to register the change. For details, see the following topics in the Planning documentation:

- Planning for Simple URLs
- DNS Requirements for Simple URLs
- Certificate Requirements for Internal Servers

For step-by-step procedures to configure the administrative access URL, see Edit or Configure Simple URLs in the Deployment documentation.

Note:

If you have more than one network adapter on the web server, you must manually configure DNS for each additional network adapter in order for DNS resolution to function properly.

Internet Information Services (IIS) Requirements

Lync Server Control Panel is one of the components of Lync Server 2013 that requires Internet Information Services (IIS). In particular, ensure that HTTP redirection and Windows authentication features are enabled, and that the World Wide Web Publishing Service (W3SVC) is running.

World Wide Publishing Service (Windows Service) Dependency

When the World Wide Web Publishing Service is stopped, you cannot access Lync Server Control Panel. You can restart the service by using the Windows Services Microsoft Management Console (MMC).

To start the World Wide Web Publishing Service

1. Log on to the computer where the World Wide Web Publishing Service is installed as part of Internet Information Services (IIS).
2. Click **Start**, click **Administrative Tools**, and then click **Services**.
3. Right-click **World Wide Web Publishing Service**, and then click **Start**.

Application Pool Mode

Configure IIS so that the CsManagementAppPool application pool uses the Network Service account as its process model identity.

User Rights and Permissions

You must sign in to Lync Server Control Panel either by using a domain account that is a member of the CsAdministrator group or by using an account to which you have delegated user rights and permissions. You cannot sign in to Lync Server Control Panel by using a local machine account. For details about delegating administrative tasks through role-based access control (RBAC), see Planning for Role-Based Access Control in the Planning documentation.

If you use a simple URL to access Lync Server Control Panel, ensure that web servers are added to the RTCUniversalServerAdmins and RTCUniversalUserAdmins groups.

1.7.1.9 Using the Centralized Logging Service

Using the Centralized Logging Service

Microsoft Lync Server 2013 > Operations > Lync Server Administrative Tools >

Topic Last Modified: *2012-11-01*

The Centralized Logging Service is a new feature in Lync Server 2013. It is an enhanced replacement for the **OCSLogger** and **OCSTracer** tools that were provided in previous releases. You can use the Centralized Logging Service to perform the following tasks:

- Start logging on one or more computers and pools from a single location and command.
- Stop logging on one or more computers and pools from a single location and command.
- Search logs on one or more computers and pools for a single location and command. You can tailor the search command to return the entire aggregation of logs that were captured and stored on all machines, or return a trimmed-down result that captures specific data.
- Configure logging sessions as follows:
  - Define a **Scenario**, or use a default scenario. A *scenario* in Centralized Logging Service is made up of scope (global or site), a scenario name to identify the purpose of the scenario, and one or more providers. You can run two scenarios at any given time on a computer.
  - Use an existing *provider* or create a new provider. A *provider* defines what the logging session collects, what level of detail, what components to trace, and what flags are applied.

    Tip:

    If you are familiar with OCSLogger, the term *providers* refers to the collection of **components** (for example, S4, SIPStack), a **logging type** (for example, WPP, EventLog, or IIS logfile), a **tracing level** (for example, All, verbose, debug), and **flags** (for example, TF_COMPONENT, TF_DIAG). These items are defined in the provider (a Windows PowerShell variable) and passed into the Centralized Logging Service command.

  - Configure the computers and pools that you want to collect logs from.
  - Define the scope for the logging session from the options **Site** (run logging captures on computers in that site only), or **Global** (run logging capture on all computers in the deployment).

The Centralized Logging Service is extremely powerful and can meet nearly all of the needs for troubleshooting problems—large or small. From root cause analysis to performance problems, the Centralized Logging Service can be an important tool for any administrator. All examples are shown using the Lync Server Management Shell. There is a command-line component for the Centralized Logging Service called **CLSController.exe**. Help is provided for the command-line tool through the tool itself. However, there is a limited set of functions that you can execute from the command line. By using Lync Server Management Shell, you have access to a much larger and much more configurable set of features. You should always consider Lync Server Management Shell as the first and foremost method when using the Centralized Logging Service.

The topics in this section explain how to use the Centralized Logging Service and examples of how to use its many features.

- Overview of the Centralized Logging Service
- Managing the Centralized Logging Service Configuration Settings
- Understanding Centralized Logging Service Configuration Settings
- Using Start for the Centralized Logging Service to Capture Logs
- Using Stop for the Centralized Logging Service
- Using Search on Capture Logs Created by the Centralized Logging Service
- Reading Capture Logs From the Centralized Logging Service

1.7.1.9.1 Overview of the Centralized Logging Service

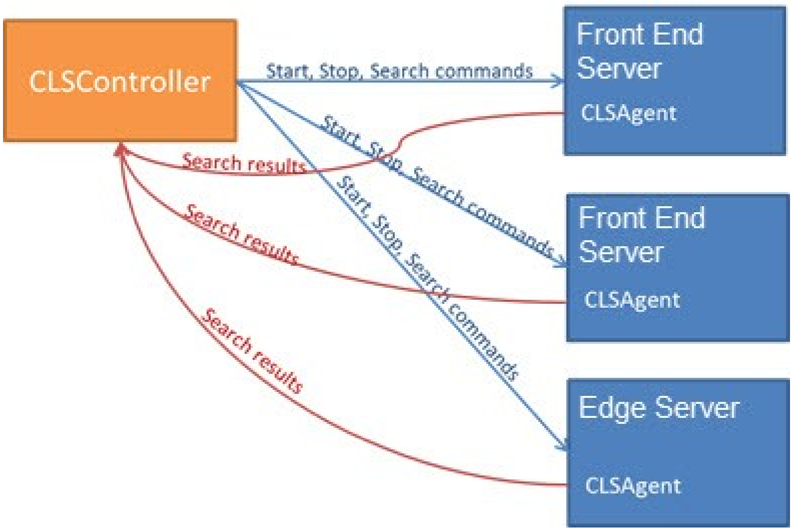
Overview of the Centralized Logging Service

Operations > Lync Server Administrative Tools > Using the Centralized Logging Service >

Topic Last Modified: *2013-02-22*

The Centralized Logging Service is designed to provide a means for controlled collection of data—with a broad or narrow scope. You can collect data from all servers in the deployment concurrently, define specific elements to trace, set trace flags and return search results from a single computer or an aggregation of all data from all servers. The Centralized Logging Service runs on all servers in your deployment. The architecture of the Centralized Logging Service is comprised of the following agents and services:

- *Centralized Logging Service Agent* ClsAgent.exe is the service executable that communicates with the controller and receives the commands that the controller is issued by the administrator. The agent is run as a service on each Lync Server computer. When the agent receives a command, it executes the command, sends messages to the defined components for tracing, and writes the trace logs to disk. It also reads the trace logs for its computer and sends the trace data back to the controller when requested. The ClsAgent listens for commands on the following ports: **TCP 50001**, **TCP 50002**, and **TCP 50003**.
- *Centralized Logging Service Controller* ClsControllerLib.dll is the command execution engine for the Lync Server Management Shell and for ClsController.exe. CLSControllerLib.dll sends Start, Stop, Flush, and Search commands to the ClsAgent. When search commands are sent, the resulting logs are returned to the ClsControllerLib.dll and aggregated. The controller is responsible for sending commands to the agent, receiving the status of those commands and managing the search log file data as it is returned from all agents on any computer in the search scope, and aggregating the log data into a meaningful and ordered output set. The information in the following topics is focused on using the Lync Server Management Shell. ClsController.exe is limited to a subset of the features and functions that are available in the Lync Server Management Shell. Help for ClsController.exe is available at the command line by typing `ClsController` in the default directory C:\Program Files\Common Files\Microsoft Lync Server 2013\ClsAgent.



You issue commands using the Windows Server command-line interface or using the Lync Server Management Shell. The commands are executed on the computer you are logged in to and sent to the ClsAgent locally or to the other computers and pools in your deployment.

ClsAgent maintains an index file of all .CACHE files that it has on the local machine. ClsAgent allocates them so that they are evenly distributed across volumes defined by the option CacheFileLocalFolders, never consuming more than 80% of each volume (that is, the local cache location and the percentage is configurable using the **Set-CsClsConfiguration** cmdlet). ClsAgent is also responsible for aging old cached event trace log (.etl) files off the local machine. After two weeks (that is, the timeframe is configurable using the **Set-CsClsConfiguration** cmdlet) these files are copied to a file share and deleted from the local computer. For details, see Set-CsClsConfiguration. When a search request is received, the search criteria is used to select the set of cached .etl files to perform the search based on the values in the index maintained by the agent.

Note:

Files that are moved to the file share from the local computer can be searched by ClsAgent. Once ClsAgent moves the files to the file share, the aging and removal of files is not maintained by ClsAgent. You should define an administrative task to monitor the size of the files in the file share and delete them or archive them.

The resulting log files can be read and analyzed using a variety of tools, including **Snooper.exe** and any tool that can read a text file, such as **Notepad.exe**. Snooper.exe is part of the Lync Server 2013 Debug Tools and is available as a Web download from http://go.microsoft.com/fwlink/?LinkId=285257.

Like OCSLogger, the Centralized Logging Service has several components to trace against, and provides options to select flags, such as TF_COMPONENT and TF_DIAG. Centralized Logging Service also retains the logging level options of OCSLogger.

The most important advantage to using the Lync Server Management Shell over the command-line ClsController is that you can configure and define new scenarios using selected providers that target the problem space, custom flags, and logging levels. The scenarios available to ClsController are limited to those that are defined for the executable.

In previous versions, OCSLogger.exe was provided to enable administrators and support personnel to collect trace files from computers in the deployment. OCSLogger, for all of its strengths, had a shortcoming. You could only collect logs on one computer at a given time. You could log on to multiple computers by using separate copies of OCSLogger, but you ended up with multiple logs and no easy way to aggregate the results.

When a user requests a log search, the ClsController determines which machines to send the request to (that is, based on the scenarios selected). It also determines whether the search needs to be sent to the file share where the saved .etl files are located. When the search results are returned to the ClsController, the controller merges the results into a single time-ordered result set that is presented to the user. Users can save the search results to their local machine for further analysis.

When you start a logging session, you specify scenarios that are relative to the problem that you are trying to resolve. You can have two scenarios running at any time. One of these two scenarios should be the AlwaysOn scenario. As the name implies, it should always be running in your deployment, collecting information on all computers, pools, and components.

Important:

By default, the AlwaysOn scenario is not running in your deployment. You must explicitly start the scenario. Once started, it will continue to run until explicitly stopped, and the running state will persist through reboots of the computers. For details on starting and stopping scenarios, see Using Start for the Centralized Logging Service to Capture Logs and Using Stop for the Centralized Logging Service.

When a problem occurs, start a second scenario that relates to the problem reported. Reproduce the problem, and stop the logging for the second scenario. Begin your log searches relative to the problem reported. The aggregated collection of logs produces a log file that contains trace messages from all computers in your site or global scope of your deployment. If the search returns more data than you can feasibly analyze (typically known as a signal-to-noise ratio, where the noise is too high), you run another search with narrower parameters. At this point, you can begin to notice patterns that show up and can help you get a clearer focus on the problem. Ultimately, after you perform a couple of refined searches you can find data that is relevant to the problem and figure out the root cause.

Tip:

When presented with a problem scenario in Lync Server, start by asking yourself “What do I already know about the problem?” If you quantify the problem boundaries, you can eliminate a large part of the operational entities in Lync Server.
Consider an example scenario where you know that users are not getting current results when looking for a contact. There is no point in looking for problems in the media components, Enterprise Voice, conferencing, and a number of other components. What you may not know is where the problem actually is: on the client, or is this a server-side problem? Contacts are collected from Active Directory by the User Replicator and delivered to the client by way of the Address Book Server (ABServer). The ABServer gets its updates from the RTC database (where User Replicator wrote them) and collects them into address book files, by default – 1:30 AM. The Lync Server clients retrieve the new address book on a randomized schedule. Because you know how the process works, you can reduce your search for the potential cause to an issue related to data being collected from Active Directory by the User Replicator, the ABServer not retrieving and creating the address book files, or the clients not downloading the address book file.

1.7.1.9.2 Managing the Centralized Logging Service Configuration Settings

Managing the Centralized Logging Service Configuration Settings

See Also

Operations > Lync Server Administrative Tools > Using the Centralized Logging Service >

Topic Last Modified: *2012-11-01*

The Centralized Logging Service is controlled and configured by settings and parameters that are created and used by the Centralized Logging Service Controller (CLSController) to send commands to the individual computer's Centralized Logging Service Agent (CLSAgent). The agent processes the commands that are sent to it and (in the case of a Start command) uses the configuration of the scenarios, providers, log size, trace duration, and flags to begin collecting trace logs according to the configuration information provided.

Important:

Not all Windows PowerShell cmdlets listed for the Centralized Logging Service are intended for use with Lync Server 2013 on-premises deployments. Although they may appear to work, the following cmdlets are not designed to function with Lync Server 2013 on-premises deployments:

- **CsClsRegion cmdlets:** Get-CsClsRegion, Set-CsClsRegion, New-CsClsRegion, and Remove-CsClsRegion.
- **CsClsSearchTerm cmdlets:** Get-CsClsSearchTerm and Set-CsClsSearchTerm.
- **CsClsSecurityGroup cmdlets:** Get-CsClsSecurityGroup, Set-CsClsSecurityGroup, New-CsClsSecurityGroup, and Remove-CsClsSecurityGroup.

The settings defined in these cmdlets will not hinder or cause any adverse behavior, but they are designed for use with Microsoft Office 365 and will not yield the expected results in on-premises deployments. This is not to say that there is no use for these cmdlets in on-premises deployments, but their use is a more advanced topic that is not covered in this documentation.

The topics in this section define the configuration options, parameters, and settings for the Centralized Logging Service. Information about how to configure the Centralized Logging Service, how to retrieve the configuration settings, creation of scenarios, management of security groups for Centralized Logging Service, searching, and more is contained in the following topics.

- Managing Computer, Site and Global Centralized Logging Service Configuration
- Configuring Providers for Centralized Logging Service
- Configuring Scenarios for the Centralized Logging Service

1.7.1.9.2.1 Managing Computer, Site and Global Centralized Logging Service Configuration

Managing Computer, Site and Global Centralized Logging Service Configuration

See Also

Lync Server Administrative Tools > Using the Centralized Logging Service > Managing the Centralized Logging Service Configuration Settings >

Topic Last Modified: *2013-02-21*

The Centralized Logging Service can be run at a scope that includes a single computer, a pool of computers, at a site scope (that is, a defined site such as the site Redmond that contains a collection of computer and pools in your deployment), or at a global scope (that is, all computers and pools in your deployment).

To configure the Centralized Logging Service scope by using the Lync Server Management

Shell, you must be a member of either the CsAdministrator or the CsServerAdministrator role-based access control (RBAC) security groups, or a custom RBAC role that contains either of these two groups. To return a list of all the RBAC roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Lync Server Management Shell or the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "<Lync Server 2013 cmdlet>"}
```

For example:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Set-CsClsConfiguration"}
```

Note:

Windows PowerShell provides you more options and additional configuration options that are not available by using CLSController.exe. CLSController offers a quick, concise method to run commands, but is limited to the set of commands available for the CLSController. Windows PowerShell is not limited to just the command available to the command processor of the CLSController, and provides a wider set of commands and a richer set of options. For example, CLSController.exe does provide you with a scope options for –computers and –pools. With Windows PowerShell, you can indicate computers or pools in most commands, and when you define new scenarios (CLSController has a finite number of scenarios that are not user modifiable) you can define a site or global scope. This powerful feature of Windows PowerShell enables you to define a scenario a site or global scope, but limit the actual logging to a computer or pool.

There are fundamental differences between the command-line commands that you can run in Windows PowerShell or CLSController. Windows PowerShell provides a rich method to configure and define scenarios, and to reuse those scenarios in a meaningful way for your troubleshooting scenarios. While CLSController does provide a fast and efficient way to issue commands and get results, the command set for CLSController is limited by the finite commands that you have available from the command line. Unlike the Windows PowerShell cmdlets, CLSController cannot define new scenarios, manage scope at a site or global level, and many other limitations of a finite command set that cannot be dynamically configured. While CLSController provides a means for fast execution, Windows PowerShell provides a means to extend the Centralized Logging Service functionality beyond what is possible with CLSController.

A single computer scope can be defined during the execution of a Search-CsClsLogging, Show-CsClsLogging, Start-CsClsLogging, Stop-CsClsLogging, Sync-CsClsLogging and Update-CsClsLogging command using the –Computers parameter. The –Computers parameter accepts a comma separated list of fully qualified domain names (FQDNs) for the target computer.

Tip:

You can also define –Pools and a comma separated list of pools that you want to run the logging commands on.

Site and Global scopes are defined in the **New-**, **Set-**, and **Remove-** Centralized Logging Service cmdlets. The following examples demonstrate how to set a site and a global scope.

Important:

The commands shown may contain parameters and concepts that are covered in other sections. The example commands are intended to demonstrate the use of the **–Identity** parameter to define scope, and the other parameters are included for completeness and to specify the scope. For details about the **Set-CsClsConfiguration** cmdlets, see Set-CsClsConfiguration in the Operations documentation.

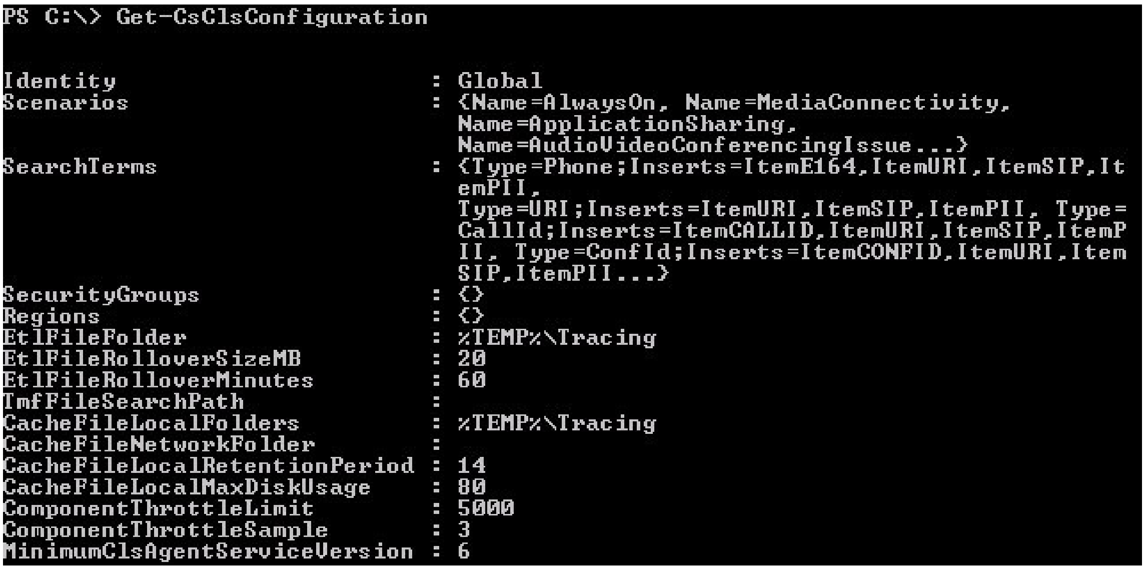
To retrieve the current Centralized Logging Service configuration

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Type the following at the command-line prompt:

```
Get-CsClsConfiguration
```

Use the **New-CsClsConfiguration** and **Set-CsClsConfiguration** cmdlets to create a new configuration or to update an existing configuration.

When you run **Get-ClsCsConfiguration**, it displays information similar to the following screen shot, where the deployment currently has the default Global configuration, but no site configurations defined:



```
PS C:\> Get-CsClsConfiguration

Identity                        : Global
Scenarios                       : {Name=AlwaysOn, Name=MediaConnectivity,
                                  Name=ApplicationSharing,
                                  Name=AudioVideoConferencingIssue...}
SearchTerms                     : {Type=Phone;Inserts=ItemE164,ItemURI,ItemSIP,It
                                  emPII,
                                  Type=URI;Inserts=ItemURI,ItemSIP,ItemPII, Type=
                                  CallId;Inserts=ItemCALLID,ItemURI,ItemSIP,ItemP
                                  II, Type=ConfId;Inserts=ItemCONFID,ItemURI,Item
                                  SIP,ItemPII...}
SecurityGroups                  : {}
Regions                         : {}
EtlFileFolder                   : %TEMP%\Tracing
EtlFileRolloverSizeMB           : 20
EtlFileRolloverMinutes          : 60
TmfFileSearchPath               :
CacheFileLocalFolders           : %TEMP%\Tracing
CacheFileNetworkFolder          :
CacheFileLocalRetentionPeriod   : 14
CacheFileLocalMaxDiskUsage      : 80
ComponentThrottleLimit          : 5000
ComponentThrottleSample         : 3
MinimumClsAgentServiceVersion   : 6
```

To retrieve the current Centralized Logging Service configuration from the computer local store

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Type the following at the command-line prompt:

```
Get-CsClsConfiguration -LocalStore
```

When you use the first example where **Get-CsClsConfiguration** does not specify any parameters, the command references the Central Management store for the data. If you specify the parameter –LocalStore, the command references the computer LocalStore instead of the Central Management store.

To retrieve a listing of scenarios currently defined

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Type the following at the command-line prompt:

```
Get-CsClsConfiguration -Identity <scope and name> | Select-Object -Exp
```

For example, to retrieve the scenarios that is defined at the global scope:

```
Get-CsClsConfiguration -Identity "global" | Select-Object -ExpandPrope
```

The cmdlet **Get-CsClsConfiguration** always displays the scenarios that are a part of a given scope's configuration. In most cases, all scenarios are not displayed, and are truncated. The command used here lists all of the scenarios and partial information about what providers, settings, and flags are used.

To update a global scope for the Centralized Logging Service by using Windows PowerShell

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Type the following at the command-line prompt:

   ```
   Set-CsClsConfiguration -Identity <scope> -EtlFileRolloverSizeMB <size
   ```

   For example:

   ```
   Set-CsClsConfiguration -Identity "global" -EtlFileRolloverSizeMB 40
   ```

The command tells the CLSAgent on each computer and pool in the deployment to set the size of the rollover value on the tracing file to 40 megabytes. Computers and pools in all sites are affected by the command, and will set their configured trace log rollover value to 40 megabytes.

To update a site scope for the Centralized Logging Service by using Windows PowerShell

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Type the following at the command-line prompt:

   ```
   Set-CsClsConfiguration -Identity <scope/site name> -EtlFileRolloverSiz
   ```

   For example:

   ```
   Set-CsClsConfiguration -Identity "site/Redmond" -EtlFileRolloverSizeMB
   ```

   Note:
   As noted in the example, the default location of the log files is %TEMP%\Tracing. However, because it is actually CLSAgent that is writing the file and CSLAgent runs as Network Service, the %TEMP% variable expands to %WINDIR%\ServiceProfiles\NetworkService\AppData\Local.

The command tells the CLSAgent on each computer and pool in the site Redmond to set the size of the rollover value on the tracing file to 40 megabytes. Computers and pools in other sites will not be affected by the command, and will continue to use the currently configured trace log rollover value defined either by default (20 megabytes) or during the start of the logging session.

To create a new Centralized Logging Service configuration

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Type the following at the command-line prompt:

   ```
   New-CsClsConfiguration -Identity <scope and name> [CsClsConfiguration
   ```

   Note:
   New-CsClsConfiguration provides access to a large number of optional configuration settings. For details about the configuration options, see Get-

CsClsConfiguration and Understanding Centralized Logging Service Configuration Settings.

For example, to create a new configuration that defines a network folder for cache files, rollover time period for the log files and rollover size for the log files, you would type:

```
New-CsClsConfiguration -Identity "site:Redmond" -CacheFileNetworkFolde
```

You should carefully plan the creation of new configurations and how you define new properties for the Centralized Logging Service. You should be cautious about making changes and make sure you understand the impact on your ability to properly log problem scenarios. You should make changes to the configuration that will enhance your ability to manage logs to a size and a rollover period that will allow problem solving when it arises.

To remove an existing Centralized Logging Service configuration

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Type the following at the command-line prompt:

```
Remove-CsClsConfiguration -Identity <scope and name>
```

For example, to remove a Centralized Logging Service configuration that you created to increase the log file rollover time, increase the rollover log file size, and set the log file cache location to a network share as follows:

```
Remove-CsClsConfiguration -Identity "site:Redmond"
```

Note:
This is the new configuration that was created in the procedure "To create a new Centralized Logging Service configuration."

If you choose to remove a site-level configuration, the site will use the global settings.

1.7.1.9.2.2 Configuring Providers for Centralized Logging Service

Configuring Providers for Centralized Logging Service

See Also

Lync Server Administrative Tools > Using the Centralized Logging Service > Managing the Centralized Logging Service Configuration Settings >

Topic Last Modified: *2012-12-24*

The concepts and configuration of *providers* in Centralized Logging Service is one of the most important to grasp. The *providers* map directly to Lync Server server role components in the Lync Server tracing model. The provider defines the components of a Lync Server 2013 that will be traced, the type of messages (for example, fatal, error, or warning) to collect, and the flags (for example, TF_Connection or TF_Diag). Providers are the traceable components in each Lync Server server role. By using providers, you define the level and type of tracing on components (for example, S4, SIPStack, IM and Presence). The defined provider is used in a scenario to group all of the providers for a given logical collection that address a specific problem condition.

To run the Centralized Logging Service functions using the Lync Server Management Shell, you must be a member of either the CsAdministrator or the CsServerAdministrator role-based access control (RBAC) security groups, or a custom RBAC role that contains either of these two groups. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Lync Server Management Shell or the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Lync Server 2013 cmdlet"}
```

For example:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Set-CsClsConfiguration"}
```

The remainder of this topic focuses on how to define providers, modify a provider and what a provider definition contains to optimize your troubleshooting. There are two ways to issue Centralized Logging Service commands. You can use the CLSController.exe that is located, by default, in the directory C:\Program Files\Common Files\Microsoft Lync Server 2013\CLSAgent. Or, you can use the Lync Server Management Shell to issue Windows PowerShell commands. The important distinction is that when you use CLSController.exe at the command line there is a finite selection of scenarios available in which the providers are already defined and are not changeable, but you can define the log level. By using Windows PowerShell, you can define new providers for use in your logging sessions, and have complete control over their creation, what they collect, and at what level they collect data.

> **Important:**
>
> As mentioned, providers are very powerful. However, scenarios are more powerful because they contain the embodiment of all information needed to set and execute tracing on the components that the providers represent. With scenarios being a collection of providers, this could be loosely compared to running a batch file containing hundreds of commands to collect a lot of information versus issuing hundreds of commands, one at a time, at the command line.
>
> Instead of requiring you to dig deeply into the details of providers, the Centralized Logging Service provides a number of scenarios that are already defined for you. The provided scenarios cover the vast majority of possible issues that you will encounter. In rare cases, you may need to create and define providers and assign them to scenarios. We strongly recommend that you become familiar with each of the scenarios provided before you investigate the need to create new providers and scenarios. While information about creating providers is found here to familiarize you with how the scenarios use the provider elements to collect trace information, details on the providers themselves are not provided at this time.

Introduced in Overview of the Centralized Logging Service, the key elements of defining a provider for use in a scenario are:

- **Providers** If you are familiar with OCSLogger, providers are the components that you choose to tell OCSLogger what the tracing engine should collect logs from. The providers are the same components, and in many cases have the same name as the components in OCSLogger. If you are not familiar with OCSLogger, providers are server-role specific components that the Centralized Logging Service can collect logs from. In the case of the Centralized Logging Service, the CLSAgent is the architectural part of the Centralized Logging Service that is doing the tracing of the components that you define in the providers configuration.
- **Logging levels** OCSLogger provided the option to choose a number of levels

  of detail for the data collected. This feature is an integral part of the Centralized Logging Service and scenarios, and is defined by the **Type** parameter. You can choose from the following:
  - **All** Collects trace messages of type fatal, error, warning, and info to the log for the defined provider.
  - **Fatal** Collects only the trace messages that indicate a failure for the defined provider.
  - **Error** Collects only the trace messages that indicate an error for the defined provider, plus fatal messages.
  - **Warning** Collects only the trace messages that indicate a warning for the defined provider, plus fatal and error messages.
  - **Info** Collects only the trace messages that indicate an informational message for the defined provider, plus fatal, error, and warning messages.
  - **Verbose** Collects all trace messages of type fatal, error, warning and info for the defined provider.
- **Flags** OCSLogger provided the option to choose flags for each provider that defined what type of information you could retrieve from the trace files. You can chose the following flags, based on the provider:
  - **TF_Connection** Provides connection-related log entries. These logs include information about connections established to and from a particular component. This may also include significant network-level information (that is, for components without the concept of a connection).
  - **TF_Security** Provides all events/log entries related to security. For example, for SipStack, these are security events such as domain validation failure, and client authentication/authorization failures.
  - **TF_Diag** Provides diagnostics events that you can use to diagnose or troubleshoot the component. For example, for SipStack, these are certificate failures, or DNS warnings/errors.
  - **TF_Protocol** Provides protocol messages such as SIP and CCCP messages.
  - **TF_Component** Enables logging on the components specified as part of the providers.
  - **All** Sets all available flags available for the provider.

To review information about existing Centralized Logging Service scenario providers

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. To review the configuration of existing providers, type the following:

   ```
   Get-CsClsScenario -Identity <scope and scenario name>
   ```

   For example, to review information about the global conferencing attendant, type:

   ```
   Get-CsClsScenario -Identity "global/CAA"
   ```

   The command displays a list of providers with the associated flags, settings, and components. If the information displayed is not enough or the list is too long for the default Windows PowerShell list format, you can display additional information by defining a different output method. To do this, type:

   ```
   Get-CsClsScenario -Identity "global/CAA" | Select-Object -ExpandProper
   ```

   The output of this command displays each provider displayed in a five line format with the provider name, type of logging, logging level, flags, GUID, and role, each one on a separate line.

To define a new Centralized Logging Service scenario provider

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.

2. A scenario provider consists of a component to trace, flags to use, and a level of detail to collect. You do this by typing:

   ```
   $<variableName> = New-CsClsProvider -Name <provider component> -Type <
   ```

   For example, a trace provider definition that defines what to collect and to what level of detail from the Lyss provider looks like the following:

   ```
   $LyssProvider = New-CsClsProvider -Name "Lyss" -Type "WPP" -Level "Inf
   ```

The –Level collects fatal, error, warning, and information messages. The flags used are all of those defined for the Lyss provider, and include TF_Connection, TF_Diag and TF_Protocol.

After the variable $LyssProvider is defined, you can use it with the **New-CsClsScenario** cmdlet to collect traces from the Lyss provider. To complete the creation and assignment of the provider to a new scenario, type:

```
New-CsClsScenario -Identity "site:Redmond/RedmondLyssInfo" -Provider $LyssProvide
```

Where $LyssProvider is the variable containing the defined scenario created with **New-CsClsProvider**.

⊟To change an existing Centralized Logging Service scenario provider

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. To update or change the configuration of an existing provider, type:

   ```
   $LyssProvider = New-CsClsProvider -Name "Lyss" -Type "WPP" -Level "Deb
   ```

   You then update the scenario to assign the provider by typing the following:

   ```
   Set-CsClsScenario -Identity "site:Redmond/RedmondLyssInfo" -Provider $
   ```

The end result of the command is that the scenario site:Redmond/RedmondLyssInfo will have updated flags and level for the provider assigned to it. You can view the new scenario by using Get-CsClsScenario. For details, see Get-CsClsScenario.

> ⚠**Warning:**
>
> **New-ClsCsProvider** does not check to determine whether the flags are valid. Make sure that the spelling of the flags (for example, TF_DIAG or TF_CONNECTION) is spelled correctly. If the flags are not spelled correctly, the provider cannot return the expected log information.

If you want to add additional providers to this scenario, type the following:

```
Set-CsClsScenario -Identity "site:Redmond/RedmondLyssInfo" -Provider @{Add=$ABSPr
```

Where each provider defined with the Add directive has already been defined using the **New-CsClsProvider** process.

⊟To remove a scenario provider

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. The cmdlets provided allow you to update existing providers and create new providers. To remove a provider, you must use the Replace directive for the Provider parameter to **Set-CsClsScenario**. The only way to completely remove a provider is to replace it with a redefined provider of the same name and use the Update directive. For example, our provider LyssProvider is

defined with WPP as the log type, level set to Debug, and flags set are TF_CONNECTION and TF_DIAG. You need to change the flags to “All”. To change the provider, type the following:

```
$LyssProvider = New-CsClsProvider -Name "Lyss" -Type "WPP" -Level "Deb
```

```
Set-CsClsScenario -Identity "site:Redmond/RedmondLyssInfo" -Provider @
```

3. If you want to completely remove a scenario and the providers associated with it, type the following:

```
Remove-CsClsScenario -Identity <scope and name of scenario>
```

For example:

```
Remove-CsClsScenario -Identity "site:Redmond/RedmondLyssInfo"
```

> **Warning:**
> The cmdlet **Remove-CsClsScenario** does not prompt you for confirmation. The scenario is deleted, along with the providers that were assigned to it. You can recreate the scenario by re-running the commands used to create it initially. There is no procedure to recover removed scenarios or providers.

When you remove a scenario by using the **Remove-CsClsScenario** cmdlet, you completely remove the scenario from the scope. To use the scenarios that you created and the providers that were a part of the scenario, you create new providers and assign them to a new scenario.

1.7.1.9.2.3 Configuring Scenarios for the Centralized Logging Service

Configuring Scenarios for the Centralized Logging Service

Lync Server Administrative Tools > Using the Centralized Logging Service > Managing the Centralized Logging Service Configuration Settings >

Topic Last Modified: *2013-02-21*

Scenarios define the scope (that is, global, site, pool, or computer) and what providers to use in the Centralized Logging Service. By using scenarios, you enable or disable tracing on providers (for example, S4, SIPStack, IM, and Presence). By configuring a scenario, you can group all of the providers for a given logical collection that address a specific problem condition. If you find that a scenario needs to be modified to meet your troubleshooting and logging needs, the Lync Server 2013 Debug Tools provides you a Windows PowerShell module named *ClsController.psm1* that contains a function named *Edit-CsClsScenario*. The purpose of the module is to edit the properties of the named scenario. Examples of how this module works are provided in this topic. The Lync Server 2013 Debug Tools are downloaded from the following link: http://go.microsoft.com/fwlink/?LinkId=285257

> **Important:**
> For any given scope—site, global, pool or computer—you can run a maximum of two scenarios at any given time. To determine which scenarios are currently running, use Windows PowerShell and Get-CsClsScenario. By using Windows PowerShell and Set-CsClsScenario, you can dynamically change which scenarios are running. You can modify which scenarios are running during a logging session to adjust or refine the data you are

collecting and from which providers.

To run the Centralized Logging Service functions by using the Lync Server Management Shell, you must be a member of either the CsAdministrator or the CsServerAdministrator role-based access control (RBAC) security groups, or a custom RBAC role that contains either of these two groups. To return a list of all the RBAC roles this cmdlet has been assigned to, including any custom RBAC roles you have created yourself, run the following command from the Lync Server Management Shell or the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Lync Server 2013 cmdlet"}
```

For example:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Set-CsClsConfiguration"}
```

The remainder of this topic focuses on how to define a scenario, modify a scenario, retrieve what scenarios are running, remove a scenario, and specify what a scenario contains to optimize your troubleshooting. There are two ways to issue Centralized Logging Service commands. You can use the CLSController.exe that is located, by default, in the directory C:\Program Files\Common Files\Microsoft Lync Server 2013\CLSAgent. Or, you can use the Lync Server Management Shell to issue Windows PowerShell commands. The important distinction is that when you use CLSController.exe at the command line there is a finite selection of scenarios available. When you use Windows PowerShell, you can define new scenarios for use in your logging sessions.

As introduced in Overview of the Centralized Logging Service, the elements of a scenario are:

- **Providers** If you are familiar with OCSLogger, providers are the components that you choose to tell OCSLogger what the tracing engine should collect logs from. The providers are the same components, and in many cases have the same name as the components in OCSLogger. If you are not familiar with OCSLogger, providers are server role specific components that the Centralized Logging Service can collect logs from. For details about the configuration of providers, see Configuring Providers for Centralized Logging Service.
- **Identity** The parameter –Identity sets the scope and name of the scenario. For example, you could set a scope of "global" and identify the scenario with "LyssServiceScenario". When you combine the two, you define the Identity (for example, "global/LyssServiceScenario").

  Optionally, you can use the –Name and –Parent parameters. You define the Name parameter to uniquely identify the scenario. If you use Name, you must also use Parent to add the scenario to either global or site.

  Important:

  If you use the Name and Parent parameters, you cannot use the **–Identity** parameter.

⊟To create a new scenario with the New-CsClsScenario cmdlet

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. To create a new scenario for a logging session, use New-CsClsProvider and define the name of the scenario (that is, how it will be uniquely identified). Choose a type of logging format from WPP (that is, Windows software tracing preprocessor and is the default), EventLog (that is, Windows event log format), or IISLog (that is, ASCII format file based on the IIS log file format). Next, define Level (as the defined under Logging Levels in this topic), and Flags (as defined under Flags in this topic).

   For this example scenario, we use LyssProvider as the example provider variable.

To create a scenario using the options defined, type:

```
New-CsClsScenario -Identity <scope>/<unique scenario name> -Provider <
```

For example:

```
New-CsClsScenario -Identity "site:Redmond/LyssServiceScenario" -Provid
```

The alternate format using –Name and –Parent:

```
New-CsClsScenario -Name "LyssServiceScenario" -Parent "site:Redmond" -
```

To create a new scenario with multiple providers with the New-CsClsScenario cmdlet

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. You are limited to two scenarios per scope. However, you are not limited to a set number of providers. In this example, assume that we have created three providers, and you want to assign all three to the scenario you are defining. The provider variable names are LyssProvider, ABServerProvider, and SIPStackProvider. To define and assign multiple providers to a scenario, type the following at a Lync Server Management Shell or Windows PowerShell command prompt:

```
New-CsClsScenario -Identity "site:Redmond/CollectDataScenario" -Provid
```

> **Note:**
> As it is known in Windows PowerShell, the convention for creating a hash table of values using `@{<variable>=<value1>, <value2>, <value>...}` is known as *splatting*. For details about splatting in Windows PowerShell, see http://go.microsoft.com/fwlink/p/?LinkId=267760.

To modify an existing scenario with the Set-CsClsScenario cmdlet

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. You are limited to two scenarios per scope. You can change which scenarios are running at any time, even when a logging capture session is in process. If you redefine the running scenarios, the current logging session will stop using the scenario that was removed and then begin using the new scenario. However, the logging information that was captured with the removed scenario remains in the captured logs. To define a new scenario, do the following (that is, assuming the addition of an already defined provider named "S4Provider"):

```
Set-CsClsScenario -Identity <name of scope and scenario defined by New
```

For example:

```
Set-CsClsScenario -Identity "site:Redmond/LyssServiceScenario" -Provid
```

If you want to replace providers, define a single provider or a comma separated list of providers to replace the current set. If you only want to replace one of many providers, add the current providers with the new providers to create a new set of providers that contains both new providers and existing providers. To replace all providers with a new set, type the following:

```
Set-CsClsScenario -Identity <name of scope and scenario defined by New
```

For example, to replace the current set of $LyssProvider, $ABServerProvider, and $SIPStackProvider with $LyssServiceProvider:

```
Set-CsClsScenario -Identity "site:Redmond/LyssServiceScenario" -Provid
```

To replace just the $LyssProvider provider from the current set of

$LyssProvider, $ABServerProvider, and $SIPStackProvider with $LyssServiceProvider, type the following:

```
Set-CsClsScenario -Identity "site:Redmond/LyssServiceScenario" -Provid
```

To remove an existing scenario with the Remove-CsClsScenario cmdlet

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. If you want to remove a scenario that has been previously defined, type the following:

   ```
   Remove-CsClsScenario -Identity <name of scope and scenario>
   ```

   For example, to remove the defined scenario site:Redmond/LyssServiceScenario:

   ```
   Remove-CsClsScenario -Identity "site:Redmond/LyssServiceScenario"
   ```

The **Remove-CsClsScenario** cmdlet removes the specified scenario, but the traces that have been captured are still available in the logs for you to search on.

To load and unload the Edit-CsClsScenario cmdlet using the ClsController.psm1 module

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.

   Important:

   The ClsController.psm1 module is provided as a separate Web download. The module is part of the Lync Server 2013 Debugging tools. By default, the debugging tools are installed in the directory C:\Program Files\Lync Server 2013\Debugging Tools.

2. From the Windows PowerShell, type:

   ```
   Import-Module "C:\Program Files\Lync Server 2013\Debugging Tools\ClsCo
   ```

   Tip:

   Successful loading of the module returns you to the Windows PowerShell command prompt. To confirm that the module is loaded and that Edit-CsClsScenario is available, type `Get-Help Edit-CsClsScenario`. You should see the basic synopsis of the syntax for EditCsClsScenario.

3. To unload the modules, type:

   ```
   Remove-Module ClsController
   ```

   Tip:

   Successful unloading of the module returns you to the Windows PowerShell command prompt. To confirm that the module is unloaded, type `Get-Help Edit-CsClsScenario`. Windows PowerShell will attempt to locate the help for the cmdlet and fail.

To remove an existing provider from a scenario with the Edit-ClsController module

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. To remove a provider from the AlwaysOn scenario, type:

   ```
   Edit-CsClsScenario -ScenarioName <string of the scenario to edit> -Pro
   ```

For Example:

```
Edit-CsClsScenario -ScenarioName AlwaysOn -ProviderName ChatServer -Re
```

The parameters ScenarioName and ProviderName are positional (that is, they must be defined in the expected position in the command line) parameters. The parameter name does not have to be explicitly defined if the scenario name is in position two and the provider is in position three, relative to the name of the cmdlet as position one. Using this information, the previous command would be typed as:

```
Edit-CsClsScenario AlwaysOn ChatServer -Remove
```

The positional placing of the parameter values applies only to –Scenario and –Provider. All other parameters must be explicitly defined.

⊟To add a provider to a scenario with the Edit-ClsController module

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. To add a provider to the AlwaysOn scenario, type:

```
Edit-CsClsScenario -ScenarioName <string of the scenario to edit> -Pro
```

For Example:

```
Edit-CsClsScenario -ScenarioName AlwaysOn -ProviderName ChatServer -Le
```

-Loglevel can be of the type Fatal, Error, Warning, Info, Verbose, Debug, or All. –Flags can be any of the flags that the provider supports, such as TF_COMPONENT, TF_DIAG. –Flags can also be of value ALL

The previous example can also be typed using the positional feature of the cmdlet. For example, to add the provider ChatServer to the AlwaysOn scenario, type:

```
Edit-CsClsScenario AlwaysOn ChatServer -Level Info -Flags ALL
```

1.7.1.9.3 Understanding Centralized Logging Service Configuration Settings

Understanding Centralized Logging Service Configuration Settings

See Also

Operations > Lync Server Administrative Tools > Using the Centralized Logging Service >

***Topic Last Modified:** 2013-02-21*

The Centralized Logging Service is configured to define what the logging service is intended to collect, how it collects, where it will collect from, and what the log settings are. You define these settings globally (that is, for the entire deployment) or for a site (that is, a named site in your deployment). Any logging that you define will use the settings that are appropriate for the identity that you use for commands to start, stop, flush, and search logs.

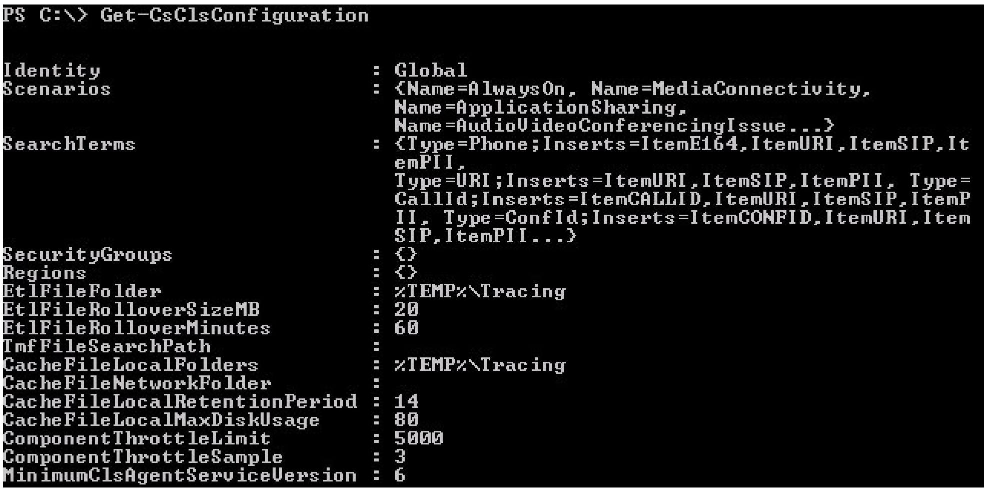
⊟To display the current Centralized Logging Service configuration

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Type the following at a command-line prompt:

```
Get-CsClsConfiguration
```

Tip:

You can narrow or expand the scope of the configuration settings that are returned by defining `-Identity` and a scope, such as "Site:Redmond" to return only the CsClsConfiguration for the site Redmond. If you want details about a given portion of the configuration, you can pipe the output into another Windows PowerShell cmdlet. For example, to get details about the scenarios defined in the configuration for site "Redmond", type: `Get-CsClsConfiguration -Identity "site:Redmond" | Select-Object -ExpandPropery Scenarios`



```
PS C:\> Get-CsClsConfiguration

Identity                         : Global
Scenarios                        : {Name=AlwaysOn, Name=MediaConnectivity,
                                   Name=ApplicationSharing,
                                   Name=AudioVideoConferencingIssue...}
SearchTerms                      : {Type=Phone;Inserts=ItemE164,ItemURI,ItemSIP,It
                                   emPII,
                                   Type=URI;Inserts=ItemURI,ItemSIP,ItemPII, Type=
                                   CallId;Inserts=ItemCALLID,ItemURI,ItemSIP,ItemP
                                   II, Type=ConfId;Inserts=ItemCONFID,ItemURI,Item
                                   SIP,ItemPII...}
SecurityGroups                   : {}
Regions                          : {}
EtlFileFolder                    : %TEMP%\Tracing
EtlFileRolloverSizeMB            : 20
EtlFileRolloverMinutes           : 60
TmfFileSearchPath                :
CacheFileLocalFolders            : %TEMP%\Tracing
CacheFileNetworkFolder           :
CacheFileLocalRetentionPeriod    : 14
CacheFileLocalMaxDiskUsage       : 80
ComponentThrottleLimit           : 5000
ComponentThrottleSample          : 3
MinimumClsAgentServiceVersion    : 6
```

The result from the cmdlet displays the current configuration of the Centralized Logging Service.

Configuration Setting	Description
Identity	Identifies the scope and name for this configuration. There is only one Global configuration, and one configuration per site.
Scenarios	Listing of all scenarios that are defined for this configuration.
SearchTerms	Defined search terms for the configuration. Office 365, not on-premises deployments.
SecurityGroups	Defined security groups that control who (that is, members of the security groups) can see computers based on the site they are located in. Site, in this context, is the site as defined in Topology Builder.
Regions	Defined regions are used to collect SecurityGroups into a region, for example EMEA.
EtlFileFolder	Defined path to the location where log files are written on computers. CLSAgent writes the log files and runs under the context of the Network Service. In this case, %TEMP% expands to %WINDIR%\ServiceProfiles\NetworkService\AppData\Local
EtlFileRolloverSizeMB	The parameter indicates the maximum

	size of the log file before a new event trace log (.etl) file is created. A new log file is created when the defined size is reached even if the maximum time set in EtlFileRolloverMinutes has not yet been reached.
EtlFileRolloverMinutes	Defined maximum amount of time, in minutes, that a log can elapse before a new .etl file is created. A new log file is created when the timer expires even if the maximum size set in EtlFileRolloverSizeMB has not yet been reached.
TmfFileSearchPath	Location to search for the trace message format files. The trace message format files are used to convert the binary files into a human readable format.
CacheFileLocalFolders	Defined path to the location where cache files are written on computers. CLSAgent writes the cache files and runs under the context of the Network Service. In this case, %TEMP% expands to %WINDIR%\ServiceProfiles\NetworkService\AppData\Local. By default, cache files and log files are written to the same directory.
CacheFileNetworkFolder	You can define a universal naming convention (UNC) path to receive the cache files during logging operations.
CacheFileLocalRetentionPeriod	Defined as the maximum time, in days, that cache files are retained.
CacheFileMaxDiskUsage	Defined as the percentage of disk space that can be used by the cache files.
ComponentThrottleLimit	Defined as the maximum number of traces per second that a component can produce before the automatic throttle limiter is triggered.
ComponentThrottleSample	Number of times in 60 seconds that the ComponentThrottleLimit can be exceeded.
MinimumClsAgentServiceVersion	The minimum version of the CLSAgent allowed to run. This element is intended for Office 365.

1.7.1.9.4 Using Start for the Centralized Logging Service to Capture Logs

Using Start for the Centralized Logging Service to Capture Logs

See Also

Operations > Lync Server Administrative Tools > Using the Centralized Logging Service >

Topic Last Modified: *2013-02-21*

To capture trace logs using the Centralized Logging Service, you issue a command to begin logging on one or more computers and pools. You also issue parameters that define which computers or pools, what scenarios to run (for example, AlwaysOn, another predefined scenario, or a scenario you have created), what Lync Server components (for example, S4, SipStack) to trace.

To capture the right information, you need to make sure you use the right scenario to collect information that is relevant to the problem. In the Centralized Logging Service, a scenario is the concept of turning logging on based on a collection of server components, logging levels, and flags, which is much more efficient and useful than having to define these elements on a per-server basis. You define and specify a scenario to run and the scenario is run consistently across all servers and pools in the scope of the infrastructure.

The default scenario is called **AlwaysOn**. The intended purpose for AlwaysOn is to run the scenario constantly, as the name of the scenario implies. The AlwaysOn scenario collects Info level information (note that Info logging level includes Fatal, Error, and Warning in addition to Info messages) for many of the most common server components. AlwaysOn collects information before, during, and after a problem occurs. This differs dramatically from the typical behavior of previous logging tools such as OCSLogger. You ran OCSLogger after the problem had already occurred, making your troubleshooting efforts more difficult because the data that you have is reactive, not proactive. If AlwaysOn does not contain the information that you are looking for in order to point to the problem component and indicate a course of action to fix it (which is not likely given the breadth and depth of providers in AlwaysOn), it will indicate a reasonable level of information to determine what else you need to do, such as creating a new scenario, gather other information, run a different search to collect more focused details, and so on.

The Centralized Logging Service provides two ways to issue commands. A number of topics have been focused squarely on using Windows PowerShell through the Lync Server Management Shell. The ability to use a number of complex configurations and commands favors Windows PowerShell for Centralized Logging Service use. Because Windows PowerShell through the Lync Server Management Shell is nearly ubiquitous for all functions in Lync Server, only the Windows PowerShell commands are discussed.

Note:

If you decide to use the limited command set available from the command line, you can get help with CLSController.exe by typing `ClsController.exe`. By default, **ClsController.exe** is installed in the directory C:\Program Files\Microsoft Lync Server 2013\ClsAgent.

To run Start-CsClsLogging with Windows PowerShell using basic commands

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Start a logging scenario with the Centralized Logging Service by typing the following:

```
Start-CsClsLogging -Scenario <name of scenario>
```

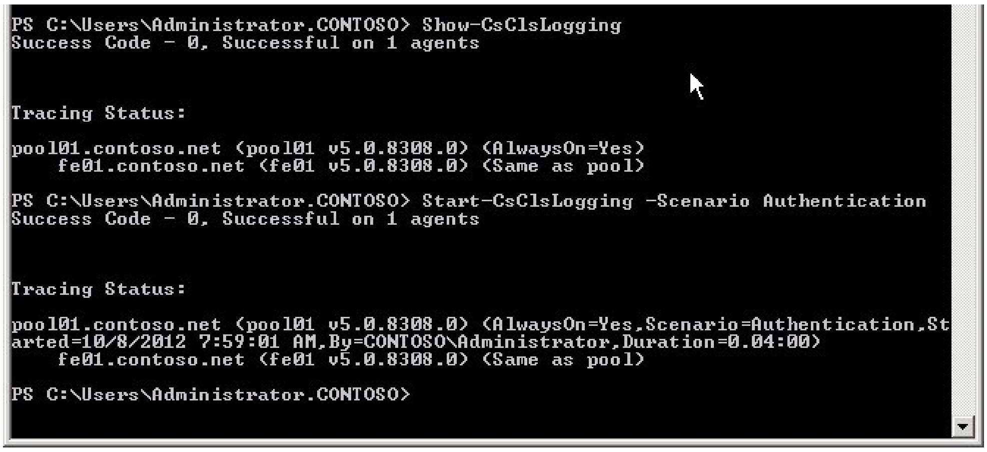
For example, to start the **AlwaysOn** scenario, type:

```
Start-CsClsLogging -Scenario AlwaysOn
```

Note:
The AlwaysOn scenario has no default duration. This scenario will run until you explicitly stop it with the **Stop-CsClsLogging** cmdlet. For details, see Stop-CsClsLogging. For all other scenarios, the default duration is 4 hours.

3. Press Enter to run the command.

Note:
It may take a short amount of time (30 to 60 seconds) for the commands to run and to receive the status back from the computers in your deployment.



```
PS C:\Users\Administrator.CONTOSO> Show-CsClsLogging
Success Code - 0, Successful on 1 agents

Tracing Status:

pool01.contoso.net (pool01 v5.0.8308.0) (AlwaysOn=Yes)
    fe01.contoso.net (fe01 v5.0.8308.0) (Same as pool)

PS C:\Users\Administrator.CONTOSO> Start-CsClsLogging -Scenario Authentication
Success Code - 0, Successful on 1 agents

Tracing Status:

pool01.contoso.net (pool01 v5.0.8308.0) (AlwaysOn=Yes,Scenario=Authentication,St
arted=10/8/2012 7:59:01 AM,By=CONTOSO\Administrator,Duration=0.04:00)
    fe01.contoso.net (fe01 v5.0.8308.0) (Same as pool)

PS C:\Users\Administrator.CONTOSO>
```

4. To start another scenario, use the **Start-CsClsLogging** cmdlet with the name of the additional scenario to run as follows (for example, the scenario **Authentication**):

```
Start-CsClsLogging -Scenario Authentication
```

Important:
You can have a total of two scenarios running on any given computer at any time. If the command is global in scope, all of the computers in your deployment will run the scenario or scenarios. To start a third scenario, you must stop logging on the computer, pool, site, or global scope that you want to run the new scenario on. If you have started a global scope, you can stop logging for one or both of the scenarios on one or more computers and pools. For details about managing which scenarios are running, see Using Stop for the Centralized Logging Service and Stop-CsClsLogging.

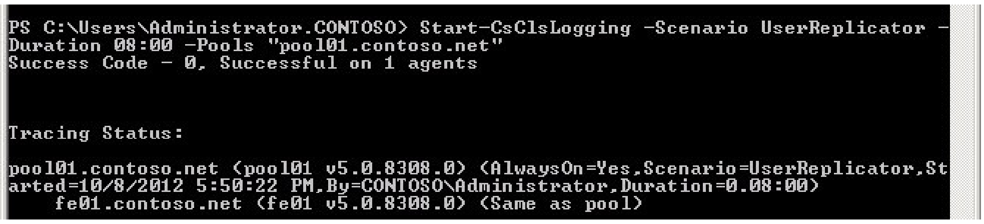
To run Start-CsClsLogging with Windows PowerShell using advanced commands

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Additional parameters are available to manage the logging commands. You can use -Duration to adjust the length of time for the scenario to run. You also can define -Computers, a list of computer fully qualified domain names (FQDNs) separated by a comma, or -Pools, a comma separated list of FQDNs for pools that you want to run logging on.

   You start a logging session for the *UserReplicator* scenario on the pool "pool01.contoso.net". You also define the duration of the logging session at 8 hours. To do this, type:

```
Start-CsClsLogging -Scenario UserReplicator -Duration 8:00 -Pools "poo
```

The successful execution of this scenario returns a result like the following:



```
PS C:\Users\Administrator.CONTOSO> Start-CsClsLogging -Scenario UserReplicator -
Duration 08:00 -Pools "pool01.contoso.net"
Success Code - 0, Successful on 1 agents

Tracing Status:

pool01.contoso.net (pool01 v5.0.8308.0) (AlwaysOn=Yes,Scenario=UserReplicator,St
arted=10/8/2012 5:50:22 PM,By=CONTOSO\Administrator,Duration=0.08:00)
    fe01.contoso.net (fe01 v5.0.8308.0) (Same as pool)
```

Note that in this example, the AlwaysOn scenario is running and the UserReplicator scenario is running.

Concepts

Overview of the Centralized Logging Service

1.7.1.9.5 Using Stop for the Centralized Logging Service

Using Stop for the Centralized Logging Service

See Also

Operations > Lync Server Administrative Tools > Using the Centralized Logging Service >

Topic Last Modified: *2012-11-01*

You can stop a currently running logging session with the Stop-CsClsLogging cmdlet. Generally, there aren't many situations in which you would need to stop a logging session. For example, you can search logs and change configurations without first needing to stop logging. If you have two scenarios running, for example AlwaysOn and UserReplicator, and you need to collect information related to Authentication, you will need to stop one of the other scenarios (at a global, site, pool or computer scope) before you can start running to Authentication scenario. For details, see Stop-CsClsLogging.

Note:

When determining what scenarios you can run on a given deployment, pool or computer, you need to remember that you are limited to running two scenarios **per computer**. If you are logging activity on a pool, you should treat a pool as a single entity. In most cases, it would not make sense to run different scenarios on each computer in a pool. It does make sense to look at the problem that you are collecting data about and think about what scenario makes the most sense on a given computer in the overall deployment. For example, if you consider the UserReplicator scenario, there would be very little value in running UserReplicator on an Edge Server or Edge pool.
After you understand the problem and the scope of the impact, you should make careful choices about what scenarios to run on which computers and pools. While the AlwaysOn scenario makes sense for a wide scope application because it collects information on a wide variety of providers, specific scenarios only have application value on specific computers or pools. Also, you should take caution when randomly starting up a logging session without first understanding the value of a given scenario. If you use the wrong scenario, or if you use a scenario that is appropriate for the task and you apply the scenario at the wrong scope (be it global, site, pool, or computer), you can get questionable data that is not very useful—as if you didn't run the scenario at all.

To control the Centralized Logging Service functions by using the Lync Server Management Shell, you must be a member of either the CsAdministrator or the CsServerAdministrator role-based access control (RBAC) security groups, or a custom RBAC role that contains either of these two groups. To return a list of all the RBAC roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Lync Server Management Shell or the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Lync Server 2013 cmdlet"}
```

For example:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Set-CsClsConfiguration"}
```

To stop a currently running Centralized Logging Service session

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Query the Centralized Logging Service to find out what scenarios are currently running by typing the following:

   ```
   Show-CsClsLogging
   ```

   
   ```
   PS C:\Users\Administrator.CONTOSO> Show-CsClsLogging
   Success Code - 0, Successful on 1 agents

   Tracing Status:

   pool01.contoso.net (pool01 v5.0.8308.0) (AlwaysOn=Yes,Scenario=Authentication,St
   arted=10/8/2012 1:16:18 PM,By=CONTOSO\Administrator,Duration=0.04:00)
       fe01.contoso.net (fe01 v5.0.8308.0) (Same as pool)

   PS C:\Users\Administrator.CONTOSO> Stop-csclslogging -scenario authentication
   Success Code - 0, Successful on 1 agents

   Tracing Status:

   pool01.contoso.net (pool01 v5.0.8308.0) (AlwaysOn=Yes)
       fe01.contoso.net (fe01 v5.0.8308.0) (Same as pool)
   ```

   The result of Show-CsClsLogging is a summary of the scenarios that are running and what scope they are running in. For details, see Show-CsClsLogging.
3. To stop a currently running logging session with a specific scenario, type:

   ```
   Stop-CsClsLogging -Scenario <scenario name> -Computers <comma separate
   ```

   For example:

   ```
   Stop-CsClsLogging -Scenario UserReplicator -Pools pool01.contoso.net
   ```

   This command will stop logging with the UserReplicatior scenario on pool01.contoso.net.

   Note:

   Logs created during this logging session using the UserReplicator scenario are not deleted. The logging is still available for you to execute searches against using the Search-CsClsLogging command. For details, see Search-CsClsLogging.

Acting as the companion command to Start-CsClsLogging, the Stop-CsClsLogging cmdlet ends the logging session, defined by scenarios, and retains the logs created by the logging session. You can run two scenarios on a given computer at any time. The method of stopping one scenario to gather information using another scenario is a common task that you can perform during most workload troubleshooting.

1.7.1.9.6 Using Search on Capture Logs Created by the Centralized Logging Service

Using Search on Capture Logs Created by the Centralized Logging Service

Operations > Lync Server Administrative Tools > Using the Centralized Logging Service >

Topic Last Modified: *2013-02-21*

The search features in the Centralized Logging Service are useful and powerful for the following reasons:

- Your searches and the results are run on a single computer, a pool, a site, or a global scope, based on the criteria you define.
- Your searches can be initially broad and then narrowed down to more targeted criteria such as time, component, or computer. You search against the same logs and don't need to run a logging session again when the search criteria changes.
- The results of your search are gathered from all computers and pools in the scope, collected and aggregated into a single output file that represents all results of the search criteria (limited to the scenarios that have been running and the data captured by the scenarios). You use familiar tools such as **Snooper** or **Notepad** to read the output file and the trace messages from across your deployment.

The CLSAgent on each individual computer creates the logs based on the scenario or scenarios (two scenarios per computer can be running at any given time). The logs and their associated index and cache files are managed by the CLSAgent. When you define and execute a search, the search command instructs the CLSAgent on what information should be retrieved. The CLSAgent executes the query against the log files, cache files, and index files and returns the results of the search to the CLSContoller. The CLSController receives the search results from all computers and pools in the scope of the search. The CLSController then aggregates (combines) the logs and puts them into time delta order, oldest entry first, and proceeding in time to the most recent entry last.

After each search, the **Sync-CsClsLogging** cmdlet is run and it flushes the cache used by searches (not to be confused with the cache files maintained by the CLSAgent). Flushing the cache helps to ensure that there is a clean log and trace file capture buffer at the CLSController for the next search operation.

To get the most benefit from the Centralized Logging Service, you need a good understanding of how to configure search to return only trace messages from the computer and pool logs that are relevant to the issue that you are researching. issues

To run the Centralized Logging Service search functions by using the Lync Server Management Shell, you must be a member of either the CsAdministrator or the CsServerAdministrator role-based access control (RBAC) security groups, or a custom RBAC role that contains either of these two groups. To return a list of all the RBAC roles that this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Lync Server Management Shell or the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Lync Server 2013 cmdlet"}
```

For example:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Set-CsClsConfiguration"}
```

The remainder of this topic focuses on how to define a search to optimize your troubleshooting.

To run a basic search by using the Centralized Logging Service

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Make sure that you have the AlwaysOn scenario running in your deployment at the global scope and then type the following at a command prompt:

   ```
   Search-CsClsLogging -OutputFilePath <string value of path and file to
   ```

   > **Note:**
   > By default, Search-CsClsLogging sends the results of the search to the console. If you want to save the search results to a file, use –OutputFilePath *<string fully qualified file path>*. To define the –OutputFilePath parameter, supply a path and a filename as part of the parameter in a string format enclosed in quotation marks (for example; C:\LogFiles\SearchOutput.txt). In this example, you must ensure that the directory C:\LogFiles exists and that you have permissions to Read and Write (NTFS permission Modify) files in the folder. The output is appended to and is not overwritten. If you need separate files, define a distinct file name for each search.

   For example:

   ```
   Search-CsClsLogging -OutputFilePath "C:\LogFiles\logfile.txt"
   ```

To run a basic search on a pool or computer by using the Centralized Logging Service

1. To limit the search to a specific pool or computer, use the –Computers parameter with the computer defined by a computer fully qualified name, enclosed in quotation marks and separated by a comma as follows:

   ```
   Search-CsClsLogging -Computers <string value of computer names> -Outpu
   ```

   For example:

   ```
   Search-CsClsLogging -Computers "fe01.contoso.net" -OutputFilePath "C:\
   ```

2. To search more than one computer, type multiple computer names enclosed in quotation marks and separated by commas, such as the following:

   ```
   Search-CsClsLogging -Computers "fe01.contoso.net", "fe02.contoso.net",
   ```

3. If you need to search an entire pool instead of a single computer, change the –Computers parameter to –Pools, remove the computer name, and replace it with the pool or pools in quotation marks separated by commas.
   For example:

   ```
   Search-CsClsLogging -Pools "pool01.contoso.net" -OutputFilePath "C:\Lo
   ```

4. When using the search commands, pools can be any pool in your deployment, such as Front End pools, Edge pools, Persistent Chat Server pools, or others that are defined as a pool in your deployment.
   For example:

   ```
   Search-CsClsLogging -Pools "pool01.contoso.net", "pchatpool01.contoso.
   ```

To run a search by using time parameters

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. By default, the beginning time for a search's time-specific parameters is 30

minutes prior to the time you initiate the search. In other words, if you initiate your search at 4:00:00 PM, the search will search the logs for the computers and pools that you define from 3:30:00 PM until 4:00:00 PM. If you need to search 60 minutes or 3 hours prior to the current time, use the –StartTime parameter and set the date and time string to indicate the time you want the search to start.

For example, by using –StartTime and –EndTime to define a time and date range, you can define a search between 8 AM and 9 AM on 11/20/2012 on your pool. You can set the output path to write the results to a file named c:\logfile.txt as follows:

```
Search-CsClsLogging -Pools "pool01.contoso.net" -StartTime "11/20/2012
```

Note:

The time and date string that you specify can be "date time" or "time date. " The command will parse the string and use the appropriate values for date and time.

3. If you want to retrieve logs beginning at 11:00:00 AM on 11/20/2012, you define the –StartTime. The default time range for the search is 30 minutes unless you define a specific –EndTime. The resulting search will return logs from the defined computer or pools from 11:00:00 AM to 11:30:00 AM.

   For example:

   ```
   Search-CsClsLogging -Pools "pool01.contoso.net" -StartTime "11/20/2012
   ```

4. To conduct a search of logs within a specific period of time, define a –StartTime and an –EndTime. You need logs from 1 PM to 2:45 PM on the computer edge01.contoso.net.

   For example:

   ```
   Search-CsClsLogging -Computers "edge01.contoso.net" -StartTime "11/20/
   ```

To run an advanced search by using other criteria and matching options

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. To run a command to collect traces for specific components, type the following:

   ```
   Search-CsClsLogging -Components <components to search on> -OutputFileP
   ```

   For example:

   ```
   Search-CsClsLogging -Components "SIPStack","S4","UserServices" -Output
   ```

   The resulting search returns all log entries that have trace components for SIPStack, S4, and UserServices on all computers and pools in your deployment for the past 30 minutes.
3. To limit the search with the same components to just your Front End pool named pool01.contoso.net, type:

   ```
   Search-CsClsLogging -Components "SIPStack","S4","UserServices" -Output
   ```

4. The default search logic for commands with multiple parameters is to use the logical OR with each of the defined parameters. You can change this behavior by specifying the **–MatchAll** parameter. To do this, type the following:

   ```
   Search-CsClsLogging -CallId "d0af828e49fa4dcb99f5f80223a634bc" -Compon
   ```

5. If your scenarios are set to run constantly, such as AlwaysOn, or you have defined a long-running scenario logs may roll off of the local machine onto the file share. You define the file share by using the CacheFileNetworkFolder parameter by using New-CsClsConfiguration to create a new configuration or modifying an existing configuration with Set-CsClsConfiguration. If you do not want the search to include the file share in the collection of logs to search, use the SkipNetworkLogs parameter as follows:

```
Search-CsClsLogging -Components "SIPStack","S4","UserServices" -StartT
```

1.7.1.9.7 Reading Capture Logs From the Centralized Logging Service

Reading Capture Logs From the Centralized Logging Service

Operations > Lync Server Administrative Tools > Using the Centralized Logging Service >

Topic Last Modified: *2013-02-22*

You realize the real benefit of the Centralized Logging Service after you run the search and you have a file that you can use to track down a reported problem. There are a number of ways that you can read the file. The output file is in a standard text format and you can use Notepad.exe or any other programs that will allow you to open and read a text file. For larger files and more complex issues, you could use a tool like Snooper.exe that is designed to read and parse the logging output from the Centralized Logging Service. Snooper is included with the Lync Server 2013 Debug Tools that are available as a separate download. You can download the Lync Server 2013 Debug Tools here: http://go.microsoft.com/fwlink/?LinkId=285257. When you install the Lync Server 2013 Debug Tools, short cuts and menu items are not created. After you install the Lync Server 2013 Debug Tools, open Windows Explorer, a command-line window, or Lync Server Management Shell and go to the directory (default location) C:\Program Files\Microsoft Lync Server 2013\Debugging Tools. Double-click Snooper.exe or type Snooper.exe, and then press ENTER if you are using the command line or Lync Server Management Shell.

> ◆**Important:**
>
> The intent of this topic is not to detail and discuss troubleshooting techniques. Troubleshooting and the processes around it is a complex subject. For details about troubleshooting basics and troubleshooting specific workloads, see the Microsoft Lync Server 2010 Resource Kit book at http://go.microsoft.com/fwlink/p/?linkId=211003. The processes and procedures still apply to Lync Server 2013.

Lync Server 2013 introduces an updated version of Snooper that includes some new features. The following screen shot shows the version of Snooper from Office Communications Server 2007.

	Time	I/O	StartLine	From	To

⊟To open a log file in Snooper

1. To use Snooper and open log files, you need read access to the log files. To use Snooper and access the log files you must be a member of the CsAdministrator or the CsServerAdministrator role-based access control (RBAC) security groups, or a custom RBAC role that contains either of these two groups.
2. After the installation of the Lync Server Debugging Tools (LyncDebugTools.msi), change directory to the location of Snooper.exe using Windows Explorer or from the command line. By default, the debugging tools are located in C:\Program Files\Microsoft Lync Server 2013\Debugging Tools. Double-click or run Snooper.exe.
3. After Snooper is open, right-click **File**, click **OpenFile**, find your log files, select a file in the **Open** dialog box, and then click **Open**.
4. The log file's **Trace** messages are displayed on the **Trace** tab. Click the **Messages** tab to view the message contents of the collected traces.

⊟To display a call flow diagram

1. To use Snooper and open log files, you need read access to the log files. To use Snooper and access the log files, you need to be a member of the CsAdministrator or the CsServerAdministrator role-based access control (RBAC) security groups, or a custom RBAC role that contains either of these two groups.
2. Open a log file and click the **Messages** tab, select a conversation in the messages view or select a trace component on the **Trace** tab.
3. Click **Call Flow**.

Note:

If you click on a message or trace that is not part of a call flow, the diagram will not appear and a status message appears at the bottom of Snooper stating "This message is not eligible for callfow". Choose another message or trace and the call flow will appear if the message or trace is part of a call flow.

4. Move through the Messages or the Trace lines and note whether the call flow diagram updates or changes to display a new diagram.
5. Hover over elements to get information about call messages, endpoints, and other components.

Topic Last Modified: *2012-11-01*

Topics in this section provide step-by-step procedures for configuring user settings that you can perform using the Lync Server 2013 Control Panel.

Important:

You cannot use Lync Server Control Panel to manage users who are members of the Active Directory Domain Admins group. For Domain Admins users, you can use Lync Server Control Panel only to perform read-only search operations. To perform write operations on Domain Admins users (for example, enable or disable for Lync Server Control Panel, change pool or policy assignments, telephony settings, SIP address), you must use Windows PowerShell cmdlets while logged on as a Domain Admins user. For details about using Windows PowerShell cmdlets to manage users, see Lync Server Management Shell.

When you perform any Lync Server 2013 administrative task that involves searching for a user or filtering user search results, there are some user properties that exist as attributes in Active Directory Domain Services (AD DS) but are not replicated to the global catalog until Microsoft Exchange Server is deployed. Microsoft Exchange, not Lync Server, marks the following attributes for replication to the global catalog when it is installed:

User Information	Address and Phone	Organization

Initials	Street address Country/region Pager Fax Mobile	Title Company Department Office

- Viewing Information about User Accounts Enabled for Lync Server 2013
- Enabling and Disabling Users for Lync Server 2013
- Managing Enterprise Voice for Users
- Modifying User Account Properties
- Manage External Access Policy for Your Organization
- Assigning Per-User Policies

You can use the results of a search query to configure users for Lync Server 2013. You can search for users by display name, first name, last name, Security Accounts Manager

(SAM) account name, SIP address, or line Uniform Resource Identifier (URI).

You can search for users by using the Lync Server Control Panel or the Active Directory Users and Computers snap-in. The following procedure describes how to use Lync Server Control Panel to search for users.

Note:

In an environment with a central forest topology, search results might not be accurate when you search for a user by the user's email address. Instead, you can search for users by specifying a SIP address prefix, for example, sip:name, add a search filter and select a SIP address that contains a partial email address, or use the **Get-CSUser** cmdlet.

To search for one or more users

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. In the **Search users** box, type all or the first portion of the display name, first name, last name, SAM account name, SIP address, or line URI of the user account that you want to search for, and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - 5.a. Click the expand arrow button in the upper-right corner of the screen above **Search results**, and then click **Add Filter**.
   - 5.b. Enter the user property by typing it or clicking the arrow in the drop-down list to select a user property.
   - 5.c. In the **Equal to** list, click **Equal to** or **Not equal to**.
   - 5.d. In the text box, type the search criteria you want to use to filter search results, and then click **Find**.
6. The search results appear under **Search Results**. You can select any or all of the users in the list and perform configuration tasks on the users you select.

After enabling a user account in Active Directory Users and Computers, you can use Lync Server Control Panel to create and enable new Lync Server 2013 user accounts by adding an Active Directory user to Lync Server.

⊟To add and enable a new Lync Server user

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Click **Enable users**.
5. On the **New Lync Server User** dialog, click **Add**.
6. In the **Search users** box, type all or the first portion of the name, display name, first name, last name, Security Accounts Manager (SAM) account name, email address, User Principal Name (UPN), or phone number of the Active Directory user account that you want, and then click **Find**.
7. In the table, select the account you want to add to Lync Server, and then click **OK**.
8. Assign the user to a pool, specify any additional details, and assign the policies to the user you want, and then click **Enable**.

Topic Last Modified: *2013-02-22*

You can use the following procedure to disable a previously enabled user account in Lync Server 2013 without losing the Lync Server settings that you configured for the user account. Because you do not lose the Lync Server user account settings, you can re-enable a previously enabled user account again without having to reconfigure the user account.

⊟To disable or re-enable a previously enabled user account for Lync Server

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account that you want to disable or re-enable, and then click **Find**.
5. In the table, click the user account that you want to disable or re-enable.
6. On the **Action** menu, do one of the following:
   - To temporarily disable the user account for Lync Server 2013, click **Temporarily disable for Lync Server**.
   - To enable the user account for Lync Server 2013, click **Re-enable for Lync Server**.

Using Windows PowerShell to Disable or Re-enable User Accounts

User accounts can be temporarily disabled, and then later re-enabled, by using the **Set-CsUser** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To disable a user account

- To temporarily disable a user account, set the value of the Enabled property to False ($False). For example:

```
Set-CsUser -Identity "Ken Myer" -Enabled $False
```

⊟To re-enable a user account

- To re-enable a disabled user account, set the value of the Enabled property to True ($True). For example:

```
Set-CsUser -Identity "Ken Myer" -Enabled $True
```

For more information, see the help topic for the Set-CsUser cmdlet.

and Disabling Users for Lync Server 2013 >

Topic Last Modified: *2013-02-22*

You can use the following procedure to remove a previously added user account in Lync Server 2013.

Note:

Removing a user will cause you to lose any settings you configured for the user account. If you would like to temporarily disable a user account instead, see the topic Disable or Re-Enable User Account for Lync Server.

To remove a user account by using Lync Server Management Shell

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account that you want to disable or re-enable, and then click **Find**.
5. In the table, click the user account that you want to remove.
6. On the **Action** menu, select **Remove from Lync Server**, and a dialog box appears.
7. From the dialog box, select **OK** to remove the user.

Removing User Accounts by Using Windows PowerShell Cmdlets

You can remove user accounts by using the Disable-CsUser cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a user account

- To remove a user account, use the Disable-CsUser cmdlet. For example:

  ```
  Disable-CsUser -Identity "Ken Myer"
  ```

  After this command has run there is no way to re-enable the account and its previous settings. Instead, you will need to use the Enable-CsUser cmdlet to create a brand-new account for Ken Myer.

For more information, see the help topic for the Disable-CsUser cmdlet.

1.7.2.1.3.1 Enable Users for Enterprise Voice

Enable Users for Enterprise Voice

See Also

Microsoft Lync Server 2013 > Deployment > Deploying Enterprise Voice >

Topic Last Modified: *2012-11-01*

After you install files for one or more Mediation Servers, configure outbound call routing, and optionally deploy one or more advanced Enterprise Voice features, you can use the following procedures to enable a user to make calls by using Enterprise Voice:

Note:
Of the following procedures, only the first can be performed by using Lync Server Control Panel. For the remaining procedures, you can use only Lync Server Management Shell.

- Enable the user account for Enterprise Voice.
- (Optional) Assign the user account a user-specific voice policy.
- (Optional) Assign the user account a user-specific dial plan.

⊟To enable a user account for Enterprise Voice

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account that you want to enable, and then click **Find**.
5. In the table, click the user account that you want to enable for Enterprise Voice.
6. On the **Edit** menu, click **Show details**.
7. On the **Edit Lync Server User** page, under **Telephony**, click **Enterprise Voice**.

8. Click **Line URI**, and then type a unique, normalized phone number (for example, tel:+14255550200).
9. Click **Commit**.

To finish enabling a user for Enterprise Voice, be sure that the user is assigned a voice policy and a dial plan, whether global (assigned by default) or user-specific.

By default, all users are assigned a global voice policy and dial plan. If a voice policy or dial plan exists at the site level for the site on which the user account is homed, those site policies will automatically apply to the user. To apply a per-user voice policy or dial plan to a user, you must run the **Grant-CsVoicePolicy** and **Grant-CsDialPlan** cmdlets. For details, see the Lync Server Management Shell documentation.

Voice Policy Assignment

Global and site-level voice policies are automatically assigned to all user accounts that are enabled for Enterprise Voice. You can also create voice policies that apply to specific users or groups. These per-user policies must be explicitly assigned to the users or groups. If you want to use the global or site voice policy for all users who are enabled for Enterprise Voice, you can skip this section and continue to Dial Plan Assignment section later in this topic.

To assign a user-specific voice policy

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. To assign an existing user voice policy to a user, run the following at the command prompt:

   ```
   Grant-CsVoicePolicy -Identity <UserIdParameter> -PolicyName <String>
   ```

   For example:

   ```
   Grant-CsVoicePolicy -Identity "Bob Kelly" -PolicyName VoicePolicyJapar
   ```

   In this example, the user with the display name Bob Kelly is assigned the voice policy with the name **VoicePolicyJapan**.

For details about assigning a user-specific voice policy or about running the **Grant-CsVoicePolicy** cmdlet, see the Lync Server Management Shell documentation.

Dial Plan Assignment

To complete user account configuration for either users of Enterprise Voice or users of dial-in conferencing, the user must be assigned a dial plan. User accounts will automatically use the global dial plan or, if one exists, the site-level dial plan, when you do not explicitly assign an existing per-user dial plan. If you want to use the global or site dial plan for all users who are enabled for Enterprise Voice, you can skip this section.

To assign a dial plan

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. To assign a user-specific dial plan, run the following at the command prompt:

   ```
   Grant-CsDialPlan -Identity <UserIdParameter> -PolicyName <String>
   ```

For example:

```
Grant-CsDialPlan -Identity "Bob Kelly" -PolicyName DialPlanJapan
```

In this example, the user with the display name Bob Kelly is assigned the user dial plan with the name **DialPlanJapan**.

For details about assigning a user dial plan or about running the **Grant-CsDialPlan** cmdlet, see the Lync Server Management Shell documentation.

Use the following procedure to disable Enterprise Voice for a user account that is enabled for Lync Server 2013.

To disable a user account for Enterprise Voice

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account that you want to enable, and then click **Find**.
5. In the table, click the user account that you want to enable for Enterprise Voice.
6. On the **Edit** menu, click **Show details**.
7. On the **Edit Lync Server User** page, under **Telephony**, click any option except **Enterprise Voice**.

   > **Note:**
   >
   > To restrict a user from making audio or video calls by using Lync, under **Telephony**, click **Audio/video disabled**.

8. Click **Commit**.

The user is now unable to use the Enterprise Voice feature.

Topic Last Modified: *2012-11-01*

Telephony settings are some of the individual settings of a user account that can be configured in Lync Server Control Panel for the user (that is, if the individual user has been enabled for Lync Server 2013 and the organization supports telephony).

Lync Server user telephony options include the following:

- **Audio/video disabled** The user cannot make calls with audio and video.
- **PC-to-PC only** The user can make only PC-to-PC audio or video calls.
- **Enterprise Voice** The user can use the Lync Server 2013 infrastructure to route all incoming and outgoing calls. The user can also make PC-to-PC calls.
- **Remote call control** The user can use Lync Server 2013 to control the desktop phone, and can also make PC-to-PC calls.

For details about configuring telephony for an organization, see Configure Telephony for a User and Deploying Enterprise Voice in the Deployment documentation.

⊟To configure telephony for a specific user account

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account that you want, and then click **Find**.
5. In the table, click the user account that you want to modify.
6. On the **Edit** menu, click **Modify**.
7. In **Telephony**, do the following:

- To disable audio and video calls for the user, click **Audio/video disabled**.
- To enable PC-to-PC audio communications for the user, but not remote call control or Enterprise Voice, click **PC-to-PC only**. Specify a value for **Line URI** for the telephone that the user uses for PC-to-PC audio communications.
- To route the user's phone calls by using the Lync Server 2010 infrastructure in accordance with the class of service policy, including PC-to-PC audio communication, click **Enterprise Voice**. In **Line URI**, specify the telephone number for Enterprise Voice. In **Dial plan policy** and **Voice policy**, specify the appropriate policies for the user. To specify the normalization rules for translating phone numbers dialed by the user to the E.164 format, select the appropriate location profile in **Location policy**.
- To enable remote call control, which enables users to control their desktop phone line from Lync Server 2013 to make PC-to-PC calls and PC-to-phone calls, click **Remote call control**. In **Line URI**, specify the telephone number for remote call control. The user must have a desktop phone and private branch exchange (PBX) connection for call routing.

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Modifying User Account Properties >

Topic Last Modified: *2013-03-11*

You can use Lync Server Control Panel to assign users to a specific server or pool.

Tip:

Moving all existing users from a source pool that is running Lync Server 2010 or earlier to a Lync Server 2013 destination pool in a complex Active Directory environment might result in slower Active Directory replication. To avoid this, you can use search filters to move users from pools that are running Lync Server 2010 or earlier separately, or you can use Lync Server Management Shell to move users with cmdlets. Also, the filter functionality works with Lync Server 2013 users.

⊟To move selected users to a different server or pool

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account that you want, and then click **Find**.
5. In the table, select a specific user or users in the list.
6. On the **Action** menu, click **Move selected users to pool**.
7. In **Move Users**, select the pool that you want to move the users to in **Destination registrar pool**.
8. (Optional) If the destination server or pool is unavailable, select the **Force** check box.

> **Caution:**
> If you select **Force**, the user account is moved, but any associated user data is deleted (for example, conferences that the user has scheduled). If you do not select it, both the account and the associated data are moved.

⊟To move all users from one server or pool to a different server or pool

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. On the **Action** menu, click **Move all users to pool**.
5. In **Move Users**, select the pool that contains the user accounts that you want to move in **Source registrar pool**.
6. In **Destination registrar pool**, select the pool that you want to move the users to.
7. (Optional) If the destination server or pool is unavailable, select the **Force** check box.

> **Caution:**
> If you select **Force**, the user account is moved, but any associated user data is deleted (for example, conferences that the user has scheduled). If you do not select it, both the account and the associated data are moved.

⊟To move users from one pool to a different pool by using a filter

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. In **User Search**, click **Search**, and then click **Add Filter**.
5. In the Search criteria, select **Registrar Pool**, select **Equal to**, select **Current Pool FQDN**, and then click **Find**.
6. On the **Action** menu, click **Move all users to pool**.

> **Note:**
> When a filter is applied to an existing set of users, the option **Move all users to pool** is in the context of the filtered subset of users, not ***all*** possible users.

7. In **Move Users**, select the pool that contains the user accounts that you want to move in **Source registrar pool**.
8. In **Destination registrar pool**, select the pool where you want to move the users.
9. (Optional) If the destination server or pool is unavailable, select the **Force** check box.

> **Caution:**
> If you select **Force**, the user account is moved, but any associated user data is deleted (for example, conferences that the user has scheduled and contacts). If you do not select it, both the account and the associated data are moved.

⊟To move users from one pool to another using Windows PowerShell cmdlets

1. Depending on how you run Windows PowerShell commands (that is, locally or remotely), you need to log on as a member of the correct Lync Server 2013

administrative roles as follows:

1.a. If you are running the commands on the local machine (for example, you log on directly to a Front End Server): Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.

1.b. If you are running the commands remotely on another computer (for example, you log on to your computer and run the commands remotely on a Standard Edition Front End Server): From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.

2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. To move single users, use the Move-CsUser cmdlet as follows:

```
Move-CsUser -Identity "Pilar Ackerman" -Target "pool01.contoso.net"
```

   Where the user to move is the user Pilar Ackerman, and the user will be moved from their currently assigned home pool to the pool pool01.contoso.net
4. To move a large number of users, use filters with the **Get-CsUser** cmdlet and pass the resulting set of users to **Move-CsUser**:

```
Get-CsUser -Filter {RegistrarPool -eq "CurrentPoolFqdn"} | Move-CsUser
```

   The combined commands of the **Get-CsUser** and **Move-CsUser** might result in this:

```
Get-CsUser -Filter {RegistrarPool -eq "pool02.contoso.net"} | Move-CsU
```

Modifying User Account Properties

1.7.2.1.5 Manage External Access Policy for Your Organization

Manage External Access Policy for Your Organization

Operations > Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 >

Topic Last Modified: *2013-02-22*

After deploying one or more Edge Servers, you must enable the types of external access that will be supported for your organization.

By default, there are no policies configured to support external user access, including remote user access, federated user access, even if you have already enabled external user access support for your organization. To control the use of external user access, you must configure one or more policies, specifying the type of external user access supported for each policy. The following policy scopes are available for creation and configuration. By default, the Global policy is created, but cannot be deleted.

- **Global policy** The global policy is created when you deploy your Edge Servers. By default, no external user access options are enabled in the global policy. To support external user access at the global level, you configure the global policy to support one or more types of external user access options. The global policy applies to all users in your organization, but site policies and user policies override the global policy. If you delete the global policy, you do not remove it. Instead, you reset it to the default setting.
- **Site policy** You can create and configure one or more site policies to limit support for external user access to specific sites. The configuration in the site policy overrides the global policy, but only for the specific site covered by the

site policy. For example, if you enable remote user access in the global policy, you might specify a site policy that disables remote user access for a specific site. By default, a site policy is applied to all users of that site, but you can assign a user policy to a user to override the site policy setting.

- **User policy** You can create and configure one or more user policies to limit support for remote user access to specific users. The configuration in the user policy overrides the global and site policy, but only for the specific users to whom the user policy is assigned. For example, if you enable remote user access in the global policy and site policy, you might specify a user policy that disables remote user access and then assign that user policy to specific users. If you create a user policy, you must apply it to one or more users before it takes effect.

> **Important:**
>
> Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object.

These options include the following types of external access:

- **Enable communications with federated users** Enable this if you want to support user access to federated partner domains. This setting configures the ability for users to communicate with other SIP federated domains, as well as Hosted providers like Microsoft Office 365. Selecting this setting allows you to select the option to allow communication with XMPP federated domains.
  As an option, you can select **Enable communications with XMPP federated partners** if you first select **Enable communications with federated users**. XMPP federation is a federation with organizations that use extensible messaging and presence protocol (XMPP).

  > **Note:**
  >
  > If you enable XMPP federation, you must also select to deploy **XMPP federation** in the Edge pools configuration section of Topology Builder. Configuring for XMPP federation deploys an XMPP Proxy on the Edge Server and an XMPP gateway on the Front End Server.

- **Enable communications with remote users** Enable this option if you want users in your organization who are outside your firewall, such as telecommuters and users who are traveling, to be able to connect to Lync Server over the Internet.
- **Enable communications with public users** Enable this option if you want internal users to be able to communicate with public IM provider contacts, such as those provided by Windows Live, Yahoo!, and America Online (AOL).

  > **Important:**
  >
  > - As of September 1st, 2012, the Microsoft Lync Public IM Connectivity User Subscription License (“PIC USL”) is no longer available for purchase for new or renewing agreements. Customers with active licenses will be able to continue to federate with Yahoo! Messenger until the service shut down date (exact date TBD, but no sooner than June 2013).
  > - The PIC USL is a per-user per-month subscription license that is required for Lync Server or Office Communications Server to federate with Yahoo! Messenger. Microsoft’s ability to provide this service has been contingent upon support from Yahoo!, the underlying agreement for which is winding down.
  > - More than ever, Lync is a powerful tool for connecting across organizations and with individuals around the world. Federation with Windows Live Messenger requires no additional user/device licenses beyond the Lync Standard CAL. Skype federation will be

added to this list, enabling Lync users to reach hundreds of millions of people with IM and voice.

Note:
In addition to enabling external user access support, you must also configure policies to control the use of external user access in your organization before any type of external user access is available to users. For details about creating, configuring, and applying policies for external user access see Enable or Disable Remote User Access.

To view external access policies by using Windows PowerShell cmdlets

- You can view external access policies by using Lync Server Management Shell and the **Get-CsExternalAccessPolicy** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

  To view information about all your external access policies, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsExternalAccessPolicy
  ```

  This command returns information similar to the following:

  ```
  Identity                          : Global
  Description                       :
  EnableFederationAccess            : False
  EnableXmppAccess                  : False
  EnablePublicCloudAccess           : False
  EnablePublicCloudAudioVideoAccess : False
  EnableOutsideAccess               : False
  ```

1.7.2.1.5.1 Configure Policies to Control Federated User Access

Configure Policies to Control Federated User Access

See Also

Deploying External User Access > Configuring SIP Federation, XMPP Federation and Public Instant Messaging > Setting Up Lync Federation >

Topic Last Modified: *2012-11-01*

When you configure policies to support communications with federated partners, the policies apply to users of federated domains. You can configure one or more external user access policies to control whether users of federated domains can collaborate with your Lync Server 2013 users. To control federated user access, you can configure policies at the global, site, and user level. Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object.

Note:
You can configure policies to control federated user access, even if you have not enabled federation for your organization. However, the policies that you configure are in effect

only when you have federation enabled for your organization. For details about enabling federation, see Enable or Disable Remote User Access in the Deployment documentation or the Operations documentation. Additionally, if you specify a user policy to control federated user access, the policy applies only to users that are enabled for Lync Server 2013 and configured to use the policy. For details about specifying federated users that can sign in to Lync Server 2013, see Assign an External User Access Policy to a Lync Enabled User in the Deployment documentation or the Operations documentation.

⊟To configure a policy to support access by users of federated domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **External Access Policy**.
4. On the **External Access Policy** page, do one of the following:
   - To configure the global policy to support federated user access, click the global policy, click **Edit**, and then click **Show details**.
   - To create a new site policy, click **New**, and then click **Site policy**. In **Select a Site**, click the appropriate site from the list and then click **OK**.
   - To create a new user policy, click **New**, and then click **User policy**. In **New External Access Policy**, create a unique name in the **Name** field that indicates what the user policy covers (for example, **EnableFederatedUsers** for a user policy that enables communications for federated domain users).
   - To change an existing policy, click the appropriate policy listed in the table, click **Edit**, and then click **Show details**.
5. (Optional) If you want to add or edit a description, specify the information for the policy in **Description**.
6. Do one of the following:
   - To enable federated user access for the policy, select the **Enable communications with federated users** check box.
   - To disable federated user access for the policy, clear the **Enable communications with federated users** check box.
7. Click **Commit**.

To enable federated user access, you must also enable support for federation in your organization. For details, see Enable or Disable Federation and Public IM Connectivity.

If this is a user policy, you must also apply the policy to users that you want to be able to collaborate with federated users. For details, see Assign an External User Access Policy to a Lync Enabled User.

⊟To configure an existing policy using Windows PowerShell to support access by users of federated domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Type the following in the Lync Server Management Shell:

   ```
   Set-CsExternalAccessPolicy -Identity <name of global, site or user pol
   ```

   An example command that will set the global policy for Federated user access to enabled, XMPP domain access to enabled, Remote user access to enabled, Public provider access to enabled, and grant the ability to use audio and video for public providers that support it:

```
Set-CsExternalAccessPolicy -Identity global -EnableFederationAccess $t
```

Tip:

The parameter "EnablePublicCloudAudioVideoAccess" does not have a corresponding selection in the Lync Server Control Panel

To create a new policy using Windows PowerShell to support access by users of federated domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Type the following in the Lync Server Management Shell:

```
New-CsExtenalAccessPolicy -Identity <name of site or user policy - you
```

An example of creating a new site policy:

```
New-CsExternalAccessPolicy -Identity site:Redmond -EnableFederationAcc
```

To delete or reset a policy using Windows PowerShell to support access by users of federated domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Type the following in the Lync Server Management Shell

```
Remove-CsExternalAccessPolicy -Identity <name of global, site or user
```

An example of resetting the global policy (The global policy can only have its setting removed. The policy cannot be deleted):

```
Remove-CsExternalAccessPolicy -Identity global
```

To remove a site policy, type:

```
Remove-CsExternalAccessPolicy -Identity site:Redmond
```

Deletes the site policy Redmond. To delete a user policy named UserEAPPolicy, type:

```
Remove-CsExternalAccessPolicy -Identity UserEAPPolicy
```

1.7.2.1.5.2 Configure Policies to Control XMPP Federated User Access

Configure Policies to Control XMPP Federated User Access

See Also

Deploying External User Access > Configuring SIP Federation, XMPP Federation and Public Instant Messaging > Setting Up XMPP Federation >

Topic Last Modified: *2012-11-01*

This is preliminary documentation and is subject to change. Blank topics are included as placeholders.

When you configure policies for support of extensible messaging and presence protocol (XMPP) federated partners, the policies apply to users of XMPP federated domains, but not to users of session initiation protocol (SIP) instant messaging (IM) service providers (for example, Windows Live), or SIP federated domains. You configure an **XMPP Federated Partner** for each XMPP federated domain that you want to allow your users to add contacts and communicate with. XMPP federated partners policies are only available in a single scope, though it is not defined as a global policy, acts as a global policy. To define a global, site or user policy for XMPP Federation Partners, you configure the policy scope by first creating and configuring the External Access Policy for the scope you require. For details about the types of policies that you can configure for external access and federation, see Managing Federation and External Access to Lync Server 2013 in the Operations documentation.

Note:

All **Federation and External Access** policies are applied through in-band provisioning. The policies that apply to the user, belong to a site, or are global in scope are communicated to the client during login. You can configure policies to control XMPP federated partner access, even if you have not enabled XMPP federation for your organization. However, the policies that you configure take effect only when you have XMPP partner federation deployed, enabled and configured for your organization. For details about deploying and configuring XMPP partner federation, see Configuring SIP Federation, XMPP Federation and Public Instant Messaging in the Deployment documentation. Additionally, if you specify a user policy in External Access Policy to control XMPP federated partners, the policy applies only to users that are enabled for Lync Server 2013 and configured to use the policy.

⊟To edit a global policy for XMPP federated partners

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **External Access Policy**.
4. On the **External Access Policy** page, do the following for the global policy:
5. Click the global policy, click **Edit**, and then click Show details.
6. Provide a description for the Global policy (optional).
7. Select **Enable communications with federated users**.
8. Select **Enable communications with XMPP federated users**.
9. Click **Commit** to save your changes to the Global policy.

⊟To create a site or user policy for XMPP federated partners

1. Click **New**, and then click **Site policy** or **User policy**. In **Select a Site**, click the appropriate site from the list and then click **OK**.
2. Provide a description for the Site policy (optional).
3. In the site or user policy, select **Enable communications with federated users**.
4. Select **Enable communications with XMPP federated users**.
5. Click **Commit** to save your changes to the site or user policy.

To edit an existing policy for XMPP federated partners

1. To change an existing policy, select the appropriate policy in the list, click **Edit**, and then click **Show details**.
2. Change or update the description for the policy (optional).
3. Select or unselect **Enable communications with federated users**.
4. Select or unselect **Enable communications with XMPP federated users**.
5. Click **Commit** to save your changes to the policy.

To edit an existing policy for XMPP federated partners by using Windows PowerShell

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Type the following in the Lync Server Management Shell:

   ```
   Set-CsExternalAccessPolicy -Identity <name of global, site or user pol
   ```

   An example command that will set the global policy for Federated user access to True (enabled) and XMPP domain access to True (enabled):

   ```
   Set-CsExternalAccessPolicy -Identity global -EnableFederationAccess $t
   ```

To create a site or user policy for XMPP federated partners using Windows PowerShell

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Type the following in the Lync Server Management Shell:

   ```
   New-CsExternalAccessPolicy -Identity <name of global, site or user pol
   ```

   An example command that will set a site policy for the Redmond site for Federated user access to enabled and XMPP domain access to enabled:

   ```
   New-CsExternalAccessPolicy -Identity site:Redmond -EnableFederationAcc
   ```

To delete an existing policy for XMPP federated partners by using Windows PowerShell

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Type the following in the Lync Server Management Shell:

   ```
   Remove-CsExternalAccessPolicy -Identity <name of global, site or user
   ```

   An example command that will delete a user policy:

   ```
   Remove-CsExternalAccessPolicy -Identity EAPUserPolicySetXMPP
   ```

4. An example command that will reset the global policy to defaults:

   ```
   Remove-CsExternalAccessPolicy -Identity global
   ```

1.7.2.1.5.3 Configure Policies to Control Remote User Access

Configure Policies to Control Remote User Access

Deployment > Deploying External User Access > Configuring Support for External User Access >

Topic Last Modified: *2012-10-18*

You configure one or more external user access policies to control whether remote users can collaborate with internal Lync Server users. To control remote user access, you can configure policies at the global, site, and user level. Site policies override the global policy, and user policies override site and global policies. For details about the types of policies that you can configure, see Managing Federation and External Access to Lync Server 2013. Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object.

Note:

You can configure policies to control remote user access, even if you have not enabled remote user access for your organization. However, the policies that you configure are in effect only when you have remote user access enabled for your organization. For details about enabling remote user access, see Enable or Disable Federation and Public IM Connectivity. Additionally, if you specify a user policy to control remote user access, the policy applies only to users that are enabled for Lync Server and configured to use the policy. For details about specifying users that can sign in to Lync Server from remote locations, see Assign an External User Access Policy to a Lync Enabled User.

Use the following procedure to configure each external access policy that you want to use to control remote user access.

Note:

This procedure describes how to configure a policy only to enable communications with remote users, but each policy that you configure to support remote user access can also configure federated user access and public user access. For details about configuring policies to support federated users, see Configure Policies to Control Federated User Access. For details about configuring policies to support public users, see Create or Edit Public SIP Federated Providers.

⊟To configure an external access policy to support remote user access

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **External**

Access Policy.

4. On the **External Access Policy** page, do one of the following:
   - To configure the global policy to support remote user access, click the global policy, click **Edit**, and then click **Show details**.
   - To create a new site policy, click **New**, and then click **Site policy**. In **Select a Site**, click the appropriate site from the list and then click **OK**.
   - To create a new user policy, click **New**, and then click **User policy**. In **New External Access Policy**, create a unique name in the **Name** field that indicates what the user policy covers (for example, **EnableRemoteUsers** for a user policy that enables communications for remote users).
   - To change an existing policy, click the appropriate policy listed in the table, click **Edit**, and then click **Show details**.
5. (Optional) If you want to add or edit a description, specify the information for the policy in **Description**.
6. Do one of the following:
   - To enable remote user access for the policy, select the **Enable communications with remote users** check box.
   - To disable remote user access for the policy, clear the **Enable communications with remote users** check box.
7. Click **Commit**.

To enable remote user access, you must also enable support for remote user access in your organization. For details, see Enable or Disable Federation and Public IM Connectivity in the Deployment documentation or the Operations documentation.

If this is a user policy, you must also apply the policy to users that you want to be able to connect remotely. For details, see Assign an External User Access Policy to a Lync Enabled User in the Deployment documentation or the Operations documentation.

1.7.2.1.5.4 Configure Policies to Control Public User Access

Configure Policies to Control Public User Access

See Also

Deploying External User Access > Configuring SIP Federation, XMPP Federation and Public Instant Messaging > Setting Up Public Instant Messaging Connectivity >

Topic Last Modified: *2013-01-11*

Public instant messaging (IM) connectivity enables users in your organization to use IM to communicate with users of IM services provided by public IM service providers, including the Windows Live network of Internet services, Yahoo!, and AOL. You configure one or more external user access policies to control whether public users can collaborate with internal Lync Server users. Public instant messaging connectivity is an added feature that relies on configuration of your deployment and users. It also depends on the provisioning of the service at the public IM provider. For information on how to provision your deployment to use the public providers, see the “Public IM Connectivity Provisioning Guide for Microsoft Lync Server, Office Communications Server, and Live Communications Server” guide: http://go.microsoft.com/fwlink/?LinkId=269821

Important:

- As of September 1st, 2012, the Microsoft Lync Public IM Connectivity User Subscription License (“PIC USL”) is no longer available for purchase for new or renewing agreements. Customers with active licenses will be able to continue to federate with Yahoo! Messenger until the service shut down date (exact date TBD, but no sooner than June 2013).
- The PIC USL is a per-user per-month subscription license that is required for Lync Server or Office Communications Server to federate with Yahoo!

Messenger. Microsoft's ability to provide this service has been contingent upon support from Yahoo!, the underlying agreement for which is winding down.

- More than ever, Lync is a powerful tool for connecting across organizations and with individuals around the world. Federation with Windows Live Messenger requires no additional user/device licenses beyond the Lync Standard CAL. Skype federation will be added to this list, enabling Lync users to reach hundreds of millions of people with IM and voice.

To access the Microsoft Lync Server Public IM Connectivity Provisioning site, use the following link: http://go.microsoft.com/fwlink/p/?linkId=212638

To control public user access, you can configure policies at the global, site, and user level. For details about the types of policies that you can configure, see Configuring Support for External User Access in the Deployment documentation or the Planning documentation. Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object.

In the case of IM invitations, the response depends on the client software. The request is accepted unless external senders are explicitly blocked by a user-configured rule (that is, the settings in the user's client **Allow** and **Block** lists). Additionally, IM invitations can be blocked if a user elects to block all IM from users who are not on his or her **Allow** list.

Note:

You can configure policies to control public user access, even if you have not enabled federation for your organization. However, the policies that you configure are in effect only when you have federation enabled for your organization. For details about enabling federation, see Enable or Disable Remote User Access in the Deployment documentation or the Operations documentation. Additionally, if you specify a user policy to control public user access, the policy applies only to users that are enabled for Lync Server and configured to use the policy. For details about specifying public users that can sign in to Lync Server, see Assign an External User Access Policy to a Lync Enabled User in the Deployment documentation or the Operations documentation.

Use the following procedure to configure a policy to support access by users of one or more public IM providers.

To configure an external access policy to support public user access

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **External Access Policy**.
4. On the **External Access Policy** page, do one of the following:
   - To configure the global policy to support public user access, click the global policy, click **Edit**, and then click **Show details**.
   - To create a new site policy, click **New**, and then click **Site policy**. In **Select a Site**, click the appropriate site from the list and then click **OK**.
   - To create a new user policy, click **New**, and then click **User policy**. In **New External Access Policy**, create a unique name in the **Name** field that indicates what the user policy covers (for example, **EnablePublicUsers** for a user policy that enables communications for public users).
   - To change an existing policy, click the appropriate policy listed in the table,

click **Edit**, and then click **Show details**.

5. (Optional) If you want to add or edit a description, specify the information for the policy in **Description**.
6. Do one of the following:
   - To enable public user access for the policy, select the **Enable communications with public users** check box.
   - To disable public user access for the policy, clear the **Enable communications with public users** check box.
7. Click **Commit**.

To enable public user access, you must also enable support for federation in your organization. For details, see Configure Policies to Control Federated User Access.

If this is a user policy, you must also apply the policy to public users that you want to be able to collaborate with public users. For details, see Assigning Per-User Policies.

Tasks

Create or Edit Public SIP Federated Providers

Other Resources

Manage SIP Federated Providers for Your Organization

1.7.2.1.5.5 Assign an External User Access Policy to a Lync Enabled User

Assign an External User Access Policy to a Lync Enabled User

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Manage External Access Policy for Your Organization >

Topic Last Modified: *2013-02-22*

If a user has been enabled for Lync Server, you can configure SIP federation, XMPP federation, remote user access, and public instant messaging (IM) connectivity in the Lync Server Control Panel by applying the appropriate policies to specific users. For example, if you created a policy to support remote user access, you must apply it to the user before the user can connect to Lync Server from a remote location and collaborate with internal users from the remote location.

Note:

To support external user access, you must enable support for each type of external user access you want to support, and configure the appropriate policies and other options to control its use. For details, see Configuring Support for External User Access in the Deployment documentation or Managing Federation and External Access to Lync Server 2013 in the Operations documentation.

Use the procedure in this topic to apply a previously created external user access policy to one or more user accounts.

⊟To apply an external user policy to a user account

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**, and then search on the user account that you want to configure.
4. In the table that lists the search results, click the user account, click **Edit**, and then click **Show details**.
5. In **Edit Lync Server User** under **External access policy**, select the user

policy that you want to apply.

Note:
The **<Automatic>** settings apply the default server or global policy settings.

Assigning Per-User External Access Policies by Using Windows PowerShell Cmdlets

Per-user external access policies can be assigned by using Windows PowerShell and the Grant-CsExternalAccessPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user external access policy to a single user

- This command assigns the per-user external access policy RedmondExternalAccessPolicy to the user Ken Myer.

```
Grant-CsExternalAccessPolicy -Identity "Ken Myer" -PolicyName "RedmondE
```

To assign a per-user external access policy to multiple users

- This command assigns the per-user external access policy USAExternalAccessPolicy to all the users who have accounts in the UnitedStates OU in Active Directory. For more information on the OU parameter used in this command, see the documentation for the Get-CsUser cmdlet.

```
Get-CsUser -OU "ou=UnitedStates,dc=litwareinc,dc=com" | Grant-CsExterna
```

To unassign a per-user external access policy

- This command unassigns any per-user external access policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsExternalAccessPolicy -Identity "Ken Myer" -PolicyName $Null
```

For more information, see the help topic for the Grant-CsExternalAccessPolicy cmdlet.

1.7.2.1.5.6 Resetting or Deleting External User Access Policies

Resetting or Deleting External User Access Policies

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Manage External Access Policy for Your Organization >

Topic Last Modified: *2012-09-08*

If you have created or configured external user access policies that you no longer want to use, you can do the following:

- Delete any site or user policy that you created.
- Reset the global policy to the default settings. The default global policy settings deny any external user access. The global policy cannot be deleted.
- Delete a Site or User Policy for External User Access

- Reset the Global Policy for External User Access

Delete a Site or User Policy for External User Access

User Accounts Enabled for Lync Server 2013 > Manage External Access Policy for Your Organization > Resetting or Deleting External User Access Policies >

Topic Last Modified: *2013-02-22*

You can delete any site or user policy that is listed in Lync Server Control Panel on the **External Access Policy** page. Deleting the global policy does not actually delete it, but only resets it to the default settings, which do not include support for any external user access options. For details about resetting the global policy, see Reset the Global Policy for External User Access.

To delete a site or user policy for external user access

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. Click **External User Access**, click **External Access Policy**.
4. On the **External Access Policy** tab, click the site or user policy you want to delete, click **Edit**, and then click **Delete**.
5. When prompted to confirm the deletion, click **OK**.

Removing PIN Policies by Using Windows PowerShell Cmdlets

External access policies can be deleted by using Windows PowerShell and the Remove-CsExternalAccessPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specific external access policy

- This command removes the external access policy applied to the Redmond site:

```
Remove-CsExternalAccessPolicy -Identity "site:Redmond"
```

To remove all the external access policies applied to the per-user scope

- This command removes all the external access policies configured at the per-user scope:

```
Get-CsExternalAccessPolicy -Filter "tag:*" | Remove-CsExternalAccessPol
```

To remove all the external access policies where outside user access is disabled

- This command deletes all the external access policies where outside user access has been disabled:

```
Get-CsExternalAccessPolicy | Where-Object {$_.EnableOutsideAccess -eq $
```

For more information, see the help topic for the Remove-CsExternalAccessPolicy cmdlet.

Reset the Global Policy for External User Access

User Accounts Enabled for Lync Server 2013 > Manage External Access Policy for Your Organization > Resetting or Deleting External User Access Policies >

Topic Last Modified: *2013-02-22*

You cannot completely delete a global policy. Using the **Delete** option on the global policy only resets the global policy to the default settings, which do not include support for any external user access options.

To reset the global policy to the default settings

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, click **External Access Policy**.
4. On the **External Access Policy** tab, click the global policy, click **Edit**, and then click **Delete**.
5. When prompted to confirm the deletion, click **OK**. A message appears at the top of the page informing you that the global policy has been reset.

Resetting the Global External Access Policy by Using Windows PowerShell Cmdlets

The global external access policy can be reset by using Windows PowerShell and the Remove-CsExternalAccessPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To reset the global external access policy

- This command resets the global external access policy:

```
Remove-CsExternalAccessPolicy -Identity "global"
```

For more information, see the help topic for the Remove-CsExternalAccessPolicy cmdlet.

1.7.2.1.6 Assigning Per-User Policies

Assigning Per-User Policies

See Also

Operations > Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 >

Topic Last Modified: *2012-10-14*

You can assign certain policies to a user or a group of users in order to specify particular settings that deviate from the settings defined in policies assigned to other users, such as global policies. These policies are called per-user policies.

- Assign a Per-User Conferencing Policy
- Assign a Per-User Client Version Policy
- Assign a Per-User PIN Policy
- Assign an External User Access Policy to a Lync Enabled User
- Assign a Per-User Archiving Policy
- Assign a Per-User Location Policy
- Assign a Per-User Mobility Policy
- Assign a Per-User Persistent Chat Policy
- Assign a Per-User Dial Plan Policy
- Assign a Per-User Voice Policy

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Assigning Per-User Policies >

Topic Last Modified: *2013-02-22*

The conferencing policy is one of the individual settings of a user account that you can configure in Lync Server Control Panel.

Deploying one or more per-user conferencing policies is optional. You can also deploy only a global-level conferencing policy or site-level conferencing policy. If you do deploy per-user policies, you must explicitly assign them to users, groups, or contact objects. Conferencing user rights and permissions automatically default to those defined in the global-level conferencing policy when no specific site-level or per-user policy is assigned.

After creating at least one per-user conferencing policy, use the procedures in this topic to assign the policy that specifies the user rights and permissions that you want the server to grant to the meetings organized by a particular user.

For a list of all available conferencing policy settings, see Conferencing Policy Settings Reference.

For details about creating conferencing policies, see Create or Modify a Conferencing Policy.

⊟To assign a per-user conferencing policy

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.

4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

     Tip:
     To add additional search clauses to your query, click **Add Filter**.

   - Click **Find**.
6. Click a user in the search results, click **Action**, and then click **Assign policies**.

   Tip:
   If you want the same per-user conferencing policy to apply to multiple users, select multiple users in the search results, then click **Actions**, and then click **Assign policies**.

7. In **Assign Policies**, under **Conferencing policy**, do one of the following:

   Note:
   Because there are multiple policies that you can configure in **Assign Policies**, **<Keep as is>** is selected by default for every policy in the dialog box. Continue using the policy previously assigned to the user by making no changes to this setting.

   - Select **<Automatic>** to allow Lync Server 2013 to automatically choose either the global-level policy or, if defined, the site-level policy.
   - Click the name of a per-user conferencing policy you previously defined on the **Conferencing Policy** page.

     Tip:
     To help you decide the policy you want to assign, after you click a policy name, click **View** to view the user rights and permissions defined in the policy.

8. When you are finished, click **OK**.

Assigning a Per-User Conferencing Policy by Using Windows PowerShell Cmdlets

Per-user conferencing policies can be assigned by using Windows PowerShell and the Grant-CsConferencingPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To assign a per-user conferencing policy to a single user

- The following command assigns the per-user conferencing policy RedmondConferencingPolicy to the user Ken Myer.

```
Grant-CsConferencingPolicy -Identity "Ken Myer" -PolicyName "RedmondCon
```

To assign a per-user conferencing policy to multiple users

- This command assigns the per-user conferencing policy HRConferencingPolicy to all the users who work for the Human Resources department. For more information on the LdapFilter parameter used in this command, see the documentation for the Get-CsUser cmdlet.

  ```
  Get-CsUser -LdapFilter "Department=Human Resources" | Grant-CsConferenc
  ```

To unassign a per-user conferencing policy

- The following command unassigns any per-user conferencing policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

  ```
  Grant-CsConferencingPolicy -Identity "Ken Myer" -PolicyName $Null
  ```

For more information, see the help topic for the Grant-CsConferencingPolicy cmdlet.

Assigning Per-User Policies

1.7.2.1.6.2 Assign a Per-User Client Version Policy

Assign a Per-User Client Version Policy

See Also

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Assigning Per-User Policies >

Topic Last Modified: *2013-02-22*

The client version policy is one of the individual settings of a user account that you can configure in the Lync Server Control Panel.

Deploying one or more per-user client version policies is optional. You can also deploy only a global-level client version policy, or site-level or pool-level client version policies. If you do deploy per-user policies, you must explicitly assign them to users, groups, or contact object. When no specific site-level, pool-level, or per-user policy is assigned, the default clients that are allowed to register with Lync Server 2013 are those defined in the global-level client version policy.

After creating at least one per-user client version policy, use the procedures in this topic to assign the policy that specifies the client versions that you want to allow to register with Lync Server.

For details about creating per-user client version policies, see Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013.

To assign a per-user client version policy

1. From a user account that is assigned to the CsUserAdministrator role or the

CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

     Tip:
     To add additional search clauses to your query, click **Add Filter**.

   - Click **Find**.
6. Click a user in the search results, click **Action**, and then click **Assign policies**.

   Tip:
   If you want the same per-user client version policy to apply to multiple users, select multiple users in the search results, then click **Actions**, and then click **Assign policies**.

7. In **Assign Policies**, under **Client version policy**, do one of the following:

   Note:
   Because there are multiple policies that you can configure by using the **Assign Policies** dialog box, **<Keep as is>** is selected by default for every policy in the dialog box. Continue using the policy previously assigned to the user by making no changes to this setting.

   - Allow Lync Server to automatically choose either the global-level policy or, if defined, the site-level policy or pool-level policy.
   - Click the name of a per-user client version policy you previously defined on the **Client Version Policy** page.

     Tip:
     To help you decide the policy you want to assign, after you click a policy name, click **View** to view the user rights and permissions defined in the policy.

8. When you are finished, click **OK**.

Assigning a Per-User Client Version Policy by Using Windows PowerShell Cmdlets

You can assign per-user client version policies by using the Grant-CsClientVersionPolicy cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user client version policy to a single user

- The following command assigns the per-user client version policy RedmondClientVersionPolicy to the user Ken Myer.

```
Grant-CsClientVersionPolicy -Identity "Ken Myer" -PolicyName "RedmondCl
```

To assign a per-user client version policy to multiple users

- This command assigns the per-user client version policy RedmondClientVersionPolicy to all the users who are currently assigned the voice policy RedmondVoicePolicy. For more information on the Filter parameter used in this command, see the documentation for the Get-CsUser cmdlet.

```
Get-CsUser -Filter {VoicePolicy -eq "RedmondVoicePolicy"} | Grant-CsCli
```

To unassign a per-user client version policy

- The following command unassigns any per-user client version policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy, his local site policy (if one exists), or the service-scope policy assigned to his Registrar. A service scope policy takes precedence over any site policy, and a site policy takes precedence over the global policy.

```
Grant-CsClientVersionPolicy -Identity "Ken Myer" -PolicyName $Null
```

For more information, see the help topic for the Grant-CsClientVersionPolicy cmdlet.

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Assigning Per-User Policies >

Topic Last Modified: *2013-02-22*

The dial-in conferencing personal identification number (PIN) policy is one of the individual settings of a user account that can be configured in the Lync Server 2013 Control Panel.

Deploying one or more per-user PIN policies is optional. You can also deploy only a global-level PIN policy or site-level PIN policy. If you do deploy per-user policies, you must explicitly assign them to users, groups, or contact object. User rights and permissions regarding the use of PINs for dial-in conferencing automatically default to those defined in the global-level PIN policy when no specific site-level or per-user policy is assigned.

After creating at least one per-user PIN policy, use the procedures in this topic to assign the policy that specifies the constraints you want the server to impose on the PINs created by and used by a particular user.

For details about creating per-user dial-in conferencing PIN policies, see Create or Modify Dial-in Conferencing PIN Settings for a Site or Group of Users.

To assign a per-user PIN policy

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

     Tip:
     To add additional search clauses to your query, click **Add Filter**.

   - Click **Find**.
6. Click a user in the search results, click **Action**, and then click **Assign policies**.

   Tip:
   If you want the same per-user PIN policy to apply to multiple users, select multiple users in the search results, then click **Actions**, and then click **Assign policies**.

7. In **Assign Policies**, under **PIN policy**, do one of the following:

   Note:
   Because there are multiple policies that you can configure by using the **Assign Policies** dialog box, **<Keep as is>** is selected by default for every policy in the dialog box. Continue using the policy previously assigned to the user by making no changes to this setting.

   - Allow Lync Server 2013 to automatically choose either the global-level policy or, if defined, the site-level policy.
   - Click the name of a per-user PIN policy you previously defined on the **PIN Policy** page.

     Tip:
     To help you decide the policy you want to assign, after you click a policy name, click **View** to view the user rights and permissions defined in the policy.

8. When you are finished, click **OK**.

Assigning a Per-User PIN Policy by Using Windows PowerShell Cmdlets

You can assign per-user PIN policies by using Windows PowerShell and the **Grant-CsPinPolicy** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote

Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To assign a per-user PIN policy to a single user

- The following command assigns the per-user PIN policy RedmondPinPolicy to the user Ken Myer.

```
Grant-CsPinPolicy -Identity "Ken Myer" -PolicyName "RedmondPinPolicy"
```

⊟To assign a per-user PIN policy to multiple users

- The following command assigns the per-user PIN policy RedmondUsersPinPolicy to all the users who work in the city of Redmond. For details about the LdapFilter parameter used in this command, see Get-CsUser.

```
Get-CsUser -LdapFilter "l=Redmond" | Grant-CsPinPolicy -PolicyName "Red
```

⊟To unassign a per-user PIN policy

- The following command unassigns any per-user PIN policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsPinPolicy -Identity "Ken Myer" -PolicyName $Null
```

For details, see Grant-CsPinPolicy.

Assigning Per-User Policies

1.7.2.1.6.4 Assign an External User Access Policy to a Lync Enabled User

Assign an External User Access Policy to a Lync Enabled User

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Manage External Access Policy for Your Organization >

Topic Last Modified: *2013-02-22*

If a user has been enabled for Lync Server, you can configure SIP federation, XMPP federation, remote user access, and public instant messaging (IM) connectivity in the Lync Server Control Panel by applying the appropriate policies to specific users. For example, if you created a policy to support remote user access, you must apply it to the user before the user can connect to Lync Server from a remote location and collaborate with internal users from the remote location.

Note:

To support external user access, you must enable support for each type of external user access you want to support, and configure the appropriate policies and other options to control its use. For details, see Configuring Support for External User Access in the Deployment documentation or Managing Federation and External Access to Lync Server 2013 in the Operations documentation.

Use the procedure in this topic to apply a previously created external user access policy to one or more user accounts.

To apply an external user policy to a user account

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**, and then search on the user account that you want to configure.
4. In the table that lists the search results, click the user account, click **Edit**, and then click **Show details**.
5. In **Edit Lync Server User** under **External access policy**, select the user policy that you want to apply.

   Note:
   The **<Automatic>** settings apply the default server or global policy settings.

Assigning Per-User External Access Policies by Using Windows PowerShell Cmdlets

Per-user external access policies can be assigned by using Windows PowerShell and the Grant-CsExternalAccessPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user external access policy to a single user

- This command assigns the per-user external access policy RedmondExternalAccessPolicy to the user Ken Myer.

```
Grant-CsExternalAccessPolicy -Identity "Ken Myer" -PolicyName "RedmondE
```

To assign a per-user external access policy to multiple users

- This command assigns the per-user external access policy USAExternalAccessPolicy to all the users who have accounts in the UnitedStates OU in Active Directory. For more information on the OU parameter used in this command, see the documentation for the Get-CsUser cmdlet.

```
Get-CsUser -OU "ou=UnitedStates,dc=litwareinc,dc=com" | Grant-CsExterna
```

To unassign a per-user external access policy

- This command unassigns any per-user external access policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsExternalAccessPolicy -Identity "Ken Myer" -PolicyName $Null
```

For more information, see the help topic for the Grant-CsExternalAccessPolicy cmdlet.

Assign a Per-User Archiving Policy

See Also

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Assigning Per-User Policies >

Topic Last Modified: *2013-02-22*

The archiving policy is one of the individual settings of a user account that you can configure in the Lync Server 2013 Control Panel.

Deploying one or more per-user archiving policies is optional. You can also deploy only a global-level archiving policy or site-level archiving policy. If you do deploy per-user policies, you must explicitly assign them to users, groups, or contact object. Archiving requirements automatically default to those defined in the global-level conferencing policy when no specific site-level or per-user policy is assigned.

After creating at least one per-user archiving policy, use the procedures in this topic to assign the policy that appropriately specifies whether a particular user’s internal communications, external communications, or both, will be archived by the server.

For details about creating per-user archiving policies, see Creating an Archiving Policy to Enable or Disable Archiving of Internal or External Communications for Specific Sites or Users.

⊟To assign a per-user archiving policy

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

Tip:
To add additional search clauses to your query, click **Add Filter**.

   - Click **Find**.
6. Click a user in the search results, click **Action**, and then click **Assign policies**.

Tip:
If you want the same per-user archiving policy to apply to multiple users,

> select multiple users in the search results, then click **Actions**, and then click **Assign policies**.

7. In **Assign Policies**, under **Archiving policy**, do one of the following:

> **Note:**
>
> Because there are multiple policies that you can configure by using the **Assign Policies** dialog box, **<Keep as is>** is selected by default for every policy in the dialog box. Continue using the policy previously assigned to the user by making no changes to this setting.

- Allow Lync Server 2013 to automatically choose either the global-level policy or, if defined, the site-level policy.
- Click the name of a per-user archiving policy you previously defined on the **Archiving Policy** page.

> **Tip:**
>
> To help you decide the policy that you want to assign, after you click a policy name, click **View** to view the user rights and permissions defined in the policy.

8. When you are finished, click **OK**.

Assigning a Per-User Archiving Policy by Using Windows PowerShell Cmdlets

You can assign per-user archiving policies by using Windows PowerShell and the **Grant-CsArchivingPolicy** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user archiving policy to a single user

- The following command assigns the per-user archiving policy RedmondArchivingPolicy to the user Ken Myer.

```
Grant-CsArchivingPolicy -Identity "Ken Myer" -PolicyName "RedmondArchiv
```

To assign a per-user archiving policy to multiple users

- This command assigns the per-user archiving policy RedmondArchivingPolicy to all the users who have accounts homed on the Registrar pool atl-cs-001.litwareinc.com. For more information on the Filter parameter used in this command, see the documentation for the Get-CsUser cmdlet.

```
Get-CsUser -Filter {RegistrarPool -eq "atl-cs-001.litwareinc.com"} | Gr
```

To unassign a per-user archiving policy

- The following command unassigns any per-user archiving policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsArchivingPolicy -Identity "Ken Myer" -PolicyName $Null
```

For more information, see the help topic for the Grant-CsArchivingPolicy cmdlet.

Assigning Per-User Policies

1.7.2.1.6.6 Assign a Per-User Location Policy

Assign a Per-User Location Policy

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Assigning Per-User Policies >

Topic Last Modified: *2013-02-22*

The location policy is one of the individual settings of a user account that you can configure in the Lync Server Control Panel.

Deploying one or more per-user location policies is optional. You can also deploy only a global-level location policy or subnet-level location policy. If you do deploy per-user policies, you must explicitly assign them to users, groups, or contact object. Enhanced 9-1-1 (E9-1-1) settings automatically default to those defined in the global-level location policy when no specific subnet-level or per-user policy is assigned.

After creating at least one per-user location policy, use the procedures in this topic to assign to the policy that specifies the settings that you want the server to apply for emergency calls placed by a particular user.

For a list of all available location policy settings, see Defining the Location Policy.

For details about creating location policies, see Create Location Policies.

⊟To assign a per-user location policy with the Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

Tip:
To add additional search clauses to your query, click **Add Filter**.

- Click **Find**.

6. Click a user in the search results, click **Action**, and then click **Assign policies**.

   > **Tip:**
   > If you want the same per-user location policy to apply to multiple users, select multiple users in the search results, then click **Actions**, and then click **Assign policies**.

7. In **Assign Policies**, under **Location policy**, do one of the following:

   > **Note:**
   > Because there are multiple policies that you can configure by using the **Assign Policies** dialog box, **<Keep as is>** is selected by default for every policy in the dialog box. Continue using the policy previously assigned to the user by making no changes to this setting.

   - Allow Lync Server 2013 to automatically choose either the global-level policy or, if defined, the subnet-level policy.
   - Click the name of a per-user location policy you previously defined by running the **New-CsLocationPolicy** cmdlet.

     > **Tip:**
     > To help you decide the policy that you want to assign, after you click a policy name, click **View** to view the user rights and permissions defined in the policy.

8. When you are finished, click **OK**.

Assigning a Per-User Location Policy by Using Lync Server Management Shell Cmdlets

You can assign per-user location policies by using the Grant-CsLocationPolicy cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user location policy to a single user

- The following command assigns the per-user location policy RedmondLocationPolicy to the user Ken Myer.

```
Grant-CsLocationPolicy -Identity "Ken Myer" -PolicyName "RedmondLocatio
```

To assign a per-user location policy to multiple users

- This command assigns the per-user location policy AccountingDepartmentLocationPolicy to all the users who work for the Accounting department. For more information on the LdapFilter parameter used in this command, see the documentation for the Get-CsUser cmdlet.

```
Get-CsUser -LdapFilter "Department=Accounting" | Grant-CsLocationPolicy
```

To unassign a per-user location policy

- The following command unassigns any per-user location policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsLocationPolicy -Identity "Ken Myer" -PolicyName $Null
```

For more information, see the help topic for the Grant-CsLocationPolicy cmdlet.

1.7.2.1.6.7 Assign a Per-User Mobility Policy

Assign a Per-User Mobility Policy

Topic Last Modified: *2013-02-22*

The mobility policy is one of the individual settings of a user account that you can configure in Lync Server Control Panel or Lync Server Management Shell.

⊟To assign a per-user mobility policy with Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

     > **Tip:**
     > To add additional search clauses to your query, click **Add Filter**.

   - Click **Find**.
6. Click a user in the search results, click **Action**, and then click **Assign policies**.

   > **Tip:**
   > If you want the same per-user mobility policy to apply to multiple users, select multiple users in the search results, then click **Actions**, and then click **Assign policies**.

7. In **Assign Policies**, under **Mobility policy**, do one of the following:

   > **Note:**
   > Because there are multiple policies that you can configure in **Assign Policies**, **<Keep as is>** is selected by default for every policy in the dialog box. Continue using the policy previously assigned to the user by making no changes to this setting.

   - Select **<Automatic>** to allow Lync Server 2013 to automatically choose either the global-level policy or, if defined, the site-level policy.

- Click the name of a per-user mobility policy you previously defined on the **Mobility Policy** page.

Tip:
To help you decide the policy you want to assign, after you click a policy name, click **View** to view the user rights and permissions defined in the policy.

8. When you are finished, click **OK**.

Assigning a Per-User Mobility Policy by Using Windows PowerShell Cmdlets

You can assign per-user mobility policies by using Windows PowerShell and the **Grant-CsMobilityPolicy** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To assign a per-user mobility policy to a single user

- The following command assigns the per-user mobility policy RedmondMobilityPolicy to the user Ken Myer.

```
Grant-CsMobilityPolicy -Identity "Ken Myer" -PolicyName "RedmondMobilit
```

⊟To assign a per-user mobility policy to multiple users

- The following command assigns the per-user mobility policy RedmondMobilityPolicy to all the users who are currently assigned the policy NorthAmericaMobilityPolicy. For details about the Filter parameter used in this command, see Get-CsUser.

```
Get-CsUser -Filter {MobilityPolicy -eq "NorthAmericaMobilityPolicy"} |
```

⊟To unassign a per-user mobility policy

- The following command unassigns any per-user mobility policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsMobilityPolicy -Identity "Ken Myer" -PolicyName $Null
```

For details, see Grant-CsMobilityPolicy.

You can assign a per-user persistent chat policy with either Lync Server 2013 Control Panel or Lync Server 2013 Management Shell. For details on creating user policies for Persistent Chat Server, see Create a User Policy for Persistent Chat.

To assign a per-user persistent chat policy with Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

     > **Tip:**
     > To add additional search clauses to your query, click **Add Filter**.

   - Click **Find**.
6. Click a user in the search results, click **Action**, and then click **Assign policies**.

   > **Tip:**
   > If you want the same per-user persistent Chat policy to apply to multiple users, select multiple users in the search results, then click **Actions**, and then click **Assign policies**.

7. In **Assign Policies**, under **Persistent Chat policy**, do one of the following:

   > **Note:**
   > Because there are multiple policies that you can configure by using the **Assign Policies** dialog box, **<Keep as is>** is selected by default for every policy in the dialog box. Continue using the policy previously assigned to the user by making no changes to this setting.

   - Select **<Automatic>** to allow Lync Server 2013 to automatically choose either the global-level policy or, if defined, the site-level policy.
   - Click the name of a per-user Persistent Chat policy you previously defined on the **Persistent Chat Policy** page.

     > **Tip:**
     > To help you decide the policy you want to assign, after you click a policy name, click **View** to view the user rights and permissions defined in the policy.

8. When you are finished, click **OK**.

Assigning a Per-User Persistent Chat Policy by Using Windows PowerShell Cmdlets

You can also assign per-user persistent chat policies by using the **Grant-CsPersistentChatPolicy** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To assign a per-user persistent chat policy to a single user

- The following command assigns the per-user Persistent Chat policy RedmondPersistentChatPolicy to the user Ken Myer.

```
Grant-CsPersistentChatPolicy -Identity "Ken Myer" -PolicyName "RedmondP
```

⊟To assign a per-user persistent chat policy to multiple users

- This command assigns the per-user Persistent Chat policy RedmondUsersPersistentChatPolicy to all the users who work for the IT department. For more information on the LdapFilter parameter used in this command, see the documentation for the Get-CsUser cmdlet.

```
Get-CsUser -LdapFilter "Department=IT" | Grant-CsPersistentChatPolicy -
```

⊟To unassign a per-user persistent chat policy

- The following command unassigns any per-user Persistent Chat policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsPersistentChatPolicy -Identity "Ken Myer" -PolicyName $Null
```

Assign a Per-User Dial Plan Policy

See Also

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Assigning Per-User Policies >

Topic Last Modified: *2013-02-22*

To complete user account configuration for either users of Enterprise Voice or users of dial-in conferencing, the user must be assigned a dial plan. User accounts will automatically use the global dial plan or, if one exists, the site-level dial plan when you do not explicitly assign an existing per-user dial plan. If you want to use the global or site dial plan for all users that are enabled for Enterprise Voice, you can skip this section.

To assign a dial plan by using the Lync Server 2013 Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account that you want to enable, and then click **Find**.
5. In the table, click the user account that you want to assign a dial plan.
6. On the **Edit** menu, click **Show details**.
7. On the **Edit Lync Server User** page, under **Telephony**, click **Enterprise Voice**.
8. Click **Dial plan policy**, and then choose the desired dial plan.
9. Click **Commit**.

For details about configuring dial plans, see the Configuring Dial Plans topic.

Assign a Per-User Dial Plan by Using Windows PowerShell Cmdlets

You can assign per-user dial plans with Windows PowerShell and the **Grant-CsdialPlan** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user dial plan to a single user

- The following command assigns the per-user dial plan RedmondDialPlan to the user Ken Myer.

```
Grant-CsDialPlan -Identity "Ken Myer" -PolicyName "RedmondDialPlan"
```

To assign a per-user dial plan to multiple users

- This command assigns the per-user dial plan RedmondDialPlan to all the users who work in the city of Redmond. For more information on the LdapFilter parameter used in this command, see the documentation for the Get-CsUser cmdlet.

```
Get-CsUser -LdapFilter "l=Redmond" | Grant-CsDialPlan -PolicyName "Redm
```

To unassign a per-user dial plan

- The following command unassigns any per-user dial plan previously assigned to Ken Myer. After the per-user dial plan is unassigned, Ken Myer will automatically be managed by using the global dial plan, his local site dial plan (if one exists), or the service-scope dial plan assigned to his Registrar or PSTN gateway. A service scope dial plan takes precedence over any site dial plan, and a site dial plan takes precedence over the global dial plan.

```
Grant-CsDialPlan -Identity "Ken Myer" -PolicyName $Null
```

For more information, see the help topic for the Grant-CsDialPlan cmdlet.

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Assigning Per-User Policies >

Topic Last Modified: *2013-02-22*

Global and site-level voice policies are automatically assigned to all Lync Server 2013 user accounts that are enabled for Enterprise Voice. You can also assign voice policies to specific users by using either the Lync Server 2013 Control Panel or the Lync Server 2013 Management Shell. Use the procedures in this topic to explicitly assign per-user policies to Lync Server users.

To assign a user-specific voice policy using the Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**, and then search on the user account that you want to configure.
4. In the table that lists the search results, click the user account, click **Edit**, and then click **Show details**.
5. In **Edit Lync Server User** under **Voice policy**, select the user policy that you want to apply.

Note:
The **<Automatic>** settings apply the default server or global policy settings.

Assigning a Per-User Voice Policy by using Windows PowerShell Cmdlets

You can assign per-user voice policies by using Windows PowerShell and the **Grant-CsVoicePolicy** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user voice policy to a single user

- The following command assigns the per-user voice policy RedmondVoicePolicy to the user Ken Myer.

```
Grant-CsVoicePolicy -Identity "Ken Myer" -PolicyName "RedmondVoicePolic
```

⊟To assign a per-user voice policy to multiple users

- This command assigns the per-user voice policy FinanceVoicePolicy to all the users who have accounts in the Finance OU in Active Directory. For more information on the OU parameter used in this command, see the documentation for the Get-CsUser cmdlet.

```
Get-CsUser -OU "ou=Finance,ou=North America,dc=litwareinc,dc=com" | Gra
```

⊟To unassign a per-user voice policy

- The following command unassigns any per-user voice policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsVoicePolicy -Identity "Ken Myer" -PolicyName $Null
```

For more information, see the help topic for the Grant-CsVoicePolicy cmdlet.

You can use Lync Server 2013 Control Panel to view a list of all the computers that are running Lync Server 2013 in your topology and see the service status of each. You can sort the list by computer, pool, or site.

⊟To view a list of computers running Lync Server

1. From a user account that is assigned to any of the predefined administrative roles for Lync Server 2013, log on to any computer in your internal deployment. For details about the predefined administrative roles available in Lync Server 2013, see Planning for Role-Based Access Control.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Topology** and then click **Status**.
4. On the **Status** page, do any of the following as needed:
   - Sort the list by clicking the **Computer**, **Pool**, or **Site** column heading, and then clicking the up arrow or the down arrow.
   - Click **Refresh** to view the most up-to-date list.
   - Search for a specific computer by typing the computer name in the search field.

Topic Last Modified: *2013-02-22*

You can use Lync Server 2013 Control Panel to view all the services that are running on a specific computer in your Lync Server topology and see the status of each service.

⊟To view the status of services running on a computer

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Topology**.
4. On the **Status** page, sort or search the list, as required, to find the computer you're interested in, and then click the computer name.
5. Do any of the following:
   - To see the latest status of services running on the computer, click **Get service status**.
   - To see a list of specific services running on the computer and the status of each service, click **Properties**, and then click **Close** to return to the list.

Viewing Service Status by Using Windows PowerShell Cmdlets

You can also view service status by using Windows PowerShell and the **Get-CsWindowsService** cmdlet. You can run this cmdlet from the Lync Server 2013

Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view service status

- To view service status on a computer, type a command similar to the following in the Lync Server Management Shell and then press Enter:

```
Get-CsWindowsService -ComputerName atl-cs-001.litwareinc.com | Select-O
```

This command returns information similar to the following:

```
RoleName                                    Status
--------                                    ------
{W3SVC}                                     Running
{CentralManagement}                         Running
{ClsAgent}                                  Running
{Registrar, UserServer, EdgeServer}         Running
{ApplicationServer}                         Running
{ConferencingServer}                        Running
{MediationServer}                           Running
```

For details, see Get-CsWindowsService.

You can use Lync Server Control Panel to prevent new sessions for all the Lync Server 2013 services running on a specific computer or to prevent new sessions for a specific Lync Server 2013 service.

⊟To prevent new sessions for all Lync Server services on a computer

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Topology** and then click **Status**.
4. On the **Status** page, sort or search through the list as needed to find the computer that is running the services for which you want to prevent new sessions, and then click it.
5. Click **Action**.
6. Click **Prevent new sessions for all services**.

⊟To prevent new sessions for a specific service

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Topology** and then click **Status**.
4. On the **Status** page, sort or search through the list as needed to find the computer that is running the service you want to start or stop, and then click it.
5. Click **Properties**.
6. Sort the list of services, if necessary, and click the service for which you want to prevent new sessions.
7. Click **Action**.
8. Click **Prevent new sessions for service**.
9. Click **Close**.

Managing the Lync Server 2013 Topology

1.7.3.6 Upgrade or Update Front End Servers

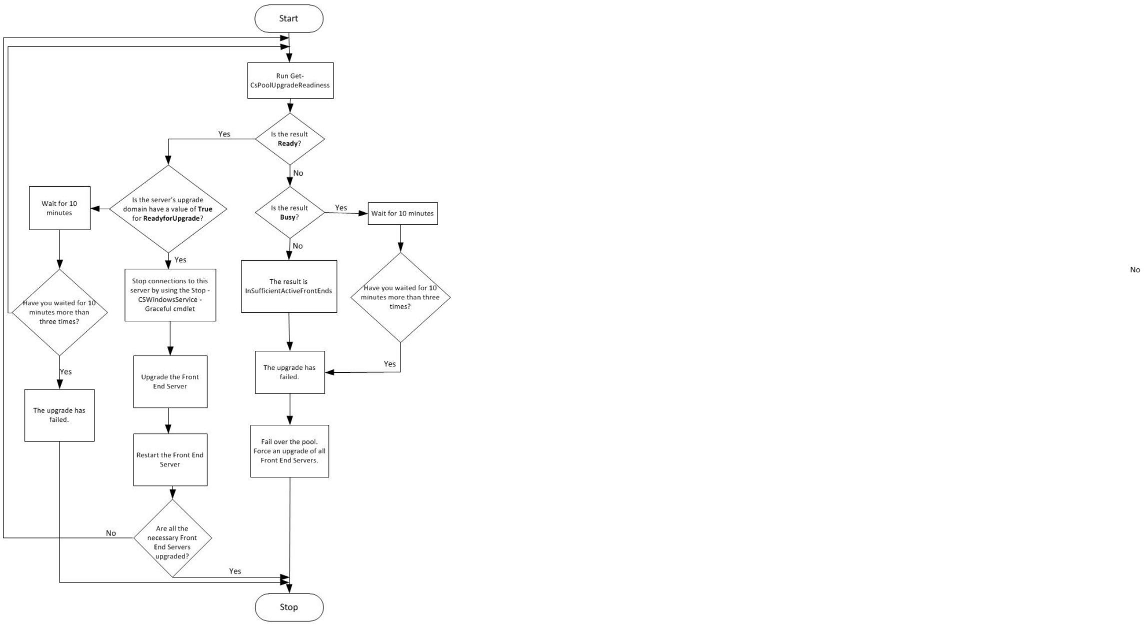
Upgrade or Update Front End Servers

Microsoft Lync Server 2013 > Operations > Managing the Lync Server 2013 Topology >

Topic Last Modified: *2013-02-22*

The Front End Servers in an Enterprise Edition pool are organized into *upgrade domains*. These are subsets of Front End Servers in the pool. Upgrade domains are created automatically by Topology Builder.

We recommend that when you upgrade Front End Servers, you perform the upgrades one server at a time. Bring one server down, upgrade it, and then restart it before you upgrade another server. Be sure to keep track of which servers you have upgraded so far.



Start
Run Get-CsPoolUpgradeReadiness
Is the result **Ready**?
Yes
No
Is the server's upgrade domain have a value of **True** for **ReadyforUpgrade**?
Wait for 10 minutes
Is the result **Busy**?
Yes
Wait for 10 minutes
No
Yes
Stop connections to this server by using the Stop -CSWindowsService -Graceful cmdlet
The result is InSufficientActiveFrontEnds
Have you waited for 10 minutes more than three times?
Have you waited for 10 minutes more than three times?
No
Yes
Yes
The upgrade has failed.
Upgrade the Front End Server
The upgrade has failed.
Restart the Front End Server
Fail over the pool. Force an upgrade of all Front End Servers.
No
Are all the necessary Front End Servers upgraded?
Yes
Stop

⊟To apply an upgrade to a Front End server in a pool

1. On a Front End Server in the pool, run the following cmdlet:

   Get-CsPoolUpgradeReadiness

   If the value of *PoolUpgradeState* is **Busy**, wait for 10 minutes, and then try **Get-CsPoolUpgradeReadiness** again. If you see **Busy** for at least three consecutive times, after waiting 10 minutes in between each attempt, or if you see any result of **InsufficientActiveFrontEnds** for **PoolUpgradeState,** then there is an issue with the pool. If this pool is paired with another Front End pool in a disaster recovery topology, you should fail the pool over to the backup pool, and then update the servers in this pool. For details, see Failing Over a Pool.

   If the value of *PoolUpgradeState* is **Ready**, go to step 2.
2. The **Get-CsPoolUpgradeReadiness** cmdlet also returns information about each upgrade domain in the pool, and about which Front End Servers are in each upgrade domain. If the **ReadyforUpgrade** value is **True** for the upgrade domain that contains the server you want to upgrade, you can safely upgrade that server now. To do so, do the following:

   2.a.Stop new connections to the Front End Server by using the `Stop -CsWindowsServices -Graceful` cmdlet.

   2.b.Restart the server, and make sure it is accepting new connections.

1.7.3.7 Add or Remove a Front End Server

Add or Remove a Front End Server

Microsoft Lync Server 2013 > Operations > Managing the Lync Server 2013 Topology >

Topic Last Modified: *2012-11-01*

When you add a Front End Server to a pool, or remove a Front End Server from a pool, you then need to restart the pool. To prevent any interruption of service to users, use the following procedure when adding or removing a Front End Server.

To add or remove Front End servers

1. If you are removing any Front End Servers, first stop new connections to those servers. To do so, you can use the following cmdlet:

   ```
   Stop -CsWindowsServices -Graceful
   ```

2. When the servers being removed have no current sessions, stop Lync Server services on them.
3. Open Topology Builder, and add or remove the necessary servers.
4. Publish the topology.
5. If the pool has gone from having two Front End Servers to more than two, or gone from more than two servers to exactly two, you need to type the following cmdlet:

   ```
   Reset-CsPoolRegistrarState-ResetType FullReset -PoolFqdn <PoolFqdn>
   ```

   If the pool has three or more servers, then at least three of those servers must be running when you type this cmdlet.
6. Restart all Front End Servers in the pool, one at a time.

1.7.3.8 Upgrade or Update a Back End Server or Standard Edition Server

Upgrade or Update a Back End Server or Standard Edition Server

Microsoft Lync Server 2013 > Operations > Managing the Lync Server 2013 Topology >

Topic Last Modified: *2012-11-01*

This topic explains how to install an update on an Enterprise Edition Back End Server or a Standard Edition server.

If a Back End Server is down for at least 30 minutes while you are upgrading it, users may then go into resiliency mode. When the upgrade is finished and the Back End Servers has again connected with the Front End Servers in the pool, users are returned to full functionality. If the upgrade takes less than 30 minutes, users will not be affected.

To update a back end server or Standard Edition server

1. Log on to the server you are upgrading as a member of the CsAdministrator role.
2. Download the update and extract it to the local hard disk.
3. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
4. Stop Lync Server services. At the command line, type:

   ```
   Stop-CsWindowsService
   ```

5. Stop the World Wide Web service. At the command line, type:

   ```
   net stop w3svc
   ```

6. Close all Lync Server Management Shell windows.
7. Install the update.
8. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
9. Stop Lync Server services again to catch Global Assembly Cache (GAC) –d assemblies. At the command line, type:

   ```
   Stop-CsWindowsService
   ```

10. Restart the World Wide Web service. At the command line, type:

    ```
    net start w3svc
    ```

11. Apply the changes made by LyncServerUpdateInstaller.exe to the SQL Server databases by doing one of the following:
    - If this is an Enterprise Edition Back End Server and there are no collocated databases on this server, such as Archiving or Monitoring databases, then type the following at a command line:

      ```
      Install-CsDatabase -Update -ConfiguredDatabases -SqlServerF
      ```

    - If this is an Enterprise Edition Back End Server and there are collocated databases on this server, then type the following at a command line:

      ```
      Install-CsDatabase -Update -ConfiguredDatabases -SqlServerF
      ```

    - If this is an Standard Edition server, type the following at a command line:

      ```
      Install-CsDatabase -Update -LocalDatabases
      ```

1.7.3.9 Managing Microsoft SIP Processing Language (MSPL) Applications

Managing Microsoft SIP Processing Language (MSPL) Applications

- View Microsoft SIP Processing Language (MSPL) Server Applications
- Mark a Microsoft SIP Processing Language (MSPL) Application as Critical or Not Critical
- Enable or Disable a Microsoft SIP Processing Language (MSPL) Server Application

1.7.3.9.1 View Microsoft SIP Processing Language (MSPL) Server Applications

View Microsoft SIP Processing Language (MSPL) Server Applications

See Also

Operations > Managing the Lync Server 2013 Topology > Managing Microsoft SIP Processing Language (MSPL) Applications >

Topic Last Modified: *2012-11-01*

A Microsoft SIP Processing Language (MSPL) server application is a script-only application that uses a scripting language instead of the Microsoft Lync 2010 API. MSPL provides more granular control over filtering and proxy behaviors, in addition to a facility for dispatching specific messages to transaction-based SIP applications. MSPL is used specifically for filtering and routing SIP messages. MSPL applications run in the same process as the UserServices module, while a program that is based on the Lync 2010 API runs in a separate process.

You can use the **Server Application** page in the **Topology** group of Lync Server Control Panel to see a list of MSPL server applications that run on Front End Servers in your Lync Server 2013 environment. The list shows the scripts that are available for each pool, as well as whether they are enabled or critical. The scripts run in the order they are listed.

These scripts include the following:

- ClientVersionFilter provides the administrator with a way to specify the version of clients that are supported by a pool. The client version filter checks the client version and can either prevent the client from logging on or present the user with a message that indicates he or she is using a client that is not supported. The client version filter can also be configured to display a message to the user that contains the URL of the latest downloadable version of the client.
- TranslationService translates a number that a user dials to an E.164 number according to the normalization rules defined by the administrator. For details, see Translation Rules.
- IncomingFederation enforces tenant-level federation validation for inter-tenant and incoming messages from external deployments.
- UserServices is the SIP Registrar, presence, and conferencing component of a Front End Server. It provides closely integrated IM, presence, and conferencing features built on top of the SIP Proxy.
- InterClusterRouting is responsible for routing calls to the callee’s primary Registrar pool. For details, see Front End Server VoIP Components.
- IIMFilter (Intelligent IM Filter) blocks messages that contain clickable URLs or that attempt to initiate file transfers. IIMFilter also checks the client version on behalf of the server. IIMFilter affects file transfers that are initiated by using either Lync Server, Communicator, or the Live Meeting 2007 client. By default, clickable links are disabled by adding an underscore character before the first character of the link. An administrator can change this behavior so that the link is blocked, in which case messages that contain clickable URLs or that attempt to initiate a file transfer are blocked by the server from reaching their intended destinations. IIMFilter is installed on all servers running Lync Server except Proxy Servers and Archiving Servers.
- UserPinService is used to verify user personal identification numbers (PINs) for dial-in conferencing.
- DefaultRouting is the default routing application for servers running Lync Server. It is enabled by default. The routing application is installed on all Standard Edition and Enterprise Edition servers.
- ExumRouting routes calls to Exchange Server Unified Messaging (UM). ExumRouting determines the appropriate Exchange UM server to route the call to when there is a new voice mail message to deposit. ExumRouting also handles some other Exchange UM integration aspects, including routing to Auto Attendant and Subscriber Access.
- OutboundRouting determines the gateway that routes a call to a phone number according to the dialed number and the user’s dialing authorization. OutboundRouting also handles rerouting of calls if a gateway cannot process a call.
- QoEAgent receives Quality of Experience (QoE) data reports from endpoints through SIP SERVICE requests, and sends the data to the destination queue on the Monitoring Server or to third-party consumers using HTTP POST. For details, see Deploying Monitoring.

- OutgoingFederation enforces tenant-level federation validation for messages going to a targeted external deployment.
- AcpRouting proxies INVITE requests destined for the audio conferencing provider to the audio conferencing provider gateway.

Scripts that run on Edge Servers include the following:

- IIMFilter
- OptionsHandler responds to incoming OPTIONS requests with **200 OK** if the request is destined for the current server. This is used for topology validation.

Tasks

Enable or Disable a Microsoft SIP Processing Language (MSPL) Server Application
Mark a Microsoft SIP Processing Language (MSPL) Application as Critical or Not Critical

1.7.3.9.2 Mark a Microsoft SIP Processing Language (MSPL) Application as Critical or Not Critical

Mark a Microsoft SIP Processing Language (MSPL) Application as Critical or Not Critical

See Also

Operations > Managing the Lync Server 2013 Topology > Managing Microsoft SIP Processing Language (MSPL) Applications >

Topic Last Modified: *2012-11-01*

Microsoft SIP Processing Language (MSPL) server applications are script-only applications that use the MSPL scripting language instead of the Microsoft Lync 2010 API. Some MSPL server applications are specified as critical. If a script is critical, the script must start during system startup in order for Lync Server 2013 to start. If the script fails while Lync Server is running, the server does not shut down, but it stops sending traffic to the script, and it writes errors in the event log.

You can use Lync Server Control Panel to mark Microsoft SIP Processing Language (MSPL) server applications as critical or unmark them.

Not all scripts support this option. For example, the DefaultRouting script is marked as critical, and this option cannot be changed for DefaultRouting.

⊟To mark or unmark an MSPL server application as critical

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Topology** and then click **Server Application**.
4. On the **Server Application** page, click a column heading to sort the applications, if needed, and then click the server application that you want to modify.
5. Click **Action**.
6. Click **Mark as critical** or **Unselect as critical** (that is, if the script supports this option).

Managing the Lync Server 2013 Topology

1.7.4 Delegating Administrative Control of Lync Server 2013

Delegating Administrative Control of Lync Server 2013

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2013-02-22*

In Lync Server 2013, administrative tasks are delegated to users by using the new role-based access control (RBAC) feature. When you install Lync Server, a number of RBAC roles are created for you. These roles correspond to universal security groups in Active Directory Domain Services (AD DS). For example, the RBAC role CsHelpDesk corresponds to the CsHelpDesk group found in the Users container in Active Directory Domain Services. In addition, each RBAC role is associated with a set of Lync Server Windows PowerShell cmdlets. These cmdlets represent the tasks that can be carried out by users who have been assigned the given RBAC role. For example, the CsHelpDesk role has been assigned the Lock-CsClientPin and UnlockCsClientPin cmdlets. That means users who have been assigned the CsHelpDesk role can lock and unlock user PIN numbers. However, the CsHelpDesk role has not been assigned the New-CsVoicePolicy cmdlet. That means that users who have been assigned the CsHelpDesk role cannot create new voice policies.

Viewing Information about RBAC Roles

You can retrieve basic information about your RBAC roles by running the following command from within the Lync Server Management Shell:

```
Get-CsAdminRole
```

Keep in mind that the Identity of the RBAC role (for example, CsVoiceAdministrator) has a direct mapping to a security group found in the Users container in Active Directory Domain Services.

To view a list of the cmdlets that have been assigned to a role, use a command similar to this:

```
Get-CsAdminRole -Identity "CsHelpDesk" | Select-Object -ExpandProperty Cmdlets
```

Assigning an RBAC Role to a User

To assign an RBAC role to a user, you must add that user to the appropriate Active Directory security group. For example, to assign the CsLocationAdministrator role to a user, you must add that user to the CsLocationAdministrator group. That can be done by carrying out the following procedure:

To assign a user to a security group

1. Using an account that has permission to modify the membership of an Active Directory group, log on to a computer where Active Directory Users and Computers has been installed.
2. Click **Start**, click **All Programs**, click **Administrative Tools**, and then click **Active Directory Users and Computers**.
3. In Active Directory Users and Computers, expand the name of your domain and click the **Users** container.
4. Right-click the security group **CsLocationAdministrator**, and then click **Properties**.
5. In the **Properties** dialog box, on the **Members** tab, click **Add**.
6. In the **Select Users, Computers, Contacts, or Groups** dialog box, type the user name or display name of the user to be added to the group (for example, **Ken Myer**) in the **Enter the object names to select** box and then click **OK**.
7. In the **Properties** dialog box, click **OK**.

To verify that the RBAC role has been assigned, use the Get-CsAdminRoleAssignment cmdlet, passing the cmdlet the SamAccountName (Active Directory logon name) of the user. For example, run this command from within the Lync Server Management Shell:

```
Get-CsAdminRoleAssignment  -Identity "kenmyer"
```

1.7.5 Managing IM and Presence Settings

Managing IM and Presence Settings

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-10-14*

Topics in this section provide step-by-step procedures for tasks that you can perform using the **IM and Presence** group in Lync Server 2013 Control Panel.

- Configuring File Transfer and URL Filtering for Instant Messaging (IM)
- Assigning Per-User Presence Policies

1.7.5.1 Configuring File Transfer and URL Filtering for Instant Messaging (IM)

Configuring File Transfer and URL Filtering for Instant Messaging (IM)

See Also

Microsoft Lync Server 2013 > Operations > Managing IM and Presence Settings >

Topic Last Modified: *2012-11-01*

The Intelligent IM Filter tool helps protect your Lync Server 2013 deployment against the spread of the most common forms of viruses with minimal degradation to the user experience. Use Intelligent IM Filter to configure filters to block unsolicited or potentially harmful instant messages from unknown endpoints outside the corporate firewall. You configure filters by specifying the criteria to be used to determine what should be blocked, such as instant messages containing hyperlinks with specific prefixes and files with specific extensions.

Intelligent IM Filter provides the following:

- Enhanced URL filtering.
- Enhanced file transfer filtering.

Configuring Intelligent IM Filter includes the following:

- Configuring URL filtering.
- Configuring file transfer filtering.

How Filtering Options Are Applied to Instant Messages

Before you deploy the Intelligent IM Message Filter tool, you need to understand how filtering options are applied as messages are routed from one Lync Server 2013 server to another. The way these filtering options are applied is consistent, regardless of whether the servers are located in a single organization or across organizational boundaries. This consistency applies to the way that the customized notice and warning texts are inserted into messages and sent across servers.

Note:

The instant message filter increases the amount of CPU resources required to process URLs in a message. This increase in CPU demand also affects the performance of Lync Server.

By using the **URL Filter** page in the **IM and Presence** group in Lync Server Control Panel, you can block some or all hyperlinks or configure a warning. The warning is inserted at the beginning of an instant message that contains a hyperlink when you choose the **Hyperlink prefix** option **Send warning message**.

When an instant message travels from one server to another, the following general guidelines apply:

- If a server blocks an instant message (because you selected the **Block URLs with file extension** check box on the **URL Filter** page or because you chose

the **Hyperlink prefix** option **Block hyperlinks**), an error message is returned to the client. Subsequent servers do not receive this instant message.
- If a server (Server1) adds a warning to an instant message that contains an active hyperlink, a subsequent server (Server2) that receives this instant message can still take a different action based on this active hyperlink present in the instant message and block the instant message or add a warning. If Server2 is configured only to add a warning for this URL, the earlier warning added by Server1 is removed, and the warning configured on Server2 is added to the beginning of the instant message.

Note:

If you are running Lync Server 2013 in a mixed environment, Live Communications Server 2005 with SP1 is the minimum version required to use the Intelligent IM Filter application. The Intelligent IM Filter is not supported on Live Communications Server 2005 without SP1.

URL Filtering

URLs are filtered according to their hyperlink prefix. The following examples are valid prefixes:

- www*.
- ftp.
- http:

If you do not configure the instant message filter to perform any URL filtering, all URLs contained in instant messages are passed unmodified through the server. If you configure the instant message filter to perform URL filtering, URLs in instant messages are filtered according to the options that you select in the **Edit URL Filter** or **New URL Filter** dialog box.

- **Enable URL filter** This option enables URL filtering for the global deployment or for the site that you select.
- **Block URLs with file extension** The instant message filter blocks any active intranet or Internet URL that contains a file with an extension listed under **File type extensions to block** in the **Edit File Filter** dialog box. When a URL is blocked, an error message is displayed to the sender. When selected, this option takes precedence over all other filtering options for any file extensions defined under **File type extensions to block**.

  Important:

  Filtering of file extensions is limited to standard file names. Filtering may not work with file extensions embedded in other names.

To configure how hyperlinks are handled in instant message conversations, select one of the following options under **Hyperlink prefix**:

- **Do not filter** URLs in messages are sent through the server. When you choose this option, the **Allow message** box appears. In the **Allow message** box, specify the notice that you want to insert at the beginning of each instant message containing hyperlinks. This notice can consist of no more than 65535 characters.
- **Block hyperlinks** Delivery of instant messages containing active hyperlinks is blocked by Lync Server, and an error message is displayed to the sender.
- **Send warning message** Lync Server permits active hyperlinks in instant messages, but it includes a warning. When you choose this option, the **Warning message** box appears. In the **Warning message** box, you must type the warning that you want to include with instant messages containing valid hyperlinks. For example, this warning might state the potential dangers of clicking an unknown link, or it might refer to your organization’s relevant policies and requirements. The warning can be no more than 65535 characters.

If you select **Block hyperlinks** or **Send warning message**, the following options are available:

- **Exclude local intranet hyperlinks** The instant message filter blocks only Internet URLs. URLs for locations within your intranet are passed unmodified through the server. However, the intranet URLs that individual servers running Lync Server pass depend on which types of local websites are considered part of their intranet zone. To check a server's intranet zone settings, see the "To configure your intranet settings in Internet Explorer" procedure in Modify the Default URL Filter.
- **Filter these hyperlink prefixes** To choose which prefixes you want to block, click **Select**, and then, in **Select Hyperlink Prefix**, add the prefixes to the **Hyperlink prefixes** list.
  All prefixes except **href** must end with a period or a colon, or an asterisk followed by a period. Valid prefixes can contain any characters in the set of valid URL characters except the asterisk (*). The set of valid URL characters is:
  #*+/0123456789=@ABCDEFGHIJKLMNOPQRSTUVWXYZ^_`
  abcdefghijklmnopqrstuvwxyz|~

File Transfer Filtering

Filter transfer filtering affects both instant messages and conferences. For conferences, these settings affect the handout feature in the Office Live Meeting 2007 client and multimedia playback features.

Note:

Lync Server also offers file transfer setting options. This server-side option is offered in addition to the client-side controls available in Lync Server.

You can filter file transfers during instant message conversations, when you are using the handout feature in the Office Live Meeting 2007 client, and for multimedia playback features for all file types. You can set the following options to control file transfers:

- **Enable file filter** This option enables file filtering for the global deployment or for the site that you select.
  When you enable the file filter, you can choose one of the following options in **File transfer**:
  - **Block specific file types** You specify which file transfer requests are filtered by the server by specifying a list of file extensions to block. Entries in the list can contain all standard characters, but not the wildcard character (*). In the Office Live Meeting 2007 client the handout feature is enabled, but any file with this extension cannot be uploaded or downloaded. If you select the **Block URLs with file extension** check box on the settings for a URL filter listed on the **URL Filter** tab, the URL filter uses this same list to block active hyperlinks that contain any of these file extensions. To choose which file types you want to block, click **Select**, and then, in **Select File Type**, add the file type extensions to the **Selected file type extensions** list.
  - **Block All** The server drops all instant messages that contain file transfer requests and returns an error message to the sender of the request. The handout feature in the Office Live Meeting 2007 client is disabled.

Important:

Filtering of file extensions is limited to standard file names. Filtering may not work with file extensions embedded in other names.

Modify the Default File Transfer Filter

See Also

Operations > Managing IM and Presence Settings > Configuring File Transfer and URL Filtering for Instant Messaging (IM) >

Topic Last Modified: *2012-11-01*

Lync Server 2013 provides a global file transfer filter that blocks specific types of files during the following file-related activities within your Lync Server 2013 deployment:

- File transfer requests during instant messaging (IM) conversations
- File uploads and downloads while using the handout feature in the Office Live Meeting 2007 client
- Multimedia playback during conferences

Depending on the types of files you want to block or allow, you can use Lync Server Control Panel to modify the global filter. For details about file transfer filtering, see Configuring File Transfer and URL Filtering for Instant Messaging (IM).

⊟To modify the default file transfer filter

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **IM and Presence** and then click **File Filter**.
4. On the **File Filter** page, double-click the **Global** filter.
5. In **Edit File Filter**, select the **Enable file filter** check box.
6. In the **File transfer** drop-down list box, click **Block All** or **Block specific file types**.
7. If you clicked **Block All**, skip to step 9.
8. If you clicked **Block specific file types**, do the following:
   - 8.a. Click **Select** to modify the default list of file type extensions that you want to block.
   - 8.b. In **Select File Type**, select the file types that you want to block or allow by adding or removing their extensions from the categories under **File type extensions**.
   - 8.c. If you do not see the extension for a file type that you want to block, type the extension in the text box under **Add file type extensions to the list**, and then click **Add**.
   - 8.d. Click **OK**.
9. Click **Commit**.

By using the instant messaging (IM) filter, Lync Server 2013 provides a global URL filter that blocks specific URLs contained in IM conversations among users throughout your Lync Server 2013 deployment. By using Lync Server Control Panel, you can do the following:

- Block all or a subset of URLs in instant message conversations.
- Allow all URLs. As an option, you can create a notice that is inserted at the beginning of each instant message that contains a URL.
- Allow specific URLs and include a warning with each instant message that contains a URL.

In addition, you can choose to block URLs that contain specific file types, or block only Internet URLs by allowing URLs that are within the server's local intranet zone — intranet URLs — to pass through the server. For details about URL filtering, see Configuring File Transfer and URL Filtering for Instant Messaging (IM).

In addition to modifying the global URL filter, you can configure custom URL filters for individual sites within your Lync Server 2013 deployment. For details about URL filtering, see Configuring File Transfer and URL Filtering for Instant Messaging (IM).

⊟To create a new URL filter

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **IM and Presence**, and then click **URL Filter**.
4. On the **URL Filter** page, click **New**.
5. In **Select a Site**, click the site for which you want to create the URL filter, and then click **OK**.
6. In the **New URL Filter** dialog box, select the **Enable URL Filter** check box to enable URL filtering for the site.
7. To block any active URL that contains a file with an extension listed under **File type extensions to block** in **Edit File Filter**, select the **Block URLs with file extension** check box.
8. In the **Hyperlink prefix** drop-down list box, click the option that corresponds to how you want to handle URLs in instant message conversations.

   The **Allow message** box enables a warning message to be sent to the user when sending hyperlinks that are allowed to be sent.
9. Click **Commit**.

1.7.5.2 Assigning Per-User Presence Policies

Assigning Per-User Presence Policies

Microsoft Lync Server 2013 > Operations > Managing IM and Presence Settings >

Topic Last Modified: *2012-10-11*

A presence policy is a set of limits and restrictions that affect presence. The following table describes the presence policy settings available in Lync Server 2013.

Presence Policy Settings

XML name	Display name	Description	Type	Value
CategorySubscriptions	Maximum Number of Subscriber Category Subscriptions	Limits the number of subscriber category subscriptions. For example, when Communicator subscribes to a user’s presence, it obtains a category subscription for each of the contact card, calendar data, notes, services, and state categories. A setting of 0 means that the user or contact object cannot be subscribed to by others. **Note:** This setting can have a significant impact on performance if it is set to a high number, and the average user has a large number of users subscribing to his or her presence.	Integer	0-3000
PromptedSubscribers	Maximum Number of	Limits the number of entries in the prompted	Integer or Token	0-500

	Queued Presence Subscription Alerts	subscribers table. This setting determines the maximum number of prompts that can be queued for a given user. For example, when user A subscribes to user B's presence, user B receives a prompt that user A is now subscribed to user B, and an acknowledgement prompt is created in user B's prompted subscribers table. After user B accepts, or acknowledges, the subscription, the acknowledgement prompt is removed from user B's prompted subscribers table. A setting of 0 means that the user is not prompted when someone subscribes to his or her presence.		

By default, the **Default Policy** and **Service: Medium** presence policies are installed when you deploy Lync Server. The following table describes the specific settings of the two presence policies.

Presence Policies

Policy name	Description	CategorySubscriptions	PromptedSubscribers
Default Policy	Policy for typical users. This is the default presence policy.	1000	200
Service: Medium	Policy for applications that require more users to subscribe to the object's presence.	1000	0

1.7.6 Managing Lync Server 2013, Persistent Chat Server

Managing Lync Server 2013, Persistent Chat Server

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-10-11*

You can use Lync Server 2013, Persistent Chat Server to enable multiple users to participate in conversations in which they post and access content about specific topics, including text, links, and files. Although users can communicate in real time during a session, the content of each session is persistent, which means that it continues to be available after a session ends.

The content of Persistent Chat rooms consists primarily of short text messages, although it can include longer messages, referred to as *stories*, and also hyperlinks, emoticons, and uploaded documents.

Note:

File upload and download is not supported by the Lync 2013 client; however, it is still supported by Lync Server 2013, Persistent Chat Server. The legacy Group Chat client can post and view files, but if the same chat room is accessed via the Lync 2013 client, it will not be able to access the files.

Access to a chat room is controlled by a membership list. The entire chat room history is available to any member for chronological review or full-text search. For details about using the Persistent Chat client, see Planning for Clients in the Planning documentation, and Deploying Clients and Devices in the Deployment documentation.

When you set up Persistent Chat Server for your organization, you specify the initial configuration during deployment. However, there may be times when you want to change how you implement Persistent Chat Server support. For example, you may need to set up Persistent Chat Server support and controls differently for a specific team or group within your organization. This section provides information and procedures to help you customize your Persistent Chat Server deployment. For details about the features and functionality that you can configure for Persistent Chat Server, see Defining Your Organization's Requirements for Persistent Chat Server in the Planning documentation, and How Persistent Chat Server Works in the Planning documentation, Deployment documentation, or Operations documentation. For details about deploying Persistent Chat Server for Lync Server 2013, see Deploying Persistent Chat Server in the Deployment documentation.

1.7.6.1 How Persistent Chat Server Works

How Persistent Chat Server Works

Microsoft Lync Server 2013 > Planning > Planning for Persistent Chat Server >

Topic Last Modified: *2012-11-21*

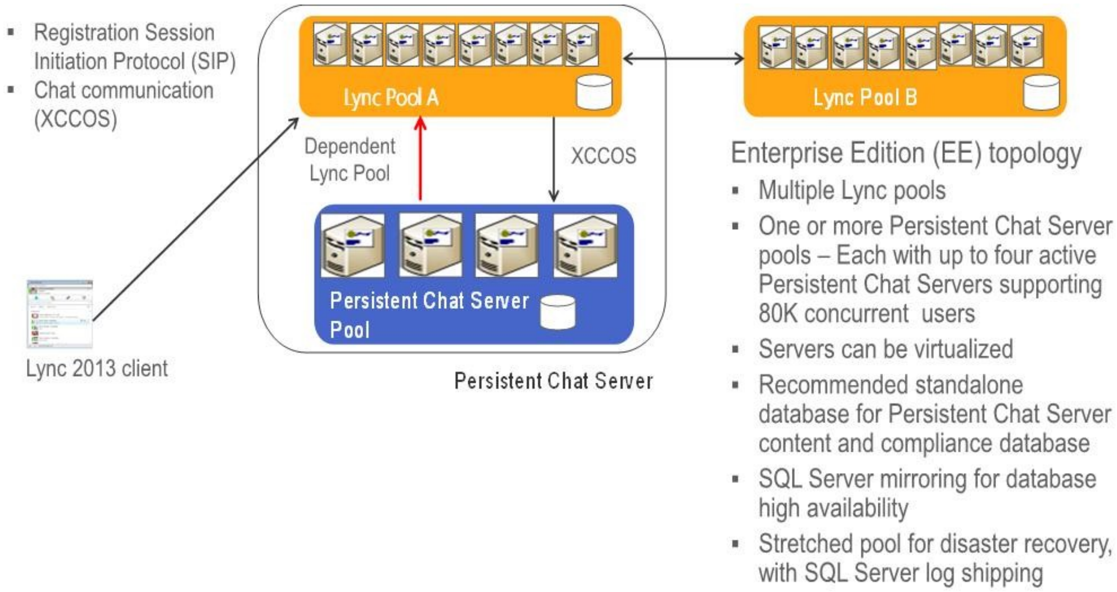
Lync Server 2013, Persistent Chat Server enables you to participate in multiparty, topic-based conversations that persist over time. Persistent Chat Server can help your organization do the following:

- Improve communication between geographically dispersed and cross-functional teams
- Broaden information awareness and participation
- Improve communication with your extended organization
- Reduce information overload
- Improve information awareness
- Increase dispersion of important knowledge and information

You can deploy Persistent Chat Server as an optional role with Lync Server 2013. Persistent Chat services run on a dedicated pool, and a Persistent Chat Server pool depends on a Lync Server pool to route messages to it. Clients use eXtensible Chat Communication Over SIP (XCCOS). The Lync Server Front End Servers are configured to route the traffic to a Persistent Chat Server pool.

High-Level Architecture

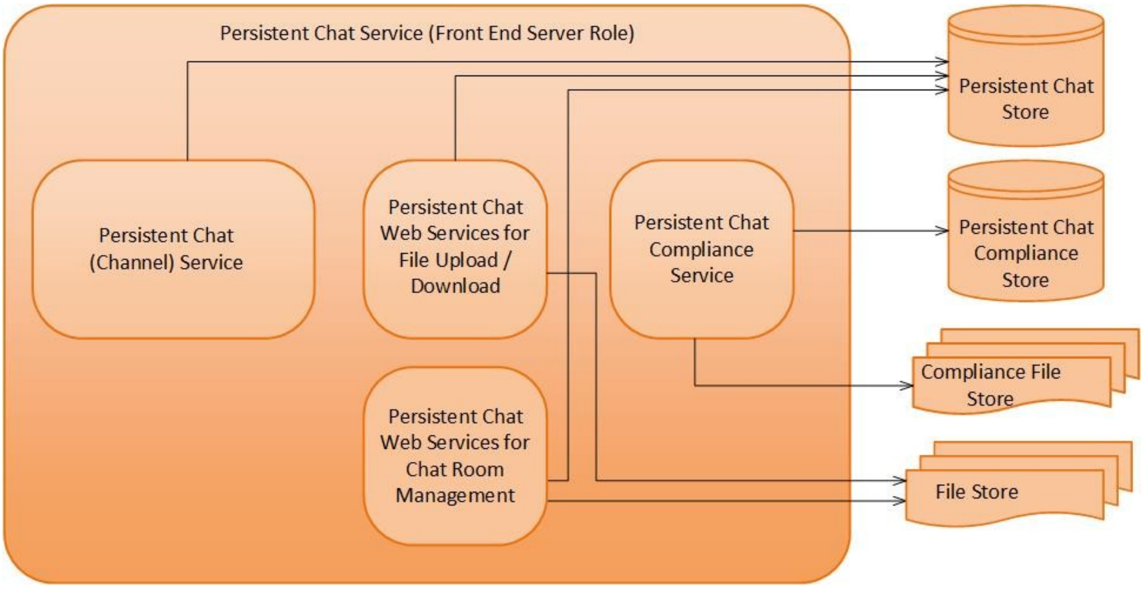
The following diagrams provide high-level perspectives of the Persistent Chat Server architecture and services.



Registration Session Initiation Protocol (SIP)
Chat communication (XCCOS)
Lync Pool A
Lync Pool B
Dependent Lync Pool
XCCOS
Persistent Chat Server Pool
Lync 2013 client
Persistent Chat Server

Enterprise Edition (EE) topology

- Multiple Lync pools
- One or more Persistent Chat Server pools – Each with up to four active Persistent Chat Servers supporting 80K concurrent users
- Servers can be virtualized
- Recommended standalone database for Persistent Chat Server content and compliance database
- SQL Server mirroring for database high availability
- Stretched pool for disaster recovery, with SQL Server log shipping



Persistent Chat Service (Front End Server Role)
Persistent Chat (Channel) Service
Persistent Chat Web Services for File Upload / Download
Persistent Chat Compliance Service
Persistent Chat Web Services for Chat Room Management
Persistent Chat Store
Persistent Chat Compliance Store
Compliance File Store
File Store

Two services run on the Persistent Chat Server Front End Servers:

- Persistent Chat (Channel)
- Compliance

Persistent Chat (Channel) Service

The Persistent Chat (Channel) service is the core service responsible for Persistent Chat Server. This service provides the following functions:

- Accepts incoming messages
- Registers and lists online participants within a Persistent Chat room
- Retransmits messages to other channel subscribers
- Implements logic for channel management, chat room invitation, search, and new content notifications

The Persistent Chat (Channel) service stores and accesses chat room content and other system metadata (authorization rules, and so on) by using the Persistent Chat Store. This service stores files that are uploaded into chat rooms in the Persistent Chat File Store.

Compliance Service

The Compliance service is an optional component of Persistent Chat Server and is responsible for archiving chat content and events to the Persistent Chat Compliance Store. If your organization has regulations that require Persistent Chat activity to be archived, you can deploy the optional Persistent Chat Compliance service. The Compliance service is installed on each Persistent Chat Server in a Persistent Chat pool. When configured, Persistent Chat Server compliance records user activity such as joining and leaving rooms, and posting and reading of messages. The Compliance service stores files that need to be archived in the Persistent Chat Compliance File Store.

Persistent Chat Web Services

On the Lync Server Front End Servers, two services run that depend on Internet Information Services (IIS), and are implemented as web components:

- **Persistent Chat Web Services for File Upload/Download** Responsible for posting and retrieving files from chat rooms.
- **Persistent Chat Web Services for Chat Room Management** Responsible for providing users the ability to manage their chat rooms, and create new chat rooms.

How Do I Start Using Persistent Chat Server?

Persistent Chat Server is an optional server role within the Lync Server 2013 infrastructure. If you install the Persistent Chat Server role, any users who have been enabled through policy by an administrator can use Persistent Chat with the Lync 2013 client.

For details about how to deploy Persistent Chat Server and enable users to leverage the capabilities by policy, see Deploying Persistent Chat Server.

For details about how to configure settings on your Persistent Chat Server deployment, see Deploying Persistent Chat Server and Managing Lync Server 2013, Persistent Chat Server.

For details about how to enable users by policy such that they can leverage Persistent Chat functionality in Lync 2013 client, see Deploying Persistent Chat Server and Managing Lync Server 2013, Persistent Chat Server.

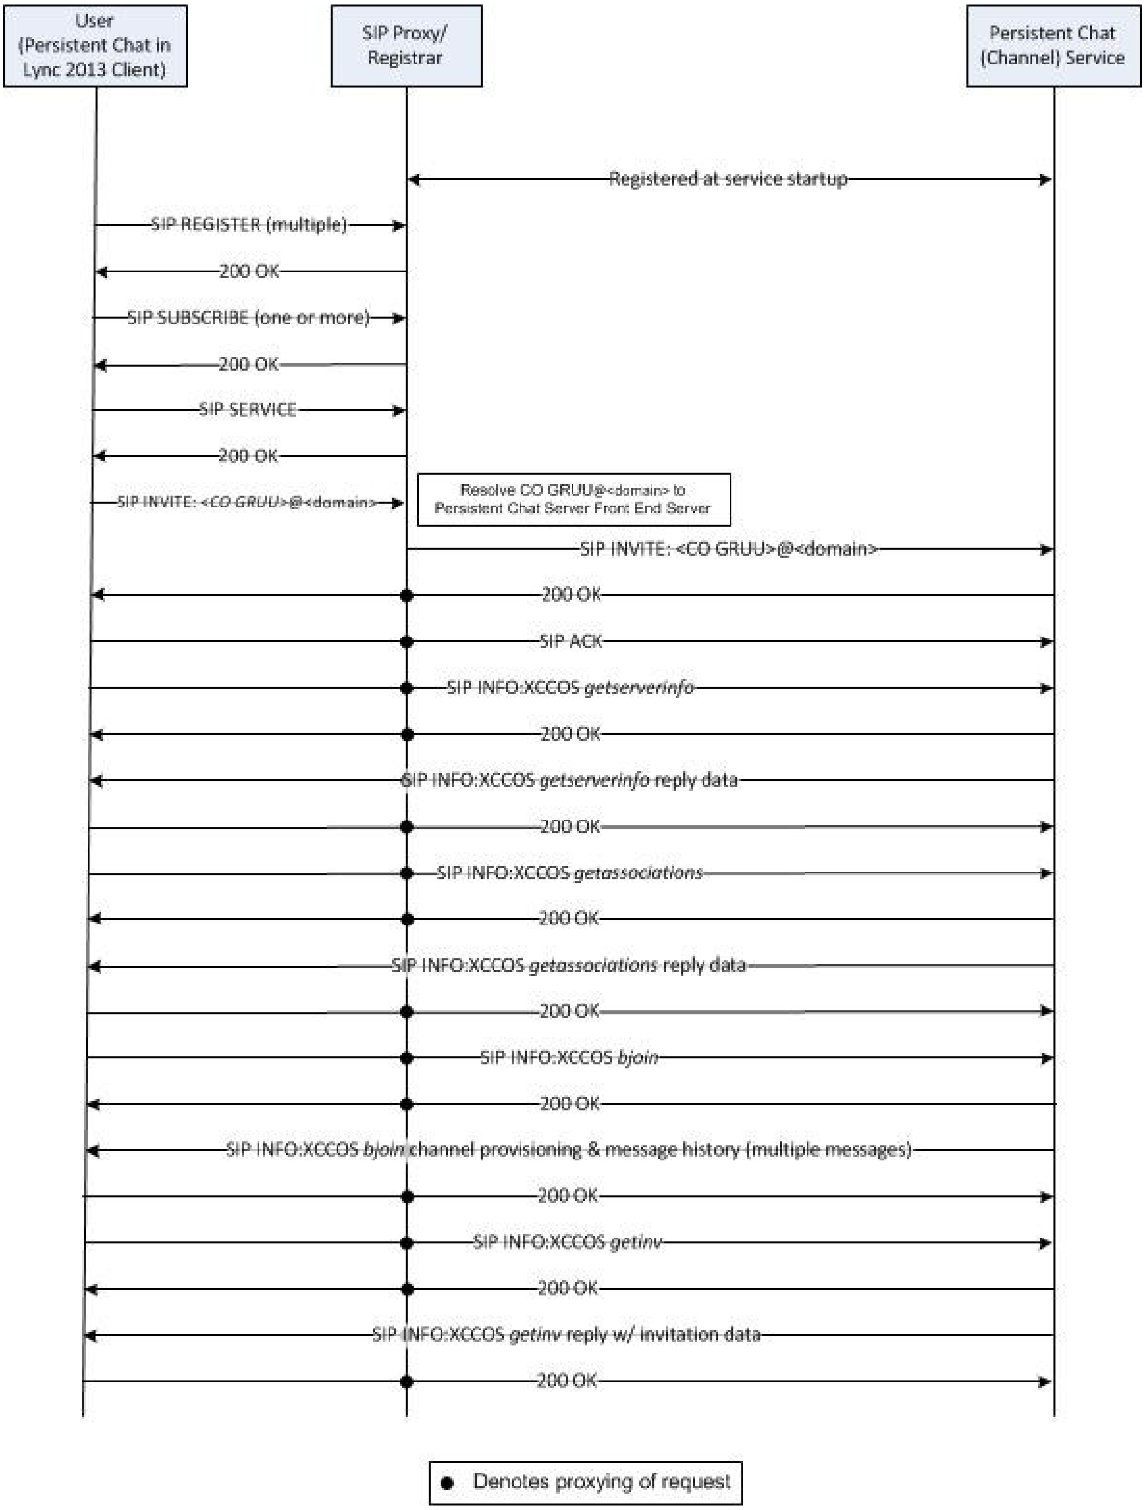
If you deployed Persistent Chat compliance, see Managing Lync Server 2013, Persistent Chat Server for details about how to configure settings for compliance.

Persistent Chat Call Flows

The Persistent Chat client communicates with the Persistent Chat service by using XCCOS. The following sequences describe the sign-in process and a typical room subscription and message post scenario.

Sign-in

The following call flow diagram and steps describe the sign-in process.



User (Persistent Chat in Lync 2013 Client)
SIP Proxy/ Registrar
Persistent Chat (Channel) Service
Registered at service startup
SIP REGISTER (multiple)
200 OK
SIP SUBSCRIBE (one or more)
200 OK
SIP SERVICE
200 OK
SIP INVITE: <CO GRUU>@<domain>
Resolve CO GRUU@<domain> to Persistent Chat Server Front End Server
SIP INVITE: <CO GRUU>@<domain>
200 OK
SIP ACK
SIP INFO:XCCOS getserverinfo
200 OK
SIP INFO:XCCOS getserverinfo reply data
200 OK
SIP INFO:XCCOS getassociations
200 OK
SIP INFO:XCCOS getassociations reply data
200 OK
SIP INFO:XCCOS bjoin
200 OK
SIP INFO:XCCOS bjoin channel provisioning & message history (multiple messages)
200 OK
SIP INFO:XCCOS getinv
200 OK
SIP INFO:XCCOS getinv reply w/ invitation data
200 OK
● Denotes proxying of request

1. The Persistent Chat client first sends a SIP SUBSCRIBE to retrieve the in-band provisioning document from the server. This document indicates if Persistent Chat is enabled or disabled for the user and the list of SIP URIs for the Persistent Chat Server pool.
2. The Persistent Chat client sends a SIP INVITE message to the SIP URI of the Persistent Chat Server that it obtained in the previous step. The INVITE sequence is followed by 200 OK and ACK, and the Persistent Chat client has

now opened a SIP session with a Persistent Chat Server endpoint. Consequently, the Persistent Chat client communicates with Persistent Chat Server by sending SIP INFO messages that contain either chat messages or commands requesting the server to take an action. All of these messages are acknowledged with either 200 OK or 503 Service Unavailable (that is, in the event of heavy server load). If the client receives a 503 response, it will retry the message. (This example does not include a 503 response.) If the server accepts the message or command and sends 200 OK, it provides a response to the client in the form of a separate SIP INFO message. This response includes a reference to the originating command.

3. The Persistent Chat client sends a SIP INFO message that contains the XCCOS **getserverinfo** command. Persistent Chat Server replies with a new SIP INFO message that contains information about the Persistent Chat service configuration.
4. The Persistent Chat client sends a SIP INFO message that contains the XCCOS **getassociations** command. Persistent Chat Server replies with a new SIP INFO message that contains the list of rooms of which the user is a member. The Persistent Chat client repeats the command to retrieve the list of rooms of which the user is a manager.
5. The Persistent Chat client gets the list of followed rooms from the "presence" document, where each followed room is represented by a "roomSetting" category. All followed rooms are joined by a single SIP INFO message that contains the XCCOS **bjoin** command that contains the list of room URIs. Because the list of followed rooms is kept on the server, any client on any computer has the same list of followed rooms for the specified user URI. The Persistent Chat client also keeps the list of opened rooms (if this option is enabled by the user) in the local computer registry, and joins each of these rooms at sign-in by sending a SIP INFO message that contains the XCCOS **join** command for each opened room. Because this list is kept in the registry, it can be different on two Persistent Chat clients running on different computers.
6. For each room joined, the Persistent Chat client sends a SIP INFO message that contains the XCCOS **bccontext** command. Persistent Chat Server replies with a new SIP INFO message that contains the most recent chat message in the room.
7. The Persistent Chat client sends a SIP INFO message that contains a XCCOS **getinv** (that is, get invitation) command to request any new room invitations that the client has not yet seen. In a separate SIP INFO message, Persistent Chat Server returns a list of those rooms.

Subscribe to a Room and Post a Message

The following call flow diagram and steps describe a typical room subscription and message post scenario.

1. From the Persistent Chat client, User1 clicks **Join a Chat Room**, clicks **Search**, and then enters some search criteria. The Persistent Chat client sends a SIP INFO message that contains the XCCOS **chansrch** (room search) command, along with the search criteria. Persistent Chat Server queries the back-end database and replies in a new SIP INFO message that contains a list of available rooms that meet the search criteria.
2. User1 selects the chat room that he or she wants to join, and then clicks **Follow this room**. The Persistent Chat client sends Persistent Chat Server a SIP INFO message that contains the XCCOS **join** command and the room ID of the chat room that the user selected. Persistent Chat Server replies with a SIP INFO message that contains the provisioning data.
3. The Persistent Chat client sends Persistent Chat Server a SIP INFO message that contains the XCCOS **bccontext** (backchat context) command. Persistent Chat Server retrieves the chat history, and returns it to the Persistent Chat client in a separate SIP INFO message. At this point, the user enters the chat

room and is ready to participate.

4. User1 enters a new message, and then clicks **Send**. The Persistent Chat client posts the message to the chat room in a SIP INFO XCCOS **grpchat** command. Persistent Chat Server stores a copy of this new message in the Persistent Chat back-end database.
5. Persistent Chat Server sends a separate copy of the SIP INFO XCCOS **grpchat** message to User2, who has already entered the chat room.

Persistent Chat Compliance Call Flows

Persistent Chat Server uses Message Queuing (also known as MSMQ) and an additional compliance database (mgccomp) to process compliance data. As an example of how compliance events are processed, the following sequence of events describes how a message post event is processed.

1. A user posts a message to a room.
2. Persistent Chat Server places information pertaining to the event in a private Message Queuing queue.
3. Persistent Chat Compliance server reads this event from the queue, and places it into the mgccomp database for processing later.
4. Periodically, the Persistent Chat Compliance server processes a set of events in the database, and sends them to the Persistent Chat Compliance adapter for processing.
5. If the adapter successfully processes the data, Persistent Chat Compliance server deletes the events from the mgccomp database.

1.7.6.2 Using Categories to Administer Persistent Chat Server

Using Categories to Administer Persistent Chat Server

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013, Persistent Chat Server >

Topic Last Modified: *2012-10-18*

Your Persistent Chat Server deployment can host many concurrent Persistent Chat rooms. Chat rooms can be organized into a set of categories on the server. Each chat room belongs to one category, and inherits some settings from that category. This organization creates a useful structure for identifying conversations, based on their business purpose, and facilitates delegated administration and simplified management.

Note:

Although many of the management features of chat rooms are available in computers running Persistent Chat (Lync client) for the user, Persistent Chat Administrators (in the **cspersistentchatadministrator** role) must use the Lync Server Control Panel or Windows PowerShell cmdlets to create or manage categories.

Persistent Chat administrators use Lync Server Control Panel or Windows PowerShell cmdlets to create and manage categories, and to design access for chat rooms for the users in their organization.

Persistent Chat room managers, who have the ability to manage one or more chat rooms, can use the Lync client to launch a room management Web application to create and manage rooms (or customers can create custom solutions and workflows to be invoked). Persistent Chat administrators can also use Lync Server Control Panel or Windows PowerShell cmdlets to create and manage rooms.

Chat room managers can make changes to all chat room properties, except for changing the category of the room. They cannot be restricted from performing the following actions:

- Disabling a chat room

- Changing a chat room name
- Changing a chat room description
- Changing a chat room type (Auditorium versus Normal)
- Changing the privacy of a room (open versus closed versus secret)
- Adding or removing members
- Adding or removing chat room managers
- Adding or removing an add-in
- Changing settings such as invitations (according to what's permitted by the category)

Delegated Administration

Creating and managing Persistent Chat rooms is much easier with the correct use of categories. A Persistent Chat Administrator can define **AllowedMembers** and **Creators** for each category, and can also define the default chat room settings and behaviors that will be applied to all chat rooms created in the category. Persistent Chat administrators create and manage categories by using Lync Server Control Panel or Windows PowerShell cmdlets.

Users, Organizational Units (OUs), and user groups that are identified as Creators of the category are the only individuals and groups that are allowed to create rooms in the category. After the category is created, they can choose users, OUs, and user groups from the category's **AllowedMembers** list as chat room managers and members to manage and participate in the room.

Chat rooms that are created in a category adhere to the policies and settings enforced by the category (such as who can be in the room's membership, who can manage the room, whether file uploads are allowed, whether invitations are sent, and so on).

1.7.6.3 Understanding Persistent Chat Membership

Understanding Persistent Chat Membership

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013, Persistent Chat Server >

Topic Last Modified: *2013-02-22*

User access to Persistent Chat rooms is managed by membership; users must be members of a chat room to be able to post and read messages. Only **Presenters** who have a designated affiliation with chat rooms are allowed to use **Posting to Auditorium rooms**. An auditorium is a type of chat room (the other is **Normal**), where only Presenters can post and everyone can read.

In addition, Persistent Chat rooms operate under the rules of a category. For details about categories, see Managing Categories, Rooms, and Add-Ins, and also the sections "How Category Scoping Works" and "Room Category Strategies" later in this topic.

A Persistent Chat administrator can create and manage chat room categories. As part of creating and managing chat room categories, the Persistent Chat administrator can configure principals (Active Directory Domain Services (AD DS) groups, containers, and users) that have access to be members or creators of chat rooms of a particular category.

Active Directory Domain Services and Persistent Chat

Persistent Chat Server relies on Active Directory for the pool of internal Persistent Chat users. After you install Persistent Chat (client), you can add domains of users and user groups to the room category. You can then add these users and groups to the membership of your room categories.

Important:

You must ensure that there are no duplicate names for users who want to make changes to their Persistent Chat room(s). If duplicate user names exist, change them to different names to unblock users from making those changes. If a user has duplicate names in Active Directory and tries to make changes in their room(s), an error message appears prompting the user to contact the administrator for resolution.

How Category Scoping Works

A category specifies all the users and groups that can be members in a membership list of a Persistent Chat room in that category, based on its **AllowedMembers** property. For example, if you set the category's **AllowedMembers** to contoso.com, you can add any group or user at *Contoso* as a member to chat rooms in that category. If you set the **AllowedMembers** on a category to *Sales*, only groups and users in this distribution list can be added as members to chat rooms in that category. Similarly, the **Creators** property enables you to control who can create chat rooms in that category. After the chat room is created, anyone from the **AllowedMembers** group can be designated as a **Manager** for ongoing management operations on the rooms (for example, membership changes and approvals).

Defining **AllowedMembers** and **Creators** for a category has the following benefits:

- All chat rooms in this category are bound by the restrictions set at the category level. You can use this to segregate chat rooms based on business need and access policies.
- A user who is in the **Creators** list can create new chat rooms in that category. If you want to implement a system where a restricted number of personnel in the organization can create chat rooms, this control can be used to meet that requirement.

Room Category Strategies

A category's **AllowedMembers** must include all users who will use any Persistent Chat room in this category. Depending on your requirements to protect business data and ensure the appropriate level of access, you may want to define one or more categories to specify who can search and participate in rooms. If you want to allow only a particular set of users (a central helpdesk, or only full-time employees) to create rooms, you can scope the **Creators** of a category to satisfy that requirement.

Categories can also be used to create ethical walls. Ethical walls prevent any conflict of interest in an organization. For example, an administrator can create chat rooms in a category for traders only, whereas chat rooms in another category can be used by analysts only.

Note:

In Lync Server 2013, Persistent Chat Server, we do not support access to federated users. If there are chats from federated users in previous versions of Persistent Chat Server, they will be migrated. The federated users are added as disabled principals.

Narrowing the Members to User Groups

When you add a domain to a category, the user groups whose group objects are contained in that domain are available to you so that you can specify them as members of rooms in that category.

We recommend, as a general rule, that you use Active Directory containers, such as domains and organizational units, for defining a category's **AllowedMembers** and **Creators**. You can add objects from any domain to an **AllowedMembers** or **Creators** list. Only objects within the **AllowedMembers** or **Creators** list can be added to rooms under that category.

1.7.6.4 Persistent Chat Server Best Practices

Persistent Chat Server Best Practices

See Also

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013, Persistent Chat Server >

Topic Last Modified: *2012-10-06*

As you create your categories and Persistent Chat rooms and design your scoping and membership, the following tips can help your planning:

- If your company does not require an ethical wall, do not narrow the scope in your category tree. Put all your users in the scope of one category, and create all chat rooms in that category. Subsequently, use only membership lists to grant or restrict access to each chat room.
- In most cases, you should enable users to create new chat rooms so that discussions about new topics can be started any time. Do this by making the **Creators** list the same as the **AllowedMembers** list. However, if you want to allow only a central support team or designated users to create rooms, then make the **Creators** list as the appropriate subset.
- Give each chat room a complete name and description summary that describes where it fits in with your organization. Because users cannot see the category name when they use the chat room, you cannot rely on the category name to help users determine the intended discussion forum for the chat room.
- You may want to have a custom room creation workflow if you have certain naming conventions or other access controls or validations to implement. The Persistent Chat configuration enables you to customize the **RoomManagementUrl** to something that you host. For example, when users click **Create a room** in their Lync client, they can be redirected to your custom solution.
- Create a variety of add-ins that help to enhance the experience of chat rooms by bringing in other business data into chat rooms. Administrators must register the add-ins that they want to allow in the system. Chat room managers and creators can choose from the list of allowed add-ins for the ones most relevant to their respective rooms.

Managing Categories, Rooms, and Add-Ins

1.7.6.5 Managing Categories, Rooms, and Add-Ins

Managing Categories, Rooms, and Add-Ins

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013, Persistent Chat Server >

Topic Last Modified: *2012-10-06*

In Lync Server 2013 Control Panel, or by using Windows PowerShell cmdlets, Persistent Chat Administrators can use the **Persistent Chat** page to create categories and add-ins. For managing Persistent Chat rooms, Administrators can use Windows PowerShell cmdlets. Alternatively, if the Persistent Chat administrator is also SIP-enabled, they can use the Lync client to launch a web page to create and manage chat rooms.

The following topics describe how to create and work with categories and chat rooms.

- Creating or Editing a New Category
- Creating or Editing a New Room
- Creating New Add-ins for Rooms
- Setting Who Can Post Messages in an Auditorium Chat Room
- Disabling or Enabling a Chat Room
- Moving a Chat Room from One Category to Another
- Deleting a Chat Room or Category
- Deleting a Message or Purging Obsolete Messages

1.7.6.5.1 Creating or Editing a New Category

Creating or Editing a New Category

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Categories, Rooms, and Add-Ins >

Topic Last Modified: *2012-10-06*

To create a new category, see Configure Categories in the Deployment documentation. If you are a Persistent Chat administrator, you can create categories by using the Lync Server Control Panel or Windows PowerShell cmdlets.

1.7.6.5.2 Creating or Editing a New Room

Creating or Editing a New Room

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Categories, Rooms, and Add-Ins >

Topic Last Modified: *2012-10-06*

Configuring Persistent Chat rooms is commonly handled by users; a Persistent Chat administrator typically does not configure or manage chat rooms. Windows PowerShell cmdlets to manage rooms are available only to **CsPersistentChatAdministrator** Administrators.

Users who are **Creators** in any given category can use the Lync client to create and manage rooms. Users who have been designated as managers for a specific chat room can also perform ongoing management of the room, such as editing the room properties or membership.

Tip:
Persistent Chat administrators can also be Creators, and they are not subject to the restrictions placed on Creators.

Optionally, if you are a Persistent Chat administrator, you can employ a user interface to create and manage chat rooms instead of using Windows PowerShell cmdlets. To do this, SIP-enable an administrator for Persistent Chat Server, and then use the Lync client to create and manage chat rooms.

If you want to create a custom room management workflow for your users, you can set the **RoomManagementUrl** property on your Persistent Chat Server configuration to redirect users to your custom solution from the Lync client.

For details about configuring chat rooms by using the Windows PowerShell command-line interface, see "Room Management" in Configuring Persistent Chat Server by Using Windows PowerShell Cmdlets.

For details about configuring chat rooms, see Configure Rooms in the Deployment documentation.

1.7.6.5.3 Creating New Add-ins for Rooms

Creating New Add-ins for Rooms

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Categories, Rooms, and Add-Ins >

Topic Last Modified: *2012-10-06*

To create Add-ins for Persistent Chat rooms, see Configure Add-ins for Rooms in the Deployment documentation. If you are a Persistent Chat administrator, you can create add-ins by using the Lync Server Control Panel or Windows PowerShell cmdlets.

1.7.6.5.4 Setting Who Can Post Messages in an Auditorium Chat Room

Setting Who Can Post Messages in an Auditorium Chat Room

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Categories, Rooms, and Add-Ins >

Topic Last Modified: *2012-10-06*

In an auditorium chat room, only users who have been granted the role of Presenter can post messages. All other members can only read messages. Presenters in an auditorium chat room must be members of the chat room.

For details about using the Windows PowerShell command-line interface to manage auditorium chat rooms, see Manage Rooms in the Deployment documentation.

Although Persistent Chat room administrators and chat room managers can manage chat room settings, they cannot post in an auditorium chat room unless they are **Presenters**.

1.7.6.5.5 Disabling or Enabling a Chat Room

Disabling or Enabling a Chat Room

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Categories, Rooms, and Add-Ins >

Topic Last Modified: *2012-10-06*

If the topic of a Persistent Chat room is no longer relevant, you can make the chat room unavailable to users by disabling it. When a chat room is disabled, all members are immediately disconnected from the room. After a chat room is disabled, users cannot rejoin it or find it in chat room searches.

A disabled chat room can be enabled later by a Persistent Chat administrator. If a chat room is disabled, its membership list and other settings are preserved. If you enable the room again, you do not need to manually re-create the settings.

If the chat room’s history persists (chat room history persistence is an optional setting on a category that applies to all rooms within the category; the default is that it is persisted, but can be turned off by setting the category’s **Enable Chat History** to false), the content is preserved when the chat room is disabled. However, that content will not appear in searches during the time that the chat room remains in a disabled state. If you later enable the chat room, users can search for messages that were posted before the chat room was disabled.

For details about disabling and enabling chat rooms by using the Windows PowerShell command-line interface, see "Room Management" in Configuring Persistent Chat Server by Using Windows PowerShell Cmdlets.

For details about configuring chat rooms, see Configure Rooms in the Deployment documentation.

1.7.6.5.6 Moving a Chat Room from One Category to Another

Moving a Chat Room from One Category to Another

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Categories, Rooms, and Add-Ins >

Topic Last Modified: *2012-11-01*

We recommend that you do not change the category of a Persistent Chat room after the chat room is created. However, if the chat room manager has **Creator** privileges in another category, he or she can move the room from one category to another. The room is not deleted and recreated. It is a change of association within the database.

Changing a chat room category should be done rarely. A category determines the allowed membership for the chat room, so when a chat room is moved to another category, all the system access control lists (SACLs) that are no longer supported by the new category are purged. For example, if a user was a member of the room and is no longer an **AllowedMember** in the new category, the room membership will be modified and the user will be removed from the room.

For details about moving a chat room by using the Windows PowerShell command-line interface, see "Room Management" in Configuring Persistent Chat Server by Using Windows PowerShell Cmdlets.

For details about configuring chat rooms, see Configure Rooms in the Deployment documentation.

1.7.6.5.7 Deleting a Chat Room or Category

Deleting a Chat Room or Category

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Categories, Rooms, and Add-Ins >

Topic Last Modified: *2012-11-01*

Persistent Chat rooms can be deleted. If you have a chat room that is no longer being used, you can disable it. For details, see Disabling or Enabling a Chat Room.

A Persistent Chat administrator can query for disabled chat rooms, and can periodically purge and permanently delete the chat rooms, by using the Windows PowerShell cmdlet, **Remove-CsPersistentChatRoom**.

Categories can be deleted. However, to delete a category, you must first either delete all chat rooms under it or move the chat rooms to a new category, leaving an empty category for deletion. Persistent Chat Server does not allow you to delete a category that contains chat rooms. For details, see Moving a Chat Room from One Category to Another.

For details about deleting empty categories by using the Windows PowerShell command-line interface, see "Room Management" in Configuring Persistent Chat Server by Using Windows PowerShell Cmdlets.

For details about chat rooms and categories, see Configure Rooms and Configure Categories in the Deployment documentation.

1.7.6.5.8 Deleting a Message or Purging Obsolete Messages

Deleting a Message or Purging Obsolete Messages

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Categories, Rooms, and Add-Ins >

Topic Last Modified: *2012-10-06*

A Persistent Chat administrator can delete a message from a Persistent Chat room (and, optionally, can replace it with another message). Administrators can also purge obsolete messages as part of ongoing maintenance, to minimize growth of the database.

1.7.6.6 Managing Persistent Chat User Access

Managing Persistent Chat User Access

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013, Persistent Chat Server >

Topic Last Modified: *2012-10-06*

The following topics describe how to use the Lync Server 2013 Control Panel and the **Persistent Chat** page to manage user access in Persistent Chat. To manage Persistent Chat Server, you must have Persistent Chat administrator rights and permissions in the system. When you install Persistent Chat Server, you specify one or more users who have the necessary Persistent Chat administrator rights and permissions. To grant administrator rights and permissions to additional user accounts, use **Manage Users and User Groups**. For details, see Enabling a User to Manage Categories, Chat Rooms, and User Rights and Permissions.

- Adding Domains of Users and User Groups to the Room Category
- Disabling Uploading and Downloading Files in Chat Rooms
- Enabling a User to Manage Categories, Chat Rooms, and User Rights and Permissions

1.7.6.6.1 Adding Domains of Users and User Groups to the Room Category

Adding Domains of Users and User Groups to the Room Category

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Persistent Chat User Access >

Topic Last Modified: *2012-08-01*

To add domains of users and user groups to the room category, see Configure Categories and Manage Categories in the Deployment documentation.

1.7.6.6.2 Disabling Uploading and Dow nloading Files in Chat Rooms

Disabling Uploading and Downloading Files in Chat Rooms

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Persistent Chat User Access >

Topic Last Modified: *2012-09-12*

By default, users can upload and download files in the messages that they post. You can disable this functionality and prevent users from uploading and downloading files in two ways:

- Prevent all users from uploading and downloading files in a certain Persistent Chat room or chat room category.
- Prevent a certain user from uploading and downloading files in any chat room. The user cannot upload and download files in any chat room, including chat rooms that allow file uploading and downloading.

For details about enabling and disabling file uploading and downloading, see Configure Categories and Manage Categories in the Deployment documentation.

1.7.6.6.3 Enabling a User to Manage Categories, Chat Rooms, and User Rights and Permissions

Enabling a User to Manage Categories, Chat Rooms, and User Rights and Permissions

Operations > Managing Lync Server 2013, Persistent Chat Server > Managing Persistent Chat User Access >

Topic Last Modified: *2012-11-01*

Members of the **CsPersistentChatAdministrator** role (Persistent Chat administrators) can grant chat room manager rights and permissions to other users and to themselves.

A Persistent Chat administrator can do the following:

- Create room categories and chat rooms.
- Set the membership of all categories and chat rooms.
- Manage all settings of all categories and chat rooms.
- Enable or disable policy for Persistent Chat Server.
- Set and manage configuration settings on a Persistent Chat Server pool.

For details, see Adding a Persistent Chat Administrator in the Deployment documentation.

1.7.6.7 Operating and Maintaining the Persistent Chat System

Operating and Maintaining the Persistent Chat System

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013, Persistent Chat Server >

Topic Last Modified: *2012-11-01*

The following topics describe how to maintain the computer that is running Persistent Chat Server and how to manage Persistent Chat Server operations.

- Backing Up the Persistent Chat Database and Compliance Database
- Customizing the XSLT Definition File
- Replacing the XmlAdapter with a Customized Persistent Chat Server Compliance Adapter
- Managing System Health
- Monitoring, Starting, and Stopping the Persistent Chat Services
- Managing High Availability and Disaster Recovery

1.7.6.7.1 Backing Up the Persistent Chat Database and Compliance Database

Backing Up the Persistent Chat Database and Compliance Database

Operations > Managing Lync Server 2013, Persistent Chat Server > Operating and Maintaining the Persistent Chat System >

Topic Last Modified: *2012-08-01*

You should regularly back up the Persistent Chat database and the compliance database. Contact the database administrator to determine the best way to do this in your environment.

1.7.6.7.2 Customizing the XSLT Definition File

Customizing the XSLT Definition File

Operations > Managing Lync Server 2013, Persistent Chat Server > Operating and Maintaining the Persistent Chat System >

Topic Last Modified: *2012-11-01*

The Compliance service records and archives data related to each Lync Server 2013, Persistent Chat Server conversation, including when a participant:

- Joins a Persistent Chat room
- Leaves a chat room
- Posts a message
- Views chat history
- Uploads a file
- Downloads a file

The data is delivered as XML, which you can transform into the format that best fits your organization, by using an XSLT definition file. This topic describes the XML file that the Compliance service creates. It also provides samples of XSLT definition and output files.

Output Format

The Compliance service output is categorized by conversation (the Conversation element) and then by message (the Messages element), as shown in the following code sample.

```
<?xml version="1.0" encoding="utf-8" ?>
<Conversations xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="h
  <Conversation>
    <Channel uri="ma-chan://litwareinc.com/300" name="ma-chan://litwareinc.com/30
    <!--FirstMessage goes here --!>
    <Messages>
      <!–Messages go here--!>
    </Messages>
    <StartTimeUTC since1970="1212610540953" string="2008-06-04T20:15:40.9535482Z"
    <EndTimeUTC since1970="1212610602532" string="2008-06-04T20:16:42.5324614Z" l
  </Conversation>
</Conversations>
```

A Conversation element contains four elements (Channel, FirstMessage, StartTimeUTC, and EndTimeUTC). The Channel element contains the Uniform Resource Identifier (URI) of the chat room, and the FirstMessage element describes the first message in the Messages element. The StartTimeUTC and EndTimeUTC elements provide the start and end times for the conversation, as shown in the following code sample.

```
<<FirstMessage type="JOIN" content="" id="0">
      <Sender UserName="TestUser kazuto" id="10" email="kazuto@litwareinc.com" in
      <DateTimeUTC since1970="1212610540953" string="2008-06-04T20:15:40.9535482Z
</FirstMessage>
```

A Message element contains two elements (Sender and DateTimeUTC) and three attributes (Type, Content, and ID). The Sender element represents the user who sends the message, and the DateTimeUTC element represents when an event occurs, as shown in the following code sample.

```
<Message type="JOIN" content="" id="0">
  <Sender UserName="TestUser kazuto" id="10" email="kazuto@litwareinc.com" intern
  <DateTimeUTC since1970="1206211842612" string="2008-03-22T18:50:42.6127374Z" lo
</Message>
```

The following table describes the message attributes Type, Content, and ID.

Messages Element Attributes

Attribute	Description	Optional/Required
Type	Specifies the message type. The message types are described in the Message Elements Message Types table.	Required
Content	Contains the content of the message. Messages with a Type of Join or Part do not use this attribute.	Optional
ID	Specifies the unique ID of the content. This attribute is used only with messages	Optional

	with a Type of Chat.	

Each Sender element contains five attributes: the user name, ID, email, internal, and URI. These attributes are described in the following table.

Sender Element Attributes

Attribute	Description	Optional/Required
Username	The name of the sender.	Optional
ID	The sender’s unique ID.	Required
Email	The sender’s email address.	Optional
Internal	Determines whether the user is an internal user or a federated user. If the value is set to true, the user is internal.	Optional
Uri	The user’s SIP URI.	Required

The following table describes the message types that the Messages element can contain. It also provides examples of how each element is used.

Message Element Message Types

Message Type	Description	Code example

Join	A user joins a chat room.	<Message type="JOIN" conten
		  <Sender UserName="TestUse
		  <DateTimeUTC since1970="
		</Message

Part	A user leaves a chat room.	<Message type="PART" conten
		  < Sender UserName="TestUs
		  <DateTimeUTC since1970="
		</Message>

Chat	The sender’s email address.	<Message type="CHAT" conten
		  <Sender UserName="TestUse
		  <DateTimeUTC since1970="
		</Message>

Backchat	A user requests content from chat history.	<Message type="BACKCHAT" co
		  <Sender UserName="TestUse
		  <DateTimeUTC since1970="
		</Message>

File upload	A user uploads a file.	<Message type="FILEUPLOAD"
		  <Sender UserName="TestUse
		  <DateTimeUTC since1970="
		</Message>

File download	A user downloads a file.	<Message type="FILEDOWNLOAD
		  <Sender UserName="kazuto
		  <DateTimeUTC since1970="
		</Message>

Default Persistent Chat Output XSD and Example XSL Transform

The following code sample contains the default output from the Compliance Server.

```
<?xml version="1.0" encoding="utf-8"?>
<xs:schema id="Conversations" xmlns="" xmlns:xs="http://www.w3.org/2001/XMLSchema
```

```
 <xs:simpleType name="ComplianceMessageType">
    <xs:restriction base="xs:string">

```

1.7.6.7.3 Replacing the XmlAdapter with a Customized Persistent Chat Server Compliance Adapter

Replacing the XmlAdapter with a Customized Persistent Chat Server Compliance Adapter

Operations > Managing Lync Server 2013, Persistent Chat Server > Operating and Maintaining the Persistent Chat System >

Topic Last Modified: *2012-11-01*

You can write a custom adapter instead of using the XmlAdapter that is installed with Persistent Chat Server. To accomplish this, you must provide a .NET Framework assembly that contains a public class that implements the **IComplianceAdapter** interface. You must place this assembly in the Persistent Chat Server installation folder of each server in your Persistent Chat Server pool. Any one of the Compliance servers can provide compliance data to your adapter, but the compliance servers will not provide duplicate compliance data to multiple instances of your adapter.

Implementing the IComplianceAdapter interface

The interface is defined in the Compliance.dll assembly in the namespace `Microsoft.Rtc.Internal.Chat.Server.Compliance`. The interface defines two methods that your custom adapter must implement.

```
void SetConfig(AdapterConfig config)
```

The Persistent Chat Compliance server will call this method when the adapter first loads. The `AdapterConfig` contains the Persistent Chat compliance configuration that is relevant to the compliance adapter.

```
void Translate(ConversationCollection conversations)
```

The Persistent Chat Compliance server calls this method at periodic intervals as long as there is new data to translate. This time interval is equal to the `RunInterval` as set in the Persistent Chat Compliance configuration.

The `ConversationCollection` contains the conversation information that was collected from the last time this method was called.

1.7.6.7.4 Managing System Health

Managing System Health

Operations > Managing Lync Server 2013, Persistent Chat Server > Operating and Maintaining the Persistent Chat System >

Topic Last Modified: *2012-11-01*

System health management and monitoring is integrated into the overall Lync Server 2013 health management and monitoring. For details, see Health Configuration in Lync Server 2013.

1.7.6.7.5 Monitoring, Starting, and Stopping the Persistent Chat Services

Monitoring, Starting, and Stopping the Persistent Chat Services

Operations > Managing Lync Server 2013, Persistent Chat Server > Operating and Maintaining the Persistent Chat System >

Topic Last Modified: *2012-10-06*

The Persistent Chat services and Persistent Chat Compliance services are part of the Lync Server 2013 topology and can therefore be monitored, stopped, and started by using the Windows PowerShell cmdlets, **get-CsWindowsService**, **stop-CsWindowsService**, and **start-CsWindowsService**, respectively.

1.7.6.7.6 Managing High Availability and Disaster Recovery

Managing High Availability and Disaster Recovery

Operations > Managing Lync Server 2013, Persistent Chat Server > Operating and Maintaining the Persistent Chat System >

Topic Last Modified: *2012-08-03*

The following topics describe how to configure high availability, disaster recovery, failing over, and failing back for Persistent Chat Server.

- Configuring for Persistent Chat High Availability and Disaster Recovery
- Failing Over and Failing Back Persistent Chat Server

1.7.6.7.6.1 Configuring for Persistent Chat High Availability and Disaster Recovery

Configuring for Persistent Chat High Availability and Disaster Recovery

Managing Lync Server 2013, Persistent Chat Server > Operating and Maintaining the Persistent Chat System > Managing High Availability and Disaster Recovery >

Topic Last Modified: *2012-10-06*

For details about how to configure the Persistent Chat services for high availability and disaster recovery, see Deploying Persistent Chat Server.

1.7.6.7.6.2 Failing Over and Failing Back Persistent Chat Server

Failing Over and Failing Back Persistent Chat Server

Managing Lync Server 2013, Persistent Chat Server > Operating and Maintaining the Persistent Chat System > Managing High Availability and Disaster Recovery >

Topic Last Modified: *2012-08-03*

To fail over and fail back Lync Server 2013, Persistent Chat Server, you should be familiar with replication and failover processes for Microsoft SQL Server 2008 R2 and later. You should also be familiar with the Persistent Chat Server services.

In This Section

- Failing Over Persistent Chat Server
- Failing Back Persistent Chat Server

Failing Over Persistent Chat Server

Operating and Maintaining the Persistent Chat System > Managing High Availability and Disaster Recovery > Failing Over and Failing Back Persistent Chat Server >

Topic Last Modified: *2012-11-01*

Failover for Persistent Chat Server is designed to be mainly a manual process.

The failover procedure is based on the assumption that the secondary data center is up and running, but the Persistent Chat Server services where the primary Persistent Chat database is located are completely unavailable, including the following:

- Persistent Chat Server primary database and Persistent Chat Server mirror database are down.
- Lync Server Front End Server is down.

The procedure is based on two basic steps:

- Recover the primary Persistent Chat database (mgc).
- Establish mirroring for the new primary database.

The Persistent Chat compliance database (mgccomp) is not failed over. The contents of this database are transient and are purged as the compliance adapter processes the data. It is your responsibility, as Persistent Chat Administrator, to correctly manage the adapter output to avoid data loss.

To fail over Persistent Chat Server

1. Remove log shipping from the Persistent Chat Server Backup Log Shipping database.
   1.a. Using SQL Server Management Studio, connect to the database instance where the Persistent Chat Server backup mgc database is located.
   1.b. Open a query window to the master database.
   1.c. Use the following command to drop log shipping:

```
exec sp_delete_log_shipping_secondary_database mgc
```

2. Copy any uncopied backup files from the backup share to the copy destination folder of the backup server.
3. Apply any unapplied transaction log backups in sequence to the secondary database. For details, see "How to: Apply a Transaction Log Backup (Transact-SQL)" at http://go.microsoft.com/fwlink/p/?linkid=247428.
4. Bring the backup mgc database online. Using the query window that opens in step 1b, do the following:
   4.a. End all connections to the mgc database, if there are any:
      4.a.a. **\exec sp_who2** to identify connections to the mgc database.
      4.a.b. **\kill <spid>** to end these connections.
   4.b. Bring the database online:
      4.b.a. **\restore database mgc with recovery**.
5. In Lync Server Management Shell, use the **Set-CsPersistentChatState service:PersistentChatPoolFqdn –PoolState FailedOver** cmdlet to fail over to the mgc backup database.
   The mgc backup database now serves as the primary database.
6. In Lync Server Management Shell, use the **Install-CsMirrorDatabase** cmdlet to establish a high availability mirror for the backup database that now serves as the primary database. Use the backup database instance as the primary database and the backup mirror database instance as the mirror instance. This is not the same mirror as the one that was initially configured for the primary database during setup. For details, see the section "Using Lync Server Management Shell Cmdlets" in Deploying SQL Mirroring for Back End Server High Availability.
7. Set the Persistent Chat Server active servers. From the Lync Server Command Shell, use the **Set-CsPersistentChatActiveServer** cmdlet to set the list of active servers.

   > **Important:**
   > All the active servers must be located within the same data center as the new primary database, or in a data center that has a low latency/high bandwidth connection to the database.

   At this point, the failover from the Persistent Chat Server primary database to the Persistent Chat Server backup database completes successfully.

Failing Back Persistent Chat Server

Operating and Maintaining the Persistent Chat System > Managing High Availability and Disaster Recovery > Failing Over and Failing Back Persistent Chat Server >

Topic Last Modified: *2012-11-01*

This procedure outlines the steps necessary to recover from a Persistent Chat Server failure, and to reestablish operations from the primary data center.

During Persistent Chat Server failure, the primary data center suffers complete outage, and the primary and mirror databases become unavailable. The primary data center fails over to the backup server.

The following procedure restores normal operation after the primary data center is back up, and the servers have been rebuilt. The procedure assumes that the primary data center has been recovered from total outage, and that the mgc database and the mgccomp database have been rebuilt and reinstalled by using Topology Builder.

The procedure also assumes that no new mirror and backup servers were deployed during the failover period, and that the only server deployed is the backup server and its mirror server, as defined in Failing Over Persistent Chat Server.

These steps are designed to recover configuration as it existed prior to the disaster, resulting in failover from the primary server to the backup server.

To fail back Persistent Chat Server

1. Clear all servers from the Persistent Chat Server Active Server list by using the `Set-CsPersistentChatActiveServer` cmdlet from the Lync Server Management Shell. This stops all Persistent Chat Servers from connecting to the mgc database and the mgccomp database during failback.

> **Important:**
>
> The SQL Server agent on the secondary Persistent Chat Server Back End Server should be running under a privileged account. Specifically, the account must include:
>
> - Read access to the network share that backups are being placed in.
> - Write access to the specific local directory that the backups are being copied to.

1. Disable mirroring on the backup mgc database:
   - Using SQL Server Management Studio, connect to the backup mgc instance.
   - Right-click the mgc database, point to **Tasks**, and then click **Mirror**.
   - Click **Remove Mirroring**.
   - Click **OK**.
   - Perform the same steps with the mgccomp database.
2. Back up the mgc database so that it can be restored to the new primary database:
   - Using SQL Server Management Studio, connect to the backup mgc instance.
   - Right-click the mgc database, point to **Tasks**, and then click **Back Up**. The **Back Up Database** dialog box appears.
   - In **Backup type**, select **Full**.
   - For **Backup component**, click **Database**.
   - Either accept the default backup set name suggested in **Name**, or enter a different name for the backup set.
   - *<Optional>* In **Description**, enter a description of the backup set.
   - Remove the default backup location from the destination list.
   - Add a file to the list by using the path to the share location that you established for log shipping. This path is available to the primary database and to the backup database.
   - Click **OK** to close the dialog box and begin the backup process.
3. Restore the primary database by using the backup database created in the previous step.
   - Using SQL Server Management Studio, connect to the primary mgc instance.
   - Right-click the mgc database, point to **Tasks**, point to **Restore**, and then click **Database**. The **Restore Database** dialog box appears.
   - Select **From Device**.
   - Click the browse button, which opens the **Specify Backup** dialog box. In **Backup media**, select **File**. Click **Add**, select the backup file that you created in step 3, and then click **OK**.
   - In **Select the backup sets to restore**, select the backup.
   - Click **Options** in the **Select a page** pane.
   - In **Restore options**, select **Overwrite the existing database**.
   - In **Recovery State**, select **Leave the database ready to use**.
   - Click **OK** to begin the restoration process.
4. Configure SQL Server Log Shipping for the primary database. Follow the procedures in Configuring Persistent Chat Server for High Availability and Disaster Recovery to establish log shipping for the primary mgc database.

5. Set the Persistent Chat Server active servers. From the Lync Server Management Shell, use the **Set-CsPersistentChatActiveServer** cmdlet to set the list of active servers.

Important:
All the active servers must be located within the same data center as the new primary database, or in a data center that has a low latency/high bandwidth connection to the database.

1.7.7.1.1 Defining Translation Rules

Defining Translation Rules

See Also

Deployment > Deploying Enterprise Voice > Configuring Trunks >

Topic Last Modified: *2013-02-22*

Lync Server 2013 Enterprise Voice routes calls based on phone numbers normalized to E.164 format. This means that all dialed strings must be normalized to E.164 format for the purpose of performing reverse number lookup (RNL) so they can be translated to their matching SIP URI. Lync Server 2013 provides the ability to manipulate the called ID and the caller ID presentation.

This section discusses how to manipulate the called ID and caller ID.

- Caller ID Presentation
- Called ID Presentation

Defining Normalization Rules

1.7.7.1.1.1 Caller ID Presentation

Caller ID Presentation

Deploying Enterprise Voice > Configuring Trunks > Defining Translation Rules >

Topic Last Modified: *2013-02-22*

With Lync Server 2010, the called party’s phone number (that is, the phone number called) can be translated from E.164 format to the local dialing format that is required by the *trunk peer* (that is, the associated gateway, private branch exchange (PBX), or SIP trunk). To do this, you must define one or more translation rules to translate the Request URI before routing it to the trunk peer.

Lync Server 2013 introduces the option to also translate the calling party’s phone number (that is, the phone number that the caller is calling from) from E.164 format to the local dialing format that is required by the trunk peer. For example, you can write a translation rule to remove +44 from the beginning of a dial string and replace it with 0144.

To configure Caller ID by using Lync Server Control Panel

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**, and then click **Trunk Configuration**.
4. On the **Trunk Configuration** page, double-click an existing trunk (for example, the **Global** trunk) to display the **Edit Trunk Configuration** dialog box.
5. To configure caller ID presentation:
    - To choose one or more rules from a list of all translation rules available in your Enterprise Voice deployment, click **Select**. In **Calling number translation rules**, click the rules that you want to associate with the trunk, and then click **OK**.
    - To define a new translation rule and associate it with the trunk, click **New**. For details about defining a new rule, see Defining Translation Rules in the Deployment documentation.
    - To edit a translation rule that is already associated with the trunk, click the rule name, and then click **Show details**. For details, see Defining Translation Rules in the Deployment documentation.
    - To copy an existing translation rule to use as a starting point for defining a new rule, click the rule name and click **Copy**, and then click **Paste**. For details, see Defining Translation Rules.

- To remove a translation rule from the trunk, highlight the rule name and click **Remove**.

⚠Warning:

Do not associate translation rules with a trunk if you have configured translation rules on the associated trunk peer, because the two rules might conflict.

1.7.7.1.1.2 Called ID Presentation

Called ID Presentation

Topic Last Modified: *2012-09-21*

With Lync Server 2010, the called party’s phone number (that is, the phone number called) can be translated from E.164 format to the local dialing format that is required by the *trunk peer* (that is, the associated gateway, private branch exchange (PBX), or SIP trunk). To do this, you must define one or more translation rules to translate the Request URI before routing it to the trunk peer.

Important:

The ability to associate one or more translation rules with an Enterprise Voice trunk configuration is intended to be used as an *alternative* to configuring translation rules on the trunk peer. Do not associate translation rules with an Enterprise Voice trunk configuration if you have configured translation rules on the trunk peer because the two rules might conflict.

You can use either of the following methods to create or modify a translation rule:

- Use the **Build a Translation Rule** tool to specify values for the starting digits, length, digits to remove and digits to add, and then let Lync Server Control Panel generate the corresponding matching pattern and translation rule for you.
- Write regular expressions manually to define the matching pattern and translation rule.

Note:

For information about how to write regular expressions, see ".NET Framework Regular Expressions" at http://go.microsoft.com/fwlink/p/?linkId=140927.

- Create or Modify a Translation Rule by Using the Build a Translation Rule Tool
- Create or Modify a Translation Rule Manually

Create or Modify a Translation Rule by Using the Build a Translation Rule Tool

See Also

Configuring Trunks > Defining Translation Rules > Called ID Presentation >

Topic Last Modified: *2012-10-05*

Follow these steps if you want to define a translation rule by entering a set of values in the **Build a Translation Rule** tool and enabling Lync Server Control Panel to generate the corresponding matching pattern and translation rule for you. Alternatively, you can a write regular expression manually to define the matching pattern and translation rule. For details, see Create or Modify a Translation Rule Manually.

⊟To define a rule by using the Build a Translation Rule tool

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. To begin defining a translation rule, follow the steps in Configure a Trunk with Media Bypass through step 10 or Configure a Trunk without Media Bypass through step 9.
4. Under **Name** on the **New Translation Rule** or **Edit Translation Rule** page, type a name that describes the number pattern being translated.
5. (Optional) Under **Description**, type a description of the translation rule, for example **US International long-distance dialing**.
6. In the **Build a Translation Rule** section of the dialog box, enter values in the following fields:
   - **Starting digits**: (Optional) Specify the leading digits of numbers you want the pattern to match. For example, enter **+** in this field to match numbers in E.164 format (which begin with +).
   - **Length**: Specify the number of digits in the matching pattern and select whether you want the pattern to match numbers that are this length exactly, at least this length, or any length. For example, enter **11** and select **At least** in the drop-down list to match numbers that are at least 11 digits in length.
   - **Digits to remove**: (Optional) Specify the number of starting digits to be removed. For example, enter **1** to strip out the **+** from the beginning of the number.
   - **Digits to add**: (Optional) Specify digits to be prepended to the translated numbers. For example, enter **011** if you want 011 to be prepended to the translated numbers when the rule is applied.

   The values you enter in these fields are reflected in the **Pattern to match** and **Translation rule** fields. For example, if you specify the preceding example values, the resulting regular expression in the **Pattern to match** field is:

   ^\+(\d{9}\d+)$

   The **Translation rule** field specifies a pattern for the format of translated numbers. This pattern has two parts:

   - A value (for example, **$1**) that represents the number of digits in the matching pattern
   - (Optional) A value that you can prepend by entering it in the **Digits to add** field

   Using the preceding example values, **011$1** appears in the **Translation rule** field.

   When this translation rule is applied, +441235551010 becomes 011441235551010.
7. Click **OK** to save the translation rule.
8. Click **OK** to save the trunk configuration.
9. On the **Trunk Configuration** page, click **Commit**, and then click **Commit all**.

> **Note:**
>
> Whenever you create or modify a translation rule, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

Follow these steps if you want to define a translation rule by writing a regular expression for the matching pattern and translation rule. Alternatively, you can enter a set of values in the **Build a Translation Rule** tool and enable Lync Server Control Panel to generate the corresponding matching pattern and translation rule for you. For details, see Create or Modify a Translation Rule by Using the Build a Translation Rule Tool.

To define a translation rule manually

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. To begin defining a translation rule, follow the steps in Configure a Trunk with Media Bypass through step 10 or Configure a Trunk without Media Bypass through step 9.
4. In the **Name** field on the **New Translation Rule** or **Edit Translation Rule** page, type a name that describes the number pattern being translated.
5. (Optional) In **Description**, type a description of the translation rule, for example **US International long-distance dialing**.
6. Click **Edit** at the bottom of the **Build a Translation Rule** section.
7. Enter the following in **Type a Regular Expression**:
   - In **Match this pattern**, specify the pattern that will be used to match the numbers to be translated.
   - In **Translation rule**, specify a pattern for the format of translated numbers.

   For example, if you enter **^\+(\d{9}\d+)$** in **Match this pattern** and **011$1** in **Translation rule**, the rule will translate +441235551010 to 011441235551010.
8. Click **OK** to save the translation rule.
9. Click **OK** to save the trunk configuration.
10. On the **Trunk Configuration** page, click **Commit**, and then click **Commit all**.

> **Note:**
> Whenever you create or modify a translation rule, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

1.7.7.1.2 Defining Normalization Rules

Defining Normalization Rules

See Also

Deployment > Deploying Enterprise Voice > Configuring Dial Plans >

Topic Last Modified: *2012-09-23*

Lync Server 2013 normalization rules use .NET Framework regular expressions to translate dialed phone numbers to E.164 format. Each dial plan must be assigned one or more normalization rules.

For details about normalization rules, see Dial Plans and Normalization Rules in the Planning documentation.

For details about how to write regular expressions, see ".NET Framework Regular Expressions" at http://go.microsoft.com/fwlink/p/?linkId=140927.

You can use either of the following methods to define or edit a normalization rule:

- Use the **Build a Normalization Rule** tool to specify values for the starting digits, length, digits to remove and digits to add, and then let Lync Server Control Panel generate the corresponding matching pattern and translation rule for you.
- Write regular expressions manually to define the matching pattern and translation rule.
- Create or Modify a Normalization Rule by Using Build a Normalization Rule

Topic Last Modified: *2012-11-01*

Complete the following steps if you want to create or modify a normalization rule in Lync Server Control Panel. Alternatively, if you want to create or modify a normalization rule manually, see Create or Modify a Normalization Rule Manually.

⊟To define a rule by using Build a Normalization Rule

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.

2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. (Optional) Follow the steps in Create a Dial Plan through step 11 or Modify a Dial Plan through step 10.
4. In **New Normalization Rule** or **Edit Normalization Rule**, type a name that describes the number pattern being normalized in **Name** (for example, **5DigitExtension**).
5. (Optional) In **Description**, type a description of the normalization rule (for example, "Translates 5-digit extensions").
6. In **Build a Normalization Rule**, enter values in the following fields:
   - **Starting digits** (Optional) Specify the leading digits of dialed numbers you want the pattern to match. For example, type **425** if you want the pattern to match dialed numbers beginning with 425.
   - **Length** Specify the number of digits in the matching pattern and select whether you want the pattern to match this length exactly, match dialed numbers that are at least this length, or match dialed numbers of any length.
   - **Digits to remove** (Optional) Specify the number of starting digits to be removed from dialed numbers you want the pattern to match.
   - **Digits to add** (Optional) Specify digits to be added to dialed numbers you want the pattern to match.

   The values you enter in these fields are reflected in **Pattern to match** and **Translation rule**. For example, if you leave **Starting digits** empty, type **7** into the **Length** field and select **Exactly**, and specify **0** in **Digits to remove**, the resulting regular expression in the **Pattern to match** is:

   ^(\d{7})$
7. In **Translation rule**, specify a pattern for the format of translated E.164 phone numbers as follows:
   - A value that represents the number of digits specified in the matching pattern. For example, if the matching pattern is **^(\d{7})$** then **$1** in the translation rule represents 7-digit dialed numbers.
   - (Optional) Type a value into the **Digits to add** field to specify digits to be prepended to the translated number (for example, **+1425**).

   For example, if **Pattern to match** contains **^(\d{7})$** as the pattern for dialed numbers and **Translation rule** contains **+1425$1** as the pattern for E.164 phone numbers, the rule normalizes 5550100 to +14255550100.
8. (Optional) If the normalization rule results in a phone number that is internal to your organization, select **Internal extension**.
9. (Optional) Enter a number to test the normalization rule, and then click **Go**. The test results are displayed under **Enter a number to test**.

   Note:
   You can save a normalization rule that does not yet pass the test and then reconfigure it later. For details, see Test Voice Routing.
10. Click **OK** to save the normalization rule.
11. Click **OK** to save the dial plan.
12. On the **Dial Plan** page, click **Commit**, and then click **Commit all**.

    Note:
    Whenever you create or change a normalization rule, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

Complete the following steps if you want to create or modify a normalization rule manually. If you want to create or modify a normalization rule by using Build a Normalization Rule in Lync Server Control Panel, see Create or Modify a Normalization Rule by Using Build a Normalization Rule.

⊟To define a normalization rule manually

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. (Optional) Follow the steps in Create a Dial Plan or Modify a Dial Plan.
4. In **New Normalization Rule** or **Edit Normalization Rule**, type a name that describes the number pattern being normalized in **Name** (for example, name the normalization rule **5DigitExtension**).
5. (Optional) In **Description** field, type a description of the normalization rule (for example, "Translates 5-digit extensions").
6. In **Build a Normalization Rule**, click **Edit**.
7. Enter the following in **Type a Regular Expression**:
   - In **Match this pattern**, specify the pattern that you want to use to match the dialed phone number.
   - In **Translation rule**, specify a pattern for the format of translated E.164 phone numbers.

   For example, if you enter **^(\d{7})$** in **Match this pattern** and **+1425$1** in **Translation rule**, the rule normalizes 5550100 to +14255550100.
8. (Optional) If the normalization rule results in a phone number that is internal to your organization, select **Internal extension**.
9. (Optional) Enter a number to test the normalization rule and then click **Go**. The test results are displayed under **Enter a number to test**.

   > **Note:**
   > You can save a normalization rule that does not yet pass the test and then reconfigure it later. For details, see Test Voice Routing.
10. Click **OK** to save the normalization rule.
11. Click **OK** to save the dial plan.

1.7.7.2 Configuring Trunks

Configuring Trunks

See Also

Microsoft Lync Server 2013 > Deployment > Deploying Enterprise Voice >

Topic Last Modified: *2012-11-01*

As part of Enterprise Voice deployment, you can configure a trunk between a Mediation Server and one or more of the following peers to provide public switched telephone network (PSTN) connectivity for Enterprise Voice clients and devices in your organization:

- SIP trunk connection to an Internet telephony service provider (ITSP)
- PSTN gateway
- Private branch exchange (PBX)

For details, see Planning for PSTN Connectivity in the Planning documentation.

Important:
Before you begin trunk configuration, verify that the topology has been created and that the Mediation Server and its peer have been configured and associated with one another. For details, see Define a Gateway in Topology Builder in the Deployment documentation.

Note:
As a part of trunk configuration, you can enable the Lync Server 2013 media bypass feature, which enables media to bypass the Mediation Server. Trunks can be configured either with or without media bypass enabled, but we strongly recommend that you enable it. For details, see Planning for Media Bypass in the Planning documentation.

Planning for Media Bypass

1.7.7.2.1 Multiple Trunk Support

Multiple Trunk Support

Deployment > Deploying Enterprise Voice > Configuring Trunks >

Topic Last Modified: *2012-11-01*

Lync Server 2013 functionality supports multiple associations between gateways and Mediation Servers. These associations are made by defining a trunk, which is a logical association between a Mediation Server pool and a public switched telephone network (PSTN) gateway, Session Border Controller (SBC), or IP-PBX. Use the Topology Builder to associate gateways with Mediation Servers (that is, trunks).

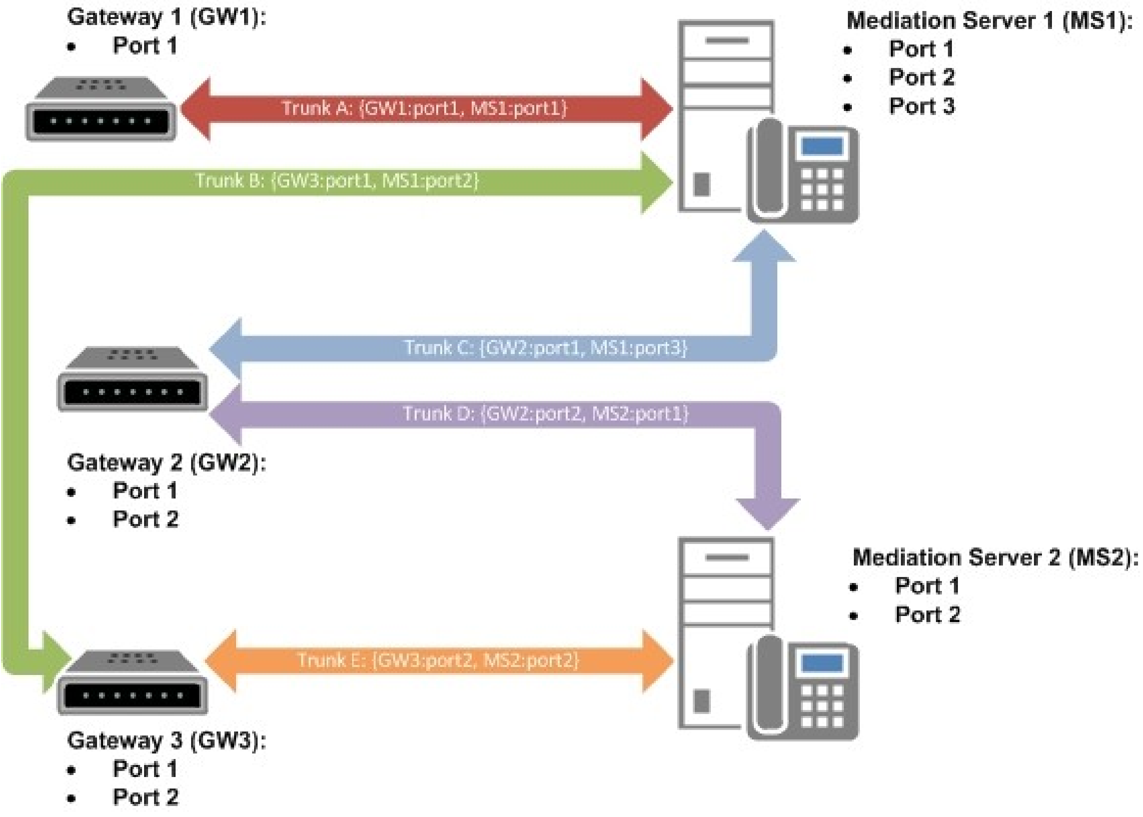
- To assign or remove a trunk in Lync Server 2013, you must first define a trunk in Topology Builder. A trunk consists of the following association: Mediation Server fully qualified domain name (FQDN), the Mediation Server listening port, the gateway FQDN, and the gateway listening port.
- To configure multiple trunks, you can create multiple associations between the same gateway and the Mediation Server. This provides additional resiliency to the Enterprise Voice infrastructure, which is especially useful in private branch exchange (PBX) interoperational scenarios.

When a trunk is defined, it must be associated to a route. To associate a trunk to a route, you define a simple name for the trunk in Topology Builder. This simple name is used as the trunk name in the Lync Server Control Panel, where trunks can be associated with routes. The simple trunk name is used as the gateway name from the Lync Server Management Shell.

```
New-CsVoiceRoute -Identity <RouteId> -NumberPattern <String> -PstnUsages @{add="<
```

The administrator must select a default trunk associated with a Mediation Server. From the Topology Builder, right-click the associated Mediation Server, and then click **Properties**. Specify the default gateway for the Mediation Server.

The following diagram illustrates the multiple trunks that are defined for each Mediation Server and gateway.



Gateway 1 (GW1):
Port 1
Trunk A: {GW1:port1, MS1:port1}
Trunk B: {GW3:port1, MS1:port2}
Mediation Server 1 (MS1):
Port 1
Port 2
Port 3
Trunk C: {GW2:port1, MS1:port3}
Trunk D: {GW2:port2, MS2:port1}
Gateway 2 (GW2):
Port 1
Port 2
Mediation Server 2 (MS2):
Port 1
Port 2
Trunk E: {GW3:port2, MS2:port2}
Gateway 3 (GW3):
Port 1
Port 2

1.7.7.2.2 Intertrunk Routing

Intertrunk Routing

Operations > Managing Voice Routing > Configuring Trunks >

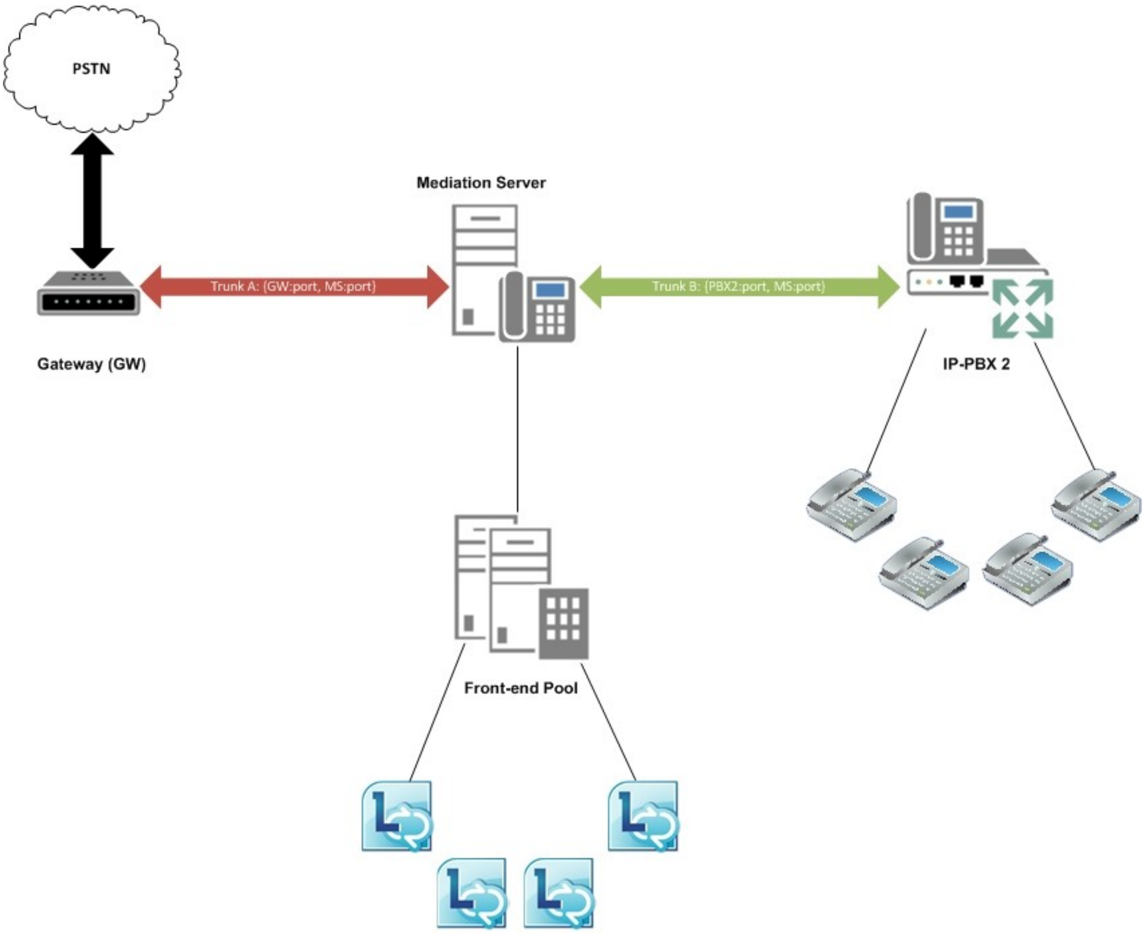
Topic Last Modified: *2012-10-20*

Lync Server 2013 can interconnect an IP-PBX to a public switched telephone network (PSTN) gateway so that calls from a PBX phone can be routed to the PSTN, and incoming PSTN calls can be routed to a private branch exchange (PBX) phone. Similarly, Lync Server 2013 can interconnect two or more IP-PBX systems so that calls can be placed and received between PBX phones from the different IP-PBX systems.

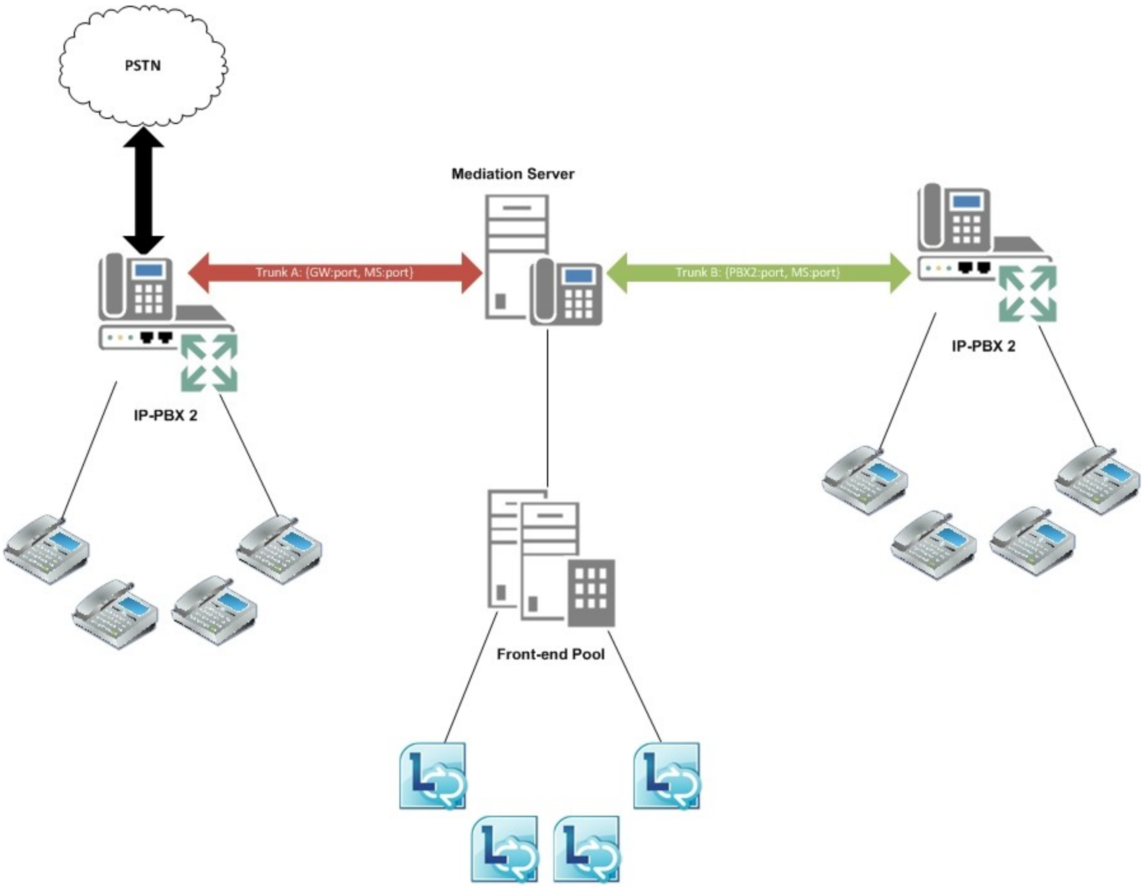
This intertrunk routing feature can be configured by using the Lync Server Management Shell cmdlet, **Set-CsTrunkConfiguration**, with the new parameter, PstnUsages. This parameter specifies the set of PSTN usage records to use. A trunk uses this PSTN usage to determine a route and to route all incoming calls accordingly.

```
Set-CsTrunkConfiguration -Identity <TrunkId> -PstnUsages @{add="<UsageString>"}
```

The following diagram illustrates Lync Server 2013 providing interconnectivity between a PSTN gateway and an IP-PBX.



The following diagram illustrates Lync Server 2013 interconnecting two IP-PBX systems.



1.7.7.2.3 View Trunk Configuration Information

View Trunk Configuration Information

Operations > Managing Voice Routing > Configuring Trunks >

Topic Last Modified: *2013-02-22*

SIP trunk configuration settings define the relationship and capabilities between a Mediation Server and the public switched telephone network (PSTN) gateway, an IP-public branch exchange (PBX), or a Session Border Controller (SBC) at the service provider. These settings do such things as specify:

- Whether media bypass should be enabled on the trunks.
- The conditions under which real-time transport control protocol (RTCP) packets are sent.
- Whether or not secure real-time protocol (SRTP) encryption is required on each trunk.

When you install Microsoft Lync Server 2013, a global collection of SIP trunk configuration settings is created for you. In addition, administrators can create custom setting collections at the site scope or at the service scope (for the PSTN gateway service, only).

⊟To view SIP trunk configuration information by using Lync Server Control Panel

1. In Lync Server Control Panel, click **Voice Routing** and then click **Trunk**

Configuration.

2. On the **Trunk Configuration** tab you will see a list of all your trunk configuration settings collection; for each collection you will see values for the **Name**, **Scope**, **State**, and **Media bypass** properties, along with the number of **PSTN usages**, **Calling number rules**, and **Called number rules** associated with the collection. To see additional details about a collection of trunk configuration settings, click the collection of interest, click **Edit**, and then click **Show details**. Note that you can view detailed information only for one collection of trunk configuration settings at a time.

Viewing SIP Trunk Configuration Information by Using Windows PowerShell Cmdlets

SIP trunk configuration settings can be viewed by using Lync Server PowerShell and the Get-CsTrunkConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view SIP trunk configuration information

- To view information about all your SIP trunk configuration settings, type the following command in the Lync Server Management Shell and then press ENTER:

```
Get-CsTrunkConfiguration
```

That will return information similar to this:

```
Identity                                  : Global
OutboundTranslationRulesList              : {}
SipResponseCodeTranslationRulesList       : {}
OutboundCallingNumberTranslationRulesList : {}
PstnUsages                                : {}
Description                               :
ConcentratedTopology                      : True
EnableBypass                              : False
EnableMobileTrunkSupport                  : False
EnableReferSupport                        : True
EnableSessionTimer                        : False
EnableSignalBoost                         : False
MaxEarlyDialogs                           : 20
RemovePlusFromUri                         : False
RTCPActiveCalls                           : True
RTCPCallsOnHold                           : True
SRTPMode                                  : Required
EnablePIDFLOSupport                       : False
EnableRTPLatching                         : False
EnableOnlineVoice                         : False
ForwardCallHistory                        : False
Enable3pccRefer                           : False
ForwardPAI                                : False
EnableFastFailoverTimer                   : True
```

For more information, see the help topic for the Get-CsTrunkConfiguration cmdlet.

Configure a Trunk with Media Bypass

See Also

Deployment > Deploying Enterprise Voice > Configuring Trunks >

Topic Last Modified: *2013-02-24*

Follow these steps to configure a trunk with media bypass enabled. To configure a trunk with media bypass disabled, see Configure a Trunk without Media Bypass.

We strongly recommend that you enable media bypass. However, before you enable media bypass on a SIP trunk, confirm that your qualified SIP trunk provider supports media bypass and is able to accommodate the requirements for successfully enabling the scenario. Specifically, the provider must have the IP addresses of servers in your organization's internal network. If the provider cannot support this scenario, media bypass will not succeed. For details, see Planning for Media Bypass in the Planning documentation.

Note:

Media bypass will not interoperate with every public switched telephone network (PSTN) gateway, IP-PBX, and Session Border Controller (SBC). Microsoft has tested a set of PSTN gateways and SBCs with certified partners and has done some testing with Cisco IP-PBXs. Media bypass is supported only with products and versions that are listed on Unified Communications Open Interoperability Program – Lync Server at http://go.microsoft.com/fwlink/p/?linkId=214406.

A trunk configuration as described below groups a set of parameters that are applied to trunks assigned this trunk configuration. A particular trunk configuration can be scoped globally (to all trunks that do not have more specific site or pool configuration), or to a site, or to a pool. The pool-level trunk configuration is used to scope a specific trunk configuration to a single trunk.

To configure a trunk with media bypass

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**, and then click **Trunk Configuration**.
4. On the **Trunk Configuration** page, use one of the following methods to configure a trunk:
   - Double-click an existing trunk (for example, the **Global** trunk) to display the **Edit Trunk Configuration** dialog box.
   - Click **New**, and then select a scope for the new trunk configuration:
     - **Site trunk:** Choose the site for this trunk configuration from **Select a Site**, and then click **OK**. Note that if a trunk configuration has already been created for a site, the site does not appear in **Select a Site**. This trunk configuration will be applied to all trunks in the site.
     - **Pool trunk:** Choose the name of the trunk that this trunk configuration applies to. This trunk can be the root trunk or any additional trunks defined in Topology Builder. From **Select a Service**, click **OK**. Note that if a trunk configuration has already been created for a specific trunk, the trunk does not appear in **Select a Service**.

> **Note:**
> After you select the scope of the trunk configuration, it cannot be changed. The **Name** field is prepopulated with the name of the trunk configuration's associated site or service and cannot be changed.

5. Specify a value in **Maximum early dialogs supported**. This is the maximum number of forked responses a public switched telephone network (PSTN) gateway, IP-PBX, or ITSP Session Border Controller (SBC) can receive to an INVITE that it sent to the Mediation Server. The default value is 20.

> **Note:**
> Before you change this value, consult your service provider or equipment manufacturer for details about the capabilities of your system.

6. Select one of the following **Encryption support level** options:
   - **Required:** Secure real-time transport protocol (SRTP) encryption must be used to help protect traffic between the Mediation Server and the gateway or private branch exchange (PBX).
   - **Optional:** SRTP encryption will be used if the service provider or equipment manufacturer supports it.
   - **Not Supported:** SRTP encryption is not supported by the service provider or equipment manufacturer and therefore will not be used.
7. Select the **Enable media bypass** check box if you want media to bypass the Mediation Server for processing by the trunk peer.

> **Important:**
> For media bypass to work successfully, the PSTN gateway, IP-PBX, or ITSP Session Border Controller must support certain capabilities. For details, see Planning for Media Bypass in the Planning documentation.

8. Select the **Centralized media processing** check box if there is a well-known media termination point (for example, a PSTN gateway where the media termination has the same IP as the signaling termination). Clear this check box if the trunk does not have a well-known media termination point.
9. If the trunk peer supports receiving SIP REFER requests from the Mediation Server, select the **Enable sending refer to the gateway** check box.

> **Note:**
> If you disable this option while the **Enable media bypass** option is selected, additional settings are required. If the trunk peer does not support receiving SIP REFER requests from the Mediation Server and media bypass is enabled, you must also run the **Set-CsTrunkConfiguration** cmdlet to disable RTCP for active and held calls in order to support proper conditions for media bypass. For details, see the Lync Server Management Shell documentation. Alternatively, you can select **Enable refer using third-party-call control** if you want transferred calls to be media bypassed, and the gateway does not support SIP REFER requests.

10. (Optional) To enable inter-trunk routing, associate and configure PSTN usage records to this trunk configuration. The PSTN usages associated to this trunk configuration will be applied for all incoming calls through the trunk that is not originating from a Lync endpoint. To manage PSTN usage records associated to a trunk configuration, use one of the following methods:
    - To select one or more records from a list of all PSTN usage records available in your Enterprise Voice deployment, click **Select**. Highlight the records you want to associate with this trunk configuration and then click **OK**.
    - To remove a PSTN usage record from this trunk configuration, select the record and click **Remove**.
    - To define a new PSTN usage record and associate it with this trunk configuration, do the following:
      - Click **New**.
      - In the **Name** field, specify a descriptive name for the record that is unique.

> **Note:**
> The PSTN usage record name must be unique within the Enterprise Voice deployment. After the record is saved, the **Name** field cannot be edited.

  - Use one of the following methods to associate and configure routes for this PSTN usage record:
    - To select one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**. Highlight the routes you want to associate with this PSTN usage record, and click **OK**.
    - To remove a route from the PSTN usage record, select the route, and click **Remove**.
    - To define a new route and associate it to this PSTN usage record, click **New**. For details, see Create a Voice Route.
    - To edit a route that is associated with this PSTN usage record, select the route, and click **Show details**. For details, see Modify a Voice Route.
  - Click **OK**.
- To edit a PSTN usage record that is already associated with this trunk configuration, do the following:
  - Select the PSTN usage record you want to edit, and click **Show details**.
  - Use one of the following methods to associate and configure routes for this PSTN usage record:
    - To select one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**. Highlight the routes you want to associate with this PSTN usage record, and click **OK**.
    - To remove a route from the PSTN usage record, select the route, and click **Remove**.
    - To define a new route and associate it to this PSTN usage record, click **New**. For details, see Create a Voice Route.
    - To edit a route that is associated with this PSTN usage record, select the route, and click **Show details**. For details, see Modify a Voice Route.
  - Click **OK**.

> **Important:**
> It important to associate PSTN usage records according to the Mediation Server peer that is associated to the trunk being configured. If the Mediation Server peer is a PSTN gateway or a Session Border Controller (SBC), it is strongly recommended that the trunk configuration is not associated to a PSTN usage record that routes to a PSTN destination or any other downstream systems connected via Lync Server.

11. Arrange the PSTN usage records for optimum performance. To change a record’s position in the list, select the PSTN usage record, and click the up or down arrows.

> **Important:**
> The order in which PSTN usage records are listed in the trunk configuration is significant. Lync Server traverses the list from top to down.

12. **Enable RTP Latching** should be selected to enable bypass media for clients behind a network address translation (NAT) or firewall and an SBC that supports latching.
13. **Enable forward call history** should be selected to enable sending of call history information to the gateway peer of the Mediation Server.
14. **Enable forward P-Asserted-Identity data** should be selected to enable the P-Asserted-Identity (PAI) call originator information to be forwarded between the Mediation Server side and gateway side (and vice versa), when present.
15. **Enable outbound routing failover timer** should be selected to enable fast failover. The gateway associated with this trunk can give notification within 10 seconds that it is processing an outbound call. Rerouting to another trunk will occur if this notification is not received by the Mediation Server. On networks where latency may delay the response time or the gateway takes

longer than 10 seconds to respond, the fast failover should be disabled.

16.(Optional) Associate and configure **calling number translation rules** for the trunk. These translation rules apply to the calling number for outbound calls

- To choose one or more rules from a list of all translation rules that are available in your Enterprise Voice deployment, click **Select**. In **Select Translation Rules**, click the rules that you want to associate with the trunk, and then click **OK**.
- To define a new translation rule and associate it with the trunk, click **New**. For details about defining a new rule, see Defining Translation Rules in the Deployment documentation.
- To edit a translation rule that is already associated with the trunk, click the rule name, and then click **Show details**. For details, see Defining Translation Rules in the Deployment documentation.
- To copy an existing translation rule to use as a starting point for defining a new rule, click the rule name and click **Copy**, and then click **Paste**. For details, see Defining Translation Rules.
- To remove a translation rule from the trunk, highlight the rule name and click **Remove**.

> ⚠**Warning:**
>
> Do not associate translation rules with a trunk if you have configured translation rules on the associated trunk peer, because the two rules might conflict.

17.(Optional) Associate and configure **called number translation rules** for the trunk. The translation rules apply to the called number in an outbound call.

- To choose one or more rules from a list of all translation rules that are available in your Enterprise Voice deployment, click **Select**. In **Select Translation Rules**, click the rules that you want to associate with the trunk, and then click **OK**.
- To define a new translation rule and associate it with the trunk, click **New**. For details about defining a new rule, see Defining Translation Rules in the Deployment documentation.
- To edit a translation rule that is already associated with the trunk, click the rule name, and then click **Show details**. For details, see Defining Translation Rules in the Deployment documentation.
- To copy an existing translation rule to use as a starting point for defining a new rule, click the rule name and click **Copy**, and then click **Paste**. For details, see Defining Translation Rules.
- To remove a translation rule from the trunk, highlight the rule name and click **Remove**.

> ⚠**Warning:**
>
> Do not associate translation rules with a trunk if you have configured translation rules on the associated trunk peer, because the two rules might conflict.

18.Make sure that the trunk’s translation rules are arranged in the correct order. To change a rule’s position in the list, highlight the rule name and then click the up or down arrow.

> ◆**Important:**
>
> Lync Server 2013 traverses the translation rule list from the top down and uses the first rule that matches the dialed number. If you configure a trunk so that a dialed number can match more than one translation rule, be sure that the more restrictive rules are sorted above the less restrictive rules. For example, if you have included a translation rule that matches any 11-digit number and a translation rule that matches only 11-digit numbers that start with +1425, be sure that the rule that matches any 11-digit number is sorted *below* the more restrictive rule.

19.When you are finished configuring the trunk, click **OK**.

20. On the **Trunk Configuration** page, click **Commit**, and then click **Commit all**.

Note:

Whenever you create or modify a trunk configuration, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

After you have configured the trunk, continue configuring media bypass by choosing between global media bypass options, as described in Global Media Bypass Options in the Deployment documentation.

Topic Last Modified: *2013-02-24*

If you want to configure a trunk with media bypass disabled, follow these steps. If you want to configure a trunk with media bypass enabled, see Configure a Trunk with Media Bypass.

A trunk configuration, as described below, groups a set of parameters that are applied to trunks assigned this trunk configuration. A particular trunk configuration can be scoped globally (to all trunks that do not have more specific site or pool configuration), or to a site, or to a pool. The pool-level trunk configuration is used to scope a specific trunk configuration to a single trunk.

⊟To configure a trunk without media bypass

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**, and then click **Trunk Configuration**.
4. On the **Trunk Configuration** page, use one of the following methods to configure a trunk:
   - Double-click an existing trunk (for example, the **Global** trunk) to display the **Edit Trunk Configuration** dialog box.
   - Click **New**, and then select a scope for the new trunk configuration:
     - **Site trunk:** Choose the site for this trunk configuration in **Select a Site** , and then click **OK**. Note that if a trunk configuration has already been created for a site, the site does not appear in **Select a Site**. This trunk

configuration will be applied to all trunks in the site.
- **Pool trunk:** Choose the name of the trunk that this trunk configuration applies to in **Select a Service** and click **OK**. This trunk can be the root trunk, or any additional trunks defined in Topology Builder. Note that if a trunk configuration has already been created for a specific trunk, the trunk does not appear in **Select a Service**.

> **Note:**
> After you select the scope of the trunk configuration, it cannot be changed. The **Name** field is prepopulated with the name of the trunk configuration's associated site or service and cannot be changed.

5. Select one of the following **Encryption support level** options:
   - **Required:** Secure real-time transport protocol (SRTP) encryption must be used to help protect traffic between the Mediation Server and the gateway or private branch exchange (PBX).
   - **Optional:** SRTP encryption will be used if the service provider or equipment manufacturer supports it.
   - **Not Supported:** SRTP encryption is not supported by the service provider or equipment manufacturer and therefore will not be used.
6. Be sure that the **Enable media bypass** check box is cleared.
7. Select the **Centralized media processing** check box if there is a well-known media termination point (for example, a public switched telephone network (PSTN) gateway where the media termination has the same IP as the signaling termination). Clear this check box if the trunk does not have a well-known media termination point.
8. If the trunk peer supports receiving SIP REFER requests from the Mediation Server, select the **Enable sending refer to the gateway** check box.
9. (Optional) To enable inter-trunk routing, associate and configure PSTN usage records to this trunk configuration. The PSTN usages associated to this trunk configuration will be applied for all incoming calls through the trunk that is not originating from a Lync endpoint. To manage PSTN usage records associated to a trunk configuration, use one of the following methods:
   - To select one or more records from a list of all PSTN usage records available in your Enterprise Voice deployment, click **Select**. Highlight the records you want to associate with this trunk configuration and then click **OK**.
   - To remove a PSTN usage record from this trunk configuration, select the record and click **Remove**.
   - To define a new PSTN usage record and associate it with this trunk configuration, do the following:
     - Click **New**.
     - In the **Name** field, specify a descriptive name for the record that is unique.

       > **Note:**
       > The PSTN usage record name must be unique within the Enterprise Voice deployment. After the record is saved, the **Name** field cannot be edited.

     - Use one of the following methods to associate and configure routes for this PSTN usage record:
       - To select one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**. Highlight the routes you want to associate with this PSTN usage record, and click **OK**.
       - To remove a route from the PSTN usage record, select the route, and click **Remove**.
       - To define a new route and associate it to this PSTN usage record, click **New**. For details, see Create a Voice Route.
       - To edit a route that is associated with this PSTN usage record, select the route, and click **Show details**. For details, see Modify a Voice Route.
     - Click **OK**.

- To edit a PSTN usage record that is already associated with this trunk configuration, do the following:
  - Select the PSTN usage record you want to edit, and click **Show details**.
  - Use one of the following methods to associate and configure routes for this PSTN usage record:
    - To select one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**. Highlight the routes you want to associate with this PSTN usage record, and click **OK**.
    - To remove a route from the PSTN usage record, select the route, and click **Remove**.
    - To define a new route and associate it to this PSTN usage record, click **New**. For details, see Create a Voice Route.
    - To edit a route that is associated with this PSTN usage record, select the route, and click **Show details**. For details, see Modify a Voice Route.
  - Click **OK**.

> ◆**Important:**
>
> It important to associate PSTN usage records according to the Mediation Server peer that is associated to the trunk being configured. If the Mediation Server peer is a PSTN gateway or a Session Border Controller (SBC), it is strongly recommended that the trunk configuration is not associated to a PSTN usage record that routes to a PSTN destination or any other downstream systems connected via Lync Server.

10.Arrange the PSTN usage records for optimum performance. To change a record’s position in the list, select the PSTN usage record, and click the up or down arrows.

> ◆**Important:**
>
> The order in which PSTN usage records are listed in the trunk configuration is significant. Lync Server traverses the list from top to down.

11.**Enable RTP Latching** should be selected to enable bypass media for clients behind a NAT or firewall and an SBC that supports latching.

12.**Enable forward call history** should be selected to enable sending of call history information to the gateway peer of the Mediation Server.

13.**Enable forward P-Asserted-Identity data** should be selected to enable PAI call originator information to be forwarded between the Mediation Server side and gateway side (and vice versa), when present.

14.**Enable outbound routing failover timer** should be selected to enable fast failover. The gateway associated with this trunk can give notification within 10 seconds that it is processing an outbound call. Rerouting to another trunk will occur if this notification is not received by the Mediation Server. On networks where latency may delay the response time or the gateway takes longer than 10 seconds to respond, the fast failover should be disabled.

15.(Optional) Associate and configure **calling number translation rules** for the trunk. These translation rules apply to the calling number for outbound calls

- To choose one or more rules from a list of all translation rules that are available in your Enterprise Voice deployment, click **Select**. In **Select Translation Rules**, click the rules that you want to associate with the trunk, and then click **OK**.
- To define a new translation rule and associate it with the trunk, click **New**. For details about defining a new rule, see Defining Translation Rules in the Deployment documentation.
- To edit a translation rule that is already associated with the trunk, click the rule name, and then click **Show details**. For details, see Defining Translation Rules in the Deployment documentation.
- To copy an existing translation rule to use as a starting point for defining a new rule, click the rule name and click **Copy**, and then click **Paste**. For details, see Defining Translation Rules.
- To remove a translation rule from the trunk, highlight the rule name and click **Remove**.

Security Note:

Do not associate translation rules with a trunk if you have configured translation rules on the associated trunk peer, because the two rules might conflict.

16.(Optional) Associate and configure **called number translation rules** for the trunk. The translation rules apply to the called number in an outbound call.

- To choose one or more rules from a list of all translation rules that are available in your Enterprise Voice deployment, click **Select**. In **Select Translation Rules**, click the rules that you want to associate with the trunk, and then click **OK**.
- To define a new translation rule and associate it with the trunk, click **New**. For details about defining a new rule, see Defining Translation Rules in the Deployment documentation.
- To edit a translation rule that is already associated with the trunk, click the rule name, and then click **Show details**. For details, see Defining Translation Rules in the Deployment documentation.
- To copy an existing translation rule to use as a starting point for defining a new rule, click the rule name and click **Copy**, and then click **Paste**. For details, see Defining Translation Rules.
- To remove a translation rule from the trunk, highlight the rule name and click **Remove**.

Caution:

Do not associate translation rules with a trunk if you have configured translation rules on the associated trunk peer, because the two rules might conflict.

17.Make sure that the trunk’s translation rules are arranged in the correct order. To change a rule’s position in the list, highlight the rule name, and then click the up or down arrow.

Important:

Lync Server traverses the translation rule list from the top down and uses the first rule that matches the dialed number. If you configure a trunk so that a dialed number can match more than one translation rule, be sure that the more restrictive rules are sorted above the less restrictive rules. For example, if you have included a translation rule that matches any 11-digit number and a translation rule that matches only 11-digit numbers that start with +1425, be sure that the rule that matches any 11-digit number is sorted *below* the more restrictive rule.

18.When you are finished configuring the trunk, click **OK**.

19.On the **Trunk Configuration** page, click **Commit**, and then click **Commit all**.

Note:

Whenever you create or modify a trunk configuration, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

Tasks

Configure a Trunk with Media Bypass

Other Resources

Defining Translation Rules

1.7.7.2.6 Create a New Collection of Trunk Configuration Settings

Create a New Collection of Trunk Configuration Settings

Operations > Managing Voice Routing > Configuring Trunks >

Topic Last Modified: *2012-11-01*

SIP trunk configuration settings define the relationship and capabilities between a Mediation Server and the public switched telephone network (PSTN) gateway, an IP-public branch exchange (PBX), or a Session Border Controller (SBC) at the service provider. These settings do such things as specify:

- Whether media bypass should be enabled on the trunks.
- The conditions under which real-time transport control protocol (RTCP) packets are sent.
- Whether or not secure real-time protocol (SRTP) encryption is required on each trunk.

When you install Microsoft Lync Server 2013, a global collection of SIP trunk configuration settings is created for you. In addition, administrators can create custom setting collections at the site scope or at the service scope (for the PSTN gateway service, only).

When creating SIP trunk configuration settings using Lync Server Control Panel, the following options are available to you:

UI Setting	PowerShell Parameter	Description
Name	Identity	Unique identifier for the collection. This property is read-only; you cannot change the Identity of a collection of trunk configuration settings.
Description	Description	Provides a way for administrators to store addition information about the settings (for example, the purpose of the trunk configuration).
Maximum early dialogs supported	MaxEarlyDialogs	The maximum number of forked responses a PSTN gateway, IP-PBX, or SBC at the service provider can receive to an Invite that it sent to the Mediation Server.
Encryption support level	SRTPMode	Indicates the level of support for protecting media traffic between the Mediation Server and the PSTN Gateway, IP-PBX, or SBC at the service provider. For media bypass cases, this value must be compatible with the EncryptionLevel setting in the media configuration. Media configuration is set by using the New-CsMediaConfiguration and Set-CsMediaConfiguration cmdlets. Allowed values are: • Required: SRTP encryption must be used. • Optional: SRTP will be used if the gateway supports it. • Not Supported: SRTP

		encryption is not supported and therefore will not be used. SRTPMode is used only if the gateway is configured to use Transport Layer Security (TLS). If the gateway is configured with Transmission Control Protocol (TCP) as the transport, SRTPMode is internally set to Not Supported.
Refer support	Enable3pccRefer EnableReferSupport	If set to **Enable sending refer to the gateway**, indicates that the trunk supports receiving Refer requests from the Mediation Server. If set to **Enable refer using third-party call control**, indicates that the 3pcc protocol can be used to allow transferred calls to bypass the hosted site. 3pcc is also known as "third party control," and occurs when a third-party is used to connect a pair of callers (for example, an operator placing a call from person A to person B).
Enable media bypass	EnableBypass	Indicates whether media bypass is enabled for this trunk. Media bypass can only be enabled if **Centralized media processing** is also enabled.
Centralized media processing	ConcentratedTopology	Indicates whether there is a well-known media termination point. (An example of a well-known media termination point would be a PSTN gateway where the media termination has the same IP as the signaling termination.)
Enable RTP latching	EnableRTPLatching	Indicates whether or not the SIP trunks support RTP latching. RTP latching is a technology that enables RTP/RTCP connectivity through a NAT (network address translator) device or firewall.
Enable forward call history	ForwardCallHistory	Indicates whether call history information will be forwarded through the trunk.
Enable forward P-Asserted-Identity data	ForwardPAI	Indicates whether the P-Asserted-Identity (PAI) header will be forwarded along with the call. The PAI header provides a way to verify the identity of the caller.
Enable outbound routing failover timer	EnableFastFailoverTimer	Indicates whether outbound calls that are not answered by the gateway within 10 seconds will be routed to

		the next available trunk; if there are no additional trunks then the call will automatically be dropped. In an organization with slow networks and gateway responses, that could potentially result in calls being dropped unnecessarily.
Associated PSTN usages	PSTNUsages	Collection of PSTN usages assigned to the trunk.
Translated number to test	N/A	Phone number that can be used to do an ad hoc test of the trunk configuration settings.
Associated translation rules	OutboundTranslationRulesList	Collection of phone number translation rules that apply to calls handled by Outbound Routing (calls routed to PBX or PSTN destinations).
Called number translation rules	OutboundCallingNumberTranslationRulesList	Collection of outbound calling number translation rules assigned to the trunk.
Phone number to test	N/A	Phone number that can be used to do an ad hoc test of the translation rules.
Calling number	N/A	Indicates that the phone number to test is the phone number of the caller.
Called number	N/A	Indicates that the phone number to test is the phone number of the person being called.

Note:

The Lync Server CsTrunkConfiguration cmdlets support additional properties not shown in Lync Server Control Panel. For more information, see the help topic for the New-CsTrunkConfiguration cmdlet.

To create new trunk configuration settings by using Lync Server Control Panel

1. In Lync Server Control Panel, click **Voice Routing**, and then click **Trunk Configuration**.
2. On the **Trunk Configuration** tab, click **New**, and then click **Site trunk** to create the new settings at the site scope, or **Pool trunk** to create the new settings at the service scope.
3. In the **Select a Site** or the **Select a Service** dialog box (the dialog box that appears will depend on whether you are creating site-scoped or service-scoped settings) select the location for the new configuration settings and then click **OK**. If the dialog box is blank, that means there is no place to create the new settings; for example, if the **Select a Site** dialog box is blank that means that all of your sites have already been assigned a collection of trunk configuration sites, and each site (and each service) can only host one such collection. In that case, you can either delete the existing collection and create a new collection, or simply modify the existing collection.
4. In the **New Trunk Configuration** dialog, make the appropriate selections and then click **OK**.
5. The **State** property for the collection will be updated to **Uncommitted**. To commit the changes, and to delete the collection, click **Commit** and then click **Commit All**.

6. In the **Uncommitted Voice Configuration Settings** dialog box, click **OK**.

7. In the **Microsoft Lync Server 2013 Control Panel** dialog box click **OK**.

1.7.7.2.7 Delete an Existing Collection of SIP Trunk Configuration Settings

Delete an Existing Collection of SIP Trunk Configuration Settings

Operations > Managing Voice Routing > Configuring Trunks >

Topic Last Modified: *2013-02-22*

SIP trunk configuration settings define the relationship and capabilities between a Mediation Server and the public switched telephone network (PSTN) gateway, an IP-public branch exchange (PBX), or a Session Border Controller (SBC) at the service provider. These settings do such things as specify:

- Whether media bypass should be enabled on the trunks.
- The conditions under which real-time transport control protocol (RTCP) packets are sent.
- Whether or not secure real-time protocol (SRTP) encryption is required on each trunk.

When you install Microsoft Lync Server 2013, a global collection of SIP trunk configuration settings is created for you. This global collection of settings cannot be deleted. However, you can use the Lync Server Control Panel or the Remove-CsTrunkConfiguration cmdlet to "reset" the properties in the global collection to their default values. For example, if you have set the Enable3pccRefer property to True, when you reset the global collection the Enable3pccRefer property will revert to its default value of False.

Administrators can also create custom trunk configuration settings at the site scope or at the service scope (for an individual PSTN gateway); these custom settings can be removed. When removing these custom settings keep the following in mind:

- If you remove service scope settings, then the SIP trunk managed by those settings will be managed by the settings applied to their site, if they exist. If site settings do not exist, those trunks will then be managed by the global collection of trunk configuration settings.
- If you remove site-scoped settings then any SIP trunks managed by those settings will now be managed by the global collection of trunk configuration settings.

⊟To remove trunk configuration settings with Lync Server Control Panel

1. In Lync Server Control Panel, click **Voice Routing** and then click **Trunk Configuration**.
2. On the **Trunk Configuration** tab, select the collection of SIP trunk configuration settings to be deleted, click **Edit** and then click **Delete**. To delete multiple collections in the same operation, click the first collection to be deleted, then hold down the Ctrl key and click any additional collections that you want to remove.
3. The **State** property for the collection will be updated to **Uncommitted**. To commit the changes, and to delete the collection, click **Commit** and then click **Commit All**.
4. In the **Uncommitted Voice Configuration Settings** dialog box, click **OK**.
5. In the **Microsoft Lync Server 2013 Control Panel** dialog box click **OK**.
6. If you change your mind and decide not to delete the collection, click **Commit** and then click **Cancel All Uncommitted Changes**. When the **Microsoft Lync Server 2013 Control Panel** dialog box appears, click **OK**.

Removing Trunk Configuration Settings by Using Windows PowerShell Cmdlets

You can delete trunk configuration settings by using Windows PowerShell and the **Remove-CsTrunkConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specified collection of settings

- The following command removes the trunk configuration settings applied to the Redmond site:

```
Remove-CsTrunkConfiguration -Identity site:Redmond
```

To remove all the collections applied to the site scope

- This command removes all the trunk configuration settings applied to the service scope:

```
Get-CsTrunkConfiguration -Filter "service:*" | Remove-CsTrunkConfigurat
```

To remove all the collections where media bypass is enabled

- The following command removes all the trunk configuration settings where media bypass has been enabled:

```
Get-CsTrunkConfiguration | Where-Object {$_.EnableBypass -eq $True} | R
```

For more information, see the help topic for the Remove-CsTrunkConfiguration cmdlet.

1.7.7.2.8 Modify SIP Trunk Configuration Settings

Modify SIP Trunk Configuration Settings

Operations > Managing Voice Routing > Configuring Trunks >

***Topic Last Modified:** 2013-02-22*

SIP trunk configuration settings define the relationship and capabilities between a Mediation Server and the public switched telephone network (PSTN) gateway, an IP-public branch exchange (PBX), or a Session Border Controller (SBC) at the service provider. These settings do such things as specify:

- Whether media bypass should be enabled on the trunks.
- The conditions under which real-time transport control protocol (RTCP) packets are sent.
- Whether or not secure real-time protocol (SRTP) encryption is required on each trunk.

When you install Microsoft Lync Server 2013, a global collection of SIP trunk configuration settings is created for you. In addition, administrators can create custom setting collections at the site scope or at the service scope (for the PSTN gateway service, only). Any of these collections can later be modified using either Lync Server Control Panel or Windows PowerShell.

When modifying SIP trunk configuration settings using Lync Server Control Panel, the following options are available to you:

UI Setting	PowerShell Parameter	Description
Name	Identity	Unique identifier for the collection. This property is read-only; you cannot change the Identity of a collection of trunk configuration settings.
Description	Description	Provides a way for administrators to store addition information about the settings (for example, the purpose of the trunk configuration).
Maximum early dialogs supported	MaxEarlyDialogs	The maximum number of forked responses a PSTN gateway, IP-PBX, or SBC at the service provider can receive to an Invite that it sent to the Mediation Server.
Encryption support level	SRTPMode	Indicates the level of support for protecting media traffic between the Mediation Server and the PSTN Gateway, IP-PBX, or SBC at the service provider. For media bypass cases, this value must be compatible with the EncryptionLevel setting in the media configuration. Media configuration is set by using the New-CsMediaConfiguration and Set-CsMediaConfiguration cmdlets. Allowed values are: • Required: SRTP encryption must be used. • Optional: SRTP will be used if the gateway supports it. • Not Supported: SRTP encryption is not supported and therefore will not be used. SRTPMode is used only if the gateway is configured to use Transport Layer Security (TLS). If the gateway is configured with Transmission Control Protocol (TCP) as the transport, SRTPMode is internally set to Not Supported.
Refer support	Enable3pccRefer EnableReferSupport	If set to **Enable sending refer to the gateway**, indicates that the trunk supports receiving Refer requests from the Mediation Server. If set to **Enable refer using third-party call control**, indicates that the 3pcc protocol can be used to allow transferred calls to bypass the hosted site. 3pcc is also known as "third party control," and occurs when a third-

		party is used to connect a pair of callers (for example, an operator placing a call from person A to person B).
Enable media bypass	EnableBypass	Indicates whether media bypass is enabled for this trunk. Media bypass can only be enabled if **Centralized media processing** is also enabled.
Centralized media processing	ConcentratedTopology	Indicates whether there is a well-known media termination point. (An example of a well-known media termination point would be a PSTN gateway where the media termination has the same IP as the signaling termination.)
Enable RTP latching	EnableRTPLatching	Indicates whether or not the SIP trunks support RTP latching. RTP latching is a technology that enables RTP/RTCP connectivity through a NAT (network address translator) device or firewall.
Enable forward call history	ForwardCallHistory	Indicates whether call history information will be forwarded through the trunk.
Enable forward P-Asserted-Identity data	ForwardPAI	Indicates whether the P-Asserted-Identity (PAI) header will be forwarded along with the call. The PAI header provides a way to verify the identity of the caller.
Enable outbound routing failover timer	EnableFastFailoverTimer	Indicates whether outbound calls that are not answered by the gateway within 10 seconds will be routed to the next available trunk; if there are no additional trunks then the call will automatically be dropped. In an organization with slow networks and gateway responses, that could potentially result in calls being dropped unnecessarily.
Associated PSTN usages	PSTNUsages	Collection of PSTN usages assigned to the trunk.
Translated number to test	N/A	Phone number that can be used to do an ad hoc test of the trunk configuration settings.
Associated translation rules	OutboundTranslationRulesList	Collection of phone number translation rules that apply to calls handled by Outbound Routing (calls routed to PBX or PSTN destinations).
Called number translation rules	OutboundCallingNumberTranslationRulesList	Collection of outbound calling number translation rules assigned to the

		trunk.
Phone number to test	N/A	Phone number that can be used to do an ad hoc test of the translation rules.
Calling number	N/A	Indicates that the phone number to test is the phone number of the caller.
Called number	N/A	Indicates that the phone number to test is the phone number of the person being called.

Note:
The Lync Server CsTrunkConfiguration cmdlets support additional properties not shown in Lync Server Control Panel. For more information, see the help topic for the Set-CsTrunkConfiguration cmdlet.

To modify SIP trunk configuration settings by using Lync Server Control Panel

1. In Lync Server Control Panel, click **Voice Routing**, and then click **Trunk Configuration**.
2. On the **Trunk Configuration** tab, double-click the trunk configuration settings to be modified. Note that you can only edit one collection of settings at a time. If you would like to make the same changes on multiple collections, use Windows PowerShell instead.
3. In the **Edit Trunk Configuration** dialog, make the appropriate selections and then click **OK**.
4. The **State** property for the collection will be updated to **Uncommitted**. To commit the changes, and to delete the collection, click **Commit** and then click **Commit All**.
5. In the **Uncommitted Voice Configuration Settings** dialog box, click **OK**.
6. In the **Microsoft Lync Server 2013 Control Panel** dialog box click **OK**.

1.7.7.2.9 Test SIP Trunk Configuration Settings

Test SIP Trunk Configuration Settings

Operations > Managing Voice Routing > Configuring Trunks >

Topic Last Modified: *2012-11-01*

SIP trunk configuration settings define the relationship and capabilities between a Mediation Server and the public switched telephone network (PSTN) gateway, an IP-public branch exchange (PBX), or a Session Border Controller (SBC) at the service provider. These settings do such things as specify:

- Whether media bypass should be enabled on the trunks.
- The conditions under which real-time transport control protocol (RTCP) packets are sent.
- Whether or not secure real-time protocol (SRTP) encryption is required on each trunk.

When you install Microsoft Lync Server 2013, a global collection of SIP trunk configuration settings is created for you. In addition, administrators can create custom setting collections at the site scope or at the service scope (for the PSTN gateway service, only). Administrators can also use the Test-CsTrunkConfiguration cmdlet to verify that a trunk can convert a number as dialed by a user to a number that can be handled by the gateway.

Trunk configuration settings can only be tested by using Windows PowerShell and the Test-CsTrunkConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To test SIP trunk configuration settings

- This command verifies that the trunk configuration settings for the Redmond site can correctly convert the dialed number 4255551212.

```
$trunk = Get-CsTrunkConfiguration -Identity "site:Redmond"
Test-CsTrunkConfiguration -DialedNumber 4255551212 -TrunkConfiguration
```

1.7.7.2.10 View Information about Individual SIP Trunks

View Information about Individual SIP Trunks

Operations > Managing Voice Routing > Configuring Trunks >

Topic Last Modified: *2013-02-21*

SIP trunks are used to connect Lync Server 2013 Voice over IP phone network with the Public Switched Telephone Network. In previous version of the product, trunks were used to route outbound calls from a Mediation Server to a PSTN gateway and each gateway was limited to a single trunk. As a result, a PSTN gateway and a SIP trunk were essentially identical. For administrators, that meant they could view information about an individual SIP trunk simply by viewing information about the associated PSTN gateway.

In Lync Server 2013, however, multiple trunks can now be assigned to a single PSTN gateway; this means that gateways and trunks are no longer one and the same. In turn, that means that administrators must use the new Get-CsTrunk cmdlet in order to view information about an individual SIP trunk.

The Get-CsTrunk cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view information for all your SIP trunks

- The following command returns information about all the SIP trunks in use in your organization:

```
Get-CsTrunk
```

To view information for a specific SIP trunk

- This command returns information only for the SIP trunk with the Identity PstnGateway:192.168.0.240:

```
Get-CsTrunk -Identity "PstnGateway:192.168.0.240"
```

Viewing Information for All the SIP Trunks Assigned to a Pool

- In this example, information is returned for all the SIP trunks assigned to the pool atl-cs-001.litwareinc.com:

```
Get-CsTrunk -PoolFqdn "atl-cs-001.litwareinc.com"
```

1.7.7.3 Configuring Voice Policies, PSTN Usage Records, and Voice Routes

Configuring Voice Policies, PSTN Usage Records, and Voice Routes

Microsoft Lync Server 2013 > Deployment > Deploying Enterprise Voice >

Topic Last Modified: *2012-10-10*

Voice policies, PSTN usage records, and voice routes are integrally related. You configure voice policies by selecting a set of calling features and then assigning the policy a set of PSTN usage records, which specify what rights are authorized for the users or groups who are assigned the voice policy. Voice routes are also assigned PSTN usage records, which serve to match routes with the users who are authorized to use them. That is, users can only place calls that use the routes for which they have a matching PSTN usage record.

The recommended workflow for a new Enterprise Voice deployment is to start by configuring a voice policy that includes the appropriate PSTN usage records, and then associate the appropriate routes to each PSTN usage record.

Note:

You can also create voice policies with *user* scope and assign them to individual users or groups.

For the detailed steps to perform each of these tasks, see the procedures in this section.

- Configuring Voice Policies and PSTN Usage Records to Authorize Calling Features and Privileges
- View PSTN Usage Records
- Configuring Voice Routes for Outbound Calls
- Exporting and Importing Voice Routing Configuration
- Publish Pending Changes to the Voice Routing Configuration
- Test Voice Routing

1.7.7.3.1 Configuring Voice Policies and PSTN Usage Records to Authorize Calling Features and Privileges

Configuring Voice Policies and PSTN Usage Records to Authorize Calling Features and Privileges

Deployment > Deploying Enterprise Voice > Configuring Voice Policies, PSTN Usage Records, and Voice Routes >

Topic Last Modified: *2012-10-10*

A *voice policy* enables a set of calling features and associates one or more PSTN usage records to define the calling features and permissions of users who are assigned the policy.

Voice policy scope can be either *Site* (which defines the default features and permissions for a network site) or *User* (which defines the features and permissions to be assigned on a per-user or group basis). Users not assigned to a voice policy will automatically be assigned to the global policy, which is the default voice policy that is installed with the product.

Note:

For details, see Voice Policies in the Planning documentation.

- Create a Voice Policy and Configure PSTN Usage Records
- Modify a Voice Policy and Configure PSTN Usage Records
- Configuring Voice Mail Escape

1.7.7.3.1.1 Create a Voice Policy and Configure PSTN Usage Records

Create a Voice Policy and Configure PSTN Usage Records

See Also

Deploying Enterprise Voice > Configuring Voice Policies, PSTN Usage Records, and Voice Routes > Configuring Voice Policies and PSTN Usage Records to Authorize Calling Features and Privileges >

Topic Last Modified: *2012-11-01*

Follow these steps if you want to create a new voice policy. If you want to edit a voice policy, see Modify a Voice Policy and Configure PSTN Usage Records for the procedure.

Note:

Each voice policy must have at least one associated public switched telephone network (PSTN) usage record. To see a listing of all PSTN usage records available in your Enterprise Voice deployment and view their properties, see View PSTN Usage Records.

⊟To create a voice policy

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing** and then click **Voice Policy**.
4. On the **Voice Policy** page, click **New** and then select a scope for the new policy:
   - **Site policy** applies to an entire site, except any users or groups that are assigned to a user policy. If you select Site for a policy scope, choose the site from the **Select a Site** dialog box. If a voice policy has already been created for a site, the site does not appear in the **Select a Site** dialog box.
   - **User policy** can be applied to specified users or groups.
5. If the voice policy scope is User, enter a descriptive name for the policy in the **Name** field.

   Note:

   If the voice policy scope is Site, the **Name** field in **New Voice Policy** is prepopulated with the site name and cannot be changed.
6. (Optional) Enter additional descriptive information for the voice policy.
7. Select or clear the following check boxes to enable or disable each of the **Calling features** for this voice policy:
   - **Voice mail escape** prevents calls from being immediately routed to the user’s mobile phone voice mail system when simultaneous ringing is configured and the phone is turned off, out of battery, or out of range.

     Note:

     This feature is only configurable through the Lync Server Management Shell
   - **Call forwarding** enables users to forward calls to other phones and client devices. Lync Server 2013 provides a significantly wider range of configuration options for call forwarding. For example, if an organization does not want to allow incoming calls to be forwarded externally to the

PSTN, an administrator can apply a special voice policy to deploy this restriction. Enabled by default.

- **Delegation** enables users to specify other users to send and receive calls on their behalf. In Lync Server 2013, a delegate can configure simultaneous ringing that enables incoming calls to his or her manager to ring all of the delegate’s simultaneous ringing targets. This provides the delegate with greater flexibility in responding to calls directed to the manager. Enabled by default.
- **Call transfer** enables users to transfer calls to other users. Enabled by default.
- **Call park** enables users to park calls on hold and then pick up the call from a different phone or client. Disabled by default.
- **Simultaneous ringing** enables incoming calls to ring on additional phones (for example, a mobile phone) or other endpoint devices. Lync Server 2013 provides a significantly wider range of configuration options for simultaneous ringing. Enabled by default.
- **Team call** enables users on a defined team to answer calls for other members of the team. Enabled by default.
- **PSTN re-route** enables calls made by users who are assigned this policy to other enterprise users to be rerouted on the public switched telephone network (PSTN) if the WAN is congested or unavailable. Enabled by default.
- **Bandwidth policy override** enables administrators to override call admission control policy decisions for a particular user. Disabled by default.

> **Note:**
> The policy will be overridden only for incoming calls to the user and not for outgoing calls that are placed by the user. After the session is established, the bandwidth consumption will be accurately recorded. This setting should be used sparingly and should be reserved for appropriate call admission control decisions.

- **Malicious call tracing** enables users to report malicious calls (such as bomb threats) by using the client UI, which in turn flags the calls in the call detail records (CDRs). Disabled by default.

8.To associate and configure PSTN usage records for this voice policy, do any of the following:

- To choose one or more records from a list of all PSTN usage records available in your Enterprise Voice deployment, click **Select**. Highlight the records that you want to associate with this voice policy, and then click **OK**.
- To remove a PSTN usage record from this voice policy, highlight the record and click **Remove**.
- To define a new PSTN usage record and associate it with this voice policy, do the following:

  8..a.Click **New**.

  8..b.In the **Name** field, enter a unique descriptive name for the record. For example, you may want to create a PSTN usage record named **Redmond** for full-time employees located in Redmond, and another named **RedmondTemps** for temporary employees.

  > **Note:**
  > The PSTN usage record name must be unique within the Enterprise Voice deployment. After the record is saved, the **Name** field cannot be edited.

  8..c.Use any of the following methods to associate and configure routes for this PSTN usage record:

  - To choose one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**, highlight the routes that you want to associate with this PSTN usage record, and then click **OK**.
  - To remove a route from the PSTN usage record, highlight the route, and then click **Remove**.

- To define a new route and associate it with this PSTN usage record, click **New**. For details, see Create a Voice Route.
- To edit a route that is already associated with this PSTN usage record, highlight the route and click **Show details**. For details, see Modify a Voice Route.

8..d.Click **OK**.

- To edit a PSTN usage record that is already associated with this voice policy, do the following:

  8..a.Highlight the PSTN usage record that you want to edit, and then click **Show details**.

  8..b.Use any of the following methods to associate and configure routes for this PSTN usage record:

  - To choose one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**, highlight the routes you want to associate with this PSTN usage record, and then click **OK**.
  - To remove a route from this PSTN usage record, highlight the route, and then click **Remove**.
  - To define a new route and associate it with this PSTN usage record, click **New**. For details, see Create a Voice Route.
  - To edit a route that is already associated with this PSTN usage record, highlight the route and lick **Show details**. For details, see Modify a Voice Route.

  8..c.Click **OK**.

9.Arrange the PSTN usage records for optimum performance. To change a record's position in the list, highlight the record name and click the up or down arrow.

> **Important:**
> The order in which PSTN usage records are listed in the voice policy is significant. Lync Server traverses the list from the top down. We recommend that you organize the list by frequency of use, for example: RedmondLocal, RedmondLongDist, RedmondInternational, RedmondBackup.

10.To associate and configure PSTN usage records for call forwarding and simultaneous ringing in this voice policy, do any of the following:

- To use the same PSTN usage records for call forwarding and simultaneous ringing as this voice policy, select the option **Route using the call PSTN usages** from the drop-down menu.
- To allow call forwarding and simultaneous ringing to internal Lync users only, select the option **Route to internal Lync users only** from the drop-down menu. Calls will not be forwarded to external PSTN numbers.
- To specify different PSTN usage records for call forwarding and simultaneous ringing than used for this voice policy, select the option **Route using custom PSTN usages** from the drop-down menu. This option displays a control to select existing PSTN usage records or create new PSTN usage records specifically for call forwarding and simultaneous ringing.

  10..a.To choose one or more records from a list of PSTN usage records for call forwarding and simultaneous ringing, click **Select**. Highlight the records that you want to associate with this call forwarding and simultaneous ringing policy, and then click **OK**.

  10..b.To remove a PSTN usage record from this call forwarding and simultaneous ringing policy, highlight the record and click **Remove**.

  10..c.To define a new PSTN usage record and associate it with this call forwarding and simultaneous ringing policy, do the following:

  - Click **New**.
  - In the **Name** field, enter a unique descriptive name for the record.

> **Note:**
> The PSTN usage record name must be unique within the Enterprise Voice deployment. After the record is saved,

the **Name** field cannot be edited.

- Use any of the following methods to associate and configure routes for this PSTN usage record:
  - To choose one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**, highlight the routes that you want to associate with this PSTN usage record, and then click **OK**.
  - To remove a route from the PSTN usage record, highlight the route and click **Remove**.
  - To define a new route and associate it with this PSTN usage record, click **New**. For details, see Create a Voice Route.
  - To edit a route that is already associated with this PSTN usage record, highlight the route and click **Show details**. For details, see Modify a Voice Route.
- Click **OK**.

10..d.To edit a PSTN usage record that is already associated with this voice policy, do the following:

- Highlight the PSTN usage record you want to edit and click **Show details**.
- Use any of the following methods to associate and configure routes for this PSTN usage record:
  - To choose one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**, highlight the routes that you want to associate with this PSTN usage record, and then click **OK**.
  - To remove a route from this PSTN usage record, highlight the route and click **Remove**.
  - To define a new route and associate it with this PSTN usage record, click **New**. For details, see Create a Voice Route.
  - To edit a route that is already associated with this PSTN usage record, highlight the route and click **Show details**. For details, see Modify a Voice Route.
- Click **OK**.

11.(Optional) Enter a number to test the voice policy and click **Go**. The test results are displayed under **Translated number to test**.

> **Note:**
> You can save a voice policy that does not yet pass the test and then reconfigure it later. For details, see Test Voice Routing.

12.Click **OK**.

13.On the **Voice Policy** page, click **Commit**, and then click **Commit all**.

> **Note:**
> Any time you create or modify a voice policy, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

14.(Optional) Voicemail Escape detects that a call was immediately answered by the user's mobile phone voice mail, and disconnects the call to the mobile phone voice mail. This allows the call to continue to ring on the user's other endpoints giving the user the opportunity to answer the call. For details on how to configure a voice mail policy, see Configuring Voice Mail Escape.

Topic Last Modified: *2012-11-01*

Follow these steps if you want to modify a voice policy. If you want to create a new voice policy, see Create a Voice Policy and Configure PSTN Usage Records for the procedure.

> **Note:**
> If a user is assigned to a voice policy has no associated public switched telephone network (PSTN) usage records, the user cannot place outbound calls. For a listing of all PSTN usage records available in your Enterprise Voice deployment and view their properties, see View PSTN Usage Records.

⊟To modify a voice policy

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**, and then click **Voice Policy**.
4. On the **Voice Policy** page, double-click a voice policy name.

   > **Note:**
   > The scope and name were set when the voice policy was created. They cannot be changed.

5. (Optional) In **Edit Voice Policy**, enter additional descriptive information for the voice policy.
6. Select or clear the following check boxes to enable or disable each of the **Calling features**:
   - **Voice mail escape** prevents calls from being immediately routed to the user's mobile phone voice mail system when simultaneous ringing is configured and the phone is turned off, out of battery, or out of range.

     > **Note:**
     > This feature is only configurable through the Lync Server Management Shell

   - **Call forwarding** enables users to forward calls to other phones and client devices. Lync Server 2013 provides a significantly wider range of configuration options for call forwarding. For example, if an organization does not want to allow incoming calls to be forwarded externally to the PSTN, an administrator can apply a special voice policy to deploy this restriction. Enabled by default.
   - **Delegation** enables users to specify other users to send and receive calls on their behalf. In Lync Server 2013, a delegate can configure simultaneous ringing that enables incoming calls to his or her manager to ring all of the delegate's simultaneous ringing targets. This provides the delegate with

greater flexibility in responding to calls directed to the manager. Enabled by default.

- **Call transfer** enables users to transfer calls to other users. Enabled by default.
- **Call park** enables users to park calls on hold, and then pick up the call from a different phone or client. Disabled by default.
- **Simultaneous ringing** enables incoming calls to ring on additional phones (for example, a mobile phone) or other endpoint devices. Lync Server 2013 provides a significantly wider range of configuration options for simultaneous ringing. Enabled by default.
- **Team call** enables users on a defined team to answer calls for other members of the team. Enabled by default.
- **PSTN re-route** enables calls made by users who are assigned this policy to other enterprise users to be rerouted on the public switched telephone network (PSTN) if the WAN is congested or unavailable. Enabled by default.
- **Bandwidth policy override** enables administrators to override call admission control (CAC) policy decisions for a particular user. Disabled by default.

  > **Note:**
  > The policy will be overridden only for incoming calls to the user and not for outgoing calls that are placed by the user. After the session is established, the bandwidth consumption will be accurately recorded. This setting should be used sparingly.

- **Malicious call tracing** enables users to report malicious calls (such as bomb threats) using the client UI, which in turn flags the calls in the call detail records (CDRs). Disabled by default.

7.To associate and configure PSTN usage records for this voice policy, do any of the following:

- To choose one or more records from a list of all PSTN usage records available in your Enterprise Voice deployment, click **Select**. Highlight the records that you want to associate with this voice policy, and then click **OK**.
- To remove a PSTN usage record from this voice policy, highlight the record and click **Remove**.
- To define a new PSTN usage record and associate it with this voice policy, do the following:

  7..a.Click **New**.

  7..b.In the **Name** field, enter a unique descriptive name for the record. For example, you may want to create a PSTN usage record named **Redmond** for full-time employees located in Redmond, and another record named **RedmondTemps** for temporary employees.

  > **Note:**
  > The PSTN usage record name must be unique within the Enterprise Voice deployment. After the record is saved, the **Name** field cannot be edited.

  7..c.Use any of the following methods to associate and configure routes for this PSTN usage record:

  - To choose one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**, highlight the routes that you want to associate with this PSTN usage record, and then click **OK**.
  - To remove a route from the PSTN usage record, highlight the route and click **Remove**.
  - To define a new route and associate it with this PSTN usage record, click **New**. For details, see Create a Voice Route.
  - To edit a route that is already associated with this PSTN usage record, highlight the route and click **Show details**. For details, see Modify a Voice Route.

  7..d.Click **OK**.

- To edit a PSTN usage record that is already associated with this voice policy, do the following:
  7..a.Highlight the PSTN usage record that you want to edit and click **Show details**.
  7..b.Use any of the following methods to associate and configure routes for this PSTN usage record:
  - To choose one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**, highlight the routes that you want to associate with this PSTN usage record, and then click **OK**.
  - To remove a route from this PSTN usage record, highlight the route and click **Remove**.
  - To define a new route and associate it with this PSTN usage record, click **New**. For details, see Create a Voice Route.
  - To edit a route that is already associated with this PSTN usage record, highlight the route and click **Show details**. For details, see Modify a Voice Route.

  7..c.Click **OK**.

8.Arrange the PSTN usage records for optimum performance. To change a record's position in the list, highlight the record name and click the up or down arrow.

> **Note:**
> The order in which PSTN usage records are listed in the voice policy is significant. Lync Server traverses the list from the top down. We recommend that you organize the list by frequency of use, for example: RedmondLocal, RedmondLongDist, RedmondInternational, RedmondBackup.

9.To associate and configure PSTN usage records for call forwarding and simultaneous ringing in this voice policy, do any of the following:

- To use the same PSTN usage records for call forwarding and simultaneous ringing as this voice policy, select the option **Route using the call PSTN usages** from the drop-down menu.
- To allow call forwarding and simultaneous ringing to internal Lync users only, select **Route to internal Lync users only** from the drop-down menu. Calls will not be forwarded to external PSTN numbers.
- To specify different PSTN usage records for call forwarding and simultaneous ringing than those used for this voice policy, select the option **Route using custom PSTN usages** from the drop-down menu. This option displays a control to select existing PSTN usage records or to create new PSTN usage records, specifically for call forwarding and simultaneous ringing.
  9..a.To choose one or more records from a list of PSTN usage records for call forwarding and simultaneous ringing, click **Select**. Highlight the records that you want to associate with this call forwarding and simultaneous ringing policy, and then click **OK**.
  9..b.To remove a PSTN usage record from this call forwarding and simultaneous ringing policy, highlight the record and click **Remove**.
  9..c.To define a new PSTN usage record and associate it with this call forwarding and simultaneous ringing policy, do the following:
  - Click **New**.
  - In the **Name** field, enter a unique descriptive name for the record.

    > **Note:**
    > The PSTN usage record name must be unique within the Enterprise Voice deployment. After the record is saved, the **Name** field cannot be edited.

  - Use any of the following methods to associate and configure routes for this PSTN usage record:
    - To choose one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**, highlight the routes

    that you want to associate with this PSTN usage record, and then click **OK**.
    - To remove a route from the PSTN usage record, highlight the route and click **Remove**.
    - To define a new route and associate it with this PSTN usage record, click **New**. For details, see [Create a Voice Route].
    - To edit a route that is already associated with this PSTN usage record, highlight the route, and then click **Show details**. For details, see [Modify a Voice Route].
  - Click **OK**.

9..d.To edit a PSTN usage record that is already associated with this voice policy, do the following:

  - Highlight the PSTN usage record that you want to edit and click **Show details**.
  - Use any of the following methods to associate and configure routes for this PSTN usage record:
    - To choose one or more routes from the list of all available routes in your Enterprise Voice deployment, click **Select**, highlight the routes you want to associate with this PSTN usage record, and then click **OK**.
    - To remove a route from this PSTN usage record, highlight the route and click **Remove**.
    - To define a new route and associate it with this PSTN usage record, click **New**. For details, see [Create a Voice Route].
    - To edit a route that is already associated with this PSTN usage record, highlight the route and click **Show details**. For details, see [Modify a Voice Route].
  - Click **OK**.

10. (Optional) Enter a number to test the voice policy and click **Go**. The test results are displayed under **Translated number to test**.

> **Note:**
> You can save a voice policy that does not yet pass the test and then reconfigure it later. For details, see Test Voice Routing.

11. Click **OK**.
12. On the **Voice Policy** page, click **Commit**, and then click **Commit all**.

> **Note:**
> Whenever you create or modify a voice policy, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

13. (Optional) Voicemail Escape detects that a call was immediately answered by the user’s mobile phone voice mail, and disconnects the call to the mobile phone voice mail. This allows the call to continue to ring on the user’s other endpoints giving the user the opportunity to answer the call. For details about how to configure a voice mail policy, see Configuring Voice Mail Escape.

Topic Last Modified: *2013-02-22*

When a user configures simultaneous ringing to a mobile phone, a caller will typically be routed to the user's personal voice mail if the mobile phone is turned off, out of battery power, or out of range. With Lync Server 2013, users can opt to have business-related calls routed to their corporate voice mail system. Specifically, a timer can be configured, and if the call is answered by the carrier's voice mail within the range of time defined, Lync Server will disconnect from the carrier's voice mail system (and the user's personal voice mail), while the user's remaining endpoints in the corporate system continue to ring. This way, the caller is automatically routed to the user's corporate voice mail.

This configuration is performed using the Lync Server Management Shell cmdlet, **Set-CsVoicePolicy**, at the voice policy level, with the following parameters.

⊟To configure voice mail escape

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Specify the following parameters to **Set-CsVoicePolicy**:
   - **EnableVoicemailEscapeTimer** - Enables or disables the escape timer.
   - **PSTNVoicemailEscapeTimer** - Specifies the timeout value in milliseconds. The default value is 1500 milliseconds, and the value can range from 0 milliseconds to 8000 milliseconds.

```
Set-CsVoicePolicy UserVoicePolicy -EnableVoiceMailEscapeTimer $true - PSTNVoicema
Set-CsVoicePolicy -Identity site:SitePolicy -EnableVoiceMailEscapeTimer $true -PS
```

A public switched telephone network (PSTN) usage record specifies a class of call (such as internal, local, or long distance) that can be made by various users or groups of users in an organization. For details, see PSTN Usage Records in the Planning documentation.

⊟To view a PSTN usage record by using Lync Server Control Panel

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.

2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing** and then click **PSTN Usage**.
4. On the **PSTN Usage** page, highlight the PSTN usage record you want to view, click **Edit** and then click **Show details**.

> **Note:**
>
> A read-only page of the selected PSTN usage record shows the associated routes and associated voice policies.

Viewing PSTN Usage Information by Using Windows PowerShell Cmdlets

You can also view PSTN usages by using Windows PowerShell and the **Get-CsPstnUsage** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view PSTN usage information by using Windows PowerShell cmdlets

- To view information about all of your PSTN usages, type the following command in the Lync Server Management Shell, and then press ENTER:

```
Get-CsPstnUsage
```

This command returns information similar to the following:

```
Identity : Global
Usage    : {Internal, Local, Long Distance}
```

For details, see Get-CsPstnUsage.

***Topic Last Modified:** 2012-11-01*

A Lync Server 2013 voice route associates destination phone numbers with one or more public switched telephone network (PSTN) gateways or SIP trunks and one or more PSTN usage records.

To view voice routes by using Lync Server Control Panel

1. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
2. Click **Voice Routing**.

3. Click **Route**.
4. Double-click a voice route to view additional properties from the list of voice routes, or select the route and click **Edit**. Then click **Show details**.

Note:
You can only view detailed information for a single route at a time.

To view voice routes by using Windows PowerShell

- Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
  Voice routes can be viewed by using Windows PowerShell and the **Get-CsVoiceRoute** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.
  To view information about all of your voice routes, type the following command in the Lync Server Management Shell, and then press ENTER:

```
Get-CsVoiceRoute
```

  That will return information similar to this:

```
Identity            : global
Priority            : -1
Description         :
NumberPattern       : ^(\+1[0-9]{10})$
PstnUsages          : {}
PstnGatewayList     : {}
Name                : global
SuppressCallerId    :
AlternateCallerId   :
```

Note:
For details, see Voice Routes in the Planning documentation.

Topic Last Modified: *2012-11-01*

The following procedure explains how to create a new voice route by using the Lync Server 2013 Control Panel. To edit an existing route, see Modify a Voice Route for the procedure.

To create a voice route by using the Lync Server Control Panel

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the **CsVoiceAdministrator**, **CsServerAdministrator**, or **CsAdministrator** administrative role.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to

start Lync Server Control Panel, see Open Lync Server Administrative Tools.

3. In the left navigation bar, click **Voice Routing**.
4. Click **Route**.
5. Click **New** to display the **New Voice Route** dialog box.
6. In **Name**, type a descriptive name for the voice route.
7. (Optional) In **Description**, type additional descriptive information for the voice route.
8. To specify the patterns that you want this route to accommodate, you can either use the **Build a pattern to match** tool to generate a regular expression, or write the regular expression manually.
   - To use the **Build a pattern to match** tool to generate a regular expression, enter values as follows. You can specify two types of pattern matching:
     - **Starting digits for numbers that you want to allow:** Enter prefix values that this route must accommodate (including the leading + if needed). For example, type **+425**, and then click **Add**. Repeat this for each prefix value that you want to include in the route.
     - **Exceptions:** If you want to specify one or more exceptions for a prefix value, highlight the prefix and click **Exceptions**. Type in one or more values for the matching patterns that you do *not* want this route to accommodate. For example, to exclude numbers starting with +425237 from the route, enter a value of **+425237** in the **Exceptions** field, and then click **OK**.
   - To define the matching pattern manually, click **Edit** in the **Build a pattern to match** tool and then type in a .NET Framework regular expression to specify the matching pattern for destination phone numbers to which the route is applied. For details about how to write regular expressions, see ".NET Framework Regular Expressions" at http://go.microsoft.com/fwlink/p/?linkId=140927.
9. Select **Suppress caller ID** if you do not want the ID of the phone making the outbound call to appear to the call recipient. If you select this option, you must specify an **Alternate caller ID** that will appear on the recipient's caller ID display.
10. To associate one or more trunks with the voice route, click **Add** and then select a trunk from the list.

Note:
If your deployment includes any Microsoft Office Communications Server 2007 R2 Mediation Servers, they will also be available in the list.

11. To associate one or more public switched telephone network (PSTN) usages with the voice route, click **Select** and choose a record from the list of PSTN usage records that have been defined for your Enterprise Voice deployment.

Note:
To view the properties of each of the available PSTN usage records, see View PSTN Usage Records.
To create or edit PSTN usage records, see Create a Voice Policy and Configure PSTN Usage Records or Modify a Voice Policy and Configure PSTN Usage Records.

12. Arrange the PSTN usage records for optimum performance. To change a record's position in the list, highlight the record name and click the up or down arrow.

Note:
In contrast to a voice policy, where the order in which PSTN usage records are listed is important, the order in which PSTN usage records are listed in the voice route is insignificant. However, we recommend that you organize the list by frequency of use. For example: RedmondLocal, RedmondLongDist, RedmondInternational, RedmondBackup. (Lync Server traverses the list from the top down.)

13. (Optional) Type a value into the **Enter a translated number to test** field and

click **Go**. The test results are displayed under the field.

> **Note:**
> You can save a voice route that does not yet pass the test and then reconfigure it later. For details, see Test Voice Routing.

14. Click **OK** to save the voice route.

> **Important:**
> Whenever you create a voice route, you must run the **Commit All** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration.

Topic Last Modified: *2012-11-01*

This topic explains how to edit a voice route. To create a new route, see Create a Voice Route.

⊟To modify a voice route

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**, and then click **Route**.
4. On the **Route** page, use either of the following methods to modify a voice route:
   - Click a voice route name, click **Edit**, and then click **Show details**.
   - Click a voice route name, click **Edit**, click **Copy**, and then click **Paste**. Click the new copy of the voice route that you just created, click **Edit**, and then click **Show details**.
5. In the **Name** field on the **Edit Voice Route** page, type a descriptive name for the voice route.
6. (Optional) In the **Description** field, type in additional descriptive information for the voice route.
7. To specify the patterns you want this route to accommodate, you can either use the **Build a pattern to match** tool to generate a regular expression, or write the regular expression manually.
   - To use the **Build a pattern to match** tool to generate a regular expression, enter values as follows. You can specify two types of pattern matching:
     - **Starting digits for numbers that you want to allow:** Enter prefix values that this route must accommodate (including the leading + if needed). For

        example, type **+425** and then click **Add**. Repeat this for each prefix value that you want to include in the route.
        - **Exceptions:** If you want to specify one or more exceptions for a prefix value, highlight the prefix and click **Exceptions**. Type in one or more values for the matching patterns that you do *not* want this route to accommodate. For example, to exclude numbers starting with +425237 from the route, enter a value of **+425237** in the **Exceptions** field, and then click **OK**.
    - To define the matching pattern manually, click **Edit** in the **Build a pattern to match** tool and then type in a .NET Framework regular expression to specify the matching pattern for destination phone numbers to which the route is applied. For information about how to write regular expressions, see ".NET Framework Regular Expressions" at http://go.microsoft.com/fwlink/p/?linkId=140927.

8. Select **Suppress caller ID** if you do not want the ID of the phone that is making the outbound call to appear to the call recipient. If you select this option, you must specify an **Alternate caller ID** that will appear on the recipient's caller ID display.
9. To associate one or more public switched telephone network (PSTN) trunks with the voice route, click **Add**, and then select a trunk from the list.

    Note:

    If your deployment includes any Microsoft Office Communications Server 2007 R2 Mediation Servers, they will also be available in the list.

10. To associate one or more PSTN usages with the voice route, click **Select** and choose a record from the list of PSTN usage records that have been defined for your Enterprise Voice deployment.

    Note:

    To view the properties of each of the available PSTN usage records, see View PSTN Usage Records.
    To create or edit PSTN usage records, see Create a Voice Policy and Configure PSTN Usage Records or Modify a Voice Policy and Configure PSTN Usage Records.

11. Arrange the PSTN usage records for optimum performance. To change a record's position in the list, highlight the record name and click the up or down arrow.

    Note:

    In contrast to a voice policy where the order in which PSTN usage records are listed is important, the order of PSTN usage records in a voice route is insignificant. However, we recommend that you organize the list by frequency of use, for example: RedmondLocal, RedmondLongDist, RedmondInternational, RedmondBackup. (Lync Server traverses the list from the top down.)

12. (Optional) Type a value into the **Enter a translated number to test** field and click **Go**. The test results are displayed under the field.

    Note:

    You can save a voice route that does not yet pass the test and then reconfigure it later. For details, see Test Voice Routing.

13. Click **OK**.
14. On the **Route** page, click **Commit**, and then click **Commit all**.

    Note:

    Whenever you create or modify a voice route, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

1.7.7.3.4 Exporting and Importing Voice Routing Configuration

Exporting and Importing Voice Routing Configuration

Microsoft Lync Server 2013 > Deployment > Deploying Enterprise Voice >

Topic Last Modified: *2012-11-01*

If you want to save your voice routing configuration without publishing it, follow these steps to use the Lync Server Control Panel configuration export and import commands to save and retrieve a snapshot of your voice routing configuration. When you import a voice routing configuration file (.vcfg), but changes have been made to the voice routing configuration on the server in the meantime, the pages in the **Voice Routing** group in Lync Server Control Panel will indicate that there are uncommitted changes to voice routing. Those uncommitted changes are the differences between the two configurations that require reconciliation.

Important:
If you have made any uncommitted changes to the settings on any page within the **Voice Routing** group, the changes are saved in the exported voice configuration file (.vcfg). This enables you to make voice routing configuration changes during multiple Lync Server Control Panel sessions before you publish the changes.

If you have made any uncommitted changes to the settings on any page within the group, the changes are saved in the exported voice configuration file (.vcfg). This enables you to make voice routing configuration changes during multiple sessions before you publish the changes.

⊟To export a voice routing configuration

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**.
4. On the **Actions** menu, click **Export configuration**.
5. Specify a location and file name, and then click **Save**.

Tasks

Import a Voice Route Configuration File

Topic Last Modified: *2012-11-01*

If you want to save your voice routing configuration without publishing it, follow these steps to use the Lync Server Control Panel configuration export and import commands to save and retrieve a snapshot of your voice routing configuration. When you import a voice routing configuration file (.vcfg), but changes have been made to the voice routing configuration on the server in the meantime, the pages in the **Voice Routing** group in Lync Server Control Panel will indicate that there are uncommitted changes to voice routing. Those uncommitted changes are the differences between the two configurations that require reconciliation.

If you have made any uncommitted changes to the settings on any page within the group, the changes are saved in the exported voice configuration file (.vcfg). This enables you to make voice routing configuration changes during multiple sessions before you publish the changes.

⊟To import a voice routing configuration

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**.
4. On the **Actions** menu, click **Import configuration**.
5. Find the configuration file you want to import and then click **Open**.
6. Click **Commit**, and then click **Commit all**.

> **Note:**
> Whenever you import a voice configuration file, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

Tasks

Export a Voice Route Configuration File
Publish Pending Changes to the Voice Routing Configuration

1.7.7.3.5 Publish Pending Changes to the Voice Routing Configuration

Publish Pending Changes to the Voice Routing Configuration

Microsoft Lync Server 2013 > Deployment > Deploying Enterprise Voice >

Topic Last Modified: *2012-08-07*

After you make changes to any of the configuration settings in pages in the **Voice Routing** group, perform this procedure to review, publish, or cancel the pending changes.

Important:

Be sure that only one user at a time modifies the Voice Routing configuration settings. All pending changes must be published at the same time by running the **Commit all** command. You cannot selectively publish pending changes. Before you publish pending changes, run the **Review uncommitted changes** command and cancel any configuration changes that you do not want to publish.
If you navigate away from the pages in the **Voice Routing** group before committing pending changes, all pending changes will be lost. However, you can export the current configuration (including any pending changes) to a voice configuration file, and then import and publish the updated configuration. For details, see Export a Voice Route Configuration File.

⊟To review, publish, or cancel voice routing configuration changes

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**.
4. Make the configuration changes you want to the settings on each page of the **Voice Routing** group.
5. To review pending changes without publishing them, select **Review uncommitted changes** from the **Commit** menu.
6. If you want to cancel any of the pending changes, do one of the following:
   - Select **Cancel all uncommitted changes** from the **Commit** menu.
   - Navigate to the tab of the **Voice Routing** page that has pending changes you want to cancel, select the item with the pending changes, click **Commit**, and then click **Cancel selected changes**.
7. After you have reviewed all pending changes and canceled any that you do not want to publish, click **Commit**, and then click **Commit all**.
8. In the **Uncommitted Voice Configuration Settings** dialog box, which displays a list of all of the pending changes, click **OK**.

   When Lync Server Control Panel has committed the changes, the **Successfully published voice routing configuration** message appears.

1.7.7.3.6 Test Voice Routing

Test Voice Routing

Microsoft Lync Server 2013 > Deployment > Deploying Enterprise Voice >

Topic Last Modified: *2013-02-24*

You can use the Lync Server Control Panel **Test Voice Routing** tab to configure test case scenarios. To define a test case, you specify the dial plan, voice policy, PSTN usage, and voice route against which to test a specified phone number.

Before you actually deploy your voice routing configuration, we recommend that you test it on various phone numbers to make sure that the results are what you're expecting.

Tip:

You can use the **Export test cases** and **Import test cases** commands to save voice routing test cases and import them for use on another computer.

Caution:

If you delete any part of your voice routing configuration, such as a dial plan, voice policy, voice route, or phone usage, you should review and update your voice routing test cases. The Lync Server Control Panel will not alert you to test cases that are no longer valid due to changed configurations.

Topic Last Modified: *2012-10-10*

⊟To create a test case

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing** and then click **Test Voice Routing**.
4. On the **Test Voice Routing** page, click **New** to create a new test case.
5. In **Name**, type in a unique name for the test case.

   The name must be unique among all voice routing test cases in your Enterprise Voice deployment. It can be up to 32 characters in length and may contain any alphanumeric characters, in addition to the backslash (\), period (.), or underscore (_).
6. In **Dialed number to test**, type in the dialed number that you want to use to test the routing configuration that you specify for this test case. Based on the dial plan, route, and voice policy, this number will be normalized and displayed as output.

7. In the **Dial Plan** list, select the dial plan to use when running the test. Default is the Global dial plan.
8. In the **Voice Policy** list, select the voice policy to use when running the test. Default is the Global voice policy.
9. In **Expected translation**, type in the phone number in the format you expect to see it after translation. This is the value of the phone number that you are testing after it has been translated by the first normalization rule that matches in the selected dial plan. When you run the test case, if the number you are testing does not result in the value in **Expected translation**, the test fails.
10. (Optional) In the **Expected PSTN usage** list, you can select the public switched telephone network (PSTN) usage record that you expect to be used when you run the test case, based on the specified dial plan and voice policy. If a different PSTN usage record is used, the test fails.
11. (Optional) In the **Expected route** list, you can select the voice route that you expect to be used when you run the test case, based on the specified dial plan and voice policy. If a different voice route is used, the test fails.
12. (Optional) Click **Run** to run the test case. The results are shown in the right panel of the page.
13. Click **OK**.
14. Click **Commit**, and then click **Commit all**.

> **Note:**
> Whenever you create a voice routing test case, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

Test cases provide a way for you to test voice routes in your organization: you define such things as the number to be dialed and the dial plan and voice policy to be employed, and Lync Server can then verify that that, given those conditions, the supplied number can successfully be routed to the PSTN network.

Test cases, which can be created by using Lync Server Control Panel, are typically saved only on the server where the case was originally created and run. However, these test cases can be exported as XML files (with the .vtest extension) and then imported on other servers. This enables you to run the same tests on different computers located at different points in your topology.

⊟To export a voice routing test case

1. In Lync Server Control Panel, click **Voice Routing** and then click **Test Voice Routing**.

2. On the **Test Voice Routing** tab, select the test case (or test cases) to be exported. To select multiple test cases, click the first case to be exported, then hold down the Ctrl key and select the additional cases to be exported.
3. Click **Action**, then click **Export test cases**.
4. In the **Save As** dialog box, select a folder to store the exported test cases and type a name for the resulting XML file in the **File name** box. Note that if you are exporting multiple tests cases all of these test cases will be saved to a single XML file.
5. To save the test cases, click **Save**.

Running Voice Routing Tests

Deployment > Deploying Enterprise Voice > Test Voice Routing >

Topic Last Modified: *2013-02-21*

Lync Server 2013 provides two different methods for testing voice routes: you can do informal, ad hoc testing against any phone number and any voice route; or you can do more formal testing using voice route test cases. With formal testing, you define such things as the number to be dialed and the dial plan and voice policy to be employed, and Lync Server can then verify that that, given those conditions, the supplied number can successfully be routed to the PSTN network. Both of these methods are described in subsequent sections of this documentation.

- Run Informal Voice Routing Tests
- Run Voice Routing Test Cases

Run Informal Voice Routing Tests

See Also

Deploying Enterprise Voice > Test Voice Routing > Running Voice Routing Tests >

Topic Last Modified: *2012-08-07*

You can use the **Create voice routing test case information** dialog box to run informal tests before creating an actual test case. When you are satisfied with the outcome of a test, you have the option of saving it as a formal test case.

⊟To run an informal voice routing test

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**, and then click **Test Voice Routing**.
4. On the **Test Voice Routing** page, click **Create voice routing test case information**.
5. In the **Dialed number** field, type in the phone number you want to use for this test. This number will be normalized and displayed in the **Normalized number** field of the **Results** pane.
6. In the **Dial plan** list, select the dial plan to use for testing the dialed number. Default is the Global dial plan.

   When you run the test, the first normalization rule in this dial plan that matches the dialed number will be displayed in the **Normalization rule** field of the **Results** pane.
7. In the **Voice Policy** list, select the voice policy to use for testing the dialed number. Default is the Global voice policy.

   When you run the test, the first matching PSTN usage record in this voice policy will be displayed in the **First PSTN usage** field of the **Results** pane. Also, the first matching voice route that is associated with this PSTN usage record will be displayed in the **First route** field.
8. (Optional) Select the **Populate from user** check box if you want to test the dialed number against the voice policy assigned to a particular user.

   8.a.Click **Browse** to display the **Select Enterprise Voice Users** dialog box.

8.b.Click **Find** to display the list of users who are enabled for Enterprise Voice.

8.c.Double-click the user name whose assigned voice policy you want to use for this test. The **Policy** field is now populated with the voice policy assigned to the selected user.

When you run the test, the first matching public switched telephone network (PSTN) usage record in this voice policy will be displayed in the **First PSTN usage** field of the **Results** pane. Also, the first matching voice route that is associated with this PSTN usage record will be displayed in the **First route** field.

9.Click **Run** to run the test case. The results are shown in the right panel of the dialog box.

10.(Optional) Click **Save as** if you want to save this test configuration as a formal test case.

10.a.In the **Name** field of the **Save Voice Routing Test Case Information** dialog box, type a unique name for the test case.

The name must be unique among all voice routing test cases in your Enterprise Voice deployment. It can be up to 32 characters in length and may contain any alphanumeric characters, in addition to the backslash (\), period (.), or underscore (_).

10.b.Note that the remaining fields on the **Save Voice Routing Test Case Information** dialog box are read-only, and are prepopulated from the informal test configuration *and* results. Verify that this is the configuration that you want to save for the test case.

> **Note:**
>
> Values from the test results are used to prepopulate fields on the **Save Voice Routing Test Case Information** dialog box as follows:
>
> - **Expected translation** is prepopulated with the value in the **Normalized number** field.
> - **Expected route** is prepopulated with the value in the **First route** field.
> - **Expected PSTN usage record** is prepopulated with the value in the **First PSTN usage** field.
>
> If matches for any of these values were not found during the test run, the corresponding field is empty on the **Save Voice Routing Test Case Information** dialog box.

1.a.Click **Ok** to save the test case, or click **Cancel** to return to return to the **View voice routing test case information** dialog box to further develop the test before saving it.

2.Click **Commit**, and then click **Commit all**.

> **Note:**
>
> Whenever you create a voice routing test case, you must run the **Commit all** command to publish the test case. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

Topic Last Modified: *2013-02-24*

You can run all of the test cases in your voice routing test case suite, or you can run one or more selected test cases.

⊟To run all voice routing test cases

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing** and then click **Test Voice Routing**.
4. On the **Test Voice Routing** page, click **Action** and then click **Run all**.

   The pass or fail status of each test case is shown in the **Pass/fail** column. If a test case has not yet been run, N/A is shown in the **Pass/fail** column.
5. (Optional) To see detailed results for each test case, double-click the test case name. Results are shown in the shaded area on the right side of the **Edit Test Case** page:
   - 5.a. **Test result:** Overall pass or fail status of the test case run.
   - 5.b. **Normalization rule:** The first normalization rule in the dial plan selected for this test case that matches the dialed number (the value in the **Number to test** field).
   - 5.c. **Normalized number:** The value of the dialed number after the normalization rule has translated it.
   - 5.d. **First PSTN usage:** The first public switched telephone network (PSTN) usage record in the voice policy selected for this test case that matches the dialed number.
   - 5.e. **First route:** The first voice route in the first PSTN usage record that matches the dialed number.

> **Note:**
>
> The **Expected PSTN usage record** and **Expected route** fields are optional in voice routing test case configuration. If the test case does not specify these values, the corresponding field in the test results will be empty.

⊟To run one or more selected voice routing test cases

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing**, and then click **Test Voice Routing**.
4. On the **Test Voice Routing** page, click the names of the test cases that you want to run.
5. On the **Action** menu, click **Run selected**.

   The pass or fail status of each test case is shown in the **Pass/fail** column. If a test case has not yet been run, N/A is shown in the **Pass/fail** column.
6. (Optional) To see detailed results for each test case, double-click the test case name. Results are shown in the shaded area on the right side of the

Edit Test Case page:

6.a.**Test result:** Overall pass or fail status of the test case run.

6.b.**Normalization rule:** The first normalization rule in the dial plan selected for this test case that matches the dialed number (the value in the **Number to test** field).

6.c.**Normalized number:** The value of the dialed number after the normalization rule has translated it.

6.d.**First PSTN usage:** The first PSTN usage record in the voice policy selected for this test case that matches the dialed number.

6.e.**First route:** The first voice route in the first PSTN usage record that matches the dialed number.

> **Note:**
> The **Expected PSTN usage record** and **Expected route** fields are optional in voice routing test case configuration. If the test case does not specify these values, the corresponding field in the test results will be empty.

Dial Plans and Normalization Rules

1.7.7.4.1 View Dial Plan Information

View Dial Plan Information

See Also

Deployment > Deploying Enterprise Voice > Configuring Dial Plans >

Topic Last Modified: *2012-11-01*

To view information for an existing dial plan, perform the steps in the following procedure. If you want to create a new dial plan, see Create a Dial Plan.

⊟To view information about a dial plan from Lync Server Control Panel

1.Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.

2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing** and then click **Dial Plan**.
4. On the **Dial Plan** page, double-click a dial plan name.

> **Note:**
> You can view information for only one dial plan at a time.

To view dial plans by using Windows PowerShell cmdlets

- Dial plans can be viewed by using the Windows PowerShell command-line interface and the **Get-CsDialPlan** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

  To view information about all your dial plans, type the following command in the Lync Server Management Shell, and then press ENTER:

```
Get-CsDialPlan
```

  That command will return information similar to this:

```
Identity                  : Global
Description               :
DialinConferencingRegion  :
NormalizationRules        : {Description=;
                            Pattern=^(\d+)$;Translation=$1;Name=
                            KeepAll;IsInternalExtension=False}
CountryCode               :
State                     :
City                      :
ExternalAccessPrefix      :
SimpleName                : DefaultProfile
OptimizeDeviceDialing     : False
```

Tasks

Create a Dial Plan
Modify a Dial Plan

1.7.7.4.2 Create a Dial Plan

Create a Dial Plan

Deployment > Deploying Enterprise Voice > Configuring Dial Plans >

Topic Last Modified: *2012-10-06*

To create a new dial plan, perform the steps in the following procedure. If you want to edit a dial plan, see Modify a Dial Plan.

To create a dial plan

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.

3. In the left navigation bar, click **Voice Routing** and then click **Dial Plan**.
4. On the **Dial Plan** page, click **New** and select a scope for the dial plan:
   - **Site dial plan** applies to an entire site, except any users or groups that are assigned to a user dial plan. If you select **Site** for a dial plan's scope, you must choose the site from the **Select a Site** dialog box. If a dial plan has already been created for a site, the site does not appear in the **Select a Site** dialog box.
   - **Pool dial plan** can apply to a public switched telephone network (PSTN) gateway or a Registrar. If you select **Pool** for a dial plan's scope, choose the PSTN gateway or Registrar from the **Select a Service** dialog box. If a dial plan has already been created for a service (PSTN gateway or Registrar), the service does not appear in the list.
   - **User dial plan** can be applied to specified users or groups.

   > **Note:**
   > After you select the dial plan scope, it cannot be changed.

5. If you are creating a user dial plan, enter a descriptive name in the **Name** field on the **New Dial Plan** dialog box. After this name is saved, it cannot be changed.

   > **Note:**
   > For site dial plans, the **Name** field is prepopulated with the site name and cannot be changed.
   > For pool dial plans, the **Name** field is prepopulated with the PSTN gateway or Registrar name and cannot be changed.

6. The **Simple name** field is prepopulated with the same name that appears in the **Name** field. You can optionally edit this field to specify a more descriptive name that reflects the site, service, or user to which the dial plan applies.

   > **Important:**
   > The **Simple name** must be unique among all dial plans within the Lync Server deployment. It cannot exceed 256 Unicode characters, each of which can be an alphabetic or numeric character, a hyphen (-), a period (.), a plus sign (+), or an underscore (_).
   > Spaces are not allowed in the **Simple name**.

7. (Optional) In the **Description** field, you can type additional descriptive information about the dial plan.
8. (Optional) If you want to use this dial plan as a region for dial-in access numbers, specify a **Dial-in conferencing region**. If you do not want to use this dial plan for dial-in access numbers, leave this field empty.

   > **Note:**
   > Dial-in conferencing regions are required to associate dial-in conferencing access numbers with one or more dial plans.

9. (Optional) In the **External access prefix** field, specify a value only if users need to dial one or more additional leading digits (for example, 9) to get an external line. You can type in a prefix value of up to four characters (#, *, and 0-9).

   > **Note:**
   > If you specify an external access prefix, you do not need to create a new normalization rule to accommodate the prefix.

10. Associate and configure normalization rules for the dial plan as follows:
    - To choose one or more rules from a list of all normalization rules available in your Enterprise Voice deployment, click **Select**. In **Select Normalization Rules**, highlight the rules you want to associate with the dial plan and then click **OK**.
    - To define a new normalization rule and associate it with the dial plan, click **New**. For details about defining a new rule, see Defining Normalization Rules.

- To edit a normalization rule that is already associated with the dial plan, highlight the rule name and click **Show details**. For details about editing the rule, see Defining Normalization Rules.
- To copy an existing normalization rule to use as a starting point for defining a new rule, highlight the rule name and click **Copy**, and then click **Paste**. For details about editing the copy, see Defining Normalization Rules.
- To remove a normalization rule from the dial plan, highlight the rule name and click **Remove**.

> **Note:**
> Each dial plan must have at least one associated normalization rule. For information about how to determine all of the normalization rules a dial plan requires, see Dial Plans and Normalization Rules in the Planning documentation.

11. Verify that the dial plan's normalization rules are arranged in the correct order. To change a rule's position in the list, highlight the rule name and then click the up or down arrow.

> **Important:**
> Lync Server traverses the normalization rule list from the top down and uses the first rule that matches the dialed number. If you configure a dial plan so that a dialed number can match more than one normalization rule, make sure the more restrictive rules are sorted above the less restrictive ones.
> The default **Keep All** normalization rule **^(\d{11})$** matches any 11-digit number. For example, if you add a normalization rule that matches 11-digit numbers that start with 1425, make sure that **Keep All** is sorted below the more restrictive **^(1425\d{7})$** rule.

12. (Optional) Enter a number to test the dial plan and then click **Go**. The test results are displayed under **Enter a number to test**.

> **Note:**
> You can save a dial plan that does not yet pass the test and then reconfigure it later. For details, see Test Voice Routing.

13. Click **OK**.
14. On the **Dial Plan** page, click **Commit**, and then click **Commit all**.

> **Note:**
> Any time you create a dial plan, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

Defining Normalization Rules

1.7.7.4.3 Modify a Dial Plan

Modify a Dial Plan

See Also

Deployment > Deploying Enterprise Voice > Configuring Dial Plans >

Topic Last Modified: *2012-11-01*

To modify an existing dial plan, perform the steps in the following procedure. If you want to create a new dial plan, see Create a Dial Plan.

⊟To modify a dial plan

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Routing** and then click **Dial Plan**.
4. On the **Dial Plan** page, double-click a dial plan name.

   Note:
   The dial plan scope and name were set when the dial plan was created. They cannot be changed.

5. (Optional) In **Edit Dial Plan**, edit the **Simple name** field, which is prepopulated with the same name that appears in the **Name** field to specify a more descriptive name that reflects the site, service, or user to which the dial plan applies.

   Important:
   The **Simple name** must be unique among all dial plans within the Lync Server 2013 deployment. It cannot exceed 256 Unicode characters, each of which can be an alphabetic or numeric character, a hyphen (-), a period (.), a plus sign (+), or an underscore (_).
   Spaces are not allowed in the **Simple name** field.

6. (Optional) In the **Description** field, type descriptive information about the dial plan.
7. (Optional) If you want to use this dial plan as a region for dial-in access numbers, specify a **Dial-in conferencing region**. If you do not want to use this dial plan for dial-in access numbers, leave this field empty.

   Note:
   Dial-in conferencing regions are required to associate dial-in conferencing access numbers with one or more dial plans.

8. (Optional) In the **External access prefix** field, specify a value only if users need to dial one or more additional leading digits to get an external line (for example, 9). You can type in a prefix value of up to four characters (that is, #, *, and 0-9).

   Note:
   If you specify an external access prefix, you do not need to create a new normalization rule to accommodate the prefix.

9. Associate and configure normalization rules for the dial plan:
   - To choose one or more rules from a list of all normalization rules available in your Enterprise Voice deployment, click **Select**. In the **Select Normalization Rules** dialog box, highlight the rules that you want to associate with the dial plan and then click **OK**.
   - To define a new normalization rule and associate it with the dial plan, click **New**. For details about defining a new rule, see Defining Normalization Rules.
   - To edit a normalization rule that is already associated with the dial plan, highlight the rule name and click **Show details**. For details about editing the rule, see Defining Normalization Rules.
   - To copy an existing normalization rule to use as a starting point for defining a new rule, highlight the rule name and click **Copy**, and then click **Paste**. For details about editing the copy, see Defining Normalization Rules.
   - To remove a normalization rule from the dial plan, highlight the rule name and click **Remove**.

   Note:

Each dial plan must have at least one associated normalization rule. For details about how to determine all of the normalization rules a dial plan requires, see Dial Plans and Normalization Rules in the Planning documentation.

10. Verify that the dial plan's normalization rules are arranged in the correct order. To change a rule's position in the list, highlight the rule name and then click the up or down arrow.

Important:

Lync Server traverses the normalization rule list from the top down and uses the first rule that matches the dialed number. If you configure a dial plan so that a dialed number can match more than one normalization rule, make sure the more restrictive rules are sorted above the less restrictive ones.

The default **Keep All** normalization rule **^(\d{11})$** matches any 11-digit number. If, for example, you add a normalization rule that matches 11-digit numbers that start with 1425, make sure that **Keep All** is sorted below the more restrictive **^(1425\d{7})$** rule.

11. (Optional) Enter a number to test the dial plan and then click **Go**. The test results are displayed under **Enter a number to test**.

Note:

You can save a dial plan that does not yet pass the test and then reconfigure it later. For details, see Test Voice Routing.

12. Click **OK**.
13. On the **Dial Plan** page, click **Commit**, and then click **Commit all**.

Note:

Any time you create or modify a dial plan, you must run the **Commit all** command to publish the configuration change. For details, see Publish Pending Changes to the Voice Routing Configuration in the Operations documentation.

1.7.8 Managing Call Management Features

Managing Call Management Features

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-12-18*

Enterprise Voice call management features control how incoming calls are routed and answered. Lync Server 2013 provides the following call management features:

- **Call Park:** Enables voice users to temporarily park a call and then pick it up from the same phone or another phone.
- **Group Pickup:** Enables users to pick up calls that are ringing for other users by dialing a call pickup group number.
- **Response Group:** Routes incoming calls to groups of agents by using hunt groups or interactive voice response (IVR) questions and answers.
- **Announcement:** Plays a message for calls made to an unassigned number, or routes the call elsewhere, or both.

This section describes how to manage these call management features in your Enterprise

Voice deployment.

- Managing Call Park
- Managing Group Call Pickup
- Managing Response Groups
- Managing Calls to Unassigned Numbers

1.7.8.1 Managing Call Park

Managing Call Park

Microsoft Lync Server 2013 > Operations > Managing Call Management Features >

Topic Last Modified: *2012-09-10*

The Call Park application enables an Enterprise Voice user to put a call on hold from one telephone and then retrieve the call later from any telephone. When the user parks a call, Lync Server transfers the call to a temporary number, called an *orbit*, where the call is held until someone retrieves it or it times out.

Topics in this section provide step-by-step procedures for tasks that you can perform to customize and maintain the Call Park application in your deployment.

- Configure Phone Number Extensions for Parking Calls
- Configure Call Park Settings
- Customize Call Park Music on Hold
- Manage Call Park During Disaster Recovery

1.7.8.1.1 Configure Phone Number Extensions for Parking Calls

Configure Phone Number Extensions for Parking Calls

Operations > Managing Call Management Features > Managing Call Park >

Topic Last Modified: *2012-09-10*

The Call Park application uses extension numbers in the Call Park orbit table to park calls. You need to configure the Call Park orbit table with the ranges of extension numbers that your organization reserves for parked calls. These extensions need to be virtual extensions (that is, extensions that have no user or phone assigned to them). Each Lync Server pool where a Call Park application is deployed and configured can have one or more orbit ranges. Orbit ranges must be globally unique across the Lync Server deployment.

◆**Important:**
You must select the **Enable call park** check box in your voice policy before you can use Call Park. By default, this option is not selected.

- Create or Modify a Call Park Orbit Range
- Delete a Call Park Orbit Range

1.7.8.1.1.1 Create or Modify a Call Park Orbit Range

Create or Modify a Call Park Orbit Range

See Also

Deploying Call Management Features > Configuring Call Park > Configure the Call Park Orbit Table >

Topic Last Modified: *2012-11-01*

Use one of the following procedures to create or modify a call park orbit range.

⊟To use Lync Server Control Panel to create or modify a range of numbers for parking calls

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Features** and then click **Call Park**.
4. On the **Call Park** page, do one of the following:
   - To create a new orbit range, click **New**. In **Name**, type an identifying name for this range of numbers.

     Note:

     After you commit the orbit range to the database, you cannot change this name.

   - To modify an existing orbit range, type all or part of the name of the orbit range in the search field. In the resulting list of orbits, click the orbit you want, click **Edit**, and then click **Show details**.
5. In the first **Number range** field, type the beginning number of the range of extensions for this call park orbit, and in the second **Number range** field, type the ending number of the range.

   Note:

   - The beginning number of the range must be less than or equal to the ending number of the range.
   - The value of the beginning number of the range must be the same length as the ending number of the range.
   - The orbit range must be unique. This range cannot overlap with any other range.
   - If the orbit range begins with the character * or #, the range must be greater than 100.
   - Valid values: Must match the regular expression string ([*|#]?[1-9]\d{0,7})|([1-9]\d{0,8}). This means the value must be a string beginning with either the character * or # or a number 1 through 9 (the first character cannot be a zero). If the first character is * or #, the following character must be a number 1 through 9 (it cannot be a zero). Subsequent characters can be any number 0 through 9 up to seven additional characters (for example, "#6000", "*92000", "*95551212", and "915551212"). If the first character is not * or #, the first character must be a number 1 through 9 (it cannot be zero), followed by up to eight characters, each a number 0 through 9 (for example, "915551212", "41212", "300").
   - You should not have more than a total of 50,000 orbits per pool. Each orbit range typically encompasses 100 or fewer orbits, but it can be much larger as long as it includes fewer than 10,000 orbits. For example, instead of specifying a starting number of "7000000" and an ending number of "8000000," consider specifying a starting number of "7000000" and an ending number of "7000100."

1. In **FQDN of destination server**, click the fully qualified domain name (FQDN) or service ID of the Application service that hosts the Call Park application. All calls parked to numbers within the range specified by the start number and

end number in the orbit range will be routed to this server or pool.
2. Click **Commit**.

⊟To use Windows PowerShell to create or modify a range of numbers for parking calls

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Use **New-CsCallParkOrbit** to create a new range of orbit numbers. Use **Set-CsCallParkOrbit** to modify an existing range of orbit numbers.

   At the command line, run:

   ```
   New-CsCallParkOrbit -Identity <name of orbit range> -NumberRangeStart
   ```

   For example:

   ```
   New-CsCallParkOrbit -Identity "Redmond orbit 1" -NumberRangeStart 100
   ```

   The following example shows how to modify the numbers in an existing orbit range,

   ```
   Set-CsCallParkOrbit -Identity "Redmond orbit 1" -NumberRangeStart 500
   ```

Tasks

Delete a Call Park Orbit Range

Topic Last Modified: *2013-02-20*

Use one of the following procedures to delete a Call Park orbit range.

⊟To use Lync Server Control Panel to delete a Call Park orbit range

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Features** and then click **Call Park**.
4. On the **Call Park** page, in the search field, type all or part of the name of the orbit range that you want to delete.
5. In the resulting list of orbits, click the orbit, click **Edit**, and then click **Delete**.
6. Click **OK**.

⊟To use Windows PowerShell to delete a Call Park orbit range

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.

2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. At the command line, type:

```
Remove-CsCallParkOrbit -Identity "<orbit range name>"
```

For example:

```
Remove-CsCallParkOrbit -Identity "Redmond orbit 1"
```

> **Note:**
> For details about more options, see Remove-CsCallParkOrbit.

Tasks

Create or Modify a Call Park Orbit Range

Remove-CsCallParkOrbit
Get-CsCallParkOrbit

1.7.8.1.2 Configure Call Park Settings

Configure Call Park Settings

See Also

Deploying Enterprise Voice > Deploying Call Management Features > Configuring Call Park >

Topic Last Modified: *2012-11-01*

If you don't want to use default Call Park settings, you can customize them. When you install the Call Park application, global settings are configured by default. You can modify the global settings, and you can also specify site-specific settings. Use the **New-CsCpsConfiguration** cmdlet to create new site-specific settings. Use the **Set-CsCpsConfiguration** cmdlet to modify existing settings.

> **Note:**
> At a minimum, we recommend that you configure the **OnTimeoutURI** option for the fallback destination to use when a parked call times out and ringback fails.

Use **New-CsCpsConfiguration** cmdlet or the **Set-CsCpsConfiguration** cmdlet to configure any of the following settings:

This option:	Specifies this:
CallPickupTimeoutThreshold	The amount of time that elapses after a call has been parked before it rings back to the phone where the call was answered. The value must be entered in the format hh:mm:ss to specify the hours, minutes, and seconds. The minimum value is 10 seconds, and the maximum value is 10 minutes. The default is 00:01:30.
EnableMusicOnHold	Whether music plays for a caller while a call is parked. Values are True or False. The default is True.
MaxCallPickupAttempts	The number of times a parked call rings back to the answering phone before it is forwarded to the fallback Uniform Resource

	Identifier (URI) that is specified for **OnTimeoutURI**. The default is 1.
OnTimeoutURI	The SIP address of the user or response group to which an unanswered parked call is routed when **MaxCallPickupAttempts** is exceeded. Value must be a SIP URI beginning with the string sip:. For example, sip:bob@contoso.com. The default is no forwarding address.

⊟To configure Call Park settings

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Run:

```
New-CsCpsConfiguration -Identity site:<sitename to apply settings> [-C
```

Tip:

Use the **Get-CsSite** cmdlet to identify the site. For details, see Lync Server Management Shell documentation.

For example:

```
New-CsCpsConfiguration -Identity site:Redmond1 -CallPickupTimeoutThres
```

Tasks

Customize Call Park Music on Hold

See Also

Deploying Enterprise Voice > Deploying Call Management Features > Configuring Call Park >

Topic Last Modified: *2012-09-10*

You can specify your own music file to use for music on hold, instead of the default music file that ships with Lync Server 2013. To customize music on hold, use the **Set-CsCallParkServiceMusicOnHoldFile** cmdlet.

Note:

If you customize music on hold and want the same music for multiple sites, you must configure the music file for each site that runs the Call Park application.

⊟To customize the music file

1. Log on to the computer where Lync Server Management Shell is installed as a

member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.

2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Run:

```
Set-CsCallParkServiceMusicOnHoldFile -Service <ServiceID where the Cal
```

Tip:
Use the **Get-CsService** cmdlet to identify the service. For details, see Get-CsService.

The following example shows how to obtain the contents of a file, soothingmusic.wma, as a byte array and assign it to a variable. Then the audio file is assigned as the music-on-hold file for Call Park. For details, see Set-CsCallParkServiceMusicOnHoldFile.

```
$a = Get-Content -ReadCount 0 -Encoding byte "C:\MoHFiles\soothingmusi
Set-CsCallParkServiceMusicOnHoldFile -Service Redmond1-applicationserv
```

1.7.8.1.4 Manage Call Park During Disaster Recovery

Manage Call Park During Disaster Recovery

Planning > Planning for High Availability and Disaster Recovery > Call Management Features for High Availability and Disaster Recovery >

Topic Last Modified: *2012-09-10*

Lync Server 2013 supports Call Park in the backup pool during disaster recovery. This section describes things to consider if you want to support Call Park during an outage and what happens to parked calls during the stages of an outage.

- Planning for Call Park Disaster Recovery
- Call Park Experience During Pool Failure

1.7.8.1.4.1 Planning for Call Park Disaster Recovery

Planning for Call Park Disaster Recovery

Planning for High Availability and Disaster Recovery > Call Management Features for High Availability and Disaster Recovery > Manage Call Park During Disaster Recovery >

Topic Last Modified: *2012-10-30*

This section describes some ways to prepare the Call Park application for disaster recovery and some considerations for the disaster recovery process.

Preparing for Call Park Disaster Recovery

Keep the following in mind when preparing for and carrying out disaster recovery procedures.

- Plan for disaster recovery when you do your capacity planning. For disaster recovery capacity, each pool in a paired pool should be able to handle the workloads of the Call Park services in both pools. For details about Call Park capacity planning, see Capacity Planning for Call Park.

- During disaster recovery, users who have been redirected to the backup pool as part of the failover process use the Call Park service running in the backup pool. Therefore, support for Call Park during disaster recovery requires the Call Park application to be deployed and enabled in both the primary pool and the backup pool.
- Each pool must have a valid range of orbit numbers for users who are homed in that pool to use for parking calls.
- Always keep a separate backup copy of any customized music on hold that has been uploaded for Call Park. These files are not backed up as part of the Lync Server 2013 disaster recovery process and will be lost if the files uploaded to the pool are damaged, corrupted, or erased.

Call Park Disaster Recovery Considerations

You can define only one set of Call Park application configuration settings and one customized music-on-hold audio file per pool. These settings include the timeout threshold, music on hold, maximum call pickup attempts, and timeout URI. To view these configuration settings, run the **Get-CsCpsConfiguration** cmdlet. For details about the **Get-CsCpsConfiguration** cmdlet, see Get-CsCpsConfiguration.

During disaster recovery, Call Park uses the Call Park application in the backup pool, so settings in the primary pool are not backed up. If the primary pool can't be recovered and you deploy a new pool to replace the primary pool, the settings from the primary pool are lost, and you need to reconfigure the Call Park settings and any customized music-on-hold audio files in the new pool.

If you deploy a new pool with a different fully qualified domain name (FQDN) to replace the primary pool, you need to reassign all the Call Park orbit ranges that were associated with the primary pool to the FQDN of the new pool. To reassign orbit ranges to the new pool, you can use either Lync Server Control Panel or the **Set-CsCallParkOrbit** cmdlet. For details about the **Set-CsCallParkOrbit** cmdlet, see Set-CsCallParkOrbit.

1.7.8.1.4.2 Call Park Experience During Pool Failure

Call Park Experience During Pool Failure

Planning for High Availability and Disaster Recovery > Call Management Features for High Availability and Disaster Recovery > Manage Call Park During Disaster Recovery >

Topic Last Modified: *2012-09-10*

When a Front End pool becomes unavailable due an unplanned incident, calls that have been parked but not yet retrieved are disconnected. During failover to a backup pool, users are redirected to the backup pool and are in resiliency mode. While in resiliency mode, users cannot park calls, but they can place calls on hold and transfer them. When failover is complete, calls can again be parked and retrieved as usual. During failback, users cannot park calls until they are out of resiliency mode.

During disaster recovery, users who have been redirected to the backup pool as part of the failover process use the Call Park application that is deployed in the backup pool. Therefore, users who are redirected to the backup pool use the call park settings that are configured for the Call Park application in the backup pool.

The following table summarizes the Call Park experience through the phases of disaster recovery.

User Experience During Disaster Recovery

Call state	When outage occurs	During failover	During failback
Call not yet parked	Call remains connected, but cannot be parked.	• During failover, call cannot be parked while users are in resiliency mode, but can be put on hold and transferred. • When failover completes, call can be parked and retrieved.	• During failback, call cannot be parked while users are in resiliency mode, but can be put on hold and transferred. • When failback completes, call can be parked and retrieved.
Call parked, but not yet retrieved	Call is disconnected.	No calls in this state.	Call remains parked.
Parked call already retrieved	Call remains connected.	Call remains connected.	Call remains connected.

1.7.8.2 Managing Group Call Pickup

Managing Group Call Pickup

Microsoft Lync Server 2013 > Operations > Managing Call Management Features >

Topic Last Modified: *2013-02-22*

Cumulative update for Lync Server 2013: February 2013 introduces Group Call Pickup as a new Enterprise Voice feature. Group Call Pickup enables Enterprise Voice users to pick up calls that are ringing for another user by dialing a call pickup group number.

Topics in this section provide step-by-step procedures for tasks that you perform to configure Group Call Pickup in your deployment.

- Configure Group Call Pickup Number Ranges
- Assign Group Call Pickup Numbers to Users
- Enable or Disable Group Call Pickup for Users
- Manage Group Call Pickup During Disaster Recovery

1.7.8.2.1 Configure Group Call Pickup Number Ranges

Configure Group Call Pickup Number Ranges

Operations > Managing Call Management Features > Managing Group Call Pickup >

Topic Last Modified: *2013-02-22*

Group Call Pickup is based on the Call Park application. When you deploy Group Call Pickup, you configure the call park orbit table with ranges of phone numbers that are designated as call pickup group numbers. These group numbers are the numbers that users dial to pick up calls that are ringing for another user.

Like call park orbit numbers, call pickup group numbers need to be virtual extensions that have no user or phone assigned to them. Each Front End pool where you deploy Group Call Pickup can have one or more ranges of call pickup group numbers. The group number ranges must be globally unique across the Lync Server deployment.

- Create or Modify a Group Call Pickup Number Range
- Delete a Group Call Pickup Number Range

1.7.8.2.1.1 Create or Modify a Group Call Pickup Number Range

Create or Modify a Group Call Pickup Number Range

See Also

Deploying Call Management Features > Configuring Group Call Pickup > Configure Call Pickup Group Numbers >

Topic Last Modified: *2013-01-30*

Use the following procedure to create or modify a call pickup group number range in the call park orbit table.

Note:

You must use Lync Server Management Shell to create, modify, remove, and view Group Call Pickup number ranges in the call park orbit table. Group Call Pickup number ranges are not available in Lync Server Control Panel.

Important:

The call pickup group number range must be assigned a type of GroupPickup. Users are enabled for Group Call Pickup only if the group number that they are assigned is type GroupPickup.

The call pickup group number ranges must comply with the following rules:

- The beginning number of the range must be less than or equal to the ending number of the range.
- The value of the beginning number of the range must be the same length as the ending number of the range.
- The number range must be unique. This range cannot overlap with any other range.
- If the number range begins with the character * or #, the range must be greater than 100.
- Valid values: Must match the regular expression string ([*|#]?[1-9]\d{0,7})|([1-9]\d{0,8}). This means the value must be a string beginning with either the character * or # or a number 1 through 9 (the first character cannot be a zero). If the first character is * or #, the following character must be a number 1 through 9 (it cannot be a zero). Subsequent characters can be any number 0 through 9 up to seven additional characters (for example, "#6000", "*92000", "*95551212", and "915551212"). If the first character is not * or #, the first character must be a number 1 through 9 (it cannot be zero), followed by up to eight characters, each a number 0 through 9 (for example, "915551212", "41212", "300").

To create or modify a call pickup group range

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Use **New-CsCallParkOrbit** to create a new range of call pickup group

numbers. Use **Set-CsCallParkOrbit** to modify an existing range of call pickup numbers.

At the command line, run:

```
New-CsCallParkOrbit -Identity <name of call pickup group range> -Numbe
```

For example:

```
New-CsCallParkOrbit -Identity "Redmond call pickup" -NumberRangeStart
```

The following example shows how to change a range of numbers from call park orbits to call pickup groups.

```
Set-CsCallParkOrbit -Identity "Redmond call pickup" -Type GroupPickup
```

> **Important:**
> Use this cmdlet to change the type assigned to number ranges only if you initially specified the incorrect type and the group range is not yet in use. If you change the number range from CallPark to GroupPickup or vice versa and the number range is already in use, either Call Park or Group Call Pickup will stop working for that number range. For example, if you change a number range from CallPark to GroupPick, the Call Park application can no longer use that range of orbits to park calls.

Tasks

Delete a Call Park Orbit Range

1.7.8.2.2 Assign Group Call Pickup Numbers to Users

Assign Group Call Pickup Numbers to Users

See Also

Operations > Managing Call Management Features > Managing Group Call Pickup >

Topic Last Modified: *2013-01-30*

After you add Group Call Pickup group numbers to the call park orbit table, you can assign the groups to users. Use the secondary extension feature activation (SEFAUtil) resource kit tool to assign call pickup groups to users.

Note:

In a hybrid deployment, do not assign a Group Call Pickup group to users who are homed online. Users who are homed online cannot participate in Group Call Pickup. That is, their calls cannot be answered by other users, and they cannot answer calls to other users.

⊟To assign a Group Call Pickup group to a user

1. Log on to the computer where you installed the SEFAUtil tool with administrator rights.
2. At the command line, run:

```
SEFAUtil.exe sip:<sip address of user> /server:<pool FQDN> /enablegrou
```

For example:

```
SEFAUtil.exe katarina@contoso.com /server:pool01.contoso.com /enablegr
```

Tasks

Enable Group Call Pickup for Users
Disable Group Call Pickup for Users

1.7.8.2.3 Enable or Disable Group Call Pickup for Users

Enable or Disable Group Call Pickup for Users

Operations > Managing Call Management Features > Managing Group Call Pickup >

Topic Last Modified: *2013-02-22*

When a Group Call Pickup range is added to the call park orbit table, you can enable and disable Group Call Pickup for the user as necessary. This section describes how to use the SEFAUtil resource kit tool to enable and disable Group Call Pickup for users.

Note:

The SEFAUtil parameter, /enablegrouppickup, enables Group Call Pickup and assigns the group number.

- Enable Group Call Pickup for Users
- Disable Group Call Pickup for Users

1.7.8.2.3.1 Enable Group Call Pickup for Users

Enable Group Call Pickup for Users

See Also

Managing Call Management Features > Managing Group Call Pickup > Enable or Disable Group Call Pickup for Users >

Topic Last Modified: *2013-01-30*

Use the SEFAUtil resource kit tool to enable Group Call Pickup for users. Users must be assigned a group number with type GroupPickup in the call park orbit table to have Group Call Pickup enabled. You assign a call pickup group number and enable Group Call Pickup at the same time by using the /enablegrouppickup parameter when you run SEFAUtil.exe.

To enable Group Call Pickup for a user

1. Log on to the computer where you installed the SEFAUtil tool with administrator rights.
2. At the command line, run:

```
SEFAUtil.exe sip:<sip address of user> /server:<pool FQDN> /enablegrou
```

For example:

```
SEFAUtil.exe katarina@contoso.com /server:pool01.contoso.com /enablegr
```

Tasks

Assign Group Call Pickup Numbers to Users
Disable Group Call Pickup for Users

1.7.8.2.3.2 Disable Group Call Pickup for Users

Disable Group Call Pickup for Users

See Also

Managing Call Management Features > Managing Group Call Pickup > Enable or Disable Group Call Pickup for Users >

Topic Last Modified: *2013-01-30*

Use the following procedure to disable Group Call Pickup for a user.

> **Note:**
> When you disable Group Call Pickup for a user, the call pickup group number that was assigned to the user is not retained. If you subsequently want to re-enable Group Call Pickup for that user, you must assign the call pickup group number again with the /enablegrouppickup parameter.

To disable Group Call Pickup for a user

1. Log on to the computer where you installed the SEFAUtil tool with administrator rights.
2. At the command line, run:

```
SEFAUtil.exe sip:<sip address of user> /server:<pool FQDN> /disablegro
```

For example:

```
SEFAUtil.exe katarina@contoso.com /server:pool01.contoso.com /disableg
```

Tasks

Assign Group Call Pickup Numbers to Users
Enable Group Call Pickup for Users

1.7.8.2.4 Manage Group Call Pickup During Disaster Recovery

Manage Group Call Pickup During Disaster Recovery

Operations > Managing Call Management Features > Managing Group Call Pickup >

Topic Last Modified: *2013-01-30*

When a Front End pool becomes unavailable due an unplanned incident, service is failed over to the backup pool. During failover to the backup pool, users are redirected to the backup pool and are in resiliency mode. While in resiliency mode, users cannot pick up other users' calls or have their calls picked up by other users. When failover is complete, users can again use Group Call Pickup as usual.

During failback to the primary pool, users are redirected to the primary pool and are again in resiliency mode. Group Call Pickup functionality is not available until the users are out of resiliency mode.

This section discusses some considerations for Group Call Pickup during disaster recovery and also describes the user experience.

Considerations for Group Call Pickup During Disaster Recovery

During disaster recovery, users who have been redirected to the backup pool as part of the failover process use the Call Park application running in the backup pool for the call pickup group numbers. Therefore, support for Group Call Pickup during disaster recovery requires the Call Park application to be deployed and enabled in both the primary pool and the backup pool.

The Group Call Pickup number ranges in the call park orbit table must be redirected to the backup pool after the failover process to the backup pool is complete. The number ranges must be redirected back to the primary pool after the failback process to the primary pool is complete. To redirect the Group Call Pickup ranges, use the **Set-CsCallParkOrbit** cmdlet.

If you deploy a new pool with a different fully qualified domain name (FQDN) to replace the primary pool, you need to reassign all the Group Call Pickup number ranges that were associated with the primary pool to the FQDN of the new pool. To reassign number ranges to the new pool, you can use the **Set-CsCallParkOrbit** cmdlet. For details about the **Set-CsCallParkOrbit** cmdlet, see Set-CsCallParkOrbit.

Group Call Pickup Experience During Pool Failure

The following table summarizes the Group Call Pickup experience through the phases of disaster recovery.

User Experience During Disaster Recovery

Call state	Failover to backup pool	Failback to primary pool

New calls	**During failover process:** • Group Call Pickup not available for users in resiliency mode **After failover is complete:** • Group Call Pickup available when users out of resiliency and Group Call Pickup number ranges are redirected to backup pool	**During failback process:** • Group Call Pickup not available for users in resiliency mode **After failback is complete:** • Group Call Pickup available when users out of resiliency and Group Call Pickup number ranges are redirected back to primary pool
Calls in Group Call Pickup queue	**During failover process:** • Calls in queue cannot be answered through Group Call Pickup. **After failover is complete:** • No calls in this state	**During failback process:** • Calls in queue cannot be answered through Group Call Pickup. **After failback is complete:** • Calls in queue cannot be answered through Group Call Pickup.
Established call	**During failover process:** • Calls stay connected **After failover is complete:** • Calls stay connected	**During failback process:** • Calls stay connected **After failback is complete:** • Calls stay connected

1.7.8.3 Managing Response Groups

Managing Response Groups

Microsoft Lync Server 2013 > Operations > Managing Call Management Features >

***Topic Last Modified:** 2012-10-01*

Response groups are a call management feature that enables you to queue calls that are made to a specific area, such as a Help Desk, and then route the calls to a designated group of people, called *agents*.

To manage response groups, you configure agent groups, queues, and workflows, which define what happens to a call from the time it is placed until an agent answers it.

Note:

If you have more than 300 workflows in a single pool in your Response Group deployment, it is better to use Lync Server Management Shell cmdlets to create the workflows. If you use the Response Group Configuration Tool to create workflows for a pool that has more than 300 workflows, the webpage takes a long time to load.

Topics in this section provide step-by-step procedures for tasks that you can perform to customize and maintain the Response Group application in your deployment

- Managing Response Group Agent Groups
- Managing Response Group Queues
- Managing Response Group Workflows
- Managing Application-Level Response Group Settings
- Moving Response Groups to a New Pool
- Managing Response Groups During a Disaster

1.7.8.3.1 Managing Response Group Agent Groups

Managing Response Group Agent Groups

Operations > Managing Call Management Features > Managing Response Groups >

Topic Last Modified: *2012-10-01*

An agent group consists of a group of people who are designated to answer calls to a response group. When you create an agent group, you select the agents who are assigned to the group and specify additional group settings, such as the routing method and whether an agent can sign in to and out of the group.

Note:

Users must be enabled for Enterprise Voice before you can add them to agent groups. For details about how to enable a user for Enterprise Voice, see Enable Users for Enterprise Voice.

Note:

Only on-premises users can be agents. If an agent is moved from on-premises to online, Response Group calls will not be routed to that agent.

An agent who must sign in and out of the group, which is different from signing in or out of Lync Server, is called a *formal agent*. Formal agents must be signed in to the group before they can receive calls that are routed to the group. This can be useful for agents who answer calls from the group on a part-time basis. Formal agents sign in and out of their groups by clicking a menu item in Lync 2013 to open the Windows Internet Explorer Internet browser and display a webpage console.

An agent who does not sign in or out of the group is called an *informal agent*. Informal agents are automatically signed in to the group when they sign in to Lync Server, and they cannot sign out of the group.

Important:

When you assign users as response group agents, inform them that, if they have Privacy mode enabled, they need to search for "RGS Presence Watcher" contacts and add them to their Contacts list. Agents who have Privacy mode enabled, but who do not have "RGS Presence Watcher" in their Contacts list, cannot receive calls to the response group. Agents who do not have Privacy mode enabled are not affected.

- Create or Modify an Agent Group
- Delete an Agent Group

1.7.8.3.1.1 Create or Modify an Agent Group

Create or Modify an Agent Group

See Also

Deploying Call Management Features > Configuring Response Group > Create Response Group Agent Groups >

Topic Last Modified: *2012-11-01*

Use one of the following procedures to create or modify an agent group.

Note:

An Administrator—for example, CsVoiceAdministrator—must enable users for Enterprise Voice and Lync Server before the users can be assigned to agent groups. If you are one of the delegated Response Group Managers for a managed workflow, you can create agent groups and use the agent groups in the workflows that you manage.

Important:

When you assign users as response group agents, inform them that, if they have Privacy mode enabled, they need to search for "RGS Presence Watcher" contacts and add them to their Contacts list. Agents who have Privacy mode enabled, but who do not have "RGS Presence Watcher" in their Contacts list, cannot receive calls to the response group. Agents who do not have Privacy mode enabled are not affected.

⊟To use Lync Server Control Panel to create or modify an agent group

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.

   Note:

   If you are one of the delegated Response Group Managers for a managed workflow, you can create groups and use them in the workflows that you manage.

2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Response Groups**, and then click **Group**.
4. On the **Group** page, do one of the following:
   - To create a new agent group, click **New**. In the **Select a Service** search field, type all or part of the name of the **ApplicationServer** service where you want to add the group. In the resulting list of services, click the service that you want, and then click **OK**.
   - To modify an existing agent group, type all or part of the name of the agent group in the search field. In the resulting list, click the group that you want, click **Edit**, and then click **Show details**.
5. In **Name**, type an identifying name for the agent group.
6. In **Description**, type a description for the group.
7. In the **Participation policy**, select one of the following to set up the sign-in behavior for the group:
   - Select **Informal** to specify that agents in the group do not need to sign in and out of the group. Agents are automatically signed in to the group when they sign in to Lync Server 2013.
   - Select **Formal** to specify that agents in the group must sign in and out of the group. When you select this option, agents click a menu item in Lync to open Internet Explorer and display a webpage console for signing in and out of the group.
8. In **Alert time (seconds)**, specify the number of seconds to ring an agent before offering the call to the next available agent (the default is 20 seconds).

   Important:

   The agent alert time setting cannot exceed 180 seconds. If the agent alert time exceeds 180 seconds, the client application rejects the call because the SIP transaction timer reaches its maximum wait time.

9. In **Routing method**, select the method for routing calls to agents in the group as follows:
   - To offer a new call first to the agent who has been idle the longest (has had a presence of **Available** or **Inactive** in Lync Server the longest), click **Longest idle**.
   - To offer a new call to all available agents at the same time, click **Parallel**. The call is sent to the first agent who accepts it.
   - To offer a new call to each agent in turn, click **Round robin**.
   - To always offer a new call to the agents in the order in which they are listed in the **Agent** list, click **Serial**.
   - To offer a new call to all agents who are signed into Lync Server 2013 and

the Response Group application at the same time, regardless of their current presence, click **Attendant**. Lync 2010 Attendant users who are configured as agents can see all the calls that are waiting and answer waiting calls in any order. The call is sent to the first agent who accepts it, after which the other Lync 2010 Attendant users no longer see the call.

10. In **Agents**, specify how you want to create your agents list:
    - To use a custom list of agents, click **Define a custom group of agents**, and do one of the following:
      - To add a user to the agent group, click **Select**, and then in the **Select Agents** search field, type all or part of the name of the user that you want to add to this group, and then click **Find**. In the resulting list of agents, click the user, and then click **OK**.
      - To remove a user from the agent group, in the list of agents, click the user you want to remove, and then click **Remove**.
      - To change the order in which agents are offered calls in groups that use either round robin routing or serial routing, in the list of agents, click a user, and then click the up arrow or down arrow.
    - To use a Microsoft Exchange Server distribution list as your agent group, click **Use an existing email distribution list**, and then in **Distribution list address**, type the email address of the distribution list (for example, NetworkSupport@contoso.com).

      If you use an email distribution list, you are subject to the following constraints:

      - You cannot select multiple distribution lists for the agent group. Each group supports only a single distribution list.
      - If the distribution list contains one or more distribution lists, members of the nested distribution lists are not added to the agent list.
      - If serial or round robin routing is selected, the server offers an incoming call to the appropriate agent according to the routing method and according to the order in which agents are listed in the distribution list.

      > **Important:**
      > If you use an email distribution list, hidden memberships or hidden lists might become visible to the Response Group administrator or users.

      Hidden memberships or hidden lists can become visible as follows:

      - If a distribution list was configured so that the membership is hidden and the Response Group administrator assigns the distribution list to the agent list, users can call the group to find out who the members are.
      - If a distribution list was configured so that it is hidden in the Exchange Global Address List, the Response Group administrator might be able to see the distribution list and assign it to the agent list if the Response Group process has the appropriate user rights and permissions, even if the administrator does not have the appropriate user rights and permissions.
11. Click **Commit**.

To use Windows PowerShell to create or modify an agent group

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Retrieve the service name for the Response Group service and assign it to a variable. At the command line, run:

   ```
   $serviceId="service:"+(Get-CsService | ?{$_.Applications -Like "*RGS*"
   ```

   > **Note:**

> If you run **Get-CsService** in a topology that has multiple pools, the variable $serviceId returns an array of all the service elements found in the topology.

4. Use **New-CsRgsAgentGroup** to create a new agent group. Use **Set-CsRgsAgentGroup** to modify an existing agent group. At the command line, run:

   ```
   $ag = New-CsRgsAgentGroup -Name "<agent group name>" -Parent $serviceI
   ```

   For example:

   ```
   $ag = New-CsRgsAgentGroup -Name "Help Desk" -Parent $serviceId -Descri
   ```

   > ◆**Important:**
   >
   > The agent alert time setting cannot exceed 180 seconds. If the agent alert time is greater than 180 seconds, the client application rejects the call because the SIP transaction timer reaches its maximum wait time.

5. Confirm that the agent group is created. Run:

   ```
   Get-CsRgsAgentGroup -Name "Help Desk"
   ```

1.7.8.3.2 Managing Response Group Queues

Managing Response Group Queues

Operations > Managing Call Management Features > Managing Response Groups >

Topic Last Modified: *2012-10-02*

Queues hold calls to a response group until an agent answers the call. When you manage a queue, you assign one or more agent groups to the queue and specify queue settings, such as the number of calls that the queue can hold before performing an overflow action and the length of time that a call waits for an agent before performing a time-out action. When the Response Group application searches for an available agent, it searches agent groups in the order that you list them.

- Create or Modify a Queue
- Delete a Response Group Queue

1.7.8.3.2.1 Create or Modify a Queue

Create or Modify a Queue

See Also

Deploying Call Management Features > Configuring Response Group > Create Response Group Queues >

Topic Last Modified: *2013-02-23*

Use one of the following procedures to create or modify a queue.

To use Lync Server Control Panel to create or modify a queue

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.

   Note:
   If you are one of the delegated Response Group Managers for a managed workflow, you can create or modify response group queues and assign them to the workflows that you manage.

2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Response Groups**, and then click **Queue**.
4. On the **Queue** page, do one of the following:
   - To create a new queue, click **New**. In **Select a Service**, type part or all of the name of the **ApplicationServer** service where you want to add the queue in the search field. In the resulting list of services, click the service

that you want, and then click **OK**.
- To modify an existing queue, type all or part of the queue name in the search field. In the resulting list of queues, click the queue that you want, click **Edit**, and then click **Show details**.

5. In **Name**, type an identifying name for the queue.
6. In **Description**, type a description for the queue.
7. In **Groups**, specify the groups you want to assign to the queue. Do one of the following:
   - To add a group to the queue, click **Select**. In the **Select Groups** search field, type all or part of the name of the agent group that you want to assign to the queue, click the agent group that you want, and then click **OK**.
   - To remove a group from the queue, in the list of agent groups, click the group that you want to remove, and then click **Remove**.
   - To change the order in which agents are searched, in the list of agent groups, click a group, and then click the up arrow or down arrow.

Note:

When the server searches for an available agent for the queue, it uses group order. That is, the first group in the list is searched first, followed by the second group in the list, and so on.

8. To specify a maximum period of time for a caller to wait on hold before an agent answers the call, select the **Enable queue time-out** check box, and then do the following:
   - In **Time-out period (seconds)**, specify the maximum number of seconds a caller waits for an agent to answer the call.
   - In **Call Action**, select the action that occurs when a call times out as follows:
   - To disconnect the call after the timeout, click **Disconnect**.
   - To forward the call to voice mail, click **Forward to voice mail**, and then in the **SIP address** field, type a voice mail address in the format sip:<*username*>@<*domainname*> (for example, sip:bob@contoso.com).
   - To forward the call to another telephone number, click **Forward to telephone number**, and then in the **SIP address** field, type the telephone number in the format sip:<*number*>@<*domainname*> (for example, sip:+14255550121@contoso.com).
   - To forward the call to another user, click **Forward to SIP address**, and then in the **SIP address** field, type the URI for the user in the format sip:<*username*>@<*domainname*>.
   - To forward the call to another queue, click **Forward to another queue**, and then browse to the queue that you want to use.
9. To specify a maximum number of calls that the queue can hold, select the **Enable queue overflow** check box, and then do the following:
   - In **Maximum number of calls**, select the maximum number of calls that you want the queue to hold.
   - In **Forward the call**, select which call is to be forwarded when the queue is full: **Newest Call** or **Oldest Call**.
   - In **Call action**, select the action that occurs when the overflow threshold is met as follows:
   - To disconnect the call after the timeout, click **Disconnect**.
   - To forward the call to voice mail, click **Forward to voice mail**, and then in the **SIP address** field, type a voice mail address in the format sip:<*username*>@<*domainname*> (for example, sip:bob@contoso.com).
   - To forward the call to another telephone number, click **Forward to telephone number**, and then in the **SIP address** field, type the telephone number in the format sip:<*number*>@<*domainname*> (for example, sip:+14255550121@contoso.com).
   - To forward the call to another user, click **Forward to SIP address**, and then in the **SIP address** field, type the URI for the user in the format

sip:*<username>*@*<domainname>*.

- To forward the call to another queue, click **Forward to another queue**, and then browse to the queue that you want to use.

10. Click **Commit**.

To use Windows PowerShell to create or modify a queue

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.

   > **Note:**
   > If you are one of the delegated Response Group Managers for a managed workflow, you will be able to create agent groups and queues, and assign agent groups to queues.

2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Create the prompt to be played when the queue timeout threshold is met, and save it in a variable. At the command line, run:

   ```
   $promptTO = New-CsRgsPrompt -TextToSpeechPrompt "<text for TTS prompt>
   ```

   For example:

   ```
   "All agents are currently busy. Please call back later."
   ```

   > **Note:**
   > To use an audio file for the prompt, use the **Import-CsRgsAudioFile** cmdlet. For details, see Import-CsRgsAudioFile.

4. Define the action to be taken when the queue timeout threshold is met, and save it in a variable. At the command line, run:

   ```
   $actionTO = New-CsRgsCallAction -Prompt <saved prompt from previous st
   ```

   > **Note:**
   > For details about possible actions and their syntax, see New-CsRgsCallAction.

   For example:

   ```
   $action = New-CsRgsCallAction -Prompt $promptTO -Action Terminate
   ```

5. Create the prompt to be played when the queue overflow threshold is met, and save it in a variable. At the command line, run:

   ```
   $promptOV = New-CsRgsPrompt -TextToSpeechPrompt "<text for TTS prompt>
   ```

   For example:

   ```
   $promptOV = New-CsRgsPrompt -TextToSpeechPrompt "Too many calls are wa
   ```

   > **Note:**
   > To use an audio file for the prompt, use the **Import-CsRgsAudioFile** cmdlet. For details, see Import-CsRgsAudioFile.

6. Define the action to be taken when the queue overflow threshold is met, and save it in a variable. At the command line, run:

   ```
   $actionOV = New-CsRgsCallAction -Prompt <saved prompt from previous st
   ```

   > **Note:**
   > For details about possible actions and their syntax, see New-CsRgsCallAction.

   For example:

   ```
   $action = New-CsRgsCallAction -Prompt $promptOV -Action Terminate
   ```

7. Retrieve the service name for the Response Group service and assign it to a variable. At the command line, run:

```
$serviceId="service:"+(Get-CSService | ?{$_.Applications -Like "*RGS*"
```

8. Get the identity of the agent group to be assigned to the queue. At the command line, run:

   ```
   $agid = (Get-CsRgsAgentGroup -Name "Help Desk").Identity;
   ```

   > **Note:**
   > For details about creating the agent group, see New-CsRgsAgentGroup

9. Create the queue. At the command line, run:

   ```
   $q = New-CsRgsQueue -Parent <saved service ID from previous step> -Nam
   ```

   For example:

   ```
   $q = New-CsRgsQueue -Parent $serviceId -Name "Help Desk" -Description
   ```

10. Confirm that the queue is created. Run:

    ```
    Get-CsRgsQueue -Name "Help Desk"
    ```

1.7.8.3.2.2 Delete a Response Group Queue

Delete a Response Group Queue

Managing Call Management Features > Managing Response Groups > Managing Response Group Queues >

Topic Last Modified: *2012-11-01*

Use one of the following procedures to delete a queue.

⊟To use Lync Server Control Panel to delete a queue

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Response Groups**, and then click **Queue**.
4. In the search field, type part or all of the name of the queue you want to delete.
5. In the list of queues, click the queue that you want, click **Edit**, and then click **Delete**.
6. Click **OK**.

⊟To use Windows PowerShell to delete a queue

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. At the command line, run:

```
Get-CsRgsQueue -Identity <Application Server service> -Name "<name of
```

For example:

```
Get-CsRgsQueue -Identity service:ApplicationServer:redmond.contoso.com
```

1.7.8.3.3 Managing Response Group Workflows

Managing Response Group Workflows

Operations > Managing Call Management Features > Managing Response Groups >

Topic Last Modified: *2012-10-01*

A Response Group workflow defines the behavior of a call from the time that the phone rings to the time that an agent answers the call. The workflow includes queue and routing information, and includes either hunt group or interactive voice response (IVR) information.

Topics in this section identify best practices for designing IVR workflows, and explain how to create customized business hours and holiday sets, how to create or modify workflows, and how to delete workgroups.

- Design Interactive Voice Response Call Flows
- (Optional) Define Response Group Business Hours
- (Optional) Define Response Group Holiday Sets
- Create or Modify a Workflow
- Delete a Workflow

1.7.8.3.3.1 Design Interactive Voice Response Call Flows

Design Interactive Voice Response Call Flows

Deploying Call Management Features > Configuring Response Group > Create Response Group Workflows >

Topic Last Modified: *2013-02-25*

You can use interactive voice response (IVR) to obtain information from callers and direct the call to the appropriate queue. Question-and-answer pairs determine which queue to use. Depending on the caller’s response, the caller either hears a follow-up question, or is routed to the appropriate queue. The IVR questions and the caller’s responses are provided to the responding agent who accepts the call, providing valuable information to the agent.

Overview of IVR Features

The Response Group application offers speech recognition and text-to-speech capabilities in 26 languages. You can enter IVR questions using text-to-speech or a wave (.wav) or Windows Media audio (.wma) file. Callers can respond by using voice or dual-tone multifrequency (DTMF) responses.

Interactive workflows support up to two levels of questions, with each question having up to four possible answers. The IVR asks the caller a question, and depending on the caller’s response, routes the caller to a queue or asks a second question. The second question can also have four possible answers. Depending on the answer to the second-level question, the caller is routed to the appropriate queue.

Note:
When you design call flows by using Lync Server Management Shell, you can define any number levels of IVR questions and any number of answers. However, for caller usability, we recommend that you not use more than three levels of questions, with not more than five answers each. In addition, if you design a call flow that has more than two levels of questions with more than four answers each, you cannot edit the call flow by using Lync Server 2013 Control Panel.

The IVR questions and the caller’s responses are provided to the responding agent who accepts the call.

Working with Speech Technologies

Speech technologies, such as speech recognition and text-to-speech, can enhance customer experience and let people access information more naturally and effectively. However, there can be cases where the specified text or the user voice response is not recognized correctly by the speech engine. For example, the "#" symbol is translated by the text-to-speech engine as the word "number." This issue can be mitigated by the following:

- The speech engine gives the caller five attempts to answer the question. If the caller answers the question incorrectly (that is, the answer is not one of the specified responses) or does not provide an answer at all, the caller gets another chance to answer the question. The caller has five attempts to answer the question before being disconnected. You can configure the IVR to play a customized message after each caller error. The question is repeated each time.
- To minimize the potential for ambient noise to be interpreted by the speech engine as a response, use longer responses. For example, responses should have more than one syllable and should sound significantly different from each other.
- If your questions have both speech and DTMF responses, configure the speech responses with words that represent the concept rather than the DTMF response. For example, instead of using "Press or say one" use "Press 1 or say billing."
- After you design your IVR, call the workflow, listen to the prompts, respond to each of the prompts using voice, and verify that the IVR sounds and behaves as expected. You can then modify the IVR to fix any interpretation issues. Following the previous example, if you need to refer to the # key, you can rewrite your IVR prompt to use the key name, rather than the # symbol. For example, "To talk to sales, press the pound key."

IVR Design Examples

The following sections contain examples of different IVR scenarios and question-and-answer pairs.

IVR with One Level of Questions

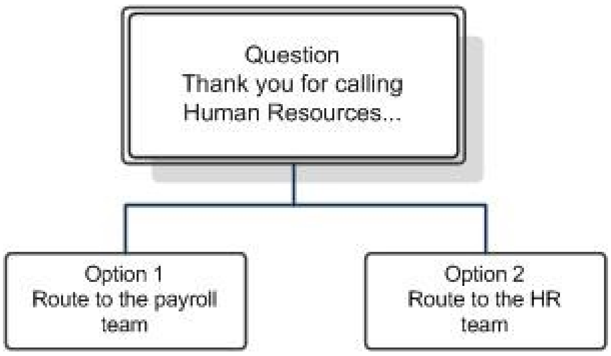
The following example shows an IVR that uses one level of questions. It uses speech recognition to detect the caller’s response.

Question: "Thank you for calling Human Resources. If you would like to speak to payroll, say payroll. Otherwise, say HR."

- **Option 1 is selected:** The caller is routed to the payroll team.
- **Option 2 is selected:** The caller is routed to the human resources team.

The following figure shows the call flow.

One-level interactive call flow



IVR with Two Levels of Questions

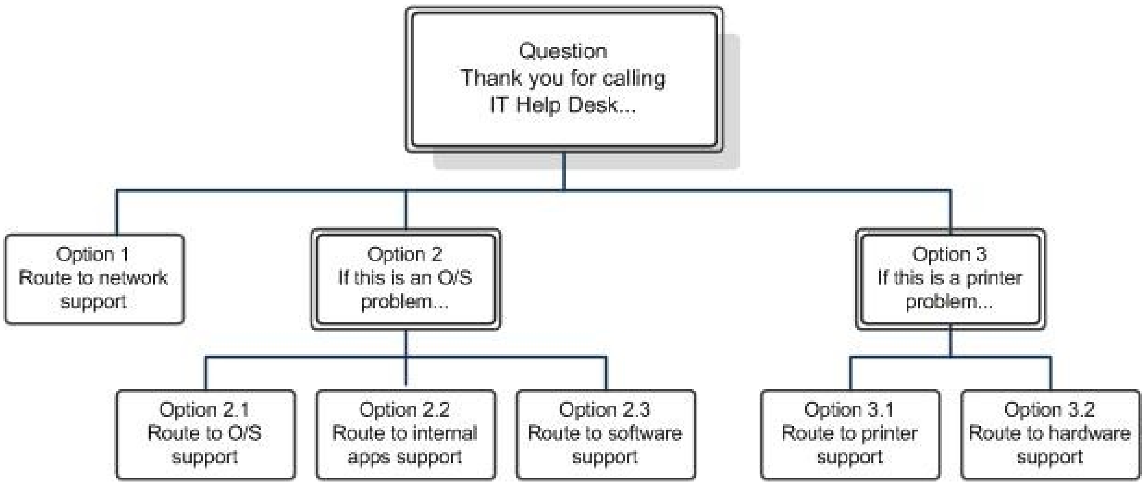
The following example shows an IVR that uses two levels of questions. It allows callers to respond using either speech or DTMF keypad input.

Question: "Thank you for calling the IT Help Desk. If you have a network access problem, press 1 or say network. If you have a software problem, press 2 or say software. If you have a hardware problem, press 3 or say hardware."

- **Option 1 is selected:** The caller is routed to the network support team.
- **Option 2 is selected:** The caller is asked a follow-up question:
  Question: "If this is an operating system problem, press 1 or say operating system. If this is a problem with an internal application, press 2 or say internal application. Otherwise, press 3 or say other."
  - **Option 1 is selected:** The caller is routed to the operating systems support team.
  - **Option 2 is selected:** The caller is routed to the internal applications support team.
  - **Option 3 is selected:** The caller is routed to the software support team.
- **Option 3 is selected:** The caller is asked a follow-up question:
  Question: "If this is a printer problem press 1. Otherwise, press 2."
  - **Option 1 is selected:** The caller is routed to the printer support team.
  - **Option 2 is selected:** The caller is routed to the hardware support team.

The following figure shows the call flow.

Two-level interactive call flow



Best Practices

The following list describes some best practices for designing your IVR:

- Let the caller get to the task quickly. Avoid providing too much information or lengthy marketing messages in your IVR.
- If you want to include a lengthy message, consider appending it to the first question instead of to the welcome message. Callers can bypass the message if it is part of the first question by answering the question, but they cannot bypass the welcome message.
- Speak in the caller’s language. Avoid stilted language. Speak naturally.
- Write efficient and effective prompts. Remove any unnecessary options. Structure the information so that the caller’s expected response is at the end of the sentence. For example, “To speak to the sales team, press 1."
- Make voice responses user friendly. For example, if you specify both DTMF and voice responses, use something like: "To speak to the sales team, press 1 or say sales."
- Test the IVR on a group of users before you deploy it across your organization.

1.7.8.3.3.2 (Optional) Define Response Group Business Hours

(Optional) Define Response Group Business Hours

See Also

Deploying Enterprise Voice > Deploying Call Management Features > Configuring Response Group >

Topic Last Modified: *2012-11-01*

Defining Business Hours

Business hour settings define when the workflow is available to answer calls and specify the actions to take for calls outside of business hours. Response Group administrators can use the **New-CsRgsHoursOfBusiness** cmdlet to create predefined schedules that you can use for any number of response groups.

Tip:

When you create or modify a workflow, you can specify a custom schedule that applies only to that workflow. For details, see Create or Modify a Hunt Group Workflow or Create or Modify an Interactive Workflow.

Note:

If a workflow is defined as a Managed workflow, then any user who is assigned the CsResponseGroupManager role can set and modify custom business hours for workflows that they manage.

Important:

Use 24-hour notation for the parameters in the following cmdlets (for example, 20:00=8:00 P.M.).

To create a predefined business hours collection

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. For each unique range of hours you want to define, run:

```
$x = New-CsRgsTimeRange [-Name <name of time range>] -OpenTime <time w
```

To create the business hours collection that uses the ranges you defined, run:

```
New-CsRgsHoursOfBusiness -Parent <service where the workflow is hosted
```

The following example specifies business hours of 9:00 A.M. to 5:00 P.M. for weekdays, 8:00 A.M. to 10:00 A.M. and again from 2:00 P.M. to 6:00 P.M. for Saturdays, and no business hours for Sundays:

```
$a = NewRgsTimeRange -Name "Weekday Hours" -OpenTime "9:00" -CloseTime
$b = NewRgsTimeRange -Name "Saturday Morning Hours" -OpenTime "8:00" -
$c = NewRgsTimeRange -Name "Saturday Afternoon Hours" -OpenTime "14:00
New-CsRgsHoursOfBusiness -Parent "ApplicationServer:Redmond.contoso.co
```

1.7.8.3.3.3 (Optional) Define Response Group Holiday Sets

(Optional) Define Response Group Holiday Sets

See Also

Deploying Enterprise Voice > Deploying Call Management Features > Configuring Response Group >

Topic Last Modified: *2012-11-01*

Holiday settings define the days that a response group is closed for business and specify the action to take on those days. A holiday set is the collection of holidays that apply to a response group.

Note:

If a workflow is defined as a Managed workflow, then any user is assigned the CsResponseGroupManager role can set and modify holidays for workflows that they manage.

To create a holiday set

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. For each holiday you want to define, run:

```
$x = New-CsRgsHoliday [-Name <holiday name>] -StartDate <starting date
```

To create the holiday set that contains the holidays you defined, run:

```
New-CsRgsHolidaySet -Parent <service where the workflow is hosted> -Na
```

The following example shows a holiday set that includes two holidays:

```
$a = New-CsRgsHoliday -Name "New Year's Day" -StartDate "1/1/2013" -En
$b = New-CsRgsHoliday -Name "Independence Day" -StartDate "7/4/2013" -
New-CsRgsHolidaySet -Parent "ApplicationServer:Redmond.contoso.com -Na
```

Managing Call Management Features > Managing Response Groups > Managing Response Group Workflows >

Topic Last Modified: *2012-10-02*

Lync Server 2013 supports two types of workflows: hunt group and interactive voice response (IVR). When you create a workflow, you use the Response Group Configuration Tool to specify the queue to use and other settings, such as a welcome message, music on hold, business hours, and questions that the Response Group application asks the caller.

Note:
You must create agent groups and queues before you create a workflow that uses them. If you want to create predefined business hours and holidays that you can use for multiple workflows, you must also define these hours and holidays before you create a workflow that uses them.

Topic Last Modified: *2012-11-27*

Use one of the following procedures to create or modify a hunt group workflow.

Note:
You can use Lync Server Management Shell or the Response Group Configuration Tool to create and modify hunt group workflows. You can access the Response Group Configuration Tool from Lync Server Control Panel, or by opening the webpage directly from a web browser by typing the following URL: **https://***<webPoolFqdn>***/RgsConfig**.

To use Response Group Configuration Tool to create or modify a hunt group workflow

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Response Groups**, and then click **Workflow**.
4. On the **Workflow** page, click **Create or edit a workflow**.
5. In the **Select a Service** search field, type all or part of the name of the **ApplicationServer** service that hosts the workflow that you want to create or change. In the resulting list of services, click the service that you want, and then click **OK**.

   Note:

   The Response Group Configuration Tool opens. You can also open the Response Group Configuration Tool directly from a web browser by typing the following URL: **https://**<*webPoolFqdn*>**/RgsConfig**.

6. Do one of the following:
   - Under **Create a New Workflow**, next to **Hunt Group, click Create**.
   - Under **Manage an Existing Workflow**, locate the workflow you want to change, and then under **Action**, click **Edit**.
7. If you are ready for users to start calling the workflow, select **Activate the workflow**.

   Note:

   If you are to creating a managed workflow, you need to select **Activate the workflow**. After you save the active, managed workflow, you can then modify and deactivate it.

8. To allow federated users to call the group, select the **Enable for federation** check box. You must also have an external access policy that applies to the Response Group application configured for federation.

   Note:

   The global external access policy applies to the Response Group application. You can configure the global policy for response group federation by using Lync Server Control Panel or by using the **Set-CsExternalAccessPolicy** cmdlet to set the EnableOutsideAccess parameter to True. Keep in mind that global policy settings apply to all users unless they are assigned a site or user policy. Therefore, before changing this setting for response groups, make sure that the federation setting meets the requirements of your organization. For details about how policies apply to users, see Manage External Access Policy for Your Organization. For details about the federation setting, see Set-CsExternalAccessPolicy.

9. To hide the identity of agents during calls, select the **Enable agent anonymity** check box.

   Note:

   Anonymous calls cannot start with instant messaging (IM) or video, although the agent or the caller can add IM and video after the call is established. An anonymous agent can also put calls on hold, transfer calls (both blind and consultative transfers), and park and retrieve calls. Anonymous calls do not support conferencing, application sharing and desktop sharing, file transfer, whiteboarding and data collaboration, and call recording. Agents using the Lync VDI Plugin can receive incoming calls anonymously, but they cannot

> make outgoing calls anonymously.

10. Under **Enter the address of the group that will receive the calls**, type the primary SIP uniform resource identifier (URI) address of the group that will answer calls to the workflow.

> **Note:**
>
> The primary URI for a workflow is how the workflow is identified and referenced. The SIP URI that you enter is created as a contact object in Active Directory Domain Services (AD DS). To create the URI, the object must be unique in Active Directory.

11. In **Display name**, type the name that you want to display for the workflow (for example, Sales Response Group).

> **Note:**
>
> Do not include the "<" or ">" characters in the display name. Do not use the following display names because they are reserved: **RGS Presence Watcher** or **Announcement Service**.

12. Under **Telephone number**, type the line URI for the response group (for example, +14255550165).
13. In **Display number**, type the number as you want it to appear for the response group (for example, +1 (425) 555-0165).
14. (Optional) In **Description**, type a description for the workflow as you want it to appear on the contact card in Lync client.
15. In **Workflow Type**, select **Managed** if this workflow will be managed by a Response Group Manager. Do the following to assign Response Group Managers to the workflow:
    - Type the SIP URI of a manager for this workflow, and click **Add**.
    - Type the SIP URI of additional managers to add to the workflow, and click **Add**.

> **Important:**
>
> Every user who is designated as a manager of a response group must be assigned the CsResponseGroupManager role. If users are not assigned this role, they cannot manage response groups.

16. Under **Step 2 Select a Language**, click the language that you want to use for speech recognition and text-to-speech.
17. If you want to configure a welcome message, under **Step 3 Configure a Welcome Message**, select the **Play a welcome message** check box, and then do one of the following:
    - To enter the welcome message as text that is converted to speech for callers, click **Use text-to-speech**, and then type the welcome message in the text box.

      > **Note:**
      >
      > Do not include HTML tags in the text you enter. If you include HTML tags, you will receive an error message.

    - To use a wave (.wav) or Windows Media audio (.wma) file recording for the welcome message, click **Select a recording**. If you want to upload a new audio file, click the **a recording** link. In the new browser window, click **Browse**, select the audio file that you want to use, and then click **Open**. Click **Upload** to load the audio file.

      > **Note:**
      >
      > All user-provided audio files must meet certain requirements. For details about supported file formats, see Technical Requirements for Response Groups.

18. Under **Step 4 Specify Your Business Hours**, in **Your time zone**, click the time zone for the workflow.

Note:
The time zone is the time zone where the callers and agents of the workflow reside. It is used to calculate the open and close hours. For example, if the workflow is configured to use the North American Eastern Time zone and the workflow is scheduled to open at 7:00 A.M. and close at 11:00 P.M., the open and close times are assumed to be 7:00 Eastern Time and 23:00 Eastern Time respectively. (You must enter the times in 24-hour time notation.)

19. Select the type of business hours schedule you want to use by doing one of the following:
    - To use a predefined schedule of business hours, click **Use a preset schedule**, and then select the schedule you want to use from the drop-down list.

      Note:
      You must have defined at least one preset schedule previously to be able to select this option. You define preset schedules by using the **New-CSRgsHoursOfBusiness** cmdlet. For details, see (Optional) Define Response Group Business Hours.

      Note:
      When you select a preset schedule, **Day**, **Open**, and **Close** are automatically filled with the days and hours that the response group is available.

    - To use a custom schedule that applies only to this workflow, click **Use a custom schedule**.
20. If you are creating a custom schedule for this workflow, click the check boxes for the days of the week that the response group is available.
21. If you are creating a custom schedule, type the **Open** and **Close** hours for each day of the week that the response group available.

Note:
The **Open** and **Close** hours must be in 24-hour time notation. For example, if your office works a 9-to-5 work day and closes at noon for lunch, the business hours are specified as **Open** 9:00, **Close** 12:00, **Open** 13:00, and **Close** 17:00.

22. If you want to play a message when the office is not open, select the **Play a message when the response group is outside of business hours** check box, and then specify the message to play by doing one of the following:
    - To enter the message as text that is converted to speech for the caller, click **Use text-to-speech**, and then type the message in the text box.

      Note:
      Do not include HTML tags in the text you enter. If you include HTML tags, you will receive an error message.

    - To use an audio file recording for the message, click **Select a recording**. If you want to upload a new audio file, click the **a recording** link. In the new browser window, click **Browse**, select the file that you want to use, and then click **Open**. Click **Upload** to load the audio file.

      Note:
      All user-provided audio files must meet certain requirements. For details about supported audio file formats, see Technical Requirements for Response Groups.

23. Specify how to handle calls after the message is played (if a message is configured):
    - To disconnect the call, click **Disconnect Call**.
    - To forward the call to voice mail, click **Forward to voice mail**, and then type the voice mail address. The format for the voice mail address is

<username>@*<domainName>* (for example, bob@contoso.com).

- To forward the call to another user, click **Forward to SIP URI**, and then type a user address. The format for the user address is *<username>*@*<domainName>*.
- To forward the call to another telephone number, click **Forward to telephone number**, and then type the telephone number. The format for the telephone number is *<number>*@*<domainName>* (for example, +14255550121@contoso.com). The domain name is used to route the caller to the correct destination.

24.Under **Step 5 Specify Your Holidays**, click the check boxes for one or more sets of holidays that define the days when the response group is closed for business.

> **Note:**
> You need to define holidays and holiday sets before you configure the workflow. Use the **New-CsRgsHoliday** and **New-CsRgsHolidaySet** cmdlets to define holidays and holiday sets. For details, see (Optional) Define Response Group Holiday Sets.

25.If you want to play a message on holidays, select the **Play a message during holidays** check box, and then specify the message to play by doing one of the following:

- To enter the message as text that is converted to speech for the caller, click **Use text-to-speech**, and then type the message in the text box.

  > **Note:**
  > Do not include HTML tags in the text you enter. If you include HTML tags, you will receive an error message.

- To use an audio file recording for the message, click **Select a recording**. If you want to upload a new audio file, click the **a recording** link. In the new browser window, click **Browse**, select the file that you want to use, and then click **Open**. Click **Upload** to load the audio file.

  > **Note:**
  > All user-provided audio files must meet certain requirements. For details about supported audio file formats, see Technical Requirements for Response Groups.

26.Specify how to handle calls after the message is played (if a message is configured):

- To disconnect the call, click **Disconnect Call**.
- To forward the call to voice mail, click **Forward to voice mail**, and then type the voice mail address. The format for the voice mail address is *<username>*@*<domainName>* (for example, bob@contoso.com).
- To forward the call to another user, click **Forward to SIP URI**, and then type a user address. The format for the user address is *<username>*@*<domainName>*.
- To forward the call to another telephone number, click **Forward to telephone number**, and then type the telephone number. The format for the telephone number is *<number>*@*<domainName>* (for example, +14255550121@contoso.com). The domain name is used to route the caller to the correct destination.

27.Under **Step 6 Configure a Queue**, in **Select the queue that will receive the calls**, select the queue that you want to hold callers until an agent becomes available.

28.Under **Step 7 Configure Music on Hold**, choose the music you want callers to listen to while waiting for an agent by doing one of the following:

- To use the default music-on-hold recording, click **Use default**.
- To use an audio file recording for the music on hold, click **Select a music file**. If you want to upload a new audio file, click the **a music file** link. In the new browser window, click **Browse**, select the file that you want to use, and then click **Open**. Click **Upload** to load the audio file.

Note:
All user provided audio files must meet certain requirements. For details about supported audio file formats, see Technical Requirements for Response Groups.

29. Click **Deploy**.

To use Windows PowerShell to create or modify a hunt group workflow

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Create the prompt to be played for the welcome message, and save it in a variable. At the command line, run:

   ```
   $promptWM = New-CsRgsPrompt -TextToSpeechPrompt "<text for TTS prompt>
   ```

   For example:

   ```
   $promptWM = New-CsRgsPrompt -TextToSpeechPrompt "Welcome to Contoso. P
   ```

   Note:
   To use an audio file for the prompt, use the **Import-CsRgsAudioFile** cmdlet. For details, see Import-CsRgsAudioFile.

4. Get the identity of the queue or question where the calls will be directed. At the command line, run:

   ```
   $qid = (Get-CsRgsQueue -Name "Help Desk").Identity
   ```

   For details about creating the queue, see New-CsRgsQueue.
5. Define the default action to be taken when a workflow is opened during business hours, and save it in a variable. At the command line, run:

   ```
   $actionWM = New-CsRgsCallAction -Prompt <saved prompt from previous st
   ```

   Note:
   For hunt group workflows, the default action must direct the call to a queue. This is parameter is required for active workflows. It is not required for inactive workflows.

   For example:

   ```
   $actionWM = New-CsRgsCallAction -Prompt $promptWM -Action TransferToQu
   ```

6. If you want to define business hours and holidays, you need to create them before you create or modify the workflow. For details, see (Optional) Define Response Group Business Hours and (Optional) Define Response Group Holiday Sets.
7. If you want to have prompts for calls that are received out of business hours or on holidays, use the **New-CsRgsPrompt** cmdlet to define the prompt, and use the **New-CsRgsCallAction** to define the action to be taken after the prompt. For details, see New-CsRgsPrompt and New-CsRgsCallAction.
8. Retrieve the service name for the Lync Server Response Group service and assign it to a variable. At the command, run:

   ```
   $serviceId="service:"+(Get-CSService | ?{$_.Applications -like "*RGS*"
   ```

9. Create or modify the workflow. To create a workflow, use **New-CsRgsWorkflow**. To modify a workflow, use **Set-CsRgsWorkflow**. At the command line, type:

   ```
   $workflowHG = New-CsRgsWorkflow -Parent <service ID for the Response G
   ```

   For example:

```
$workflowHG = New-CsRgsWorkflow -Parent $serviceID -Name "Human Resour
```

Important:

All users who are designated managers for workflows must be assigned the CsResponseGroupManager role.

Note:

For details about additional optional parameters, see New-CsRgsWorkflow or Set-CsRgsWorkflow

Create or Modify an Interactive Workflow

Deploying Call Management Features > Configuring Response Group > Create Response Group Workflows >

Topic Last Modified: *2012-11-27*

Use one of the following procedures to create or modify an interactive workflow.

Note:

You can use Lync Server Management Shell or the Response Group Configuration Tool to create and modify interactive workflows. You can access the Response Group Configuration Tool from Lync Server Control Panel, or by opening the webpage directly from a web browser by typing the following URL: **https://***<webPoolFqdn>***/RgsConfig**.

To use Response Group Configuration Tool to create or modify an Interactive workflow

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Response Groups**, and then click **Workflow**.
4. On the **Workflow** page, click **Create or edit a workflow**.
5. In the **Select a Service** search field, type all or part of the name of the **ApplicationServer** service that hosts the workflow that you want to create or modify. In the resulting list of services, click the service that you want, and then click **OK**.

Note:

The Response Group Configuration Tool opens. You can also open the

Response Group Configuration Tool directly from a web browser by typing the following URL: **https://***<webPoolFqdn>***/RgsConfig**.

6. Do one of the following:
   - Under **Create a New Workflow**, next to **Interactive**, click **Create**.
   - Under **Manage an Existing Workflow**, locate the workflow you want to change, and then under **Action**, click **Edit**.
7. If you are not ready for users to start calling the workflow, clear the **Activate the workflow** check box.

Note:

If you are to creating a managed workflow, you need to select **Activate the workflow**. After you save the active, managed workflow, you can then modify and deactivate it.

8. To allow federated users to call the group, select the **Enable for federation** check box. You must also have an external access policy that applies to the Response Group application configured for federation.

Note:

The global external access policy applies to the Response Group application. You can configure the global policy for response group federation by using Lync Server Control Panel or by using the **Set-CsExternalAccessPolicy** cmdlet to set the EnableOutsideAccess parameter to True. Keep in mind that global policy settings apply to all users unless they are assigned a site or user policy. Therefore, before changing this setting for response groups, make sure that the federation setting meets the requirements of your organization. For details about how policies apply to users, see Manage External Access Policy for Your Organization. For details about the federation setting, see **Set-CsExternalAccessPolicy** in Lync Server Management Shell documentation.

9. To hide the identity of agents during calls, select the **Enable agent anonymity** check box.

Note:

Anonymous calls cannot start with instant messaging (IM) or video, although the agent or the caller can add IM and video after the call is established. An anonymous agent can also put calls on hold, transfer calls (both blind and consultative transfers), and park and retrieve calls. Anonymous calls do not support conferencing, application sharing and desktop sharing, file transfer, whiteboarding and data collaboration, and call recording. Agents using the Lync VDI Plugin can receive incoming calls anonymously, but they cannot make outgoing calls anonymously.

10. Under **Enter the address of the group that will receive the calls**, type the primary SIP uniform resource identifier (URI) address of the group that will answer calls to the workflow.
11. In **Display name**, type the name that you want to display for the workflow (for example, Sales IVR Response Group).

Note:

Do not include the "<" or ">" characters in the display name. Do not use the following display names because they are reserved: RGS Presence Watcher or Announcement Service.

12. In **Telephone number**, type the line URI for the response group (for example, +14255550165).
13. In **Display number**, type the number as you want it to appear for the response group (for example, +1 (425) 555-0165).
14. (Optional) In **Description**, type a description for the workflow that you want to appear on the contact card in the Lync client.
15. In **Workflow Type**, select **Managed** if this workflow will be managed by a Response Group Manager. Do the following to assign Response Group Managers to the workflow:

- Type the SIP URI of a manager for this workflow, and click **Add**..
- Type the SIP URI of additional managers to add to the workflow, and click **Add**..

Important:

Every user who is designated as a manager of a response group must be assigned the CsResponseGroupManager role. If users are not assigned this role, they cannot manage response groups.

16.Under **Step 2 Select a Language**, click the language to use for speech recognition and text-to-speech.

17.If you want to configure a welcome message, under **Step 3 Configure a Welcome Message**, select the **Play a welcome message** check box, and then do one of the following:

- To enter the welcome message as text that is converted to speech for callers, click **Use text-to-speech**, and then type the welcome message in the text box.

  Note:

  Do not include HTML tags in the text you enter. If you include HTML tags, you will receive an error message.

- To use a Wave or Windows Media Audio file recording for the welcome message, click **Select a recording**. If you want to upload a new audio file, click the **a recording** link. In the new browser window, click **Browse**, select the audio file that you want to use, and then click **Open**. Click **Upload** to load the audio file.

  Note:

  All user-provided audio files must meet certain requirements. For details about supported file formats, see Technical Requirements for Response Groups.

18.Under **Step 4 Specify Your Business Hours**, in the **Your time zone** box, click the time zone of the workflow.

Note:

The time zone is the time zone where the callers and agents of the workflow reside. It is used to calculate the open and close hours. For example, if the workflow is configured to use the North American Eastern Time zone and the workflow is scheduled to open at 7:00 A.M. and close at 11:00 P.M., the open and close times are assumed to be 7:00 Eastern Time and 11:00 Eastern Time respectively. (You must enter the times in 24-hour time notation.)

19.Select the type of business hours schedule you want to use by doing one of the following:

- To use a predefined schedule of business hours, click **Use a preset schedule**, and then select the schedule you want to use from the drop-down list.

  Note:

  You must have defined at least one preset schedule previously to be able to select this option. You define preset schedules by using the **New-CSRgsHoursOfBusiness** cmdlet. For details, see (Optional) Define Response Group Business Hours. When you select a preset schedule, **Day**, **Open**, and **Close** are automatically filled with the days and hours that the response group is available.

- To use a custom schedule that applies only to this workflow, click **Use a custom schedule**.

20.If you are creating a custom schedule for this workflow, click the check boxes for the days of the week that the response group is available.

21.If you are creating a custom schedule, type the **Open** and **Close** hours when the response group available.

> **Note:**
> The **Open** and **Close** hours must be in 24-hour time notation. For example, if your office works a 9-to-5 work day and closes at noon for lunch, the business hours are specified as **Open** 9:00, **Close** 12:00, **Open** 13:00, and **Close** 17:00.

22. If you want to play a message when the office is not open, select the **Play a message when the response group is outside of business hours** check box, and then specify the message to play by doing one of the following:
    - To enter the message as text that is converted to speech for the caller, click **Use text-to-speech**, and then type the message in the text box.

      > **Note:**
      > Do not include HTML tags in the text you enter. If you include HTML tags, you will receive an error message.

    - To use an audio file recording for the message, click **Select a recording**. If you want to upload a new audio file, click the **a recording** link. In the new browser window, click **Browse**, select the file that you want to use, and then click **Open**. Click **Upload** to load the audio file.

      > **Note:**
      > All user-provided audio files must meet certain requirements. For details about supported file formats, see Technical Requirements for Response Groups.

23. Specify how to handle calls after the message is played (if a message is configured):
    - To disconnect the call, click **Disconnect Call**.
    - To forward the call to voice mail, click **Forward to voice mail**, and then type the voice mail address. The format for the voice mail address is *<username>*@*<domainname>* (for example, bob@contoso.com).
    - To forward the call to another user, click **Forward to SIP URI**, and then type a user address. The format for the user address is *<username>*@*<domainname>*.
    - To forward the call to another telephone number, click **Forward to telephone number**, and then type the telephone number. The format for the telephone number is *<number>*@*<domainname>* (for example, +14255550121@contoso.com). The domain name is used to route the caller to the correct destination.
24. Under **Step 5 Specify Your Holidays**, click the check boxes for one or more sets of holidays that define the days when the response group is closed for business.

> **Note:**
> You need to define holidays and holiday sets before you configure the workflow. Use the **New-CsRgsHoliday** and **New-CsRgsHolidaySet** cmdlets to define holidays and holiday sets. For details, see (Optional) Define Response Group Holiday Sets.

25. If you want to play a message on holidays, select the **Play a message during holidays** check box, and then specify the message to play by doing one of the following:
    - To enter the message as text that is converted to speech for the caller, click **Use text-to-speech**, and then type the message in the text box.

      > **Note:**
      > Do not include HTML tags in the text you enter. If you include HTML tags, you will receive an error message.

    - To use an audio file recording for the message, click **Select a recording**. If you want to upload a new audio file, click the **a recording** link. In the new browser window, click **Browse**, select the file that you want to use, and then click **Open**. Click **Upload** to load the audio file.

> **Note:**
> All user-provided audio files must meet certain requirements. For details about supported audio file formats, see Technical Requirements for Response Groups.

26. Specify how to handle calls after the message is played (if a message is configured):
    - To disconnect the call, click **Disconnect Call**.
    - To forward the call to voice mail, click **Forward to voice mail**, and then type the voice mail address. The format for the voice mail address is *<username>*@*<domainname>* (for example, bob@contoso.com).
    - To forward the call to another user, click **Forward to SIP URI**, and then type a user address. The format for the user address is *<username>*@*<domainname>*.
    - To forward the call to another telephone number, click **Forward to telephone number**, and then type the telephone number. The format for the telephone number is *<number>*@*<domainname>* (for example, +14255550121@contoso.com). The domain name is used to route the caller to the correct destination.
27. Under **Step 6 Configure Music on Hold**, choose what you want callers to listen to while waiting for an agent by doing one of the following:
    - To use the default music on-hold recording, click **Use default**.
    - To use an audio file recording for the on-hold music, click **Select a music file**. If you want to upload a new audio file, click the **a music file** link. In the new browser window, click **Browse**, select the file that you want to use, and then click **Open**. Click **Upload** to load the audio file.

> **Note:**
> All user-provided audio files must meet certain requirements. For details about supported file formats, see Technical Requirements for Response Groups.

28. Under **Step 7 Configure Interactive Voice Response**, under the **The user will hear the following text or recorded message** heading, specify the question to ask callers as follows:
    - To enter the question in text format, click **Use text-to-speech**, and type the question in the text box.

> **Note:**
> Do not include HTML tags in the text you enter. If you include HTML tags, you will receive an error message.

> **Note:**
> The "#" symbol is translated by the text-to-speech engine as the word "number". If you need to refer to the # key, you should use the key name, rather than the symbol, in your prompt. For example, "To talk to sales, press the pound key."

- To use a prerecorded audio file that contains the question, click **Select a recording**, and then click the **a recording** link to upload the file. In the new browser window, click **Browse**, select the audio file, and then click **Open**. Click **Upload** to load the file, and then optionally you can type the question in the text box (this enables the question, and the caller’s response, to be forwarded to the responding agent).

> **Note:**
> All user-provided audio files must meet certain requirements. For details about supported file formats, see Technical Requirements for Response Groups.

29. Under **Response 1**, specify the first possible answer to the question by doing the following:

Important:
Do not use quotation marks (") in any voice responses. Quotation marks cause the IVR to fail.

Note:
You can choose to allow callers to answer using speech, alphanumeric keypad input, or both.

- If you want to allow the caller to respond using speech, enter the answer in **Enter a voice response**.
- If you want to allow the caller to respond by pressing a key on the keypad, in **Digit**, click the keypad digit.

30. Specify whether to route the caller to a queue, or to ask another question as follows:
    - To route the caller to a queue, click **Send to a queue**, and in **Select a queue**, click the queue that you want to use.
    - To ask another question, click **Ask another question**, and then click **Use text-to-speech** and type the question, or click **Select a recording**. Use the response groupings in this section to specify up to four possible responses to the additional question and the queue to use for each response. To specify a third or fourth possible response, click the **Response 3** check box or the **Response 4** check box.
31. Specify up to three more possible answers to the original question by repeating steps 28 and 29 to specify the possible responses and the action to take for each response. To specify a third or fourth possible answer, click the **Response 3** check box or the **Response 4** check box.
32. Click **Deploy**.

To use Windows PowerShell to create or modify an Interactive workflow

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Retrieve the service name for the Response Group service and assign it to a variable. At the command line, run:

```
$serviceId="service:"+(Get-CSService | ?{$_.Applications -like "*RGS*"
```

4. An interactive workflow requires two or more queues and two or more agent groups. First, create the agent groups. Run:

```
$AGSupport = New-CsRgsAgentGroup -Parent $serviceId -Name "Technical S
$AGSales = New-CsRgsAgentGroup -Parent $serviceId -Name "Sales Team" [
```

5. Create the queues. Run:

```
$QSupport = New-CsRgsQueue -Parent $ServiceId -Name "Contoso Support"
$QSales = New-CsRgsQueue -Parent $ServiceId -Name "Contoso Sales" -Age
```

6. Create the first response group prompt. Run:

```
$SupportPrompt = New-CsRgsPrompt -TextToSpeechPrompt "Please be patien
```

7. Then create the action to be performed after the prompt. Run:

```
$SupportAction = New-CsRgsCallAction -Prompt $SupportPrompt -Action Tr
```

8. Create the first response group answer. Run:

```
$SupportAnswer = New-CsRgsAnswer -Action $SupportAction [-DtmfResponse
```

9. Now create the second prompt, call action, and answer. First create the prompt. Run:

```
$SalesPrompt = New-CsRgsPrompt -TextToSpeechPrompt "Please hold while
```

10. Create the second call action. Run:

```
$SalesAction = New-CsRgsCallAction -Prompt $SalesPrompt -Action Transf
```

11. Create the second response group answer. Run:

```
$SalesAnswer = New-CsRgsAnswer -Action $SalesAction [-DtmfResponse 2]
```

12. Create the top-level prompt. Run:

```
$TopLevelPrompt = New-CsRgsPrompt -TextToSpeechPrompt "Thank you for c
```

13. Create the top-level question. Run:

```
$TopLevelQuestion = New-CsRgsQuestion -Prompt $TopLevelPrompt [-Answer
```

14. Now create the workflow. Run:

```
$IVRAction = New-CsRgsCallAction -Action TransferToQuestion [-Question
$IVRWorkflow = New-CsRgsWorkflow -Parent $ServiceId -Name "Contoso Hel
```

Note:
All users who have been designated as manager of a response group must be assigned th CsResponseGroupManager role. If users are not assigned this role, they cannot manage response groups.

1.7.8.3.3.5 Delete a Workflow

Delete a Workflow

Managing Call Management Features > Managing Response Groups > Managing Response Group Workflows >

Topic Last Modified: *2012-11-01*

Use one of the following procedures to delete a workflow.

To use Lync Server Control Panel delete a workflow

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Response Groups**, and then click **Workflow**.
4. On the **Workflow** page, click **Create or edit a workflow**.
5. In the **Select a Service** search field, type part or all of the name of the **ApplicationServer** service that hosts the workflow that you want to delete.
6. In the list of services, click the service that you want, and then click **OK**.

Note:
The Response Group Configuration Tool webpage opens. You can also open the Response Group Configuration Tool webpage directly from a web browser by connecting to **https://*<webPoolFqdn>*/RgsConfig**.

7. Under **Manage an Existing Workflow**, locate the workflow you want to delete, and then under **Action**, click **Delete**.
8. Click **Yes**.

To use Windows PowerShell to delete a workflow

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.

3. At the command line, run:

```
Get-CsRgsWorkflow -Identity <Application Server service> -Name "<name
```

For example:

```
Get-CsRgsWorkflow -Identity service:ApplicationServer:redmond.contoso.
```

1.7.8.3.4 Managing Application-Level Response Group Settings

Managing Application-Level Response Group Settings

See Also

Deploying Enterprise Voice > Deploying Call Management Features > Configuring Response Group >

Topic Last Modified: *2012-11-01*

Application-level settings for Response Group application include the default music-on-hold configuration, the default music-on-hold audio file, the agent ringback grace period, and the call context configuration. You can define only one set of application-level settings per pool. To view application-level settings, use the **Get-CsRgsConfiguration** cmdlet. To modify the application-level settings, use the **Set-CsRgsConfiguration** cmdlet.

The default music on hold is played when a call is placed on hold only if no custom music on hold is defined. Call context is available only for queues assigned to interactive workflows. If call context is enabled, an agent can see information such as caller wait time or workflow questions and answers when the call is received.

⊟To modify Response Group application-level settings

1. Log on as a member of the RTCUniversalServerAdmins group, or as a member of one of the predefined administrative roles that support Response Group.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. At the command line, run:

```
Set-CsRgsConfiguration -Identity <name of service hosting Response Gro
```

For example:

```
Set-CsRgsConfiguration -Identity "service:ApplicationServer:redmond.co
```

To specify an audio file to use as the default music on hold, you need to import the audio file first. For example:

```
$x = Import-CsRgsAudioFile -Identity "service:ApplicationServer:redmon
Set-CsRgsConfiguration -Identity "service:ApplicationServer:redmond.co
```

Other Resources

Get-CsRgsConfiguration
Set-CsRgsConfiguration
Import-CsRgsAudioFile

1.7.8.3.5 Moving Response Groups to a New Pool

Moving Response Groups to a New Pool

Operations > Managing Call Management Features > Managing Response Groups >

Topic Last Modified: *2012-11-01*

Lync Server 2013 introduces new cmdlet support for moving response groups from one pool to another pool, even when the fully qualified domain name (FQDN) is different.

Use the steps in the following procedure to move response groups from one Front End pool to another Front End pool with a different FQDN.

Note:
In a coexistence environment, you can move response groups only between Lync Server 2013 Front End pools.

To move response groups to a pool with a different FQDN

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Export the response groups in the source pool. At the command line, type:

   ```
   Export-CsRgsConfiguration -Source "service:ApplicationServer:<source F
   ```

   For example:

   ```
   Export-CsRgsConfiguration -Source "service:ApplicationServer:source.co
   ```

   To remove the response groups from the source pool during the export, include the –RemoveExportedConfiguration parameter. For example:

   ```
   Export-CsRgsConfiguration -Source ApplicationServer:source.contoso.com
   ```

3. Import the response groups to the destination pool and assign the destination pool as the new owner. At the command line, type:

   ```
   Import-CsRgsConfiguration -Destination "service:ApplicationServer:<des
   ```

   If you also want to copy the Response Group application-level settings from the source pool to the destination pool, include the –ReplaceExistingSettings parameter. You can define only one set of application-level settings per pool. If you copy the application-level settings from the source pool to the destination pool, the settings from the source pool replace the settings for the destination pool. If you do not copy the application-level settings from the source pool, the existing settings from the destination pool apply to the imported response groups.
   For example:

   ```
   Import-CsRgsConfiguration -Destination "service:ApplicationServer:dest
   ```

   Note:
   Application-level settings include the default music-on-hold configuration, the default music-on-hold audio file, the agent ringback grace period, and the call context configuration. To view these configuration settings, run the **Get-CsRgsConfiguration** cmdlet. For details about this cmdlet, see Get-CsRgsConfiguration.

4. Verify that the import was successful by displaying the imported response group configuration by doing the following:
   - Verify that all the workflows were imported. At the command line, type the following:

     ```
     Get-CsRgsWorkflow -Identity "service:ApplicationServer:<dest
     ```

   - Verify that all the queues were imported. At the command line, type the following:

     ```
     Get-CsRgsQueue -Identity "service:ApplicationServer:<destina
     ```

   - Verify that all the agent groups were imported. At the command line, type the following:

     ```
     Get-CsRgsAgentGroup -Identity "service:ApplicationServer:<de
     ```

- Verify that all the hours of business were imported. At the command line, type the following:

```
Get-CsRgsHoursOfBusiness -Identity "service:ApplicationServe
```

- Verify that all the holiday sets were imported. At the command line, type the following:

```
Get-CsRgsHolidaySet -Identity "service:ApplicationServer:<de
```

5. Verify that the import was successful by placing a call to one of the response groups and verifying that the call is handled correctly.
6. Request agents who are members of formal agent groups to sign in to their agent groups in the destination pool.
7. If you did not previously remove response groups from the source pool, remove the response groups from the source pool. At the command line, type:

```
Export-CsRgsConfiguration -Source "service:ApplicationServer:<source p
```

For example:

```
Export-CsRgsConfiguration -Source "service:ApplicationServer:source.co
```

1.7.8.3.6 Managing Response Groups During a Disaster

Managing Response Groups During a Disaster

Planning > Planning for High Availability and Disaster Recovery > Call Management Features for High Availability and Disaster Recovery >

Topic Last Modified: *2012-11-01*

Lync Server 2013 supports running response groups in the backup pool during disaster recovery. This section describes how to plan for response groups during an outage, how response groups work during the outage, and the steps required to fail over and fail back response groups.

- Planning for Response Group Disaster Recovery
- Response Group Experience During Pool Failure
- Response Group Disaster Recovery Procedures

1.7.8.3.6.1 Planning for Response Group Disaster Recovery

Planning for Response Group Disaster Recovery

Planning for High Availability and Disaster Recovery > Call Management Features for High Availability and Disaster Recovery > Managing Response Groups During a Disaster >

Topic Last Modified: *2012-11-01*

This section describes some ways to prepare response groups for disaster recovery and provides an overview of the disaster recovery process.

Preparing for Response Group Disaster Recovery

Keep the following in mind when you prepare for and carry out disaster recovery procedures.

Note:

In a coexistence environment, only the Lync Server 2013 response groups are supported for the disaster recovery procedures described in this document.

- Plan for disaster recovery when you do your capacity planning. For disaster recovery capacity, each pool in a paired pool should be able to handle the workloads of all the response groups in both pools. For details about Response Group capacity planning, see Capacity Planning for Response Group.
- Take regular backup copies of all the response group configurations in all the Front End pools where you deployed the Response Group application by using the export procedure described in this document. For details, see Response Group Disaster Recovery Procedures. Keep the backup copies in a safe location.
- Keep a separate backup copy of all the original audio files you used for the Response Group application, including any recordings and music-on-hold files. Keep the backup files in a safe location.
- For Lync Server 2013 disaster recovery, all Response Group settings must have unique names across your deployment. This requirement applies to workflows, queues, agent groups, holiday sets, and hours of business. You should verify that this requirement is met when the primary and backup pools are still active, and before you need to initiate any failover procedure. If you encounter name conflicts while importing response group data to the backup pool, the import fails. To complete the import and failover procedure, you need to resolve the name conflicts by renaming the response group object in the backup pool or by using the **Import-CsRgsConfiguration** cmdlet with the –ResolveNameConflicts parameter to automatically resolve the conflict by appending a unique identifying number to the response group object.
- In general, we recommend that you perform daily backups, but if you have a high volume of changes, you might want to schedule more frequent backups. The amount of information you can lose in the event of a disaster depends on the frequency of your backups, as well as the frequency and volume of changes.
- It is possible to import response groups to a backup pool before a disaster or failover operation occurs. Importing response groups in advance reduces downtime, because the Lync Server Response Group service can be restored in the backup pool as soon as calls are routed to the backup pool.

Note:

The Response Group application cannot reach any agents homed in an inactive pool until failover is complete. During this time, the Response Group application processes calls as if those agents are unavailable.

Response Group Disaster Recovery Process

In the event of a disaster, you can recover response groups by using either of the following recovery approaches:

- Fail over to a backup pool and then fail back to the original pool.
- Fail over to a backup pool, create a new pool with a different fully qualified domain name (FQDN), and then import the response groups to the new pool.

During the failover phase of disaster recovery, the response groups reside in multiple pools: in the primary pool (which is unavailable) and in the backup pool. The response groups in both pools have the same name and the same owner (the primary pool), but they have different parents.

When you recover by creating a new pool with a different FQDN, you need to assign the new pool as the owner of the response groups when you import them. Ownership of response groups remains with the original pool unless or until you explicitly reassign ownership by using the –OverwriteOwner parameter with the **Import-**

CsRgsConfiguration cmdlet.

Note:

You also need to use the –OverwriteOwner parameter if you rebuilt the pool during the recovery (that is, the Response Group database is empty), whether or not you use the same FQDN. You do not need to use the –OverwriteOwner parameter if you did not rebuild the pool, but it is permissible to use this parameter whenever you import response groups back to the primary pool.

You can define only one set of application-level Response Group configuration settings per pool. These settings include the default music-on-hold configuration, the default music-on-hold audio file, the agent ringback grace period, and the call context configuration. To view these configuration settings, run the **Get-CsRgsConfiguration** cmdlet. For details about the **Get-CsRgsConfiguration** cmdlet, see Get-CsRgsConfiguration.

You can transfer these application-level settings from one pool to another by using the **Import-CsRgsConfiguration** cmdlet with the –ReplaceExistingSettings parameter, but doing so overrides the settings in the destination pool.

Important:

This constraint about transferring settings to another pool is true only for the application-level settings and the default music-on-hold audio file. It does not apply to agent groups, queues, workflows, business hours, and holiday sets.

If you don't want to replace the application-level settings in the backup pool during a disaster and the primary pool can't be recovered, the application-level settings from the primary pool will be lost. If you need to create a new pool to replace the primary pool during recovery, either with the same FQDN or with a different FQDN, you can't recover the original application-level settings. In this case, you need to configure the new pool with these settings and include the music-on-hold audio file.

If you decide to use the **Import-CsRgsConfiguration** cmdlet to transfer application-level settings from the primary pool to the backup pool during a disaster, you can then transfer the settings from the backup pool to the new pool during recovery in the same way that you transferred them from the primary pool to the backup pool.

The following table is an overview of the steps involved in recovering response groups.

For details about performing these steps, see Response Group Disaster Recovery Procedures.

Response Group Disaster Recovery Steps

Phase	Steps	Required groups and roles
Before outage	On a routine basis, run the **Export-CsRgsConfiguration** cmdlet to create backups of all Response Group configurations in all Front End pools where Response Group application is deployed.	RTCUniversalServerAdmins CsResponseGroupAdministrator
During outage	Run the **Import-CsRgsConfiguration** cmdlet to import the backed up Lync Server Response Group service configuration from the primary pool to the backup pool. **Note:** Use the –ReplaceExistingSettings	RTCUniversalServerAdmins CsResponseGroupAdministrator

	parameter if you want to replace application-level Response Group settings in the backup pool with the settings from the primary pool. If you do not transfer the application-level settings from the primary pool to the backup pool, and the primary pool can't be recovered, you will lose the settings from the primary pool.	
After importing	Run Response Group cmdlets with either the –ShowAll parameter (to display all response groups) or the –Owner parameter (to display only imported response groups) to verify that all response group configurations were imported to the backup pool. ◆**Important:** If you do not use either the –ShowAll parameter or the –Owner parameter, the response groups that you imported to the backup pool will not be listed in the results returned by the cmdlets. Run the following cmdlets: • **Get-CsRgsWorkflow** • **Get-CsRgsQueue** • **Get-CsRgsAgentGroup** • **Get-CsRgsHoursOfBusiness** • **Get-CsRgsHolidaySet**	RTCUniversalServerAdmins CsResponseGroupAdministrator
After failover	• Place a test call to a response group that was imported to the backup pool and verify that the call is handled correctly. • All formal agents must sign in again to their formal groups on backup pool. • Manage configuration changes: Response groups in the backup pool, whether imported to the backup pool or owned by the backup pool, can be modified as usual during the outage. ◆**Important:** You must use Lync Server Management Shell to manage the response groups that you imported to the backup pool. You cannot use Lync Server Control Panel to manage these response groups while they are in the	N/A

	backup pool.	
After recovery, before failback	Run the **Export-CsRgsConfiguration** cmdlet specifying the -Source parameter as the backup pool and the –Owner parameter as the primary pool to export the response groups owned by the primary pool from the backup pool.	RTCUniversalServerAdmins CsResponseGroupAdministrator
After failback	• Run the **Import-CsRgsConfiguration** cmdlet to import the response groups back to the primary pool. **Note:** If the primary pool can't be recovered and you deploy a new pool to replace it, use the –ReplaceExistingSettings parameter to transfer the application-level settings from the backup pool to the new pool. If you do not transfer the settings from the backup pool, the new pool will use the default settings. • Run the following cmdlets with either the –ShowAll parameter (to display all response groups) or the –Owner parameter (to display only imported response groups) to verify that all response group configurations were successfully imported back to the primary pool: • **Get-CsRgsWorkflow** • **Get-CsRgsQueue** • **Get-CsRgsAgentGroup** • **Get-CsRgsHoursOfBusiness** • **Get-CsRgsHolidaySet** • Place a test call to a response group that was imported back to the primary pool and verify that the call is handled correctly. • Optionally, run the **Export-CsRgsConfiguration** cmdlet on the backup pool with the –	RTCUniversalServerAdmins CsResponseGroupAdministrator

		RemoveExportedConfiguration parameter to remove the response groups owned by the primary pool from the backup pool.	

1.7.8.3.6.2 Response Group Experience During Pool Failure

Response Group Experience During Pool Failure

Planning for High Availability and Disaster Recovery > Call Management Features for High Availability and Disaster Recovery > Managing Response Groups During a Disaster >

Topic Last Modified: *2012-10-30*

This section describes in detail how response group activity is affected in the following stages:

- An outage occurs in the primary pool, but failover is not yet initiated.
- Service is failed over to the backup pool.
- Service is failed back to the primary pool.

User Experience When Outage Occurs

When a pool or site outage occurs, but the administrator has not yet initiated failover, response group activity is handled as described in the following table.

Note:
During disaster recovery, calls behave differently depending on whether the primary pool response groups were imported to the backup pool during recovery. In the following table, references to imported response groups mean that primary pool response groups were imported to the backup pool during disaster recovery mode.

Outage Occurs

Type of call or user action	**During outage**
Calls connected to an agent	• Regular calls remain connected. • Anonymous calls are disconnected.
In progress calls not yet connected to an agent	Calls are disconnected.
New calls	• Calls are disconnected. • If response groups were imported, calls connect to backup pool, but agents homed in primary pool are unreachable.
Agent calls on behalf of response group	Feature is disabled during this stage.
Agent sign-in and agent information	• Agent groups owned by the primary pool can be viewed on agent console but agents cannot sign in. • Agent groups owned by the backup pool can be viewed on agent console and agents can sign in. • Imported agent groups are not displayed on agent console.
Response group configuration	• Response groups owned by the primary pool can be viewed, depending on the availability of the primary pool's back-

	end database, but cannot be modified. • Response groups owned by the backup pool can be viewed and modified. • Imported response groups cannot be viewed with Lync Server Control Panel or the Response Group Configuration Tool, but can be configured by using Lync Server Management Shell cmdlets.

User Experience During Failover

When an administrator invokes failover to a backup pool, response group activity is handled during and after the failover as described in the following table. The first column describes the type of activity that might be taking place. The middle column describes how each activity is handled during the brief time that it takes to fail over to the backup pool. The last column describes how the activity is handled for the duration, after the failover process is complete and the backup pool is standing in for the primary pool.

Note:

During disaster recovery, calls behave differently depending on whether the primary pool response groups were imported to the backup pool during recovery. In the following table, references to imported response groups mean that primary pool response groups were imported to the backup pool during disaster recovery mode.

Failover Is Initiated

Type of call or user action	During Failover	After Failover Completes
Calls connected to an agent	• Regular calls remain connected. • Anonymous calls are disconnected.	• Regular calls remain connected. • For imported response groups, anonymous calls that have reached the backup pool remain connected.
In progress calls not yet connected to an agent	Calls are disconnected.	• If response groups were not imported, no calls are in this status. • For imported response groups, calls that have reached the backup pool remain connected.
New calls	• Calls are disconnected. • For imported response groups, calls connect to the backup pool, but agents homed in the primary pool are unreachable.	• If response groups were not imported, calls are disconnected. • For imported response groups, calls connect to the backup pool.
Agent calls on behalf of response group	Feature is disabled during this stage	• If response groups were not imported, calls fail. • For imported response groups, calls succeed.
Agent sign-in and	• Agent groups owned by the primary pool	• Agent groups owned by the primary pool

agent information	can be viewed on agent console but agents cannot sign in. • Agent groups owned by the backup pool can be viewed on agent console and agents can sign in. • Imported agent groups are displayed on agent console and agents can sign in.	can be viewed on agent console but agents cannot sign in. • Agent groups owned by the backup pool can be viewed on agent console and agents can sign in. • Imported agent groups are displayed on agent console and agents can sign in.
Response group configuration	• Response groups owned by the primary pool can be viewed, depending on the availability of the primary pool's back-end database, but cannot be modified. • Response groups owned by the backup pool can be viewed and modified. • Imported response groups cannot be viewed with Lync Server Control Panel or the Response Group Configuration Tool, but can be configured by using Lync Server Management Shell cmdlets.	• Response groups owned by the primary pool can be viewed, depending on the availability of the back end database, but cannot be modified. • Response groups owned by the backup pool can be viewed and modified. • Imported response groups cannot be viewed with Lync Server Control Panel or the Response Group Configuration Tool, but can be configured by using Lync Server Management Shell cmdlets.

User Experience During Failback

When an administrator invokes failback to the primary pool, response group activity is handled during and after the failback as described in the following table.

Note:

During disaster recovery, calls behave differently depending on whether the primary pool response groups were imported to the backup pool during recovery. In the following table, references to imported response groups mean that primary pool response groups were imported to the backup pool during disaster recovery mode.

Call Handling in Failback

Type of call or user action	During Failback	After Failback Completes
Calls connected to an agent	• Regular calls remain connected. • If response groups were not imported, no anonymous calls are in this status. • For imported response groups, anonymous	• Regular calls remain connected. • If response groups were not imported, no anonymous calls are in this status. • For imported response groups, anonymous

	calls remain connected.	calls remain connected.
In progress calls not yet connected to an agent	• If response groups were not imported, no calls are in this status. • For imported response groups, calls will be disconnected.	• If response groups were not imported, no calls are in this status. • For imported response groups, calls will be disconnected.
New calls	Calls connect to the primary pool, but agents homed in the primary pool are unreachable.	Calls connect to the primary pool.
Agent calls on behalf of response group	Feature is disabled during this stage.	Calls succeed.
Agent sign-in and agent information	• Agent groups owned by the primary pool can be viewed on agent console but agents cannot sign in. • Agent groups owned by the backup pool can be viewed on agent console and agents can sign in. • Imported agent groups are displayed on agent console and agents can sign in.	• Agent groups owned by the primary pool can be viewed on agent console and agents can sign in. • Agent groups owned by the backup pool can be viewed on agent console and agents can sign in. • Imported agent groups are not displayed on agent console.
Response group configuration	• Response groups owned by the primary pool can be viewed, depending on the availability of the primary pool's back-end database, but cannot be modified. • Response groups owned by the backup pool can be viewed and modified. • Imported response groups cannot be viewed with Lync Server Control Panel or the Response Group Configuration Tool, but can be configured by using Lync Server Management Shell cmdlets.	• Response groups owned by the primary pool can be viewed and modified. • Response groups owned by the backup pool can be viewed and modified. • Imported response groups cannot be viewed with Lync Server Control Panel or the Response Group Configuration Tool, but can be configured by using Lync Server Management Shell cmdlets.

1.7.8.3.6.3 Response Group Disaster Recovery Procedures

Response Group Disaster Recovery Procedures

Planning for High Availability and Disaster Recovery > Call Management Features for High Availability and Disaster Recovery > Managing Response Groups During a Disaster >

Topic Last Modified: *2012-11-01*

During the failover phase of disaster recovery, the response groups reside in multiple pools: in the primary pool (which is unavailable) and in the backup pool. The response groups in both pools have the same name and the same owner (the primary pool), but they have different parents. During this time, Response Group cmdlets work a little differently. Be sure to use parameters as specified in the following procedure. For details about how cmdlets work during the failover phase, see NextHop blog article "Lync Server 2013: Recovering Response Groups During Disaster Recovery" at http://go.microsoft.com/fwlink/p/?LinkId=263957. This blog article also applies to the released version of Lync Server 2013.

Use the steps in the following procedure to prepare for and perform disaster recovery for Lync Server Response Group service.

⊟To fail over and fail back Response Group

1. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
2. Routinely perform backups. At the command line, type:

   ```
   Export-CsRgsConfiguration -Source "service:ApplicationServer:<primary
   ```

   For example:

   ```
   Export-CsRgsConfiguration -Source "service:ApplicationServer:primary.c
   ```

3. During an outage, after failover to the backup pool, import the response groups to the backup pool. At the command line, type:

   ```
   Import-CsRgsConfiguration -Destination "service:ApplicationServer:<bac
   ```

   If you want to replace the application-level settings in the backup pool with the settings from the primary pool, include the –ReplaceExistingSettings parameter. For example:

   ```
   Import-CsRgsConfiguration -Destination "service:ApplicationServer:back
   ```

   Caution:

   If you do not replace the settings in the backup pool and the primary pool can't be recovered, the primary pool settings will be lost. For details, see Planning for Response Group Disaster Recovery.

4. Verify that the import was successful by displaying the imported response groups. The imported response groups are still owned by the primary pool. Do the following:
   - Display all the workflows in the backup pool that are owned by the primary pool, and verify that all the primary pool workflows are included. At the command line, type:

     ```
     Get-CsRgsWorkflow -Identity "service:ApplicationServer:<bac
     ```

     For example:

     ```
     Get-CsRgsWorkflow -Identity "service:ApplicationServer:backu
     ```

   - Display all the queues in the backup pool that are owned by the primary pool, and verify that all the primary pool queues are included. At the command line, type:

```
Get-CsRgsQueue -Identity "service:ApplicationServer:<backup
```

For example:

```
Get-CsRgsQueue -Identity "service:ApplicationServer:backup.c
```

- Display all the agent groups in the backup pool that are owned by the primary pool, and verify that all the primary pool agent groups are included. At the command line, type:

```
Get-CsRgsAgentGroup -Identity "service:ApplicationServer:<ba
```

For example:

```
Get-CsRgsAgentGroup -Identity "service:ApplicationServer:bac
```

- Display all the hours of business in the backup pool that are owned by the primary pool, and verify that all the primary pool hours of business are included. At the command line, type:

```
Get-CsRgsHoursOfBusiness -Identity "service:ApplicationServe
```

For example:

```
Get-CsRgsHoursOfBusiness -Identity "service:ApplicationServe
```

- Display all the holiday sets in the backup pool that are owned by the primary pool, and verify that all the primary pool holiday sets are included. At the command line, type:

```
Get-CsRgsHolidaySet -Identity "service:ApplicationServer:<ba
```

For example:

```
Get-CsRgsHolidaySet -Identity "service:ApplicationServer:bac
```

Alternatively, you can display all the response groups in the backup pool, including the ones owned by the primary pool and the ones owned by the backup pool by using the –ShowAll parameter instead of the –Owner parameter. For example:

```
Get-CsRgsWorkflow -Identity "service:ApplicationServer:<backup pool FQ
```

Important:

You must use either the –ShowAll parameter or the –Owner parameter. If you do not use either of these parameters, the response groups that you imported to the backup pool will not be listed in the results returned by the cmdlets.

5. Verify that the import was successful by placing a call to an imported response group and verifying that the call is handled correctly.
6. Request agents who are members of formal agent groups to sign in to their agent groups in the backup pool.
7. Manage and modify the imported response groups as usual.

Important:

While the response groups are in the backup pool, you need to use Lync Server Management Shell to manage them. You cannot use Lync Server Control Panel to manage the response groups that you imported to the backup pool.

8. After the primary pool is restored and failback is complete, export the primary pool response groups that were imported to the backup pool. At the command line, type:

```
Export-CsRgsConfiguration -Source ApplicationServer:<backup pool FQDN>
```

9. Import the response groups back to the primary pool. At the command line, type:

```
Import-CsRgsConfiguration -Destination "service:ApplicationServer:<pri
```

For example:

```
Import-CsRgsConfiguration -Destination "service:ApplicationServer:prim
```

Note:
If you rebuild a pool during recovery, whether with the same or a different fully qualified domain name (FQDN), you need to use the –OverwriteOwner parameter. As a rule of thumb, you can always use the –OverwriteOwner parameter when you import response groups back to the primary pool.

If you deployed a new pool (with the same or a different FQDN) to replace the primary pool, and you want to use the application-level settings from the backup pool for the new pool, include the –ReplaceExistingSettings parameter. At the command line, type:

```
Import-CsRgsConfiguration -Destination "service:ApplicationServer:<new
```

For example:

```
Import-CsRgsConfiguration -Destination "service:ApplicationServer:newp
```

Important:
If you don't want to replace the application-level settings and default music-on-hold audio file for the new pool with the settings from the backup pool, the new pool will use the default application-level settings.

10. Verify that the import back to the primary pool was successful by displaying the imported response group configuration. Do the following:
    - Display all the workflows in the primary pool, and verify that all the imported workflows are included. At the command line, type:

      ```
      Get-CsRgsWorkflow -Identity "service:ApplicationServer:<prim
      ```

      For example:

      ```
      Get-CsRgsWorkflow -Identity "service:ApplicationServer: prim
      ```

    - Display all the queues in the primary pool, and verify that all the imported queues are included. At the command line, type:

      ```
      Get-CsRgsQueue -Identity "service:ApplicationServer:<primary
      ```

      For example:

      ```
      Get-CsRgsQueue -Identity "service:ApplicationServer:primary.
      ```

    - Display all the agent groups in the primary pool, and verify that all the imported agent groups are included. At the command line, type:

      ```
      Get-CsRgsAgentGroup -Identity "service:ApplicationServer: <p
      ```

      For example:

      ```
      Get-CsRgsAgentGroup -Identity "service:ApplicationServer:pri
      ```

    - Display all the hours of business in the primary pool, and verify that all the imported hours of business are included. At the command line, type:

      ```
      Get-CsRgsHoursOfBusiness -Identity "service:ApplicationServe
      ```

      For example:

      ```
      Get-CsRgsHoursOfBusiness -Identity "service:ApplicationServe
      ```

    - Display all the holiday sets in the primary pool, and verify that all the imported holiday sets are included. At the command line, type:

      ```
      Get-CsRgsHolidaySet -Identity "service:ApplicationServer:<p
      ```

      For example:

      ```
      Get-CsRgsHolidaySet -Identity "service:ApplicationServer:pri
      ```

11. Verify that the import was successful by placing a call to an imported response group and verifying that the call is handled correctly.
12. Optionally, remove the response groups owned by the primary pool from the backup pool. At the command line, type:

```
Export-CsRgsConfiguration -Source "service:ApplicationServer:<backup p
```

For example:

```
Export-CsRgsConfiguration -Source "service:ApplicationServer:backup.co
```

Note:
This step creates a new file with the exported configuration, and then removes it from the backup pool.

1.7.8.4 Managing Calls to Unassigned Numbers

Managing Calls to Unassigned Numbers

Microsoft Lync Server 2013 > Operations > Managing Call Management Features >

Topic Last Modified: *2012-11-01*

Lync Server lets you configure the handling of incoming phone calls when the dialed number is valid for your organization, but is not assigned to a user or phone. You can use the Announcement application to transfer these calls to a predetermined destination (phone number, SIP URI, or voice mail), or play an audio announcement, or both. You can also transfer these calls to an Exchange UM Auto Attendant phone number. Handling calls to unassigned numbers in one of these ways helps you avoid the situations in which a caller misdials and then hears a busy tone, or the SIP client receives an error message.

This section describes how to manage unassigned number ranges to handle calls to unassigned phone numbers. The section also describes how to manage Announcements during disaster recovery if you want this functionality during an outage.

Note:
Using unassigned number handling during an outage is optional.

- Create an Announcement
- Configure Unassigned Phone Numbers
- Manage Announcements During Disaster Recovery

1.7.8.4.1 Configure Announcements

Configure Announcements

Operations > Managing Call Management Features > Managing Calls to Unassigned Numbers >

Topic Last Modified: *2012-09-12*

When you configure announcements, you are really configuring how you want calls to unassigned numbers to be handled. You can play a prompt, which can be an audio file or a text-to-speech (TTS) file, or you can just transfer the call to a specified destination without playing a prompt.

You need to create announcements before you define the unassigned number table. You need to perform this step for all announcements that use an audio prompt, a TTS prompt, or no prompt.

- Create an Announcement
- Delete an Announcement

1.7.8.4.1.1 Create an Announcement

Create an Announcement

See Also

Deploying Enterprise Voice > Deploying Call Management Features > Configuring Announcements for Unassigned Numbers >

Topic Last Modified: *2012-11-01*

To create a new announcement, you need to perform the following steps:

1. For audio prompts, record the audio file by using your favorite audio recording application.
2. For audio prompts, run the **Import-CsAnnouncementFile** cmdlet to import the contents of the audio file to File Store.
3. Run the **New-CsAnnouncement** cmdlet to create and name the announcement. Perform this step to create announcements with an audio prompt, a text-to-speech (TTS) prompt, or no prompt.

   > **Tip:**
   > You might want to create an announcement with no prompt (for example, if you want to transfer calls to a specific destination without playing a message).

4. Assign the new announcement to a number range in the unassigned number table.

This topic describes how to import and create announcements. For details about assigning announcements in the unassigned number table, see Configure the Unassigned Number Table.

To create a new announcement

1. For audio prompts, create the audio file.
2. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
3. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
4. For audio prompts, run:

   ```
   Import-CsAnnouncementFile -Parent <service of the Application Server r
   ```

5. Run:

   ```
   New-CsAnnouncement -Parent <service of Application Server running the
   ```

   For transferring calls to voice mail, type SIPAddress in the format sip:username@domainname;opaque=app:voicemail (for example, sip:bob@contoso.com;opaque=app:voicemail). For transferring calls to a phone number, type SIPAddress in the format sip:number@domainname;user=phone (for example, sip:+14255550121@contoso.com;user=phone).

   For example, to specify an audio prompt:

   ```
   $a = Get-Content ".\PromptFile.wav" -ReadCount 0 -Encoding Byte
   Import-CsAnnouncementFile -Parent service:ApplicationServer:pool0@cont
   New-CsAnnouncement -Parent service:ApplicationServer:pool0.contoso.com
   ```

   For example, to specify a TTS prompt:

   ```
   New-CsAnnouncement -Parent service:ApplicationServer:pool0.contoso.com
   ```

   For more detail about these cmdlets, and to see a list of the language codes to use in the **TextToSpeechPrompt** parameter, see New-CsAnnouncement.

1.7.8.4.1.2 Delete an Announcement

Delete an Announcement

See Also

Managing Call Management Features > Managing Calls to Unassigned Numbers > Configure Announcements >

Topic Last Modified: *2012-11-01*

Use the following procedure to delete an announcement that is used for calls to unassigned numbers.

To delete an announcement

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. List all the announcements in your organization. At the command line, run:

   ```
   Get-CsAnnouncement
   ```

4. In the resulting list, locate the announcement you want to delete, and copy the GUID. Then, at the command line, run:

   ```
   Remove-CsAnnouncement -Identity "<Service:service ID/guid>"
   ```

   For example:

   ```
   Remove-CsAnnouncement -Identity "ApplicationServer:Redmond.contoso.com
   ```

   Note:
   For details about more options, see Get-CsAnnouncement and Remove-CsAnnouncement.

1.7.8.4.2 Configure Unassigned Phone Numbers

Configure Unassigned Phone Numbers

Operations > Managing Call Management Features > Managing Calls to Unassigned Numbers >

Topic Last Modified: *2012-11-01*

Lync Server lets you configure what happens to incoming calls to phone numbers that are valid for your organization, but are not assigned to a user or a phone. To configure the handling of such calls, you set up an unassigned number table. You can use the table to route the calls to an Announcement application or to an Exchange UM server.

How you configure the unassigned number table depends on how you want to use it. You can configure the table with all the valid extensions for your organization, with only unassigned extensions, or with a combination of both types of numbers. The unassigned number table can include both assigned and unassigned numbers, but it is invoked only when a caller dials a number that is not currently assigned. If you include all the valid extensions in the unassigned number table, you can specify the action that occurs whenever someone leaves your organization, without needing to reconfigure the table. If you include unassigned extensions in the table, you can tailor the action that occurs for specific numbers. For example, if you change the extension for your customer service desk, you can include the old customer service number in the table and assign it to an announcement that provides the new number.

Important:

Before you configure the unassigned number table, you must already have either one or more announcements defined or an Exchange UM Auto Attendant set up. For details about creating announcements, see Create an Announcement. To see if you have configured Exchange UM settings, run the **Get-CsExUmContact** cmdlet. For details, see Get-CsExUmContact.

- Create or Modify an Unassigned Number Range
- Delete an Unassigned Number Range

1.7.8.4.2.1 Create or Modify an Unassigned Number Range

Create or Modify an Unassigned Number Range

See Also

Deploying Call Management Features > Configuring Announcements for Unassigned Numbers > Configure the Unassigned Number Table >

Topic Last Modified: *2012-11-01*

Use one of the following procedures to configure unassigned number ranges for the Announcement application.

Important:

Before you configure the unassigned number table, you must have already defined one or more announcements or set up an Exchange Unified Messaging (UM) Auto Attendant.

To use Lync Server Control Panel to configure unassigned phone numbers

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Features**, and then click **Unassigned Number**.
4. On the **Unassigned Number** page, do one of the following:
   - To create a new number range, click **New**. In **Name**, type an identifying name for this range of numbers.

     Note:

     After you commit the new unassigned number range to the database, you cannot change this name.
   - To modify an existing number range, type all or part of the name of the number range in the search field. In the resulting list of number ranges, click the name you want, click **Edit**, and then click **Show details**.

5. In the first **Number range** field, type the beginning number of the range, and in the second **Number range** field, type the ending number of the range.

Note:

- The beginning number of the range must be less than or equal to the ending number of the range.
- If the beginning number of the range or the ending number of the range includes an extension number, both the beginning number and the ending number of the range must include an extension, and the extension number must be the same for both the beginning number and the ending number.
- The number must match the regular expression (tel:)?(\+)?[1-9]\d{0,17}(;ext=[1-9]\d{0,9})?. This means the number may begin with the string tel: (if you don't specify that string, it will be automatically added for you), a plus sign (+), and a digit 1 through 9. The phone number can be up to 17 digits and may be followed by an extension in the format ;ext= followed by the extension number.

1. In **Announcement service**, do one of the following:
   - Click **Announcement**.
   - Click **Exchange UM**.
2. If, in the previous step, you clicked **Announcement**, do the following:
   - Under **FQDN of destination server**, click **Select**, click the service ID of the Application service that runs the Announcement application that will handle incoming calls to this range of unassigned numbers, and then click **OK**.
   - In **Announcement**, click the announcement to be played for this range of unassigned numbers.
3. If, in the previous step, you clicked **Exchange UM**, under **Auto Attendant phone number**, click **Select**, click the phone number to be used for this range of unassigned numbers, and then click **OK**.
4. Click **OK**.
5. On the **Unassigned Number** page, be sure that the unassigned number ranges are arranged in the order that you want. To change a range's position in the table, click one or more consecutive names in the list of ranges, and then click the up arrow or the down arrow.

Tip:

Lync Server searches the unassigned number table from top to bottom and uses the first range that matches the unassigned number. If you have overlapping ranges and one range specifies a last resort action, make sure that range is at the bottom of the list.

6. When you have the unassigned number ranges in the order that you want, click **Commit all**.

To use Windows PowerShell to configure unassigned phone numbers

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Use **New-CsUnassignedNumber** to create a new unassigned number range. Use **Set-CsUnassignedNumber** to modify an existing unassigned number range.

Tip:

If you have overlapping ranges and want the ranges to be applied in a specific order, include the Priority parameter. The range with the highest priority will be applied to the call.

At the command line, do one of the following:

- To create a number range for an Announcement service, run:

```
New-CsUnassignedNumber -Identity <unique identifier for unas
```

- Or, to create a number range for Exchange UM Auto Attendant, run:

```
New-CsUnassignedNumber -ExUmAutoAttendantPhoneNumber <phone
```

For example:

```
New-CsUnassignedNumber -Identity "Unassigned range 1" -NumberRangeStar
```

Or

```
New-CsUnassignedNumber -ExUmAutoAttendantPhoneNumber "+12065551234" -I
```

The following example shows how to modify the numbers in an existing unassigned number range:

```
Set-CsUnassignedNumber -Identity "Unassigned range 1" -NumberRangeStar
```

Topic Last Modified: *2012-11-01*

Use one of the following procedures to delete an unassigned number range for Announcements.

⊟To use Lync Server Control Panel to delete an unassigned number range

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Voice Features** and then click **Unassigned Number**.
4. On the **Unassigned Number** page, in the search field, type all or part of the name of the unassigned number range you want to delete.
5. In the resulting list of number ranges, click the name, click **Edit**, and then click **Delete**.
6. Click **Commit all**.

⊟To use Windows PowerShell to delete an unassigned number range

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click

Microsoft Lync Server 2013, and then click **Lync Server Management Shell**.

3. At the command line, type:

```
Remove-CsUnassignedNumber -Identity "<name of unassigned number range>
```

For example:

```
Remove-CsUnassignedNumber -Identity "Unassigned range 1"
```

> **Note:**
> For details about more options, see Remove-CsCallParkOrbit.

1.7.8.4.3 Manage Announcements During Disaster Recovery

Manage Announcements During Disaster Recovery

Planning > Planning for High Availability and Disaster Recovery > Call Management Features for High Availability and Disaster Recovery >

Topic Last Modified: *2013-02-23*

Lync Server 2013 supports announcements for calls to unassigned numbers during outages. Restoring announcement functionality during an outage is optional. If you choose to restore announcements during an outage, you need recreate your announcement configuration in the backup pool. This section describes what you need to do if you choose to restore announcements during disaster recovery.

This section applies to unassigned number ranges that use the Announcement application. This section does not apply to unassigned number ranges that use Exchange Unified Messaging (UM) Auto Attendant.

Before an Outage

Regardless of whether you choose to use announcements during outages, you should take separate backups of any customized audio files that you configured for the Announcement application. Customized announcements are not backed up as part of the Lync Server disaster recovery process. If you do not take separate backups of the files and the files that you uploaded to the server or pool are damaged, corrupted, or erased, the files will be lost.

If you do not have backup copies of customized audio files, and the original audio files are no longer available, you can find the audio files that you configured for an Announcement application by looking in the File Store for the server or pool where you originally imported the files. You can copy all the audio files that you configured for the Announcement application from the File Store.

To copy audio files from the file store

1. At the command line, run:

```
Xcopy <Source: Pool Announcement Service File Store path> <Destination
```

For example:

```
Xcopy "<Pool File Store Path>\X-ApplicationServer-X\AppServerFiles\RGS
```

Where X-ApplicationServer-X refers to the service ID of the Application Server of the pool (for example, 1-ApplicationServer-1")

During an Outage

To use the Announcement application during an outage, you need to recreate the announcement configuration in the backup pool by performing the tasks described in this section.

> **Note:**
> We recommend that you perform these tasks after you fail over to the backup pool, because as soon as you perform step 2, the backup pool takes ownership of the unassigned number ranges.

> **Note:**
> These steps are not required for number ranges that use an Exchange UM Auto Attendant phone number.

To recreate the announcement configuration in the backup pool

1. Recreate the announcements that you deployed in the primary pool in the backup pool by doing the following:
   1.a. Import any audio files used in the primary pool to the backup pool by using the **Import-CsAnnouncementFile** cmdlet and specifying the backup pool for the Parent parameter.
   1.b. Recreate each announcement by using the **New-CsAnnouncement** cmdlet and specifying the backup pool for the Parent parameter.

   > **Note:**
   > For details about using these parameters to create announcements in the backup pool, see Create an Announcement.

2. After all announcements are recreated in the backup pool, redirect all the unassigned number ranges that use announcements in the primary pool to the recreated announcements in the backup pool.

   For each unassigned number range that uses an announcement in the primary pool, run the following:

   ```
   Set-CsUnassignedNumber -Identity "<name of number range>" -Announcemen
   ```

After the Outage

When the primary pool becomes available, you need to redirect the unassigned number ranges that you changed for the outage back to the primary pool.

> **Note:**
> These steps are not required for number ranges that use an Exchange UM Auto Attendant phone number.

To restore announcements in the primary pool

1. If you had to rebuild the primary pool during the recovery, you need to recreate the announcements in the primary pool by importing the audio files and creating announcements, just as you did in the backup pool, except that you specify the primary pool for the Parent parameter. For details, see "During an Outage" earlier in this topic.
2. For each unassigned number range that you changed for the outage, run the following:

   ```
   Set-CsUnassignedNumber [-Identity "<name of number range>"] -Announcem
   ```

3. Optionally, remove the announcements that you recreated in the backup pool. Get a list of announcements for the backup pool Announcement application. At the command line, run:

   ```
   Get-CsAnnouncement -Identity "<Service:service ID>"
   ```

For example:

```
Get-CsAnnouncement -Identity "ApplicationServer:redmond.contoso.com
```

In the resulting list, locate the announcements you want to remove and copy the GUIDs. For each announcement you want to remove, run:

```
Remove-CsAnnouncement -Identity "<Service:service ID/guid>"
```

For example:

```
Remove-CsAnnouncement -Identity "ApplicationServer:redmond.contoso.com
```

1.7.9 Managing Meetings and Conferences

Managing Meetings and Conferences

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-11-01*

Topics in this section provide step-by-step procedures for tasks you can perform using the pages in the **Conferencing** group in Lync Server Control Panel.

- Meeting Configuration Settings
- Conferencing Policies
- Dial-In Conferencing (Configuration/Access Numbers)

1.7.9.1 Meeting Configuration Settings

Meeting Configuration Settings

Microsoft Lync Server 2013 > Operations > Managing Meetings and Conferences >

Topic Last Modified: *2012-11-01*

In Lync Server 2013, conferencing policy defines the user scheduling and participation experience, and meeting join settings located on the meeting configuration page define the following:

- Whether users dialing in from the public switched telephone network (PSTN) go to the lobby
- Who can be a presenter
- Whether conference type is assigned by default
- Whether anonymous (unauthenticated) users are admitted by default

The topics in this section describe how to configure meeting join settings.

- View Meeting Configuration Settings
- Create or Modify a Collection of Meeting Configuration Settings
- Delete an Existing Collection of Meeting Configuration Settings

1.7.9.1.1 View Meeting Configuration Settings

View Meeting Configuration Settings

Operations > Managing Meetings and Conferences > Meeting Configuration Settings >

Topic Last Modified: *2013-02-23*

In Lync Server 2013 Control Panel, you use meeting configuration setting to control how meetings are implemented in your deployment. This includes the following meeting configurations:

- A global configuration that is created by default when you deploy Lync Server 2013.
- Optional site-level and user-level configurations that you can create and use to specify how meetings are implemented for specific sites or users.

To view meeting configuration settings

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Meeting Configuration**.
4. On the **Meeting Configuration** page, click the meeting configuration that you would like to view.
5. In **Edit File Filter**, select the **Show Details...** check box.

   Edit Meeting Configuration - <policy> opens displaying the settings for the selected policy. For details about configuring the settings, see Create or Modify a Collection of Meeting Configuration Settings.

Viewing Meeting Configuration Information by Using Windows PowerShell Cmdlets

Meeting configuration settings can be viewed by using Windows PowerShell and the Get-CsMeetingConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view meeting configuration information

- To view information about all your meeting configuration settings, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsMeetingConfiguration
  ```

  That will return information similar to this:

  ```
  Identity                         : Global
  PstnCallersBypassLobby           : True
  EnableAssignedConferenceType     : True
  DesignateAsPresenter             : Company
  AssignedConferenceTypeByDefault  : True
  AdmitAnonymousUsersByDefault     : True
  RequireRoomSystemsAuthorization  : False
  LogoURL                          :
  LegalURL                         :
  HelpURL                          :
  CustomFooterText                 :
  AllowConferenceRecording         : True
  ```

For more information, see the help topic for the Get-CsMeetingConfiguration cmdlet.

1.7.9.1.2 Create or Modify a Collection of Meeting Configuration Settings

Create or Modify a Collection of Meeting Configuration Settings

Operations > Managing Meetings and Conferences > Meeting Configuration Settings >

Topic Last Modified: *2013-02-23*

You can use the settings on the Meeting Configuration page to define various characteristics of the meeting join experience. By default, the global settings define the join experience. You can also create site-level and pool-level meeting join settings. If you create pool-level settings, those settings apply to all meetings hosted by that pool. If you do not create pool-level settings, site-level settings apply, if they exist. If you do not define site-level settings, the global settings apply to all meetings.

⊟To create new meeting join settings

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Meeting Configuration**.
4. On the **Meeting Configuration** page, click **New**, and then do one of the following:
   - To create a site-level policy, click **Site configuration**. In the **Select a Site** search field, type all or part of the name of the site for which you want to define meeting join settings. In the resulting list of sites, click the site you want, and then click **OK**.
   - To create a pool-level policy, click **Pool configuration**. In the **Select a Service** search field, type all or part of the name of the pool service for which you want to define meeting join settings. In the resulting list of services, click the pool you want, and then click **OK**.
5. To route participants who dial in from the public switched telephone network (PSTN) through the lobby, clear the **PSTN callers bypass lobby** check box. By default, participants dialing in from the PSTN go directly to the meeting.
6. To configure who can be a presenter in the meeting, in **Designate as presenter**, do one of the following:
   - To not allow anyone other than the organizer to be a presenter, click **None**.
   - To allow only participants who are members of your organization to be a presenter, click **Company**. This is the default setting.
   - To allow any participants to be a presenter, click **Everyone**.
7. To have the organizer select a conference type when scheduling a meeting, clear the **Assigned conference type by default** check box. By default, the conference type is automatically assigned.
8. To prevent anonymous (unauthenticated) users from being automatically admitted, clear the **Admit anonymous users by default** check box. By default, anonymous users are automatically admitted to meetings.
9. To customize the meeting invite that is sent out to participants, do the following. Note that the maximum length for URLs and custom footer text is 1KB. Except for **Help URL**, if you do not specify a value for the customizations, they will not be included in the meeting. If you do not include a custom help URL, the default help URL for Lync will be displayed in the invite.
   - To customize the logo that appears in the meeting invite, in **Logo URL**, enter the location of the logo.

Note:

> The logo must be a GIF or JPG image with a size of 188 by 30 pixels.

- To customize the help text that appears in the meeting invite, in **Help URL**, enter the location of the help text.
- To customize the legal text that appears in the meeting invite, in **Legal text URL**, enter the location of the legal text.
- To customize the footer text that appears in the meeting invite, in **Custom footer text**, enter text.

10. Click **Commit**.

To modify an existing collection of meeting configurations

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Meeting Configuration**.
4. In the list of meeting configurations, click the configuration that you want to change, click **Edit**, and then click **Show details**.
5. In **Edit Meeting Configuration**, modify any of the configuration settings, except for the configuration name, which cannot be modified.
6. Click **Commit**.

Creating New Meeting Configuration Settings by Using Windows PowerShell Cmdlets

Meeting configuration settings can be created (at the site scope only) by using Windows PowerShell and the New-CsMeetingConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To create meeting configuration settings that use the default values

- This command creates a new set of meeting configuration settings for the Redmond site:

  ```
  New-CsMeetingConfiguration -Identity "site:Redmond"
  ```

  Because no parameters (other than the mandatory Identity parameter) were specified in the preceding command, the new meeting configuration settings will use the default values for all its properties.

To change a property value when creating meeting configuration settings

- To create settings that use different property values, simply include the appropriate parameter and parameter value. For example, to create a collection of meeting configuration settings that, by default, admit everyone to a meeting as a presenter use a command like this:

  ```
  New-CsMeetingConfiguration -Identity "site:Redmond" -DesignateAsPresent
  ```

To change multiple property values when creating meeting configuration settings

- Multiple property values can be modified by including multiple parameters. For example, this command admits everyone to a meeting as a presenter and also forces PSTN users to wait in the lobby until they are formally admitted to the meeting:

  ```
  New-CsMeetingConfiguration -Identity "site:Redmond" -DesignateAsPresent
  ```

For more information, see the help topic for the New-CsMeetingConfiguration cmdlet.

1.7.9.1.3 Delete an Existing Collection of Meeting Configuration Settings

Delete an Existing Collection of Meeting Configuration Settings

Operations > Managing Meetings and Conferences > Meeting Configuration Settings >

Topic Last Modified: *2013-02-23*

You can delete a site or user configuration. The global configuration cannot be removed. If you delete the global configuration, it is automatically reset to the default values.

⊟To delete a site or user meeting configuration

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Meeting Configuration**.
4. In the list of meeting configurations, click the site or pool configuration that you want to delete, click **Edit**, and then click **Delete**.

Removing Meeting Configuration Settings by Using Windows PowerShell Cmdlets

Meeting settings can be deleted by using Windows PowerShell and the Remove-CsMeetingConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To remove a specified collection of meeting configuration settings

- This command removes the meeting configuration settings applied to the Redmond site:

  ```
  Remove-CsMeetingConfiguration -Identity "site:Redmond"
  ```

⊟To remove all the meeting configuration settings applied to the site scope

- This command removes all the meeting configuration settings applied to the site scope:

  ```
  Get-CsMeetingConfiguration -Filter "site:*" | Remove-CsMeetingConfigura
  ```

⊟To remove all the meeting configuration settings that admit anonymous users by default

- And this one removes all the settings that allow anonymous users to be admitted by default:
```
Get-CsMeetingConfiguration | Where-Object {$_.AdmitAnonymousUsersByDefa
```

For more information, see the help topic for the Remove-CsMeetingConfiguration cmdlet.

1.7.9.2 Conferencing Policies

Conferencing Policies

Microsoft Lync Server 2013 > Operations > Managing Meetings and Conferences >

Topic Last Modified: *2012-09-18*

Conferencing policy defines the features and capabilities that users have available during a conference (also known as a meeting). Conferencing policy settings encompass a wide variety of scheduling and participation options, ranging from whether a meeting can include IP audio and video to the maximum number of people who can attend. Administrators can use conferencing policy to manage security, bandwidth, and legal aspects of meetings.

You can define conferencing policy on three levels: global scope, site scope, and user scope. Settings apply to a specific user from the narrowest scope to the widest scope. If you assign a user policy to a user, those settings take precedence. If you do not assign a user policy, site settings apply. If no user or site policies apply, global policy provides the default settings.

A global policy exists by default, so you cannot create a new global policy. You also cannot delete the existing global policy, but you can change the existing global policy to customize your default settings.

- View Conferencing Policy Information
- Create or Modify a Conferencing Policy
- Delete an Existing Conferencing Policy
- Conferencing Policy Settings Reference

1.7.9.2.1 View Conferencing Policy Information

View Conferencing Policy Information

Operations > Managing Meetings and Conferences > Conferencing Policies >

Topic Last Modified: *2013-02-23*

In Lync Server 2013 Control Panel, you use conferencing policies to control how conferencing is implemented in your deployment. This includes the following conferencing policies:

- A global policy that is created by default when you deploy Lync Server 2013.
- Optional site-level and user-level policy that you can create and use to specify how conferencing is implemented for specific sites or users.

To view conferencing policy settings

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.

3. In the left navigation bar, click **Conferencing** and then click **Conferencing Policy**.
4. On the **Conferencing Policy** page, double-click the conferencing policy that you would like to view.
5. In **Edit File Filter**, select the **Show Details...** check box.

   Edit Conferencing Policy - <policy> opens displaying the settings for the selected policy. For details about configuring the settings, see Create or Modify a Conferencing Policy.

Viewing Conferencing Policies by Using Windows PowerShell Cmdlets

Conferencing policies can be viewed by using Windows PowerShell and the Get-CsConferencingPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view conferencing policies

- To view information about all your conferencing policies, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsConferencingPolicy
  ```

  That will return information similar to this:

  ```
  Identity                                  : Global
  AllowIPAudio                              : True
  AllowIPVideo                              : True
  AllowMultiView                            : True
  Description                               :
  AllowParticipantControl                   : True
  AllowAnnotations                          : True
  DisablePowerPointAnnotations              : False
  AllowUserToScheduleMeetingsWithAppSharing : True
  AllowNonEnterpriseVoiceUsersToDialOut     : False
  AllowAnonymousUsersToDialOut              : False
  AllowAnonymousParticipantsInMeetings      : True
  AllowExternalUsersToSaveContent           : True
  AllowExternalUserControl                  : False
  AllowExternalUsersToRecordMeeting         : False
  AllowPolls                                : True
  AllowSharedNotes                          : True
  EnableDialInConferencing                  : True
  EnableAppDesktopSharing                   : Desktop
  AllowConferenceRecording                  : False
  EnableP2PRecording                        : False
  EnableFileTransfer                        : True
  EnableP2PFileTransfer                     : True
  EnableP2PVideo                            : True
  AllowLargeMeetings                        : False
  EnableDataCollaboration                   : True
  MaxVideoConferenceResolution              : VGA
  MaxMeetingSize                            : 250
  AudioBitRateKb                            : 200
  VideoBitRateKb                            : 50000
  AppSharingBitRateKb                       : 50000
  FileTransferBitRateKb                     : 50000
  TotalReceiveVideoBitRateKb                : 6000
  EnableMultiViewJoin                       : True
  ```

For more information, see the help topic for the Get-CsConferencingPolicy cmdlet.

Create or Modify a Conferencing Policy

Operations > Managing Meetings and Conferences > Conferencing Policies >

***Topic Last Modified:** 2013-02-07*

Follow these steps to create a user-level or a site-level conferencing policy. For details about how to assign a user-level policy to a user, see Assign a Per-User Conferencing Policy. For a list of all available conferencing policy settings, see Conferencing Policy Settings Reference.

⊟To create a new user or site policy

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Conferencing Policy**.
4. Click **New**, and then do one of the following:
   - To create a user-level policy, click **User policy**. In **New Conferencing Policy**, in **Name**, type a descriptive name for the policy.
   - To create a site-level policy, click **Site policy**. In the **Select a Site** search field, type all or part of the name of the site for which you want to create a policy. In the list of sites, click the site that you want, and then click **OK**.

     > **Note:**
     > The site name becomes the conferencing policy name, and it cannot be changed.
5. In **Description**, type a description for the policy.
6. Under **Organizer policy**, in **Maximum meeting size**, type the maximum number of users that you want to allow at a meeting. By default, the maximum meeting size is 250.
7. To prevent users from inviting anonymous users to meetings, clear the **Allow participants to invite anonymous users** check box. Anonymous users are users who do not have credentials in your organization’s Active Directory Domain Services (AD DS) and who, therefore, are not authenticated. By default, users can invite anonymous users to meetings.
8. In **Recording**, do one of the following:
   - To prevent participants from recording meetings, click **None**. This is the default setting.
   - To allow participants to record meetings, click **Enable recording**.
9. To allow external participants to record meetings, select the **Allow federated and anonymous participants to record** check box. The default is to prevent external participants from recording meetings.
10. In **Audio/video**, do one of the following:
    - To prevent the use of audio and video, click **None**.
    - To allow the use of audio but not video, click **Enable IP audio**.
    - To allow the use of audio and video, click **Enable IP audio/video**. This is the default setting.
11. If you chose to allow the use of audio in **Audio/video**, do the following:
    - To prevent users from joining the meeting by dialing in, clear the **Enable PSTN dial-in conferencing** check box. By default, users can dial in to meetings by using the public switched telephone network (PSTN).
    - If you allow users to dial in to meetings and you want to allow unauthenticated (anonymous) users to join a meeting by using dial out

phoning, select the **Allow anonymous participants to dial out** check box. With dial-out phoning, the conference server calls the user, and the user answers the phone to join the meeting. By default, anonymous users cannot join a meeting by using dial-out phoning.

12. If you chose to allow the use of video in **Audio/video**, check **Allow multiple video streams** .
13. In **Data collaboration**, do one of the following:
    - To prevent data collaboration, click **None**.
    - To allow data collaboration, click **Enable data collaboration**. This is the default setting.
14. If you chose to allow data collaboration in **Data collaboration**, do the following:
    - To prevent external downloads, clear the **Allow federated and anonymous participants to download content** check box. By default, external users can download content.
    - To prevent file transfers, clear the **Allow participants to transfer files** check box. By default, users can transfer files.
    - To prevent the use of annotations, clear the **Enable annotations** check box. To the use of annotations in shard PowerPoint presentations, clear the **Enable PowerPoint annotations**. By default, annotations are allowed.
    - To prevent the use of polls, clear the **Enable polls** check box. By default, polls are allowed.
15. In **Application sharing**, do one of the following:
    - To prevent the use of application sharing, click **Disable application sharing**.
    - To allow the use of application sharing, click **Enable application sharing**. This is the default setting.
16. If you chose to allow application sharing in **Application sharing**, do the following:
    - To prevent meeting participants from taking control of application sharing, clear the **Allow participants to take control** check box. By default, participants can take control of application sharing.
    - If you chose to allow meeting participants to take control of application sharing, select the **Allow federated and anonymous participants to take control** check box to allow external users to take control of application sharing. By default, external users cannot take control of application sharing.
17. Under **Participant policy**, do one of the following:
    - To prevent both application sharing and desktop sharing, click **Disable application and desktop sharing**.
    - To allow application sharing but not desktop sharing, click **Enable application sharing**.
    - To allow both application sharing and desktop sharing, click **Enable application and desktop sharing**. This is the default setting.
18. To prevent peer-to-peer file transfers, clear the **Enable peer-to-peer file transfer** check box. By default, peer-to-peer file transfers are allowed.
19. To allow peer-to-peer recording, select the **Enable peer-to-peer recording** check box. By default, peer-to-peer recording is not allowed.
20. To allow participants to join with multiple video streams, select the **Enable participants to join with multiple video streams** check box. By default, multiple video streams are allowed.
21. Click **Commit**.

⊟To modify an existing user or site policy

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Conferencing**

Policy.

4. In the list of conferencing policies, click the policy that you want to change, click **Edit**, and then click **Show details**.
5. In **Edit Conferencing Policy**, modify any of the policy settings, except for the policy name, which cannot be modified.

6. Click **Commit**.

1.7.9.2.3 Delete an Existing Conferencing Policy

Delete an Existing Conferencing Policy

Operations > Managing Meetings and Conferences > Conferencing Policies >

Topic Last Modified: *2013-02-23*

Follow these steps to delete a user-level or a site-level conferencing policy.

Note:

You cannot delete the global conferencing policy.

⊟To delete a site or user conferencing policy

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Conferencing Policy**.
4. In the list of conferencing policies, click the site or user policy that you want to delete, click **Edit**, and then click **Delete**.

Removing Conferencing Policies by Using Windows PowerShell Cmdlets

You can delete conferencing policies by using Lync Server Management Shell and the **Remove-CsConferencingPolicy** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To remove a specified conferencing policy

- The following command removes the conferencing policy with the Identity RedmondConferencingPolicy:

```
Remove-CsConferencingPolicy -Identity "RedmondConferencingPolicy"
```

⊟To remove all of the conferencing policies applied to the per-user scope

- The following command removes all the conferencing policies configured at the per-user scope:

```
Get-CsConferencingPolicy -Filter "tag:*" | Remove-CsConferencingPolicy
```

⊟To remove all of the conferencing polices that allow recording by external

users

- The following command deletes any conferencing policies that allow external users to record the conference:

```
Get-CsConferencingPolicy | Where-Object {$_.AllowExternalUsersToRecordM
```

For details, see Remove-CsConferencingPolicy.

1.7.9.2.4 Conferencing Policy Settings Reference

Conferencing Policy Settings Reference

Operations > Managing Meetings and Conferences > Conferencing Policies >

Topic Last Modified: *2012-09-30*

The tables in this topic list all the conferencing policy settings that you can specify by using Lync Server 2013 Control Panel.

Organizer Policy Settings

The following table lists all the conferencing policy settings that you can apply to conference organizers.

Organizer Policy Settings

Setting	Description
Maximum meeting size	Sets the maximum number of participants allowed in a meeting.
Allow participants to invite anonymous users	Allows meeting organizers to invite unauthenticated users to meetings.
Enable recording	Allows presenters or attendees to record the meeting.
Allow federated and anonymous participants to record	Allows external and unauthenticated participants to record the meeting.
Enable IP audio	Allows the use of audio in a meeting.
Enable IP audio/video	Allows the use of audio and video in a meeting.
Enable PSTN dial-in conferencing	Allows the user to attend a meeting by dialing in from the public switched telephone network (PSTN).
Allow anonymous participants to dial out	Allows unauthenticated users to join a meeting by using dial-out phoning. With dial-out phoning, the conference server calls the user, and the user answers the phone to join the meeting.
Maximum video resolution allowed for conferencing	Sets the maximum resolution for video conferencing. Valid values are **640*480 (VGA)** and **352*288(CIF)**.

Enable data collaboration	Enables data collaboration conferencing or web conferencing.
Allow federated and anonymous participants to download content	Allows external and unauthenticated participants to download content from the meeting.
Allow participants to transfer files	Allows meeting participants to transfer files during a meeting.
Enable annotations	Allows meeting participants to create annotations in content.
Enable polls	Allows meeting participants hold a poll during a meeting.
Enable application sharing	Allows users to schedule meetings that support application sharing.
Allow participants to take control	Allows participants to take control of another user's shared application.
Allow federated and anonymous participants to take control	Allows external and anonymous participants to take control of another user's shared application. **Note:** If this setting is set to True and **Allow participants to take control** is set to False, this setting is overridden.

Participant Policy Settings

The following table lists all the conferencing policy settings that you can apply to conference participants.

Participant Policy Settings

Setting	Description
Enable application sharing	Allows users to schedule meetings that support application sharing.
Enable application and desktop sharing	Allows users to participate in meetings that support application sharing and desktop sharing. In a conference, the value of this setting that applies to the organizer of the conference will be applied to all anonymous endpoints who also participate.
Enable peer-to-peer file transfer	Allows participants to perform peer-to-peer file transfers during a meeting. A peer-to-peer file transfer does not involve all the meeting participants.
Enable peer-to-peer recording	Allows participants to record peer-to-peer conferencing sessions.

1.7.9.3 Dial-In Conferencing (Configuration/Access Numbers)

Dial-In Conferencing (Configuration/Access Numbers)

Microsoft Lync Server 2013 > Operations > Managing Meetings and Conferences >

Topic Last Modified: *2012-09-18*

The topics in this section describe how to use Lync Server 2013 Control Panel to configure dial-in conferencing for use your Lync Server 2013 environment.

- Enable or Disable Dial-In Conferencing For Meetings
- Dial-In Conferencing Access Numbers
- Configure Dial-in Conferencing Personal Identification Number (PIN) Rules

1.7.9.3.1 Enable or Disable Dial-In Conferencing For Meetings

Enable or Disable Dial-In Conferencing For Meetings

Operations > Managing Meetings and Conferences > Dial-In Conferencing (Configuration/Access Numbers) >

Topic Last Modified: *2012-11-01*

The following procedure describes how to allow user to join a meeting using dial-in.

⊟To enable or disable dial-in conferencing

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Conferencing Policy**.
4. In the list of conferencing policies, select the policy for which you want to enable dial-in conferencing, click **Edit**, and then click **Show details**.
5. To allow users to join meeting by dialing in, check the **Enable PSTN dial-in conferencing** check box. By default, users can dial in to meetings by using the public switched telephone network (PSTN).
6. Click **Commit**.

1.7.9.3.2 Dial-In Conferencing Access Numbers

Dial-In Conferencing Access Numbers

Operations > Managing Meetings and Conferences > Dial-In Conferencing (Configuration/Access Numbers) >

Topic Last Modified: *2012-09-18*

To enable users to join the audio portion of on-premises conferences by dialing in from the public switched telephone network (PSTN), you must configure dial-in conferencing access numbers. Dial-in conferencing access numbers are the numbers that users call to join a conference.

Dial-in access numbers are displayed in meeting invitations and on the Dial-in Conferencing Settings webpage.

Note:
You cannot use a new dial-in access number until Active Directory replication of that access number is complete. Replication can take several hours.

- View Dial-In Conferencing Access Numbers
- Create or Modify a Dial-in Conferencing Access Number
- Delete a Dial-in Conferencing Access Number

1.7.9.3.2.1 View Dial-In Conferencing Access Numbers

View Dial-In Conferencing Access Numbers

Managing Meetings and Conferences > Dial-In Conferencing (Configuration/Access Numbers) > Dial-In Conferencing Access Numbers >

Topic Last Modified: *2013-02-23*

In Lync Server 2013 Control Panel, you provide dial-in access numbers to users so that they can join a meeting externally.

To view dial-in access numbers

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Dial-in Access Number**.
4. On the **Dial-in Access Number** page, click the access number that you would like to view.
5. In **Edit**, select the **Show Details...** check box.

Viewing Dial-in Conferencing Access Numbers by Using Windows PowerShell Cmdlets

Dial-in conferencing access numbers can be viewed by using Windows PowerShell and the Get-CsDialInConferencingAccessNumber cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view dial-in conferencing access numbers

- To view information about all your dial-in conferencing access numbers, type the following command in the Lync Server Management Shell and then press ENTER:

```
Get-CsDialInConferencingAccessNumber
```

That will return information similar to this:

```
Identity            : CN={20ca8dc8-5ff8-41f4-b5bb-22ba9972ae2e},
                      CN=Application Contacts,CN=RTCService=Services,
                          CN=Configuration,DC=litwareinc,DC=com
PrimaryUri              : sip:testnumber@litwareinc.com
DisplayName             : Test
DisplayNumber           : 1-425-555-1019
LineUri                 : tel:+14255551019
PrimaryLanguage         : en-US
SecondaryLanguages      : {}
Pool                    : atl-cs-001.litwareinc.com
HostingProvider         :
Regions                 : {US}
```

For more information, see the help topic for the Get-CsDialInConferencingAccessNumber cmdlet.

1.7.9.3.2.2 Create or Modify a Dial-in Conferencing Access Number

Create or Modify a Dial-in Conferencing Access Number

Deploying Conferencing > Configuring Dial-in Conferencing > Configure Dial-in Conferencing Access Numbers >

Topic Last Modified: *2012-09-17*

Follow these steps if you want to create or modify a dial-in conferencing access number.

Important:

Before you create a new dial-in access number, you must set a dial-in conferencing region in the dial plan that is associated with the new dial-in access number. Multiple dial plans can use the same region.

To create or modify a dial-in access number

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing** and then click **Dial-in Access Number**.
4. On the **Dial-in Access Number** page, do one of the following:
   - Click **New** to open **New Dial-in Access Number**.
   - Click one of the dial-in access numbers in the list, click **Edit**, and then click **Show details**.

   Note:

   Using the search field to search for the contents of a column in the list of dial-in access numbers may not yield the results you expect. Instead, sort the list by the column of interest to identify the dial-in access number you want to view or change.
5. In **Display number**, type the phone number that public switched telephone network (PSTN) phone users dial to join a conference.

   Note:

   This number is displayed in meeting invitations and on the Dial-in Conferencing Settings webpage.
6. In **Display name**, type a description for the dial-in access number. This is the name that is associated with the dial-in access number in Lync search results.

   Note:

This name is displayed in the client when a user calls the access number.

7. In **Line URI**, type the E.164 number of the dial-in access number in TEL URI format, including the + symbol before the number and excluding spaces. For example, tel:+14255550200.

> **Note:**
> The same Line URI cannot be reused by another dial-in conferencing access number.

8. In **SIP URI**, do the following:
   - In the text box, type a unique SIP URI for this dial-in conferencing access number. This SIP URI is displayed in various locations including, but not limited to, call notification messages and previous versions of Communicator clients.

     > **Note:**
     > The same SIP URI cannot be reused by another dial-in conferencing access number. The SIP URI cannot be modified after the access number is created. The only way to change the SIP URI is to delete and recreate the access number.

   - In the drop-down list box, click the domain of the Conferencing Attendant application that supports this dial-in access number.
9. In **Pool**, click the pool that is running the instance of Conferencing Attendant that supports this dial-in access number.

> **Note:**
> If you need to change the pool after you create the access number, you must use the **Move-CsApplicationEndpoint** cmdlet or delete and recreate the access number.

10. In **Primary language**, click the language in which prompts are played for this dial-in access number.

> **Note:**
> The primary language is the language that the Conferencing Attendant uses to answer the call. Supported languages are displayed alongside each access phone number on the Dial-in Conferencing Settings webpage.

11. (Optional) In **Secondary languages (maximum of four)**, click **Add**, select one or more additional languages that you want to support for callers to this dial-in access number, and then click **OK**.

> **Note:**
> You can choose up to four secondary languages for each dial-in access number. Users can select a secondary language before entering the conference ID when they dial in to a conference.

12. To add a region for the dial-in access number, under **Associated regions**, click **Add**, click one or more regions that are associated with the dial plans for this dial-in access number, and then click **OK**.
13. To delete a region from the dial-in access number, under **Associated regions**, click the region you want to delete, and then click **Remove**.

14. Click **Commit**.

1.7.9.3.2.3 Delete a Dial-in Conferencing Access Number

Delete a Dial-in Conferencing Access Number

Managing Meetings and Conferences > Dial-In Conferencing (Configuration/Access Numbers) > Dial-In Conferencing Access Numbers >

Topic Last Modified: *2013-02-23*

Follow these steps to delete a dial-in conferencing access number.

To delete a dial-in conferencing access number

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing**, and then click **Dial-in Access Number**.
4. On the page, click the dial-in number you want to delete in the list, click **Edit**, and then click **Delete**.
5. Click **OK**.

Removing Dial-in Conferencing Access Numbers by Using Windows PowerShell Cmdlets

Dial-in conferencing access numbers can be deleted by using Windows PowerShell and the **Remove-CsDialInConferencingAccessNumber** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specific dial-in conferencing access number

- This command deletes the dial-in conferencing access number with Identity sip:RedmondDialInAccess@litwareinc.com:

```
Remove-CsDialInConferencingAccessNumber -Identity "sip:RedmondDialInAcc
```

To remove all the dial-in conferencing access numbers assigned to a specific region

- This command deletes all the dial-in conferencing access numbers associated with the Northwest region:

```
Get-CsDialInConferencingAccessNumber -Region "Northwest" | Remove-CsDia
```

To remove dial-in conferencing access numbers based on primary language

- This command deletes all the dial-in conferencing access numbers where Italian is the primary language:

```
Get-CsDialInConferencingAccessNumber | Where-Object {$_.PrimaryLanguage
```

For more information, see the help topic for the Remove-CsDialInConferencingAccessNumber cmdlet.

1.7.9.3.3 Configure Dial-in Conferencing Personal Identification Number (PIN) Rules

Configure Dial-in Conferencing Personal Identification Number (PIN) Rules

Operations > Managing Meetings and Conferences > Dial-In Conferencing (Configuration/Access Numbers) >

Topic Last Modified: *2012-06-19*

Lync Server 2013 users who have Active Directory Domain Services (AD DS) credentials in your organization can join dial-in conferences as authenticated users by using a personal identification number (PIN). PIN policy defines the rules for how dial-in conferencing PINs work.

You can create a new PIN policy if you want a specific policy to apply to a site or to a certain group of users. If you want to use the same PIN policy for your entire organization, you can use the global PIN policy and modify it as needed. PIN policies apply to users from the narrowest scope to the widest scope. If you assign a user-level PIN policy to a user, those settings take precedence. If you do not assign a user policy, the site-level PIN policy applies, if it exists. If no user or site policies apply, global PIN policy provides the default settings.

- Modify the Default Dial-in Conferencing PIN Settings
- Create or Modify Dial-in Conferencing PIN Settings for a Site or Group of Users
- Delete Dial-in Conferencing PIN Settings for a Site or Group of Users

1.7.9.3.3.1 Modify the Default Dial-in Conferencing PIN Settings

Modify the Default Dial-in Conferencing PIN Settings

Deploying Conferencing > Configuring Dial-in Conferencing > (Optional) Verify PIN Policy Settings >

Topic Last Modified: *2012-10-18*

The global PIN policy defines the rules for dial-in conferencing PINs at the forest level. Follow these steps to modify the global dial-in conferencing PIN policy. For details about creating or modifying a dial-in conferencing PIN policy at the site or user level, see Create or Modify Dial-in Conferencing PIN Settings for a Site or Group of Users.

⊟To modify the global PIN policy

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing**, and then click **PIN Policy**.
4. On the **PIN Policy** page, click the **Global** policy, click **Edit**, and then click **Show details**.
5. In **Edit PIN Policy**, in **Minimum PIN length**, type or select the minimum PIN length that you want to allow. The default minimum length is five digits.
6. To be able to specify the maximum number of logon attempts before a user is locked out, select the **Specify maximum logon attempts** check box. If you do not select this option, the maximum number of allowed attempts is automatically determined based on the PIN length. By default, the maximum

number of attempts is automatically determined.

7. If you selected the **Specify maximum logon attempts** check box, in **Maximum logon attempts**, type or select the maximum number of logon attempts that you want to allow.
8. To have PINs expire, select the **Enable PIN expiration** check box. If you do not select this option, PINs will never expire. By default, PINs never expire.
9. If you selected the **Enable PIN expiration** check box, in **PIN expires after (days)**, type or select the number of days after which PINs expire.
10. In **PIN history count**, type the number of PINs that a user must create before the user can reuse a PIN. By default, users can reuse their PINs.
11. To allow common patterns of digits in PINs, such as sequential numbers and repetitive sets of numbers, select the **Allow common patterns** check box. If you do not select this option, only complex patterns of digits are allowed. By default, only complex patterns of digits are allowed.

    Important:

    We recommend that you do not allow common patterns.

12. Click **Commit**.

1.7.9.3.3.2 Create or Modify Dial-in Conferencing PIN Settings for a Site or Group of Users

Create or Modify Dial-in Conferencing PIN Settings for a Site or Group of Users

Deploying Conferencing > Configuring Dial-in Conferencing > (Optional) Verify PIN Policy Settings >

Topic Last Modified: *2012-10-18*

Follow these steps to create or modify a user-level or a site-level dial-in conferencing personal identification number (PIN) policy. For details about how to change the global PIN policy, see Modify the Default Dial-in Conferencing PIN Settings.

⊟To create a user or site PIN policy

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing**, and then click **PIN Policy**.
4. On the **PIN Policy** page, click **New**, and then do one of the following:
    - To create a user-level policy, click **User policy**. In **New PIN Policy**, in **Name**, type a name that describes the policy.
    - To create a site-level policy, click **Site policy**. In the **Select a Site** search field, type all or part of the name of the site for which you want to create a policy. In the list of sites, click the site you want, and then click **OK**.
5. In the **Description** field, type a description of the PIN policy.
6. In the **Minimum PIN length** field, type or select the minimum PIN length that you want to allow. The default minimum length is five digits.
7. To be able to specify the maximum number of logon attempts before a user is locked out, select the **Specify maximum logon attempts** check box. If you do not select this option, the maximum number of allowed attempts is automatically determined based on the PIN length. By default, the maximum number of attempts is automatically determined.

8. If you selected the **Specify maximum logon attempts** check box, in **Maximum logon attempts**, type or select the maximum number of logon attempts that you want to allow.
9. To have PINs expire, select the **Enable PIN expiration** check box. If you do not select this option, PINs will never expire. By default, PINs never expire.
10. If you selected the **Enable PIN expiration** check box, in **PIN expires after (days)**, type or select the number of days after which PINs expire.
11. In **PIN history count**, type the number of PINs that a user must create before the user can reuse a PIN. By default, users can reuse their PINs.
12. To allow common patterns of digits in PINs, such as sequential numbers and repetitive sets of numbers, select the **Allow common patterns** check box. If you do not select this option, only complex patterns of digits are allowed. By default, only complex patterns of digits are allowed.

    Important:

    We recommend that you do not allow common patterns.

13. Click **Commit**.

⊟To change a user or site PIN policy

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing**, and then click **PIN Policy**.
4. On the **PIN Policy** page, click the PIN policy that you want to change, click **Edit**, and then click **Show details**.
5. In **Edit PIN Policy**, modify any of the policy settings (except for the policy name, which cannot be modified).
6. Click **Commit**.

1.7.9.3.3.3 Delete Dial-in Conferencing PIN Settings for a Site or Group of Users

Delete Dial-in Conferencing PIN Settings for a Site or Group of Users

Managing Meetings and Conferences > Dial-In Conferencing (Configuration/Access Numbers) > Configure Dial-in Conferencing Personal Identification Number (PIN) Rules >

Topic Last Modified: *2012-10-18*

Follow these steps to delete a user-level or a site-level PIN policy.

Note:

You cannot delete the global PIN policy.

⊟To delete a user or site PIN policy

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.

3. In the left navigation bar, click **Conferencing**, and then click **PIN Policy**.
4. On the **PIN Policy** page, in the search field, type all or part of the name of the policy you want to delete.
5. In the list of policies, click the policy that you want, click **Edit**, and then click **Delete**.

6. Click **OK**.

1.7.10.1 Common Area Phones

Common Area Phones

Microsoft Lync Server 2013 > Operations > Managing Devices, Phones, and Client Applications >

Topic Last Modified: *2013-02-20*

Common area phones are IP phones that are not associated with an individual user. Instead of being located in someone’s office, common area phones are typically located in building lobbies, cafeterias, employee lounges, meeting rooms, and other locations where a large number of people are likely to gather. Unlike other phones in Lync Server, which are typically maintained by using voice policies and dial plans that are assigned to individual users, common area phones do not have individual users assigned to them. This means that they must be managed differently than your other phones.

To manage common area phones, you create Active Directory Domain Services (AD DS) contact objects for all your common area phones that, like user accounts, can be assigned policies and voice plans. This approach enables you to maintain control over common area phones, even though those phones are not associated with an individual user.

Use the topics in this section to learn how to create contact objects for common area phones, modify and delete them, and configure and view configuration information about the common area phones in your deployment.

Note:

You have three options for common area phones: the Aastra 6721ip common area phone, the HP 4110 IP Phone, and the Polycom CX500 IP common area phone. The Polycom CX3000 IP conferencing phone is another variant common area phone. However, it is intended for use in conference rooms. For details about common area phones, see the Common Area Phones section of Choosing New Devices.

- View Common Area Phone Information
- Create or Modify a Common Area Phone Contact Object
- Enable or Disable Hot Desking
- Delete a Common Area Phone Contact Object
- Assign Policies to a Common Area Phone

1.7.10.1.1 View Common Area Phone Information

View Common Area Phone Information

Operations > Managing Devices, Phones, and Client Applications > Common Area Phones >

Topic Last Modified: *2013-02-20*

You can view information about the common area phones configured for use in your organization by using the **Get-CsCommonAreaPhone** cmdlet. Used without any parameters, this cmdlet returns information about all your common area phones. Optional parameters provide different ways for you to filter information. For example, you can return all the common area phones that have contact objects in a specified organizational unit (OU) or all the contacts objects located in a specified building. For details about **Get-CsCommonAreaPhone** parameters, see Get-CsCommonAreaPhone.

Run **Get-CsCommonAreaPhone** either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

⊟Viewing Information about All Your Common Area Phones

- To view information about all your common area phones, type the following command in the Lync Server Management Shell, and then press Enter:

```
Get-CsCommonAreaPhone
```

You'll get information similar to this:

```
Identity            : CN=Building 14 Lobby,OU=Redmond,
                      DC=litwareinc,DC=com

```

For details, see the Help topic for the Get-CsCommonAreaPhone cmdlet.

1.7.10.1.2 Create or Modify a Common Area Phone Contact Object

Create or Modify a Common Area Phone Contact Object

Operations > Managing Devices, Phones, and Client Applications > Common Area Phones >

Topic Last Modified: *2013-02-20*

To create Active Directory Domain Services (AD DS) contact objects for all your common area phones, use the **New-CsCommonAreaPhone** cmdlet. This cmdlet can either create new contact objects for use with common area phones, or it can associate existing contact objects with a new common area phone. To modify the properties of the contact objects associated with common area phones, use the **Set-CsCommonAreaPhone** cmdlet. Optional parameters for **Set-CsCommonAreaPhone** enable you to change items, such as the contact’s Active Directory display name or the line Uniform Resource Identifier (URI) associated with the phone, and enable and disable the account for use with Lync Server. For details about all the available modifications, see the Parameters section at Set-CsCommonAreaPhone. For details about **New-CsCommonAreaPhone** parameters, see New-CsCommonAreaPhone.

You can run these two cmdlets from either the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

Creating a common area phone contact object

- To create a new common area phone contact object, use the **New-CsCommonAreaPhone** cmdlet. At a minimum, you must supply the following information when creating a contact object:
  - **LineUri**: The telephone number assigned to the common area phone. Note that you must use the E.164 format when specifying the phone number.
  - **RegistrarPool**: The fully qualified domain name (FQDN) of the Registrar pool that will host the contact object.
  - **OU**: Distinguished name of the Active Directory container where the contact object will be created.

  We also recommend that you provide an Active Directory Domain Services (AD DS) display name. Otherwise, you will need to use a GUID to specify the phone Identity. For example:

  ```
  New-CsCommonAreaPhone -LineUri "tel:+12065551219" -RegistrarPool "atl-c
  ```

Modifying a common area phone contact object

- To modify the properties of an existing common area phone, contact object use the **Set-CsCommonAreaPhone** cmdlet. For example, this command configures the SIP address for the common area phone with the DisplayName Lobby:

  ```
  Set-CsCommonAreaPhone -Identity "Lobby" -SipAddress "sip:lobby@litwarei
  ```

For details, see the Help topics for the New-CsCommonAreaPhone cmdlet and the Set-CsCommonAreaPhone cmdlet.

1.7.10.1.3 Enable or Disable Hot Desking

Enable or Disable Hot Desking

Operations > Managing Devices, Phones, and Client Applications > Common Area Phones >

Topic Last Modified: *2013-02-20*

You can set up common area phones as *hot-desk phones*. With hot-desk phones, users can log on to their own user account, and, after they are logged on, use Lync Server features and their own user profile settings. Hot desking is managed by using client policies: to enable or disable hot desking, you need to modify the client policies that are used by your common area phones. For details about how to determine the conferencing policies that have been assigned to your common area phones, see View Common Area Phone Information.

You use the EnableHotdesking parameter of the **New-CSClientPolicy** cmdlet or the **Set-CSClientPolicy** cmdlet to enable or disable hot desking on a phone, as follows. Run these cmdlets from either the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

Enabling hot desking

- To enable hot desking for a common area phone, you must modify the client policy that has been assigned to that phone (or collection of phones).

  After you have identified the policy that needs to be modified, the next step is to use the **Set-CsClientPolicy** cmdlet to set the EnableHotdesking parameter to True. For example:

  ```
  Set-CsClientPolicy -Identity "CommonAreaPhonePolicy" - EnableHotdesking
  ```

- Alternatively, you can use the **New-CsClientPolicy** cmdlet to create a new client policy that enables hot desking. For example:

  ```
  New-CsClientPolicy -Identity "NewCommonAreaPhonePolicy" - EnableHotdesk
  ```

Important:

After this policy has been created, you must assign it to the appropriate common area phones. For details, see Assign Policies to a Common Area Phone.

Disabling hot desking

- To disable hot desking for a common area phone, reset the EnableHotdesking parameter of the **Set-CsClientPolicy** cmdlet to the default value of False. For example:

  ```
  Set-CsClientPolicy -Identity "CommonAreaPhonePolicy" - EnableHotdesking
  ```

For details, see the Help topics for the New-CsClientPolicy cmdlet and the Set-CsClientPolicy cmdlet.

1.7.10.1.4 Delete a Common Area Phone Contact Object

Delete a Common Area Phone Contact Object

See Also

Operations > Managing Devices, Phones, and Client Applications > Common Area Phones >

Topic Last Modified: *2013-02-20*

You might want to delete the contact object associated with a common area phone. For example, if you remove the phone from an employee lounge, there’s no need to have a contact object associated with that phone. The **Remove-CsCommonAreaPhone** cmdlet provides a way for you to delete common area phone accounts. When you run this cmdlet, the phone is deleted from the list of common area phones returned by **Get-CsCommonAreaPhone**. In addition, the contact object associated with that phone is deleted from Active Directory Domain Services (AD DS).

Use **Remove-CsCommonAreaPhone** to remove one common area phone or all common area phones that have a common element, such as a display name or country and area code. You can run this cmdlet from either the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

Removing a Specified Common Area Phone

- The following command removes the common area phone with the SIP address sip:mainlobby@litwareinc.com:

```
Remove-CsCommonAreaPhone -Identity "sip:mainlobby@litwareinc.com"
```

Removing Common Area Phones Based on Their Display Name

- This command removes all the common area phones where the display name includes the string value "Building 14":

```
Get-CsCommonAreaPhone | Where-Object {$_.DisplayName -match "Building 1
```

Removing Common Area Phones Based on Their Country and Area Codes

- This command removes all the common area phones for the United States (country code 1) and the area code 425:

```
Get-CsCommonAreaPhone | Where-Object {$_.LineUri  -match "^tel:\+1425"}
```

For details, see the Help topic for the Remove-CsCommonAreaPhone cmdlet.

1.7.10.1.5 Assign Policies to a Common Area Phone

Assign Policies to a Common Area Phone

See Also

Operations > Managing Devices, Phones, and Client Applications > Common Area Phones >

Topic Last Modified: *2013-02-20*

After you create your policy for common area phones (for details, see Create a Voice Policy and Configure PSTN Usage Records), you can assign the policy to a common area phone by using Windows PowerShell and the appropriate **Grant-Cs** cmdlet. These cmdlets can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

Assigning a Policy to a Single Common Area Phone

- The following command assigns the per-user voice policy RedmondVoice to the common area phone that has the Identity Building 14 Lobby.

```
Grant-CsVoicePolicy -Identity "Building 14 Lobby" -PolicyName "RedmondV
```

Assigning a Policy to Multiple Common Area Phones

- In this example, the per-user voice policy RedmondVoice is assigned to all the common area phones configured for use in the organization.

```
Get-CsCommonAreaPhone | Grant-CsVoicePolicy  -PolicyName "RedmondVoiceP
```

For details, see the Help topics for the Grant-CsVoicePolicy.

Get-CsCommonAreaPhone

1.7.10.2 Conferencing Devices

Conferencing Devices

Microsoft Lync Server 2013 > Operations > Managing Devices, Phones, and Client Applications >

Topic Last Modified: *2013-02-20*

Conferencing devices bring Lync Phone Edition features into conference rooms, enabling people in the room to hear, and, depending on the device, see people in other locations.

Use the topics in this section to learn how to set up and manage your conferencing devices.

Note:

Lync Server provides support for two conferencing devices: the Polycom CX5000, which replaced the discontinued Microsoft RoundTable conferencing device, and the Polycom CX3000, the IP conferencing device. For details about conferencing devices, see the Conferencing Devices section of Choosing New Devices.

- View Conferencing Device Information
- Create or Modify a Conferencing Device Contact Object
- Enable or Disable a Conferencing Device
- Move a Conferencing Device to a New Registrar Pool

1.7.10.2.1 View Conferencing Device Information

View Conferencing Device Information

Operations > Managing Devices, Phones, and Client Applications > Conferencing Devices >

Topic Last Modified: *2013-02-20*

You can view information about the conferencing devices configured for use in your organization by using Windows PowerShell and the **Get-CsMeetingRoom** cmdlet. Run the

Get-CsMeetingRoom cmdlet from either the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:
For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

If you use the **Get-CsMeetingRoom** cmdlet without any parameters, it returns information about all your conferencing devices. Optional parameters provide different ways for you to filter information. For details, see the Parameters section of Get-CsMeetingRoom.

Viewing Information about All Your Conferencing Devices

- To view details about all your conferencing devices, type the following command in the Lync Server Management Shell, and then press Enter:

  ```
  Get-CsMeetingRoom
  ```

  This cmdlet returns information similar to the following for each conferencing device. Note that this example shows only some of the information that you'll see when you run this cmdlet:

  ```
  ContactOptionFlags                 : 64
  OwnerUrn                           : urn:device:roomsystem
  OriginatorSid                      :
  SamAccountName                     : room12129
  UserPrincipalName                  : room1219@litwareinc.com
  FirstName                          :
  LastName                           :
  WindowsEmailAddress                :
  Sid                                : S-1-5-21-2831376166-2963252556-2165
  LineServerURI                      :
  AudioVideoDisabled                 : False
  IPPBXSoftPhoneRoutingEnabled       : False
  RemoteCallControlTelephonyEnabled  : False
  PrivateLine                        :
  AcpInfo                            : {}
  HostedVoiceMail                    :
  DisplayName                        : Room 1219
  ```

Viewing Information about a Specific Conferencing Device

- To view information for a specific conferencing device, include the Identity parameter followed by the conferencing device identity (typically, the Active Directory display name). For example:

  ```
  Get-CsMeetingRoom -Identity "Room 1219"
  ```

For details, see the Help topic for the Get-CsMeetingRoom cmdlet.

1.7.10.2.2 Create or Modify a Conferencing Device Contact Object

Create or Modify a Conferencing Device Contact Object

Operations > Managing Devices, Phones, and Client Applications > Conferencing Devices >

Topic Last Modified: *2013-02-20*

To create a conferencing room object, first create an Active Directory user account to represent the device. Then, use the **Enable-CsMeetingRoom** cmdlet to enable that account to function as a conferencing device. If you need to change the properties of an existing conferencing device, use the **Set-CsMeetingRoom** cmdlet.

These cmdlets can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

> **Note:**
> For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

Creating a Conferencing Device

- After you create the Active Directory user account that represents the new conferencing device, enable it by using the **Enable-CsMeetingRoom** cmdlet. Be sure to include a) the conferencing device identity, b) the registrar pool where the room account will be homed, and c) the SIP address to be assigned to that account. For example:

```
Enable-CsMeetingRoom -Identity "Redmond Conferencing device" -Registrar
```

Modifying a Conferencing Device

- To modify the property values of an existing conferencing device, use the **the Set-CsMeetingRoom** cmdlet. For example, the following command updates the phone number (LineUri) associated with a conferencing device:

```
Set-CsMeetingRoom -Identity "Redmond Conferencing device" -LineUri "tel
```

For details, see the Help topics for the Enable-CsMeetingRoom cmdlet and the Set-CsMeetingRoom cmdlet.

1.7.10.2.3 Enable or Disable a Conferencing Device

Enable or Disable a Conferencing Device

Operations > Managing Devices, Phones, and Client Applications > Conferencing Devices >

Topic Last Modified: *2013-02-20*

Enable and disable a conferencing device by using the **Enable-CsMeetingRoom** cmdlet and the **Disable-CsMeetingRoom** cmdlet. These cmdlets can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

> **Note:**
> For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

Enabling a Conferencing Device

- To enable a conferencing device, use the **Enable-CsMeetingRoom** cmdlet. When enabling a conferencing device, you must include a) the conferencing device identity, b) the Registrar pool where the room account will be homed, and c) the SIP address to be assigned to that account.

```
Enable-CsMeetingRoom -Identity "Redmond Conferencing device" -Registrar
```

Disabling a Conferencing Device

- To disable a conferencing device, use the **Disable-CsMeetingRoom** cmdlet. Make sure that you specify the identity of the conferencing device to be disabled:

  ```
  Disable-CsMeetingRoom -Identity "sip:RedmondMeetingRoom@litwareinc.com"
  ```

For details, see the Help topics for the Enable-CsMeetingRoom cmdlet and the Disable-CsMeetingRoom cmdlet.

1.7.10.2.4 Move a Conferencing Device to a New Registrar Pool

Move a Conferencing Device to a New Registrar Pool

Operations > Managing Devices, Phones, and Client Applications > Conferencing Devices >

Topic Last Modified: *2013-02-20*

Move a conferencing device from one Registrar pool to another by using the **Move-CsMeetingRoom** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:

For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

Moving a Conferencing Device to a New Registrar Pool

- To move a conferencing device, you must specify the identity of the room to be moved, and then set the Target parameter to the fully qualified domain name (FQDN) of the Registrar pool the device will be moved to. For example:

  ```
  Move-CsMeetingRoom -Target "atl-cs-001.litwareinc.com" -Identity "Room
  ```

For details, see the Help topic for the Move-CsMeetingRoom cmdlet.

1.7.10.3 Mobile Phones (Policy/Push Notification)

Mobile Phones (Policy/Push Notification)

Microsoft Lync Server 2013 > Operations > Managing Devices, Phones, and Client Applications >

Topic Last Modified: *2012-10-15*

You can configure mobility policies and push notifications for Lync Server 2013 from the **Clients** section of Lync Server 2013 Control Panel. Use the procedures in this section to configure your mobile phone settings.

- Mobility Policies
- Push Notifications

1.7.10.3.1 Mobility Policies

Mobility Policies

See Also

Operations > Managing Devices, Phones, and Client Applications > Mobile Phones (Policy/Push Notification) >

Topic Last Modified: *2012-10-18*

Use the following procedures to configure mobility policies for Lync Server 2013.

- Create or Modify a Mobility Policy
- Assign a Per-User Mobility Policy
- Enforce Phone Locking

⊟See Also

Planning for Mobility

1.7.10.3.1.1 Create or Modify a Mobility Policy

Create or Modify a Mobility Policy

See Also

Managing Devices, Phones, and Client Applications > Mobile Phones (Policy/Push Notification) > Mobility Policies >

Topic Last Modified: *2013-02-23*

You can create or modify mobility policy to allow mobile users to use supported mobile devices for Lync functionality such as instant messaging (IM), presence, and contacts. You can create or modify mobility policies from Lync Server 2013 Control Panel or Lync Server 2013 Management Shell

⊟To create a mobility policy with Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Mobility Policy** navigation button.
4. On the **Mobility Policy** page, click **New**, and do one of the following:
   4.a. To create a site mobility policy, click **Site policy**, click a site, click **OK**, review the default settings, and, if you want to, make any changes.
   4.b. To create a user mobility policy, click **User policy**, type a name, review the default settings, and if you want to, make any changes.
5. Click **Commit**.

⊟To modify a mobility policy with Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Mobility Policy** navigation button.

4. On the **Mobility Policy** page, click one of the existing mobility policies.
5. On the **Edit** menu, click **Show details**.
6. Edit any of the settings.
7. Click **Commit**.

Creating External Access Policies by Using Windows PowerShell Cmdlets

You can create mobility policies (at the site scope or the per-user scope) by using Windows PowerShell and the **New-CsMobilityPolicy** cmdlet. Additionally, you can use the **Set-CsMobilityPolicy** cmdlet to modify any of your existing policies, including the global policy. These cmdlets can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To create a mobility policy at the site scope

- This command creates a new mobility policy for the Redmond site:

  ```
  New-CsMobilityPolicy -Identity "site:Redmond"
  ```

  Because no parameters (other than the mandatory Identity parameter) were specified in the preceding command, the policies will use the default values for all its properties.

To create a mobility policy at the per-user scope

- To create a mobility policy at the per-user scope, specify a unique Identity for the policy:

  ```
  New-CsMobilityPolicy -Identity "RedmondMobilityPolicy"
  ```

To change a single property value when creating a mobility policy

- To create policies that use different property values, include the appropriate parameter and parameter value. For example, this command creates mobility policy that disables Call via Work:

  ```
  New-CsMobilityPolicy -Identity "site:Redmond" -EnableOutsideVoice $Fals
  ```

To change multiple property values when creating a mobility policy

- Multiple property values can be modified by including multiple parameters. For example, this command creates a policy that disables both mobility and Call via Work:

  ```
  New-CsMobilityPolicy "site:Redmond" -EnableMobility $False -EnableOutsi
  ```

For details, see the Help topic for the New-CsMobilityPolicy and the Set-CsMobilityPolicy cmdlets.

Tasks

Configuring Mobility Policy

Assign a Per-User Mobility Policy

See Also

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Assigning Per-User Policies >

Topic Last Modified: *2013-02-22*

The mobility policy is one of the individual settings of a user account that you can configure in Lync Server Control Panel or Lync Server Management Shell.

⊟To assign a per-user mobility policy with Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

     > **Tip:**
     > To add additional search clauses to your query, click **Add Filter**.

   - Click **Find**.
6. Click a user in the search results, click **Action**, and then click **Assign policies**.

   > **Tip:**
   > If you want the same per-user mobility policy to apply to multiple users, select multiple users in the search results, then click **Actions**, and then click **Assign policies**.

7. In **Assign Policies**, under **Mobility policy**, do one of the following:

   > **Note:**
   > Because there are multiple policies that you can configure in **Assign Policies**, **<Keep as is>** is selected by default for every policy in the dialog box. Continue using the policy previously assigned to the user by making no changes to this setting.

   - Select **<Automatic>** to allow Lync Server 2013 to automatically choose either the global-level policy or, if defined, the site-level policy.
   - Click the name of a per-user mobility policy you previously defined on the **Mobility Policy** page.

Tip:
To help you decide the policy you want to assign, after you click a policy name, click **View** to view the user rights and permissions defined in the policy.

8. When you are finished, click **OK**.

Assigning a Per-User Mobility Policy by Using Windows PowerShell Cmdlets

You can assign per-user mobility policies by using Windows PowerShell and the **Grant-CsMobilityPolicy** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user mobility policy to a single user

- The following command assigns the per-user mobility policy RedmondMobilityPolicy to the user Ken Myer.

```
Grant-CsMobilityPolicy -Identity "Ken Myer" -PolicyName "RedmondMobilit
```

To assign a per-user mobility policy to multiple users

- The following command assigns the per-user mobility policy RedmondMobilityPolicy to all the users who are currently assigned the policy NorthAmericaMobilityPolicy. For details about the Filter parameter used in this command, see Get-CsUser.

```
Get-CsUser -Filter {MobilityPolicy -eq "NorthAmericaMobilityPolicy"} |
```

To unassign a per-user mobility policy

- The following command unassigns any per-user mobility policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsMobilityPolicy -Identity "Ken Myer" -PolicyName $Null
```

For details, see Grant-CsMobilityPolicy.

Tasks

Configuring Mobility Policy

1.7.10.3.1.3 Enforce Phone Locking

Enforce Phone Locking

See Also

Managing Devices, Phones, and Client Applications > Mobile Phones (Policy/Push Notification) > Mobility Policies >

Topic Last Modified: *2013-02-23*

Lync Phone Edition devices can be locked for security purposes. If you enforce phone lock, the device running Lync Phone Edition locks after a period of time that you configure.

When a phone is locked, a user can make calls but cannot access calendar and contact information, voice mail, or call logs or use search. To unlock the phone, the user enters a PIN.

To enforce phone lock, enable and configure it by using Lync Server Control Panel or Lync Server PowerShell cmdlets. You can enforce phone lock globally or only within the site for which it is configured.

To configure and enforce the phone lock

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. Click **Clients**, and then click **Device Configuration**.
4. On the **Device Configuration** tab, in the list of device configurations, double-click the configuration for which you want to change the phone lock settings.
5. In the **Edit Device Configuration** dialog box, verify that the **Enforce device locking** check box is selected.
6. In **Minimum PIN length**, accept the default value for the minimum number of digits that the unlock PIN must contain or specify a new value. The range for the PIN length is four to 15 digits, and the default is six.
7. In **Phone lock time-out**, accept the default value for the minimum length of time before the phone locks itself or specify a new value. The range for the timeout is 0 to 60 minutes, and the default is 10. Enter the value in the format HH:MM:SS.
8. Click **Commit**.

Enforcing Phone Locking by Using Windows PowerShell Cmdlets

Phone locking can be enforced by using the Set-CsUCPhoneConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable phone locking

- The following command enables phone locking for the Redmond site. To disable phone locking, set the EnforcePhoneLock property to False ($False).

```
Set-CsUCPhoneConfiguration -Identity" site:Redmond" -EnforcePhoneLock $
```

To enable phone locking and modify the phone lock timeout

- This command enables phone locking and also sets the phone lock timeout to 30 minutes.

```
Set-CsUCPhoneConfiguration -Identity" site:Redmond" -EnforcePhoneLock $
```

To enable phone locking throughout the organization

- In this example, phone locking is enabled on all the UC phone configuration settings in use in the organization.

```
Get-CsUCPhoneConfiguration | Set-CsUCPhoneConfiguration  -EnforcePhoneL
```

For more information, see the help topic for the Set-CsUCPhoneConfiguration cmdlet.

Topic Last Modified: *2013-02-23*

Push notifications, in the form of badges, icons, or alerts, can be sent to an iPhone even when the mobile application is inactive. Push notifications notify a user of events such as a new or missed IM invitation and voice mail. You can enable or disable push notifications for iPhone by using either Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

⊟To enable push notifications for iPhone by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Push Notification Configuration** navigation button.
4. On the **Push Notification Configuration** page, click the site you want to edit, click the **Edit** menu, and then click **Show details**.
5. Click the **Enable Apple push notifications** checkbox.

6. Click **Commit**.

To disable push notifications for iPhone by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Push Notification Configuration** navigation button.
4. On the **Push Notification Configuration** page, click the site you want to edit, click the **Edit** menu, and then click **Show details**.
5. Clear the **Enable Apple push notifications** checkbox.
6. Click **Commit**.

Enabling or Disabling Push Notifications to iPhone by Using Windows PowerShell Cmdlets

Push notifications to Apple iPhone can be enabled or disabled by using the **Set-CsPushNotificationConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable push notifications for iPhone

- To enable push notifications for iPhone set the value of the EnableApplePushNotificationService property to True ($True). For example:

```
Set-CsPushNotificationConfiguration -Identity "site:Redmond" -EnableApp
```

To disable push notifications for iPhone

- To disable push notifications for iPhone set the value of the EnableApplePushNotificationService property to False ($False). For example:

```
Set-CsPushNotificationConfiguration -Identity "site:Redmond" -EnableApp
```

For more information, see the help topic for the Set-CsPushNotificationConfiguration cmdlet.

Push notifications, in the form of badges, icons, or alerts, can be sent to a Windows Phone even when the mobile application is inactive. Push notifications notify a user of events such as a new or missed IM invitation and voice mail. You can enable or disable push notifications for Windows Phone devices by using either Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

⊟To enable push notifications for Windows Phone by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Push Notification Configuration** navigation button.
4. On the **Push Notification Configuration** page, click the site you want to edit, click the **Edit** menu, and then click **Show details**.
5. Click the **Enable Microsoft push notifications** checkbox.
6. Click **Commit**.

⊟To disable push notifications for Windows Phone by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Push Notification Configuration** navigation button.
4. On the **Push Notification Configuration** page, click the site you want to edit, click the **Edit** menu, and then click **Show details**.
5. Clear the **Enable Microsoft push notifications** checkbox.
6. Click **Commit**.

Enabling or Disabling Push Notifications for Windows Phone by Using Windows PowerShell Cmdlets

You can enable or disable push notifications for Windows Phone by using the **Set-CsPushNotificationConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To enable push notifications for Windows Phone

- To enable push notifications for Windows Phone set the value of the EnableMicrosoftPushNotificationService property to True ($True). For example:

```
Set-CsPushNotificationConfiguration -Identity "site:Redmond" -EnableMic
```

⊟To disable push notifications for Windows Phone

- To disable push notifications for Windows Phone set the value of the

EnableMicrosoftPushNotificationService property to False ($False). For example:

```
Set-CsPushNotificationConfiguration -Identity "site:Redmond" -EnableMic
```

Push notifications, in the form of badges, icons, or alerts, can be sent to a mobile device even when the mobile application is inactive. Push notifications notify a user of events such as a new or missed IM invitation and voice mail. You can view information push notifications settings for mobile devices by using either Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

To view push notification information from Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Push Notification Configuration** navigation button.
4. On the **Push Notification Configuration** page, click the site you want to view, click the **Edit** menu, and then click **Show details**.

Viewing Push Notification Information by Using Windows PowerShell Cmdlets

You can view push notification configuration settings by using Windows PowerShell and the **Get-CsPushNotificationConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view push notification configuration information

- To view information about all your push notification configuration settings, type the following command in the Lync Server Management Shell and then press ENTER:

```
Get-CsPushNotificationConfiguration
```

That will return information similar to this:

```
Identity                                : Global
EnableApplePushNotificationService      : False
EnableMicrosoftPushNotificationService : False
```

For more information, see the help topic for the Get-CsPushNotificationConfiguration cmdlet.

1.7.10.4 Test Devices

Test Devices

Microsoft Lync Server 2013 > Operations > Managing Devices, Phones, and Client Applications >

Topic Last Modified: *2012-10-15*

You can test devices from the **Test Device** page of the **Clients** section in Lync Server 2013 Control Panel.

- Create a Device to Test Update Functionality

1.7.10.4.1 Create a Device to Test Update Functionality

Create a Device to Test Update Functionality

Operations > Managing Devices, Phones, and Client Applications > Test Devices >

Topic Last Modified: *2013-02-23*

You can add a test device to the **Test Device** page and then use this device to verify the functionality of new updates before deploying the updates to production devices. You can test a device globally (throughout your entire Lync Server environment) or within a single site. You identify a test device by its Media Access Control (MAC) address or serial number. When you add a device, it appears in the list on the **Test Device** page of the Lync Server Control Panel.

To add a test device

1. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
2. In the left navigation bar, click **Clients**, and then click **Test Device**.
3. Click **New**, and then click either **Global test device** or **Site test device**.
4. Do one of the following:
   - If you clicked **Global test device**, skip to the next step.
   - If you clicked **Site test device**, select a site from the list of available sites, and then click **OK**.
5. In **New Test Device**, type a name for the device in **Device name**.
6. Under **Identifier type**, click either **MAC address** or **Serial number**.
7. In the **Unique identifier** box, type the MAC address or serial number of the device.
8. Click **Commit**.

Creating Test Devices by Using Windows PowerShell Cmdlets

Test devices can be created by using Windows PowerShell and the New-CsTestDevice cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

When creating test devices using this cmdlet, you must do two things:

- Specify either MACAddress or SerialNumber as the IdentifierType.
- Include the scope when specifying the device Identity. To create a new device at the global scope use syntax similar to this:

  ```
  -Identity "global/WindowsPhone"
  ```

  To create a test device at the site scope use syntax similar to this:

  ```
  -Identity "site:Redmond/WindowsPhone"
  ```

To create a test device by using the MAC address

- This command creates a test device at the global scope, and using the MAC address as the IdentifierType:

  ```
  New-CsTestDevice -Identity "global/WindowsPhone" -IdentifierType "MACAd
  ```

To create a test device by using the serial number

- This command creates a new test device at the site scope (for the Redmond site) and uses the serial number as the IdentifierType:

  ```
  New-CsTestDevice -Identity "site:Redmond/WindowsPhone" -IdentifierType
  ```

For more information, see the help topic for the New-CsTestDevice cmdlet.

1.7.10.5 Lync Phone Edition Configuration Settings

Lync Phone Edition Configuration Settings

Microsoft Lync Server 2013 > Operations > Managing Devices, Phones, and Client Applications >

Topic Last Modified: *2012-10-10*

Configuration settings for devices running Lync Phone Edition apply globally, or you can create new collections of settings that apply to a particular site. Collections include SIP security, device lock settings, and more.

- View Lync Phone Edition Configuration Settings Information
- Create or Modify a Collection of Lync Phone Edition Configuration Settings
- Delete an Existing Collection of Lync Phone Edition Configuration Settings
- Configure Security Settings for Lync Phone Edition
- Enforce Phone Locking

1.7.10.5.1 View Lync Phone Edition Configuration Settings Information

View Lync Phone Edition Configuration Settings Information

See Also

Operations > Managing Devices, Phones, and Client Applications > Lync Phone Edition Configuration Settings >

Topic Last Modified: *2013-02-23*

You can view configuration information about devices running Lync Phone Edition. The information is organized into collections. When you install Lync Server, you get a collection of Lync Phone Edition settings that apply to all the devices running Lync Phone Edition in your deployment. You can also create new collections of settings for a specific site. Site settings take precedence over global settings. Each collection of settings consists of a name, the scope (global or site), SIP security setting, logging level, voice quality of service (QoS) level, phone-lock setting, and phone-lock details, that is, the minimum length of the unlock personal identification number (PIN) and time before the phone locks itself.

⊟To view configuration information about devices running Lync Phone Edition

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Device Configuration** navigation button.
4. On the **Device Configuration** page, click the collection of settings you want to view information about. The name, scope, SIP security setting, voice quality level, and phone lock setting are listed on the main page. To view the logging level and phone lock details, click the **Edit** menu, and then click **Show details**.

Viewing Lync Phone Edition Configuration Information by Using Windows PowerShell Cmdlets

You can view Lync Phone Edition configuration settings by using Lync Server Management Shell and the **Get-CsUCPhoneConfiguration** cmdlet. You can run this cmdlet can from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To view Lync Phone Edition configuration information

- To view information about all your Lync Phone Edition configuration settings, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsUCPhoneConfiguration
  ```

  The command returns information similar to the following:

  ```
  Identity              : Global
  CalendarPollInterval  : 00:03:00
  EnforcePhoneLock      : True
  ```

```
PhoneLockTimeout      : 00:10:00
MinPhonePinLength     : 6
SIPSecurityMode       : High
VoiceDiffServTag      : 40
Voice8021p            : 0
LoggingLevel          : Off
```

For details, see Get-CsUCPhoneConfiguration.

1.7.10.5.2 Create or Modify a Collection of Lync Phone Edition Configuration Settings

Create or Modify a Collection of Lync Phone Edition Configuration Settings

See Also

Operations > Managing Devices, Phones, and Client Applications > Lync Phone Edition Configuration Settings >

Topic Last Modified: *2013-02-23*

When you install Lync Server, you get a global collection of Lync Phone Edition settings. These settings apply to all devices running Lync Phone Edition in your deployment. You can change these settings at any time. You can also set up a new collection of settings that apply to the devices in a specific site. Site settings take precedence over global settings.

Configuration settings consist of the collection name, scope (global or site), SIP security setting, logging level, voice quality of service (QoS) level, phone-lock setting, and phone-lock details, that is, how long the a) unlock personal identification number (PIN) must be and b) phone stays idle before locking itself.

To create a collection of Lync Phone Edition configuration settings or edit settings for an existing collection

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Device Configuration** navigation button.
4. On the **Device Configuration** page, do one of the following:
   - To create a new collection of Lync Phone Edition configuration settings, click **New**, select a site, click **OK**, review the default settings, and, if you want to, make any changes.
   - To edit any of the settings in an existing collection, click the collection, click the **Edit** menu, click **Show details**, and then make your changes.

> **Tip:**
> To go back to using the default settings for the global collection, click the global collection, click the **Edit** menu, click **Delete**, and

then click **OK**. This will not delete the global collection; it just resets the settings to the defaults.

5. Click **Commit**.

Creating New Lync Phone Edition Configuration Settings by Using Windows PowerShell Cmdlets

You can create Lync Phone Edition configuration settings can (at the site scope only) by using Windows PowerShell and the **New-CsUCPhoneConfiguration** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To create new Lync Phone Edition configuration settings that use the default values

- This command creates a new set of UC phone configuration settings for the Redmond site:

  ```
  New-CsUCPhoneConfiguration -Identity "site:Redmond"
  ```

  Because no parameters (other than the mandatory Identity parameter) were specified in the preceding command, the new collection of configuration settings will use the default values for all its properties.

⊟To change a single property value when creating new Lync Phone Edition configuration settings

- To create settings that use different property values, simply include the appropriate parameter and parameter value. For example, to create a collection of UC phone configuration settings that, by default, require phone locking, use a command like this:

  ```
  New-CsUCPhoneConfiguration -Identity "site:Redmond" -EnforcePhoneLock $
  ```

⊟To change multiple property values when creating new Lync Phone Edition configuration settings

- Multiple property values can be modified by including multiple parameters. For example, this command enforces phone locking and also sets the minimum PIN length to 8 digits:

  ```
  New-CsUCPhoneConfiguration -Identity "site:Redmond" -EnforcePhoneLock $
  ```

For details, see New-CsUCPhoneConfiguration.

Configure Security Settings for Lync Phone Edition
Enforce Phone Locking

1.7.10.5.3 Delete an Existing Collection of Lync Phone Edition Configuration Settings

Delete an Existing Collection of Lync Phone Edition Configuration Settings

Operations > Managing Devices, Phones, and Client Applications > Lync Phone Edition Configuration Settings >

Topic Last Modified: *2013-02-23*

If you no longer want to use a collection of settings for devices running Lync Phone Edition, delete it. If you delete a collection for a site, the global settings will apply to the phones in that site. You cannot delete the global collection.

Note:

Instead of deleting a collection, you might just want to change some of the settings. For details about how to do so, see Create or Modify a Collection of Lync Phone Edition Configuration Settings.

⊟To delete a collection of Lync Phone Edition configuration settings

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Device Configuration** navigation button.
4. On the **Device Configuration** page, click the collection you want to delete, click the **Edit** menu, and then click **Delete**.

   Note:

   If you delete the global collection, the settings just revert to the default settings. The collection does not go away.
5. In the confirmation box, click **OK**.

Removing Lync Phone Edition Configuration Settings by Using Windows PowerShell Cmdlets

You can delete Lync Phone Edition configuration settings by using Windows PowerShell and the **Remove-CsUCConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To remove a specified collection of Lync Phone Edition configuration settings

- This command deletes the UC phone configuration settings applied to the Redmond site:

```
Remove-CsUCPhoneConfiguration -Identity "site:Redmond"
```

⊟To remove all of the Lync Phone Edition configuration settings applied to the site scope

- This command removes all the UC phone configuration settings applied to the service scope:

```
Get-CsUCPhoneConfiguration -Filter "site:*" | Remove-CsUCPhoneConfigura
```

⊟To remove all of the Lync Phone Edition configuration settings where phone locking is disabled

- This command deletes any collection of UC phone configuration settings where phone locking has been disabled:

```
Get-CsUCPhoneConfiguration | Where-Object {$_.EnforcePhoneLock -eq $Fal
```

For details, see Remove-CsUCPhoneConfiguration.

1.7.10.5.4 Configure Security Settings for Lync Phone Edition

Configure Security Settings for Lync Phone Edition

Operations > Managing Devices, Phones, and Client Applications > Lync Phone Edition Configuration Settings >

Topic Last Modified: *2013-02-23*

Help improve the security of devices running Lync Phone Edition via your SIP security setting and phone lock settings.

⊟To configure security settings for Lync Phone Edition

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click **Device Configuration**.
4. On the **Device Configuration** page, in the list of device configurations, double-click the configuration for which you want to change security settings.
5. In **Edit Device Configuration**, in **SIP security**, specify the SIP security level. The default level is **High**, which we recommend using.
6. In **Edit Device Configuration**, under **Phone Lock**, select or clear the **Enforce device locking** check box (selected by default) and specify the minimum PIN length (6 characters by default) and timeout period (10 minutes by default). We recommend using these defaults or increasing the PIN length and/or decreasing the timeout period.

Note:
For details, see Enforce Phone Locking.

Configuring Security Settings for Lync Phone Edition Phones by Using Windows PowerShell Cmdlets

Security settings can be managed by using Lync Server Management Shell and the **Get-CsUCPhoneConfiguration** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using

Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To modify the SIP security mode

- This command sets the SIPSecurityMode for the global collection of UC phone settings to Medium. SIP security could also be set to Low or High (the default value).

```
Set-CsUCPhoneConfiguration -Identity global -SIPSecurityMode "Medium"
```

To modify the minimum PIN length

- In this example, all the UC phone settings are modified to require a minimum PIN length of 7 digits.

```
Get-CsUCPhoneConfiguration | Set-CsUCPhoneConfiguration -MinPhonePinLen
```

For details, see Get-CsUCPhoneConfiguration.

Enforce Phone Locking

See Also

Managing Devices, Phones, and Client Applications > Mobile Phones (Policy/Push Notification) > Mobility Policies >

Topic Last Modified: *2013-02-23*

Lync Phone Edition devices can be locked for security purposes. If you enforce phone lock, the device running Lync Phone Edition locks after a period of time that you configure. When a phone is locked, a user can make calls but cannot access calendar and contact information, voice mail, or call logs or use search. To unlock the phone, the user enters a PIN.

To enforce phone lock, enable and configure it by using Lync Server Control Panel or Lync Server PowerShell cmdlets. You can enforce phone lock globally or only within the site for which it is configured.

To configure and enforce the phone lock

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. Click **Clients**, and then click **Device Configuration**.
4. On the **Device Configuration** tab, in the list of device configurations, double-click the configuration for which you want to change the phone lock settings.
5. In the **Edit Device Configuration** dialog box, verify that the **Enforce device locking** check box is selected.
6. In **Minimum PIN length**, accept the default value for the minimum number of digits that the unlock PIN must contain or specify a new value. The range for the PIN length is four to 15 digits, and the default is six.

7. In **Phone lock time-out**, accept the default value for the minimum length of time before the phone locks itself or specify a new value. The range for the timeout is 0 to 60 minutes, and the default is 10. Enter the value in the format HH:MM:SS.
8. Click **Commit**.

Enforcing Phone Locking by Using Windows PowerShell Cmdlets

Phone locking can be enforced by using the Set-CsUCPhoneConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable phone locking

- The following command enables phone locking for the Redmond site. To disable phone locking, set the EnforcePhoneLock property to False ($False).

```
Set-CsUCPhoneConfiguration -Identity" site:Redmond" -EnforcePhoneLock $
```

To enable phone locking and modify the phone lock timeout

- This command enables phone locking and also sets the phone lock timeout to 30 minutes.

```
Set-CsUCPhoneConfiguration -Identity" site:Redmond" -EnforcePhoneLock $
```

To enable phone locking throughout the organization

- In this example, phone locking is enabled on all the UC phone configuration settings in use in the organization.

```
Get-CsUCPhoneConfiguration | Set-CsUCPhoneConfiguration  -EnforcePhoneL
```

For more information, see the help topic for the Set-CsUCPhoneConfiguration cmdlet.

Device Update Web Service

See Also

Microsoft Lync Server 2013 > Operations > Managing Devices, Phones, and Client Applications >

Topic Last Modified: *2013-02-20*

Lync Server includes the Device Update Web service, which is automatically installed as part of the Web Services role. This service lets you download updates from Microsoft, test them, and then deploy the updates to IP phones in your organization. You can also use Device Update Web service to roll back devices to previous software versions.

This section provides details about how to manage the Device Update Web service and deployed updates by using device update logs, rules (Lync Phone Edition uses *rules* to associate firmware version updates with hardware devices), and configuration settings.

For details about the Device Update Web service process and features, see Updating Devices in the Lync Server 2010 TechNet Library. (Note that the Device Update Web service, like all Lync Phone Edition components, works the same way with Lync Server 2013 as it does with Lync Server 2010.)

Device Update Logs and Files

Operations > Managing Devices, Phones, and Client Applications > Device Update Web Service >

Topic Last Modified: *2013-02-20*

Device update logs contain important information that you can use to manage and troubleshoot the Device Update Web service. You can change what is logged and remove device logs and updates that you don’t want or no longer need. This section describes how you can use Lync Server Control Panel or Lync Server Management Shell to modify logging settings, clear the device update log, or remove log files from the server.

Note:
For details about device update log files, see Log File Types and Locations in the Lync Server 2010 TechNet Library. (Note that the Device Update Web service, like all Lync Phone Edition components, works the same way with Lync Server 2013 as it does with Lync Server 2010.)

⊟In This Section

- Modify Settings for Device Update Log Files
- Delete Device Update Log Files
- Remove Device Update Files Not Associated With a Device

1.7.10.6.1.1 Modify Settings for Device Update Log Files

Modify Settings for Device Update Log Files

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Logs and Files >

Topic Last Modified: *2013-02-23*

You can change settings for how device update information is logged in your organization by using Lync Server Control Panel or Lync Server Management Shell. The following table shows which settings are modifiable, and which tool(s) you use to modify the settings.

Log settings can be changed and applied globally, or per site.

To change	Use
The maximum size (in bytes) for a log file	Lync Server Control Panel -or- Lync Server Management Shell
The maximum amount of information (in bytes) that can be held in the cache	Lync Server Control Panel -or- Lync Server Management Shell
How often (in minutes) to write cached information to the log file	Lync Server Control Panel -or- Lync Server Management Shell
How long (in days) to keep log files	Lync Server Control Panel -or- Lync Server Management Shell
When (time of day) to check for expired files that should be deleted	Lync Server Management Shell
What log file extensions to permit	Lync Server Management Shell
Which log file types to retain	Lync Server Management Shell

To change logging settings by using Lync Server Control Panel

1. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
2. In the left navigation bar, click **Clients**, and then click **Device Log Configuration**.
3. On the **Device Log Configuration** page, double-click the configuration that you want to change.
4. In the **Edit Log Setting** dialog box, change any of the following settings:
   - **Maximum file size (bytes)** Specifies the maximum size a log file can become before it is purged. The default is 1,024,000 bytes (1 MB).
   - **Maximum cache size (bytes)** Specifies the maximum amount of information (in bytes) that can be held in the log file cache before that cache must be cleared and the data is written to a log file. The default is 512,000 bytes (0.5 MB).
   - **Number of minutes to flush cache (1-60)** Indicates how often information stored in the log file cache is written to the actual log file. After the data is logged, the cache is cleared. The default is five minutes.
   - **Number of days to keep log files (1-365)** Specifies the number of days the log files are kept before they are purged. The default is 10 days.
5. Click **Commit**.

Changing Logging Settings by Using Windows PowerShell Cmdlets

Device update log file settings can be modified by using Windows PowerShell and the

Set-CsDeviceUpdateConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

> **Note:**
> For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

The following examples show a couple of the ways that you can use **Set-CsDeviceUpdateConfiguration** to modify settings.

To modify the maximum log file size and the log cleanup interval

- The following command modifies the device update log settings applied to the Redmond site. In this example, the maximum log file size is set to 204800 bytes and the log cleanup interval is set to 14 days.

```
Set-CsDeviceUpdateConfiguration -Identity "site:Redmond" -MaxLogFileSiz
```

To modify the log cleanup time of day

- This command sets the log cleanup time for the Redmond site to 3:00 AM.

```
Set-CsDeviceUpdateConfiguration -Identity "site:Redmond" -LogCleanupTim
```

For details, see the Help topic for the Set-CsDeviceUpdateConfiguration cmdlet.

1.7.10.6.1.2 Delete Device Update Log Files

Delete Device Update Log Files

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Logs and Files >

Topic Last Modified: *2013-02-23*

The Device Update Web service keeps an extensive collection of log files. This collection includes both audit logs conducted by the service itself and log files uploaded from client devices. To prevent the server from filling up with Device Update Web service service logs, you'll probably want to clear it of log files that have been around for a certain number of days. Set this number of days based on update activity and the number of client devices in your organization, and by using Lync Server Control Panel or Lync Server Management Shell.

To clear the device update log by using Lync Server Control Panel

1. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
2. In the left navigation bar, click **Clients**, and then click **Device Log Configuration**.
3. On the **Device Log Configuration** page, double-click the configuration that you want to change.
4. In the **Edit Log Setting** dialog box, in **Number of days to keep log files (1-365)**, specifiy a number of days.
5. Click **Commit**. All files that have been on the server for more than the specified number of day are deleted. This setting will apply to this configuration until you change it.

Clearing the Device Update Log by Using the Windows PowerShell Cmdlets

You can clear device update logs by using Windows PowerShell and the **Clear-CsDeviceUpdateLog** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:
For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To clear device update logs on one server

- The following command clears the device update log on the Web server atl-cs-001.litwareinc.com. All log entries more than 10 days old (the value specified by the DaysBack parameter) will be removed from the log.

```
Clear-CsDeviceUpdateLog -Identity "service:WebServer:atl-cs-001.litware
```

To clear all device update logs

- This command removes outdated entries (in this example, entries more than 10 days old) from all the device update logs currently in use in your organization.

```
Get-CsService -WebServer | Foreach-Object {Clear-CsDeviceUpdateLog -Ide
```

For details, see the Help topic for the Clear-CsDeviceUpdateLog cmdlet.

1.7.10.6.1.3 Remove Device Update Files Not Associated With a Device

Remove Device Update Files Not Associated With a Device

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Logs and Files >

Topic Last Modified: *2013-02-20*

Each time new device updates are uploaded to the system, a corresponding device update rule is created. By default, these new device update rules are assigned to the Pending state. This means that the rules can be downloaded and installed on test devices, but not on production devices, which enables you to test the updates before making them available to users. Based on the tests, you either accept and deploy or reject and delete the update. When you reject an update, the device update is disassociated from its device update rule.

Device update files that are no longer associated with a device can be removed by using Windows PowerShell and the **Clear-CsDeviceUpdateFile** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:
For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

- For example, the following command removes any device update rules on the Web server atl-cs-001.litwareinc.com that are no longer associated with a device:

```
Clear-CsDeviceUpdateFile -Identity "service:WebServer:atl-cs-001.litwar
```

For details, see the Help topic for the Clear-CsDeviceUpdateFile cmdlet.

1.7.10.6.2 Device Update Rules

Device Update Rules

Operations > Managing Devices, Phones, and Client Applications > Device Update Web Service >

Topic Last Modified: *2013-02-20*

Periodically, Microsoft releases a new set of device firmware updates for Lync Phone Edition. *Device update rules* associate firmware updates with hardware devices—phones and other devices running Lync Phone Edition.

To get the latest set of device update rules, go to the Help and Support page on the Microsoft website, and search for "Phone Edition." Download the update package, and extract the files to a folder on the computer where the updates are to be uploaded. After the files have been extracted, import the device update rules found in the extracted .CAB file (which have the name UCUpdates.cab). Then, use the Lync Server Control Panel or Windows PowerShell cmdlets to view and manage these rules for your organization's devices.

The following topics tell you how to import, view, and manage device update rules.

- View Information about Device Update Rules
- Import Device Update Rules
- Approve a Device Update Rule
- Remove a Device Update Rule
- Reset a Device Update Rule
- Restore a Device Update Rule

1.7.10.6.2.1 View Information about Device Update Rules

View Information about Device Update Rules

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Rules >

Topic Last Modified: *2013-02-23*

View details about device update rules that have already been imported, including the type, model, and brand of devices the update applies to; version and type of update; and locale and pool for the update. Information is available for all imported device update rules—those that are pending approval, deployed (approved), recalled (restored), and those you've decided not to use (reset). Access this information from either Lync Server Control Panel or Windows PowerShell.

Note:

For details about how to import, approve, reset, restore, and remove rules, see the topics listed at Device Update Rules.

To view device update rules by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Device Update** navigation button. Imported rules are listed on the **Device Update** page.

Viewing Device Update Rules by Using Windows PowerShell Cmdlets

Detailed information about all your device update rules can also be viewed by using Windows PowerShell and the **Get-CsDeviceUpdateRule** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:

For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view all your device update rules

- The following command returns information about all the device updates rules configured for use in your organization:

  ```
  Get-CsDeviceUpdateRule
  ```

  The command returns information similar to the following for each of your device update rules:

  ```
  Identity        : Service:WebServer:pool0.vdomain.com/2de8cbf6-9441-4f6
  Id              : 2de8cbf6-9441-4f61-b755-1e4bef1effde
  DeviceType      : UCPhone
  Brand           : Microsoft
  Model           : CPE
  Revision        : A
  Locale          : ENU
  UpdateType      : CPE
  ApprovedVersion :
  RestoreVersion  :
  PendingVersion  : 4.0.7577.4066
  ```

To view all the device update rules on a specific web server

- To view the device update rules on a specific computer, use the Filter parameter followed by the server Identity and the wildcard character (*). For example:

  ```
  Get-CsDeviceUpdateRule -Filter "service:WebServer:atl-cs-001.litwareinc
  ```

For details, see the Help topic for the Get-CsDeviceUpdateRule cmdlet.

1.7.10.6.2.2 Import Device Update Rules

Import Device Update Rules

See Also

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Rules >

Topic Last Modified: *2013-02-23*

Device update rules can be imported only by using Windows PowerShell and the **Import-CsDeviceUpdate** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:

For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To import device update rules to a single web server

- The following command imports device update rules to the Web server atl-cs-001.litwareinc.com:

```
Import-CsDeviceUpdate -Identity "service:WebServer:atl-cs-001.litwarein
```

To import device update rules to all your web servers

- In this example, device update rules are imported to all the Web servers deployed in your organization. For this command to work, the folder \\atl-fs-001.litwareinc.com\Updates must be shared and available to all the Web servers.

```
Get-CsService -WebServer | ForEach-Object {Import-CsDeviceUpdate -Ident
```

For details, see the Help topic for the Import-CsDeviceUpdate cmdlet.

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Rules >

Topic Last Modified: *2013-02-23*

After you import a device update rule, it’s installed on your test devices. If your testing is successful, and you want to roll out the update to your organization, approve it by using either Lync Server Control Panel or Windows PowerShell.

To approve a device update rule by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.

2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. On the **Device Update** page, do one of the following:
   - To approve one rule, select that rule.
   - To approve all rules, click **Edit**, and then click **Select All**.
4. Click **Action**, and then click **Approve**.

Approving a Device Update Rule by Using Windows PowerShell Cmdlets

Device update rules can also be approved by using Windows PowerShell and the **Approve-CsDeviceUpdateRule** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:

For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To approve a single device update rule

- The following command approves the device update rule d5ce3c10-2588-420a-82ac-dc2d9b1222ff9 found on the Web server atl-cs-001.litwareinc.com:

```
Approve-CsDeviceUpdateRule -Identity service:WebServer:atl-cs-001.litwa
```

To approve multiple device update rules

- This command approves all the device update rules for Microsoft-branded devices:

```
Get-CsDeviceUpdateRule | Where-Object {$_.Brand -eq "Microsoft"} | Appr
```

For details, see the Help topic for the Approve-CsDeviceUpdateRule cmdlet.

***Topic Last Modified:** 2013-02-23*

Removing a device update rule takes it permanently out of the device update queue.

Removing a rule is different from uninstalling an update from the devices in your deployment or from your test devices. To uninstall an approved update from your deployment, you *restore* the device update rule. For details, see Restore a Device Update Rule. To uninstall an update you haven’t approved from your test devices, you *reset* it. For details, see Reset a Device Update Rule.

You can remove a device update rule by using either Lync Server Control Panel or Windows PowerShell.

To remove device update rules by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Device Update** navigation button.
4. On the **Device Update** page, do one of the following:
   - To remove one rule, select the rule you want to delete.
   - To remove all rules, click the **Edit** menu, and then click **Select All**.
5. Click **Edit**, and then click **Delete**.

Removing Device Update Rules by Using Windows PowerShell Cmdlets

Device update rules can also be removed by using Windows PowerShell and the **Remove-CsDeviceUpdateRule** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a single device update rule from a server

- The following command removes the device update rule d5ce3c10-2588-420a-82ac-dc2d9b1222ff9 from the Web server on atl-cs-001.litwareinc.com.

```
Remove-CsDeviceUpdateRule -Identity "service:WebServer:atl-cs-001.litwa
```

To remove all the device update rules from a server

- This command removes all the device update rules from the web server on atl-cs-001.litwareinc.com.

```
Get-CsDeviceUpdateRule -Filter "service:WebServer:atl-cs-001.litwareinc
```

For details, see the Help topic for the Remove-CsDeviceUpdateRule cmdlet.

See Also

Tasks

Approve a Device Update Rule

1.7.10.6.2.5 Reset a Device Update Rule

Reset a Device Update Rule

See Also

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Rules >

Topic Last Modified: *2013-02-23*

If you don’t like the way that an update works on your test devices, you can reset the device update rule, which removes the rule's pending status and uninstalls the update from the test devices.

You can remove a device update rule by using either Lync Server Control Panel or Windows PowerShell.

Note:
To uninstall a rule that you've already approved (that is, rolled out), restore it. For details, see Restore a Device Update Rule.

To reset a device update rule by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Device Update** navigation button.
4. On the **Device Update** page, do one of the following:
   - To reset one rule, select the rule you want to reset.
   - To reset all rules, on the **Edit** menu, click **Select All**.
   - To reset all rules for one brand, use the **Brand** column menu.
5. Click **Action**, and then click **Cancel pending updates**.

Tip:
If you're sure you'll never want to roll out the device update rule(s) that you cancelled, you might want to delete them. For details, see Remove a Device Update Rule.

Resetting a Device Update Rule by Using Windows PowerShell Cmdlets

Device update rules can also be reset by using Windows PowerShell and the **Reset-CsDeviceUpdateRule** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:
For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To reset a specific device update rule on a server

- The following command resets the device update rule d5ce3c10-2588-420a-82ac-dc2d9b1222ff9 on the Web server atl-cs-001.litwareinc.com:

```
Reset-CsDeviceUpdateRule -Identity "service:WebServer:atl-cs-001.litwar
```

To reset all the device update rules on a server

- This command resets all the device update rules on the Web server atl-cs-001.litwareinc.com:

```
Get-CsDeviceUpdateRule -Filter "service:WebServer:atl-cs-001.litwareinc
```

To reset all the device updates rules that have a specific brand

- In this example, all the device updates throughout the organization that have a Brand equal to Microsoft are reset:

```
Get-CsDeviceUpdateRule | Where-Object {$_.Brand -eq "Microsoft"} | Rese
```

For details, see the Help topic for the Reset-CsDeviceUpdateRule cmdlet.

Tasks

Approve a Device Update Rule

1.7.10.6.2.6 Restore a Device Update Rule

Restore a Device Update Rule

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Rules >

Topic Last Modified: *2013-02-23*

To uninstall a device update rule from the devices in your deployment, restore it. Restoring a device update rule both uninstalls the update and reinstalls the previous version of that rule.

You can restore a device update rule by using either Lync Server Control Panel or Windows PowerShell.

To restore device update rules by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Device Update** navigation button.
4. On the **Device Update** page, do one of the following:
   - To restore one rule, select that rule.
   - To restore all rules, click **Edit**, and then click **Select All**.
5. Click the **Action** menu, and then click **Restore**.

Restoring Device Update Rules by Using Windows PowerShell Cmdlets

Device updates rules can also be restored by using Windows PowerShell and the **Restore-CsDeviceUpdateRule** cmdlet.. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:

For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To restore a single device update rule on a server

- The following command restores the device update rule d5ce3c10-2588-420a-82ac-dc2d9b1222ff9 on the Web server atl-cs-001.litwareinc.com:

```
Restore-CsDeviceUpdateRule -Identity "service:WebServer:atl-cs-001.litw
```

To restore all the device update rules on a server

- This command restores all the device update rules on the web server atl-cs-001.litwareinc.com:

  ```
  Get-CsDeviceUpdateRule -Filter "service:WebServer:atl-cs-001.litwareinc
  ```

For details, see the Help topic for the Restore-CsDeviceUpdateRule cmdlet.

1.7.10.6.3 Device Update Configuration Settings

Device Update Configuration Settings

Operations > Managing Devices, Phones, and Client Applications > Device Update Web Service >

Topic Last Modified: *2013-02-20*

The Device Update Web service is managed by using device configuration settings. These settings can be applied at the global scope or at the site scope.

- View Device Update Configuration Settings
- Create or Modify a Collection of Device Update Configuration Settings
- Delete a Collection of Device Update Configuration Settings

1.7.10.6.3.1 View Device Update Configuration Settings

View Device Update Configuration Settings

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Configuration Settings >

Topic Last Modified: *2013-02-20*

You can view the Device Update Service configuration settings by using Lync Server Management Shell and the **Get-CsDeviceUpdateConfiguration** cmdlet, which you can run from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell

Note:

For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

- To view information about all your voice routes, type the following command in the Lync Server Management Shell and press Enter:

  ```
  Get-CsDeviceUpdateConfiguration
  ```

  This command returns information similar to the following:

  ```
  Identity               : Global
  ValidLogFileTypes      : {Watson, Config, Diaglog, CELog}
  ValidLogFileExtensions : {.dmp, .clg, .clg1, .clg2...}
  MaxLogFileSize         : 1024000
  MaxLogCacheLimit       : 512000
  LogCleanUpInterval     : 10.00:00:00
  LogFlushInterval       : 00:05:00
  LogCleanUpTimeOfDay    :
  ```

For details about this cmdlet, see Help topic at Get-CsDeviceUpdateConfiguration.

1.7.10.6.3.2 Create or Modify a Collection of Device Update Configuration Settings

Create or Modify a Collection of Device Update Configuration Settings

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Configuration Settings >

Topic Last Modified: *2013-02-23*

Device update configuration settings can be created (at the site scope only) by using Windows PowerShell and the **New-CsDeviceUpdateConfiguration** cmdlet and modified by using the **Set-CsDeviceUpdateConfiguration** cmdlet. These cmdlets can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell.

Note:
For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To create device update configuration settings that use the default values

- This command creates a new set of device update configuration settings for the Redmond site:

  ```
  New-CsDeviceUpdateConfiguration -Identity "site:Redmond"
  ```

  Because no parameters other than the mandatory Identity parameter were specified in the preceding command, the new collection of configuration settings will use the default values for all its properties.

To change a single property value when creating device update configuration settings

- To create settings that use different property values, simply include the appropriate parameter and parameter value. For example, to create a collection of device update configuration settings that, by default, deletes old log files every 21 days, use a command like this one:

  ```
  New-CsDeviceUpdateConfiguration -Identity "site:Redmond" -LogCleanupInt
  ```

To change multiple property values when creating device update configuration settings

- Multiple property values can be modified by including multiple parameters. For example, this command sets the log cleanup interval to 21 days and the log flush interval to 30 minutes:

  ```
  New-CsDeviceUpdateConfiguration -Identity "site:Redmond" -LogCleanupInt
  ```

For details about modifying existing device configuration settings, see the Help topic for the Set-CsDeviceUpdateConfiguration cmdlet. For details about creating collections of configuration settings, see the Help topic for the New-CsDeviceUpdateConfiguration cmdlet.

1.7.10.6.3.3 Delete a Collection of Device Update Configuration Settings

Delete a Collection of Device Update Configuration Settings

Managing Devices, Phones, and Client Applications > Device Update Web Service > Device Update Configuration Settings >

***Topic Last Modified:** 2013-02-20*

Device update configuration settings can also be deleted by using Windows PowerShell and the **Remove-CsdeviceUpdateConfiguration** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To remove a specific collection of device update configuration settings

- This command deletes the device update configuration settings applied to the Redmond site:

```
Remove-CsDeviceUpdateConfiguration -Identity "site:Redmond"
```

⊟To remove all the device update configuration settings applied to the site scope

- This command deletes all the device update configuration settings applied to the site scope:

```
Get-CsDeviceUpdateConfiguration -Filter "site:*" | Remove-CsDeviceUpdat
```

⊟To remove device update configuration settings based on the value of the LogCleanUpInterval property

- The following command deletes all the device update configuration settings where the log cleanup interval is greater than 10 days (10.00:00:00):

```
Get-CsDeviceUpdateConfiguration | Where-Object {$_.LogCleanUpInterval -
```

For details, see the Help topic for the Remove-CsDeviceUpdateConfiguration cmdlet.

1.7.10.6.4 View Software Updates for Devices in Your Organization

View Software Updates for Devices in Your Organization

See Also

Operations > Managing Devices, Phones, and Client Applications > Device Update Web Service >

***Topic Last Modified:** 2012-11-01*

With Lync Server 2013, you use Device Update Web service to view and manage software updates for your organization’s devices. These updates are available in .cab (cabinet) files from the Microsoft Support website at http://go.microsoft.com/fwlink/p/?linkId=204091. After you download the .cab file, run the **Import-CSDeviceUpdate** cmdlet to import the device update rules from the .cab file. For details about the **Import-CSDeviceUpdate** cmdlet, see Import-CsDeviceUpdate in the Lync Server Management Shell documentation.

Tip:

Before deploying a new update to your organization, verify that it functions correctly on a test device.

To view software updates for UC devices

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. From the Microsoft Support website at http://go.microsoft.com/fwlink/p/?linkId=204091, download the .cab file to a location on a Lync Server 2013 computer (for example, C:\Updates\UCUpdates.cab).
3. Import the device update rules from the C:\Updates\UCUpdates.cab file by running one of the following cmdlets:
   - If the .cab file is located on the same computer as the one running the service to be updated (service:Redmond-websvc-2), run the following cmdlet:

     ```
     Import-CsDeviceUpdate -Identity service:Redmond-websvc-2 -Fi
     ```

   - If the .cab file is located on a different computer than the one running the service to be updated (service:Redmond-websvc-3), run the following cmdlet:

     ```
     Import-CsDeviceUpdate -Identity service:Redmond-websvc-3 -By
     ```

4. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
5. In the left navigation bar, click **Clients**, and then click **Device Update**.
6. On the **Device Update** page, click an update in the list, and then do one of the following:
   - **Cancel a pending update.** To prevent the selected update from being deployed to your organization’s devices, click the **Action** menu, and then click **Cancel pending updates**.
   - **Approve an update.** To allow the selected update to be deployed to your organization’s devices, click the **Action** menu, and then click **Approve**.
   - **Restore an update.** To allow a previously approved update to be deployed to your organization’s devices, click the **Action** menu, and then click **Restore**.

Microsoft Lync Server 2013 > Operations > Managing Devices, Phones, and Client Applications >

Topic Last Modified: *2012-12-11*

Lync Server 2013 enables you to specify the version of clients that are supported in your environment. Using client version policies can help reduce the costs associated with supporting multiple client versions. It can also improve the overall user experience, because when earlier and later versions of clients interact, the available features can be limited by the earlier version of the client.

There are three components of client version control:

- Client version configuration settings are used to turn client version control on or off, either globally or for particular sites.

- Client version policies are used to assign a set of rules globally, or to a particular site, pool, or group of users.
- Client version policy rules make up a client version policy, and are used to define the actions that should be taken when users attempt to log on with specific clients and client versions.

Note:
Because anonymous users are not associated with a user, site, or service, anonymous users are affected by global-level policies only.

In This Section

Client Version Configuration Settings

Operations > Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 >

Topic Last Modified: *2012-12-12*

Client version configuration settings are used to turn client version control on or off, either globally or for particular sites. Use the following procedures to configure client version configuration settings for Lync Server 2013.

- Enable or Disable Client Versioning
- Create or Modify a Collection of Client Version Configuration Settings
- Modify the Default Action for Clients Not Explicitly Supported or Restricted
- View Client Version Configuration Settings
- Delete an Existing Collection of Client Version Configuration Settings

1.7.10.7.1.1 Enable or Disable Client Versioning

Enable or Disable Client Versioning

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Configuration Settings >

Topic Last Modified: *2013-02-23*

Client version configuration settings are used to turn client version control on or off, either globally or for particular sites. The global client version configuration installs with Lync Server 2013 and is used to enable or disable client version control for the entire server deployment. When the global configuration is enabled, any client version policies you have in place will take effect when users attempt to log on. You can disable the global client version configuration if you do not want any client version control to occur. You can enable or disable client versioning from Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

Note:
Because anonymous users are not associated with a user, site, or service, anonymous users are affected by global-level policies only.

To enable or disable client versioning by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Client Version Configuration** navigation button.
4. Do the following:
   - To globally enable or disable client versioning, double-click the **Global** configuration, and then modify the settings.
   - To enable or disable client versioning for a particular site, click **New**, select the site, click **OK**, and then modify the settings for the site.

Enabling or Disabling Client Versioning by Using Windows PowerShell Cmdlets

You can enable or disable client versioning by using the **Set-CsClientVersionConfiguration** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable client versioning

- You can enable client versioning by setting the **Enabled** property to True ($True).

```
Set-CsClientVersionConfiguration -Identity "site:Redmond" -Enabled $Tru
```

To disable client versioning

- You can disable client versioning by setting the **Enabled** property to False ($False).

```
Set-CsClientVersionConfiguration -Identity "site:Redmond" -Enabled $Tru
```

For details, see the Help topic for the Set-CsClientVersionConfiguration cmdlet.

1.7.10.7.1.2 Create or Modify a Collection of Client Version Configuration Settings

Create or Modify a Collection of Client Version Configuration Settings

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Configuration Settings >

Topic Last Modified: *2013-02-23*

Client version configuration settings are used to turn client version control on or off. The global client version configuration installs with Lync Server and is used to enable or disable client version control for the entire server deployment. You can also configure client version configuration settings for individual sites. You can create or modify client version configuration settings from Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

> **Note:**
> Because anonymous users are not associated with a user, site, or service, anonymous users are affected by global-level policies only.

To create or modify client version configuration settings by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Client Version Configuration** navigation button.
4. On the **Client Version Configuration** page, do the following:
   - To create a new configuration, click **New**, select a site, click **OK** name, and update the settings.
   - To modify a configuration, select the configuration, click **Edit**, click **Show details**, and make changes to the settings.

Creating or Modifying Client Version Configuration Settings by Using Windows PowerShell Cmdlets

You can create client version configuration settings by using the **New-CsClientVersionConfiguration** cmdlet, and modify them by using the **Set-CsClientVersionConfiguration** cmdlet. These cmdlets can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To create a new collection of client version configuration settings

- The following command creates a new collection of client version configuration settings applied to the Redmond site. In this example, client versioning is disabled for the Redmond site.

```
New-CsClientVersionConfiguration -Identity "site:Redmond" -Enabled $Fal
```

To enable client versioning for a site

- This command enables client versioning for the Redmond site.

```
Set-CsClientVersionConfiguration -Identity "site:Redmond" -Enabled $Tru
```

To disable client versioning throughout the organization

- In this example, client versioning is disabled for all the client version configuration settings in use in the organization.

```
Get-CsClientVersionConfiguration | Set-CsClientVersionConfiguration  -E
```

For details, see the Help topic for the New-CsClientVersionConfiguration and Set-

CsClientVersionConfiguration cmdlets.

1.7.10.7.1.3 Modify the Default Action for Clients Not Explicitly Supported or Restricted

Modify the Default Action for Clients Not Explicitly Supported or Restricted

See Also

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Configuration Settings >

Topic Last Modified: *2013-02-23*

In addition to specifying the version of clients that you want to support in your Lync Server 2013 environment, you can also specify a default action for clients that do not already have a version policy defined. This enables you to restrict which client versions are used in your Lync Server environment, which can help you control the costs associated with supporting multiple client versions.

⊟To modify the default action for clients not explicitly supported or restricted

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click **Client Version Configuration**.
4. On the **Client Version Configuration** page, double-click the **Global** configuration in the list.
5. In the **Edit Client Version Configuration** dialog box, verify that the **Enable version control** check box is selected and then, under **Default action**, select one of the following:
   - **Allow** Allows the client to log on if the client version does not match any filter in the **Client version policies** list.
   - **Block** Prevents the client from logging on if the client version does not match any filter in the **Client version policies** list.
   - **Block with URL** Prevents the client from logging on if the client version does not match any filter in the **Client version policies** list, and include an error message containing a URL where a newer client can be downloaded.
   - **Allow with URL** Allows the client to log on if the client version does not match any filter in the **Client version policies** list, and include an error message containing a URL where a newer client can be downloaded.
6. If you selected **Block with URL**, type the client download URL to include in the error message in the **URL** box.
7. Click **Commit**.

⊟To disable client version control

- To disable version control to allow all clients to log on regardless of the client version, clear the **Enable version control** check box, and then click **Commit**.

Modifying the Default Action by Using Windows PowerShell Cmdlets

The default action to be taken when users try to sign on using clients that are not explicitly supported or restricted by a client version policy can be managed by using Windows PowerShell command-line interface and the **Set-CsClientVersionPolicy** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To configure the default action to block access

- The following command sets the default action for the Redmond site Block. This will block registration for any client for which no client version configuration rule exists.

```
Set-CsClientVersionConfiguration -Identity "site:Redmond" -DefaultActio
```

To configure the default action to allow access

- In this example, the default action for the Redmond site is set to Allow. This will allow registration for any client for which no client version configuration rule exists.

```
Set-CsClientVersionConfiguration -Identity "site:Redmond" -DefaultActio
```

For details, see the Help topic for the Set-CsClientVersionPolicy cmdlet.

Client version configuration settings are used to turn client version control on or off. The global client version configuration installs with Lync Server 2013 and is used to enable or disable client version control for the entire server deployment. When the Global configuration is enabled, any client version policies you have in place will take effect when users attempt to log on. You can view client version configuration settings from Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

> **Note:**
>
> Because anonymous users are not associated with a user, site, or service, anonymous users are affected by global-level policies only.

To view client version configuration settings by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Client Version Configuration** navigation button.

4. Double-click the name of the client version configuration you want to view.

Viewing Client Version Configuration Settings by Using Windows PowerShell Cmdlets

You can view client version configuration settings by using the **Get-CsClientVersionConfiguration** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view client version configuration information

- To view information about all your client version configuration settings, type the following command in the Lync Server Management Shell and then press ENTER:

```
Get-CsClientVersionConfiguration
```

That will return information similar to this:

```
Identity      : Global
DefaultAction : Allow
DefaultURL    :
Enabled       : True
```

For details, see the Help topic for the Get-CsClientVersionConfiguration cmdlet.

1.7.10.7.1.5 Delete an Existing Collection of Client Version Configuration Settings

Delete an Existing Collection of Client Version Configuration Settings

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Configuration Settings >

Topic Last Modified: *2013-02-23*

If you want to remove the client configuration settings that have been previously configured for a site, you can remove the settings from Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

To remove client configuration settings by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Client Version Configuration** navigation button.
4. Select the site, click **Edit**, click **Delete**, and then click **OK**.

Removing Client Version Configuration

Settings by Using Windows PowerShell Cmdlets

You can delete client version configuration settings by using the **Remove-CsClientVersionConfiguration** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To remove a specified collection of client version configuration settings

- The following command removes the client version configuration settings applied to the Redmond site:

```
Remove-CsClientVersionConfiguration -Identity "site:Redmond"
```

⊟To remove all the client version configuration settings applied to the site scope

- This command removes all the client version configuration settings configured at the site scope:

```
Get-CsClientVersionConfiguration -Filter site:* | Remove-CsClientVersio
```

⊟To remove all the client version configuration settings based on the value of the DefaultAction property

- And this command removes all the client version configuration settings where the default action has been set to "Block":

```
Get-CsClientVersionConfiguration | Where-Object {$_.DefaultAction -eq "
```

For details, see the Help topic for the Remove-CsClientVersionConfiguration cmdlet.

1.7.10.7.2 Client Version Policies

Client Version Policies

Operations > Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 >

Topic Last Modified: *2012-12-11*

Client version policies are used to apply a set of client versioning rules globally or to a particular site, pool, or group of users. Use the following procedures to configure client version policies for Lync Server 2013.

- View Client Version Policies
- Create or Modify a New Client Version Policy
- Delete an Existing Client Version Policy

1.7.10.7.2.1 View Client Version Policies

View Client Version Policies

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Policies >

Topic Last Modified: *2013-02-23*

Client version policies are used to apply a set of client versioning rules globally or to a particular site, pool, or group of users. You can view the client version policies that have been configured in your Lync Server 2013 environment from Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

⊟To view client version policies by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Client Version Policy** navigation button.
4. If you want to view the rules for a client version policy, on the **Client Version Policy** page, double-click the policy you want to view.

Viewing Client Version Policies by Using Windows PowerShell Cmdlets

You can view client version policies by using the **Get-CsClientVersionPolicy** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To view client version policies

- To view information about all your client version policies, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsClientVersionPolicy
  ```

  That will return information similar to this:

  ```
  Identity    : Global
  Rules       : {RuleId=2336c611-a243-4c5d-994b-eea8a524d0e4;

1.7.10.7.2.2 Create or Modify a New Client Version Policy

Create or Modify a New Client Version Policy

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Policies >

***Topic Last Modified:** 2013-02-23*

You can use client version policies to specify the versions of clients that are supported in your environment. Using client versioning can help reduce the costs associated with supporting multiple client versions. It can also improve the overall user experience, because when earlier and later versions of clients interact, the available features can be limited by the earlier version of the client. You can create or modify client version policies from Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

⊟To create or modify client version policies by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**.

   Note:
   The **Client Version Policy** tab is selected by default.

4. On the **Client Version Policy** page, do one of the following:
   - To create a client version policy, click **New**, select **Site policy**, **Pool policy**, or **User policy**, and then click **OK**.
   - To modify the global policy or another existing client version policy, select the policy, click **Edit**, and then click **Show details**.
5. On the **Edit Client Version Policy** page, create or modify rules as described in Create or Modify a New Client Version Policy Rule.

Creating or Modifying Client Version Policies by Using Windows PowerShell Cmdlets

You can create client version policies by using the **New-CsClientVersionPolicy** cmdlet, and modify them by using the **Set-CsClientVersionPolicy** cmdlet. These cmdlets can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To create a new site-scoped client version policy

- The following command creates a new client version policy applied to the Redmond site. Because no additional parameters are specified, the new policy will use the default client version settings.

```
New-CsClientVersionPolicy -Identity "site:Redmond"
```

⊟To create a new per-user client version policy

- To create a per-user policy, use a command similar to this:

```
New-CsClientVersionPolicy -Identity "RedmondClientVersionPolicy"
```

For details, see the Help topics for the New-CsClientVersionPolicy cmdlet and the Set-CsClientVersionPolicy cmdlet.

1.7.10.7.2.3 Delete an Existing Client Version Policy

Delete an Existing Client Version Policy

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Policies >

Topic Last Modified: *2013-02-23*

If you want to delete a client version policy that was previously configured, you can delete it from Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

To delete client version policies by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Client Version Policy** navigation button.
4. On the **Client Version Policy** page, select the client version policy or policies you want to delete, click **Edit**, and then click **Delete**.

Deleting Client Version Policies by Using Windows PowerShell Cmdlets

You can delete client version policies by using the **Remove-CsClientVersionPolicy** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specific client version policy

- This command deletes the client version policy applied to the Redmond site:

```
Remove-CsClientVersionPolicy -Identity site:Redmond
```

To remove all the client version policies applied to the site scope

- This command removes all the client version policies configured at the site scope:

```
Get-CsClientVersionPolicy -Fiter "site:*" | Remove-CsClientVersionPolic
```

To remove client version policies that do not include a specific user agent

- And this command removes any client version policies that do not include a rule for the Windows Phone Lync (WPLync) user agent:

```
Get-CsClientVersionPolicy | Where-Object {$_.Rules -notmatch "UserAgent
```

For details, see the Help topic for the Remove-CsClientVersionPolicy cmdlet.

1.7.10.7.3 Client Version Rules

Client Version Rules

Operations > Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 >

Topic Last Modified: *2012-12-11*

A client version policy is made up of a set of client version policy rules. These rules define the actions that should be taken when users attempt to log on with specific clients and client versions. Use the following procedures to configure client version policy rules for Lync Server 2013

- View Client Version Policy Rules
- Create or Modify a New Client Version Policy Rule
- Delete an Existing Client Version Policy Rule

1.7.10.7.3.1 View Client Version Policy Rules

View Client Version Policy Rules

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Rules >

Topic Last Modified: *2013-02-23*

A client version policy is made up of a set of client version policy rules. These rules define the actions that should be taken when users attempt to log on with specific clients and client versions. You can view client version policy rules from Lync Server 2013 Control Panel or Lync Server 2013 Management Shell.

⊟To view client version policy rules by using Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Client Version Policy** navigation button.
4. On the **Client Version Policy** page, double-click a client version policy you want to view.
5. The rules appear on the **Edit Client Version Policy** page. To view the details for a rule, select the rule, and then click **Show details**.

Viewing Client Version Policy Rules by Using Windows PowerShell Cmdlets

You can view client version policy rules by using Lync Server Management Shell and the **Get-CsClientVersionPolicyRule** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view client version policy rules

- To view the client version policy rules, type the following command in the Lync Server Management Shell and then press ENTER:

```
Get-CsClientVersionPolicyRule
```

  That will return information similar to this for each configured rule:

```
Identity          : Global/2336c611-a243-4c5d-994b-eea8a524d0e4
Priority          : 0
RuleId            : 2336c611-a243-4c5d-994b-eea8a524d0e4
Description       :
Action            : Block
ActionUrl         :
MajorVersion      : 1
MinorVersion      : 3
BuildNumber       :
QfeNumber         :
UserAgent         : RTC
UserAgentFullName :
Enabled           : True
CompareOp         : LEQ
```

For details, see the help topic for the Get-CsClientVersionPolicyRule cmdlet.

1.7.10.7.3.2 Create or Modify a New Client Version Policy Rule

Create or Modify a New Client Version Policy Rule

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Rules >

Topic Last Modified: *2013-01-21*

Client version policy rules define the actions that should be taken when users attempt to log on with specific clients and client versions. You can create or modify individual rules for a client version policy from Lync Server 2013 Control Panel.

Important:

Rules are listed in order of precedence. For example, if you have a rule that allows clients running version 1.5 to connect, followed by a rule that blocks clients running a version earlier than 2.0, the first rule takes precedence, and clients running version 1.5 are allowed to connect.

To create or modify client version policy rules with Lync Server Control Panel

1. Create or Modify a New Client Version Policy with Lync Server Control Panel.
2. On the **Edit Client Version Policy** page, do one of the following:
   - Click **New** to create a new client version rule.
   - Click one of the defined client types in the list, and then click **Show details**.

   Note:

   You can use wildcards to indicate the client type.
3. In **User agent**, select a client type.
4. Under **Version number**, do the following:
   - In **Major version**, type the number that corresponds to the major release of the client.
   - In **Minor version**, type the number that corresponds to the minor release of the client.
   - In **Build**, type the number that corresponds to the major and minor release

of the client.

- In **Update**, type the number that corresponds to the updated release of the client.

> **Note:**
> You can use wildcards to indicate the client version number.

5. To specify the matching operation for the client version you specified in the preceding steps, in **Comparison operation**, click one of the following:
   - **Same as**
   - **Is not**
   - **Newer than**
   - **Newer than or same as**
   - **Older than**
   - **Older than or same as**
6. To specify the action to perform when the criteria in the preceding steps are met, click one of the following in **Action**:
   - To allow the client to log on, click **Allow**.
   - To allow the client to log on and receive updates from Windows Server Update Service or Microsoft Update, click **Allow and Upgrade**. This action is available only when user agent **OC** is selected.

     > **Note:**
     > Selecting this action causes a notification to appear the next time users sign in to Lync 2013. The notification states that an update is available, even if updates have not yet been released to Windows Server Update Service or Microsoft Update. To avoid confusion, you should choose this action only after updates become available.

   - To allow the client to log on and display a message about where to download another client version, click **Allow with URL**. You specify the URL later in this procedure.
   - To prevent the client from logging on, click **Block**.
   - To prevent the client from logging on and allow the client to receive updates from Windows Server Update Service or Microsoft Update, click **Block and Upgrade**. This action is available only when user agent **OC** is selected.
   - To prevent the client from logging on and display a message about where to download another client version, click **Block with URL**. You specify the URL later in this procedure.
7. (Optional) If you clicked **Allow with URL** or **Block with URL** in the previous step, type the client download URL to include in the message in **URL**.
8. Click **OK**, and then click **Commit**.

1.7.10.7.3.3 Delete an Existing Client Version Policy Rule

Delete an Existing Client Version Policy Rule

Managing Devices, Phones, and Client Applications > Specifying the Client Applications That Can Be Used to Log On to Lync Server 2013 > Client Version Rules >

***Topic Last Modified:** 2013-01-21*

A client version policy is made up of a set of client version policy rules. These rules define the actions that should be taken when users attempt to log on with specific clients and client versions. You can delete individual rules from a client version policy from Lync Server 2013 Control Panel.

⊟To delete client version policy rules with Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Clients**, and then click the **Client Version Policy** navigation button.
4. On the **Client Version Policy** page, double-click the client version policy for the rule you want to delete.
5. The rules appear on the **Edit Client Version Policy** page. To delete a rule, select the rule, and then click **Remove**.

1.7.11 Managing Federation and External Access to Lync Server 2013

Managing Federation and External Access to Lync Server 2013

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2013-01-11*

Deploying an Edge Server or Edge pool is the first step to supporting external users. For details about deploying Edge Servers, see Deploying External User Access in the Deployment documentation.

After installing and configuring your internal deployment of Lync Server 2013, internal users in your organization can collaborate with other internal users who have SIP accounts in your Active Directory Domain Services (AD DS). Collaboration can include sending and receiving instant messages, and update of presence status and participating in conferences (also known as "meetings"). You enable and configure external user access to control whether supported external users can collaborate with internal Lync Server users. External users can include remote users of your deployment, federated users (including supported users of public instant messaging (IM) service providers), XMPP federation and anonymous participants in conferences.

If your deployment included the installation of a Lync Server 2013 Edge Server or an Edge pool, the scope of possible communication types is greatly expanded with a number of options for external user access, communication with members of other SIP federated domains, SIP federated providers, and XMPP federated users. After setting up the Edge Server or Edge pool, you enable the types of external user access that you want to provide, and configure the policies to control for the external access. In Lync Server 2013, you enable and configure external user access and policies using the Lync Server Control Panel, the Lync Server Management Shell or both, based on the task requirements. For details about these management tools, see Lync Server Administrative Tools in the Operations documentation, Lync Server Management Shell in the Operations documentation, and Install Lync Server Administrative Tools in the Operations documentation.

Important:

When you design your configuration and policies for external user access, you must understand the precedence of policies and how the policies are applied. Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object.

By default, no policies are configured to support external user access, including remote user access, federated user access, even if you have already enabled external user access support for your organization. To control the use of external user access, you must configure one or more policies, specifying the type of external user access supported for each policy. This includes the following external access policies:

- **Global policy** The global policy is created when you deploy your Edge Servers. By default, no external user access options are enabled in the global policy. To support external user access at the global level, you configure the global policy to support one or more types of external user access options. The global policy applies to all users in your organization, but site policies and user policies override the global policy. If you delete the global policy, you do not remove it. Instead, you reset it to the default setting.
- **Site policy** You can create and configure one or more site policies to limit support for external user access to specific sites. The configuration in the site policy overrides the global policy, but only for the specific site covered by the site policy. For example, if you enable remote user access in the global policy, you might specify a site policy that disables remote user access for a specific site. By default, a site policy is applied to all users of that site, but you can assign a user policy to a user to override the site policy setting.
- **User policy** You can create and configure one or more user policies to limit support for remote user access to specific users. The configuration in the user policy overrides the global and site policy, but only for the specific users to whom the user policy is assigned. For example, if you enable remote user access in the global policy and site policy, you might specify a user policy that disables remote user access and then assign that user policy to specific users. If you create a user policy, you must apply it to one or more users before it takes effect.

To determine which configuration settings and which policies you need to create or edit, refer to the following decision points:

Do you want to allow internal and external users of your domain to be able to collaborate using instant messaging, Web conferencing, and Audio/Video?

Configure the settings as detailed in the topics Configure Policies to Control Remote User Access, and Enable or Disable Federation and Public IM Connectivity

Do you want to allow anonymous users to attend and be invited to conferences hosted by users in your deployment?

Configure the settings as detailed in the topic Assign Conferencing Policies to Support Anonymous Users, Create or Modify a Conferencing Policy and Conferencing Policy Settings Reference

Do you want to allow users to communicate with SIP Federated Domain contacts?

Configure the settings as detailed in the topics Configure Policies to Control Federated User Access, Enable or Disable Federation and Public IM Connectivity, and Manage SIP Federated Domains for Your Organization

If you have enabled communication with SIP Federation Domains, do you want to enable communications with XMPP Federated Partner contacts?

Configure the settings as detailed in the topic Configure Policies to Control XMPP Federated User Access and Manage XMPP Federated Partners for Your Organization.

If you have enabled communication with SIP Federated Domains, do you want to enable SIP Federation automatic discovery?

Configure the settings as detailed in the topic Enable or Disable Discovery of Federation

Partners.

If you have enabled communication with SIP Federation Domains, do you want to enable sending a disclaimer to Federated contacts notifying them that you use archiving and that communications may be archived?

Configure the settings as detailed in the topic Enable or Disable Sending an Archiving Disclaimer to Federated Partners.

Do you want to allow users to communicate with SIP Federated Providers that enable communication with public providers, such as Windows Live Messenger, AOL, and Yahoo!?

Configure the settings as detailed in the topics Configure Policies to Control Public User Access Enable or Disable Federation and Public IM Connectivity, and Create or Edit Public SIP Federated Providers.

◆Important:

- As of September 1st, 2012, the Microsoft Lync Public IM Connectivity User Subscription License ("PIC USL") is no longer available for purchase for new or renewing agreements. Customers with active licenses will be able to continue to federate with Yahoo! Messenger until the service shut down date (exact date TBD, but no sooner than June 2013).
- The PIC USL is a per-user per-month subscription license that is required for Lync Server or Office Communications Server to federate with Yahoo! Messenger. Microsoft's ability to provide this service has been contingent upon support from Yahoo!, the underlying agreement for which is winding down.
- More than ever, Lync is a powerful tool for connecting across organizations and with individuals around the world. Federation with Windows Live Messenger requires no additional user/device licenses beyond the Lync Standard CAL. Skype federation will be added to this list, enabling Lync users to reach hundreds of millions of people with IM and voice.

Do you want to allow users to communicate with SIP Federated Providers that are hosted providers running Microsoft Office 365, Microsoft Lync Online and Microsoft Lync Online 2010?

Configure the settings as detailed in the topics Create or Edit Public SIP Federated Providers, Enable or Disable Federation and Public IM Connectivity and Create or Edit Hosted SIP Federated Providers

Is your deployment configured in a split (also known as a hybrid) domain, where some users have their home server in an on-premise deployment, and other users are configured with a home server in an online environment?

Configure the settings as detailed in the topics Configure Policies to Control Federated User Access, Enable or Disable Federation and Public IM Connectivity and Create or Edit Hosted SIP Federated Providers

If you prefer a table that lists the requirements:

Tab in Federation and External Access (Across) Federation or External Access Type	External Access Policy	Access Edge Config	SIP Federated Domains	SIP Federated Providers	XMPP Federated Partner

(Down)					
Remote Users	Configure Policies to Control Remote User Access	Enable or Disable Remote User Access			
SIP Federated Contacts	Configure Policies to Control Federated User Access	Enable or Disable Federation and Public IM Connectivity Enable or Disable Discovery of Federation Partners Enable or Disable Sending an Archiving Disclaimer to Federated Partners	Manage SIP Federated Domains for Your Organization		
XMPP Federated Contacts	Configure Policies to Control Federated User Access Configure Policies to Control XMPP Federated User Access	Enable or Disable Federation and Public IM Connectivity			Manage XMPP Federated Partners for Your Organization
Split Domain / Hybrid Users	Configure Policies to Control Federated User Access	Enable or Disable Federation and Public IM Connectivity		Create or Edit Hosted SIP Federated Providers	
Public IM Service Contacts	Configure Policies to Control Public User Access	Enable or Disable Federation and Public IM Connectivity		Create or Edit Public SIP Federated Providers	
Anonymous user access to meetings and conferences		Assign Conferencing Policies to Support Anonymous Users **Note:** You must also consider the			

		following configuration settings under Conferencing policies: Create or Modify a Conferencing Policy and Conferencing Policy Settings Reference			

You can configure external user access settings, including any policies that you want to use to control external user access, even if you have not enabled external user access for your organization. However, the policies and other settings that you configure are in effect only when you have external user access enabled for your organization. External users cannot communicate with users of your organization when external user access is disabled or if no external user access policies are configured to support it.

Your edge deployment authenticates the types of external users (except for anonymous users, who are authenticated by the conference ID and a passkey that is sent to the anonymous participant when you create the conference and invite participants) and controls access based on how you configure your edge support. In order to control communications, you can configure one or more policies and configure settings that define how users inside and outside your deployment communicate with each other. The policies and settings include the default global policy for external user access, in addition to site and user policies that you can create and configure to enable one or more types of external user access for specific sites or users.

1.7.11.1 Manage External Access Policy for Your Organization

Manage External Access Policy for Your Organization

Operations > Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 >

Topic Last Modified: *2013-02-22*

After deploying one or more Edge Servers, you must enable the types of external access that will be supported for your organization.

By default, there are no policies configured to support external user access, including remote user access, federated user access, even if you have already enabled external user access support for your organization. To control the use of external user access, you must configure one or more policies, specifying the type of external user access supported for each policy. The following policy scopes are available for creation and configuration. By default, the Global policy is created, but cannot be deleted.

- **Global policy** The global policy is created when you deploy your Edge Servers. By default, no external user access options are enabled in the global policy. To support external user access at the global level, you configure the global policy to support one or more types of external user access options. The global policy applies to all users in your organization, but site policies and user policies override the global policy. If you delete the global policy, you do not remove it. Instead, you reset it to the default setting.

- **Site policy** You can create and configure one or more site policies to limit support for external user access to specific sites. The configuration in the site policy overrides the global policy, but only for the specific site covered by the site policy. For example, if you enable remote user access in the global policy, you might specify a site policy that disables remote user access for a specific site. By default, a site policy is applied to all users of that site, but you can assign a user policy to a user to override the site policy setting.
- **User policy** You can create and configure one or more user policies to limit support for remote user access to specific users. The configuration in the user policy overrides the global and site policy, but only for the specific users to whom the user policy is assigned. For example, if you enable remote user access in the global policy and site policy, you might specify a user policy that disables remote user access and then assign that user policy to specific users. If you create a user policy, you must apply it to one or more users before it takes effect.

> **Important:**
>
> Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object.

These options include the following types of external access:

- **Enable communications with federated users** Enable this if you want to support user access to federated partner domains. This setting configures the ability for users to communicate with other SIP federated domains, as well as Hosted providers like Microsoft Office 365. Selecting this setting allows you to select the option to allow communication with XMPP federated domains.
  As an option, you can select **Enable communications with XMPP federated partners** if you first select **Enable communications with federated users**. XMPP federation is a federation with organizations that use extensible messaging and presence protocol (XMPP).

  > **Note:**
  >
  > If you enable XMPP federation, you must also select to deploy **XMPP federation** in the Edge pools configuration section of Topology Builder. Configuring for XMPP federation deploys an XMPP Proxy on the Edge Server and an XMPP gateway on the Front End Server.

- **Enable communications with remote users** Enable this option if you want users in your organization who are outside your firewall, such as telecommuters and users who are traveling, to be able to connect to Lync Server over the Internet.
- **Enable communications with public users** Enable this option if you want internal users to be able to communicate with public IM provider contacts, such as those provided by Windows Live, Yahoo!, and America Online (AOL).

  > **Important:**
  >
  > - As of September 1st, 2012, the Microsoft Lync Public IM Connectivity User Subscription License (“PIC USL”) is no longer available for purchase for new or renewing agreements. Customers with active licenses will be able to continue to federate with Yahoo! Messenger until the service shut down date (exact date TBD, but no sooner than June 2013).
  > - The PIC USL is a per-user per-month subscription license that is required for Lync Server or Office Communications Server to

> federate with Yahoo! Messenger. Microsoft’s ability to provide this service has been contingent upon support from Yahoo!, the underlying agreement for which is winding down.
>
> - More than ever, Lync is a powerful tool for connecting across organizations and with individuals around the world. Federation with Windows Live Messenger requires no additional user/device licenses beyond the Lync Standard CAL. Skype federation will be added to this list, enabling Lync users to reach hundreds of millions of people with IM and voice.

> **Note:**
>
> In addition to enabling external user access support, you must also configure policies to control the use of external user access in your organization before any type of external user access is available to users. For details about creating, configuring, and applying policies for external user access see Enable or Disable Remote User Access.

To view external access policies by using Windows PowerShell cmdlets

- You can view external access policies by using Lync Server Management Shell and the **Get-CsExternalAccessPolicy** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

  To view information about all your external access policies, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsExternalAccessPolicy
  ```

  This command returns information similar to the following:

  ```
  Identity                          : Global
  Description                       :
  EnableFederationAccess            : False
  EnableXmppAccess                  : False
  EnablePublicCloudAccess           : False
  EnablePublicCloudAudioVideoAccess : False
  EnableOutsideAccess               : False
  ```

- Configure Policies to Control Federated User Access
- Configure Policies to Control XMPP Federated User Access
- Configure Policies to Control Remote User Access

1.7.11.1.1 Configure Policies to Control Federated User Access

Configure Policies to Control Federated User Access

See Also

Deploying External User Access > Configuring SIP Federation, XMPP Federation and Public Instant Messaging > Setting Up Lync Federation >

Topic Last Modified: *2012-11-01*

When you configure policies to support communications with federated partners, the policies apply to users of federated domains. You can configure one or more external user access policies to control whether users of federated domains can collaborate with your Lync Server 2013 users. To control federated user access, you can configure policies at the global, site, and user level. Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object.

Note:

You can configure policies to control federated user access, even if you have not enabled federation for your organization. However, the policies that you configure are in effect only when you have federation enabled for your organization. For details about enabling federation, see Enable or Disable Remote User Access in the Deployment documentation or the Operations documentation. Additionally, if you specify a user policy to control federated user access, the policy applies only to users that are enabled for Lync Server 2013 and configured to use the policy. For details about specifying federated users that can sign in to Lync Server 2013, see Assign an External User Access Policy to a Lync Enabled User in the Deployment documentation or the Operations documentation.

⊟To configure a policy to support access by users of federated domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **External Access Policy**.
4. On the **External Access Policy** page, do one of the following:
   - To configure the global policy to support federated user access, click the global policy, click **Edit**, and then click **Show details**.
   - To create a new site policy, click **New**, and then click **Site policy**. In **Select a Site**, click the appropriate site from the list and then click **OK**.
   - To create a new user policy, click **New**, and then click **User policy**. In **New External Access Policy**, create a unique name in the **Name** field that indicates what the user policy covers (for example, **EnableFederatedUsers** for a user policy that enables communications for federated domain users).
   - To change an existing policy, click the appropriate policy listed in the table, click **Edit**, and then click **Show details**.
5. (Optional) If you want to add or edit a description, specify the information for the policy in **Description**.
6. Do one of the following:
   - To enable federated user access for the policy, select the **Enable communications with federated users** check box.
   - To disable federated user access for the policy, clear the **Enable communications with federated users** check box.
7. Click **Commit**.

To enable federated user access, you must also enable support for federation in your organization. For details, see Enable or Disable Federation and Public IM Connectivity.

If this is a user policy, you must also apply the policy to users that you want to be able to collaborate with federated users. For details, see Assign an External User Access Policy to a Lync Enabled User.

⊟To configure an existing policy using Windows PowerShell to support access by users of federated domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click

Microsoft Lync Server 2013, and then click **Lync Server Management Shell**.

3. Type the following in the Lync Server Management Shell:

```
Set-CsExternalAccessPolicy -Identity <name of global, site or user pol
```

An example command that will set the global policy for Federated user access to enabled, XMPP domain access to enabled, Remote user access to enabled, Public provider access to enabled, and grant the ability to use audio and video for public providers that support it:

```
Set-CsExternalAccessPolicy -Identity global -EnableFederationAccess $t
```

Tip:

The parameter "EnablePublicCloudAudioVideoAccess" does not have a corresponding selection in the Lync Server Control Panel

To create a new policy using Windows PowerShell to support access by users of federated domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Type the following in the Lync Server Management Shell:

```
New-CsExtenalAccessPolicy -Identity <name of site or user policy – you
```

An example of creating a new site policy:

```
New-CsExternalAccessPolicy -Identity site:Redmond -EnableFederationAcc
```

To delete or reset a policy using Windows PowerShell to support access by users of federated domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Type the following in the Lync Server Management Shell

```
Remove-CsExternalAccessPolicy -Identity <name of global, site or user
```

An example of resetting the global policy (The global policy can only have its setting removed. The policy cannot be deleted):

```
Remove-CsExternalAccessPolicy -Identity global
```

To remove a site policy, type:

```
Remove-CsExternalAccessPolicy -Identity site:Redmond
```

Deletes the site policy Redmond. To delete a user policy named UserEAPPolicy, type:

```
Remove-CsExternalAccessPolicy -Identity UserEAPPolicy
```

1.7.11.1.2 Configure Policies to Control XMPP Federated User Access

Configure Policies to Control XMPP Federated User Access

See Also

Deploying External User Access > Configuring SIP Federation, XMPP Federation and Public Instant Messaging > Setting Up XMPP Federation >

Topic Last Modified: *2012-11-01*

This is preliminary documentation and is subject to change. Blank topics are included as placeholders.

When you configure policies for support of extensible messaging and presence protocol (XMPP) federated partners, the policies apply to users of XMPP federated domains, but not to users of session initiation protocol (SIP) instant messaging (IM) service providers (for example, Windows Live), or SIP federated domains. You configure an **XMPP Federated Partner** for each XMPP federated domain that you want to allow your users to add contacts and communicate with. XMPP federated partners policies are only available in a single scope, though it is not defined as a global policy, acts as a global policy. To define a global, site or user policy for XMPP Federation Partners, you configure the policy scope by first creating and configuring the External Access Policy for the scope you require. For details about the types of policies that you can configure for external access and federation, see Managing Federation and External Access to Lync Server 2013 in the Operations documentation.

Note:

All **Federation and External Access** policies are applied through in-band provisioning. The policies that apply to the user, belong to a site, or are global in scope are communicated to the client during login. You can configure policies to control XMPP federated partner access, even if you have not enabled XMPP federation for your organization. However, the policies that you configure take effect only when you have XMPP partner federation deployed, enabled and configured for your organization. For details about deploying and configuring XMPP partner federation, see Configuring SIP Federation, XMPP Federation and Public Instant Messaging in the Deployment documentation. Additionally, if you specify a user policy in External Access Policy to control XMPP federated partners, the policy applies only to users that are enabled for Lync Server 2013 and configured to use the policy.

⊟To edit a global policy for XMPP federated partners

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **External Access Policy**.
4. On the **External Access Policy** page, do the following for the global policy:
5. Click the global policy, click **Edit**, and then click Show details.
6. Provide a description for the Global policy (optional).
7. Select **Enable communications with federated users**.
8. Select **Enable communications with XMPP federated users**.
9. Click **Commit** to save your changes to the Global policy.

⊟To create a site or user policy for XMPP federated partners

1. Click **New**, and then click **Site policy** or **User policy**. In **Select a Site**, click the appropriate site from the list and then click **OK**.
2. Provide a description for the Site policy (optional).
3. In the site or user policy, select **Enable communications with federated users**.
4. Select **Enable communications with XMPP federated users**.
5. Click **Commit** to save your changes to the site or user policy.

To edit an existing policy for XMPP federated partners

1. To change an existing policy, select the appropriate policy in the list, click **Edit**, and then click **Show details**.
2. Change or update the description for the policy (optional).
3. Select or unselect **Enable communications with federated users**.
4. Select or unselect **Enable communications with XMPP federated users**.
5. Click **Commit** to save your changes to the policy.

To edit an existing policy for XMPP federated partners by using Windows PowerShell

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Type the following in the Lync Server Management Shell:

   ```
   Set-CsExternalAccessPolicy -Identity <name of global, site or user pol
   ```

   An example command that will set the global policy for Federated user access to True (enabled) and XMPP domain access to True (enabled):

   ```
   Set-CsExternalAccessPolicy -Identity global -EnableFederationAccess $t
   ```

To create a site or user policy for XMPP federated partners using Windows PowerShell

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Type the following in the Lync Server Management Shell:

   ```
   New-CsExternalAccessPolicy -Identity <name of global, site or user pol
   ```

   An example command that will set a site policy for the Redmond site for Federated user access to enabled and XMPP domain access to enabled:

   ```
   New-CsExternalAccessPolicy -Identity site:Redmond -EnableFederationAcc
   ```

To delete an existing policy for XMPP federated partners by using Windows PowerShell

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Type the following in the Lync Server Management Shell:

   ```
   Remove-CsExternalAccessPolicy -Identity <name of global, site or user
   ```

An example command that will delete a user policy:

```
Remove-CsExternalAccessPolicy -Identity EAPUserPolicySetXMPP
```

4. An example command that will reset the global policy to defaults:

```
Remove-CsExternalAccessPolicy -Identity global
```

1.7.11.1.3 Configure Policies to Control Remote User Access

Configure Policies to Control Remote User Access

Deployment > Deploying External User Access > Configuring Support for External User Access >

Topic Last Modified: *2012-10-18*

You configure one or more external user access policies to control whether remote users can collaborate with internal Lync Server users. To control remote user access, you can configure policies at the global, site, and user level. Site policies override the global policy, and user policies override site and global policies. For details about the types of policies that you can configure, see Managing Federation and External Access to Lync Server 2013. Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object.

Note:
You can configure policies to control remote user access, even if you have not enabled remote user access for your organization. However, the policies that you configure are in effect only when you have remote user access enabled for your organization. For details about enabling remote user access, see Enable or Disable Federation and Public IM Connectivity. Additionally, if you specify a user policy to control remote user access, the policy applies only to users that are enabled for Lync Server and configured to use the policy. For details about specifying users that can sign in to Lync Server from remote locations, see Assign an External User Access Policy to a Lync Enabled User.

Use the following procedure to configure each external access policy that you want to use to control remote user access.

Note:
This procedure describes how to configure a policy only to enable communications with remote users, but each policy that you configure to support remote user access can also configure federated user access and public user access. For details about configuring policies to support federated users, see Configure Policies to Control Federated User Access. For details about configuring policies to support public users, see Create or Edit Public SIP Federated Providers.

⊟To configure an external access policy to support remote user access

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **External Access Policy**.
4. On the **External Access Policy** page, do one of the following:
   - To configure the global policy to support remote user access, click the global policy, click **Edit**, and then click **Show details**.
   - To create a new site policy, click **New**, and then click **Site policy**. In **Select a Site**, click the appropriate site from the list and then click **OK**.
   - To create a new user policy, click **New**, and then click **User policy**. In **New External Access Policy**, create a unique name in the **Name** field that indicates what the user policy covers (for example, **EnableRemoteUsers** for a user policy that enables communications for remote users).
   - To change an existing policy, click the appropriate policy listed in the table, click **Edit**, and then click **Show details**.
5. (Optional) If you want to add or edit a description, specify the information for the policy in **Description**.
6. Do one of the following:
   - To enable remote user access for the policy, select the **Enable communications with remote users** check box.
   - To disable remote user access for the policy, clear the **Enable communications with remote users** check box.
7. Click **Commit**.

To enable remote user access, you must also enable support for remote user access in your organization. For details, see Enable or Disable Federation and Public IM Connectivity in the Deployment documentation or the Operations documentation.

If this is a user policy, you must also apply the policy to users that you want to be able to connect remotely. For details, see Assign an External User Access Policy to a Lync Enabled User in the Deployment documentation or the Operations documentation.

1.7.11.1.4 Configure Policies to Control Public User Access

Configure Policies to Control Public User Access

See Also

Deploying External User Access > Configuring SIP Federation, XMPP Federation and Public Instant Messaging > Setting Up Public Instant Messaging Connectivity >

Topic Last Modified: *2013-01-11*

Public instant messaging (IM) connectivity enables users in your organization to use IM to communicate with users of IM services provided by public IM service providers, including the Windows Live network of Internet services, Yahoo!, and AOL. You configure one or more external user access policies to control whether public users can collaborate with internal Lync Server users. Public instant messaging connectivity is an added feature that relies on configuration of your deployment and users. It also depends on the provisioning of the service at the public IM provider. For information on how to provision your deployment to use the public providers, see the “Public IM Connectivity Provisioning Guide for Microsoft Lync Server, Office Communications Server, and Live Communications Server” guide: http://go.microsoft.com/fwlink/?LinkId=269821

Important:

- As of September 1st, 2012, the Microsoft Lync Public IM Connectivity User Subscription License ("PIC USL") is no longer available for purchase for new or renewing agreements. Customers with active licenses will be able to continue to federate with Yahoo! Messenger until the service shut down date (exact date TBD, but no sooner than June 2013).
- The PIC USL is a per-user per-month subscription license that is required for Lync Server or Office Communications Server to federate with Yahoo! Messenger. Microsoft's ability to provide this service has been contingent upon support from Yahoo!, the underlying agreement for which is winding down.
- More than ever, Lync is a powerful tool for connecting across organizations and with individuals around the world. Federation with Windows Live Messenger requires no additional user/device licenses beyond the Lync Standard CAL. Skype federation will be added to this list, enabling Lync users to reach hundreds of millions of people with IM and voice.

To access the Microsoft Lync Server Public IM Connectivity Provisioning site, use the following link: http://go.microsoft.com/fwlink/p/?linkId=212638

To control public user access, you can configure policies at the global, site, and user level. For details about the types of policies that you can configure, see Configuring Support for External User Access in the Deployment documentation or the Planning documentation. Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object.

In the case of IM invitations, the response depends on the client software. The request is accepted unless external senders are explicitly blocked by a user-configured rule (that is, the settings in the user's client **Allow** and **Block** lists). Additionally, IM invitations can be blocked if a user elects to block all IM from users who are not on his or her **Allow** list.

Note:

You can configure policies to control public user access, even if you have not enabled federation for your organization. However, the policies that you configure are in effect only when you have federation enabled for your organization. For details about enabling federation, see Enable or Disable Remote User Access in the Deployment documentation or the Operations documentation. Additionally, if you specify a user policy to control public user access, the policy applies only to users that are enabled for Lync Server and configured to use the policy. For details about specifying public users that can sign in to Lync Server, see Assign an External User Access Policy to a Lync Enabled User in the Deployment documentation or the Operations documentation.

Use the following procedure to configure a policy to support access by users of one or more public IM providers.

To configure an external access policy to support public user access

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **External Access Policy**.
4. On the **External Access Policy** page, do one of the following:
   - To configure the global policy to support public user access, click the global policy, click **Edit**, and then click **Show details**.

- To create a new site policy, click **New**, and then click **Site policy**. In **Select a Site**, click the appropriate site from the list and then click **OK**.
- To create a new user policy, click **New**, and then click **User policy**. In **New External Access Policy**, create a unique name in the **Name** field that indicates what the user policy covers (for example, **EnablePublicUsers** for a user policy that enables communications for public users).
- To change an existing policy, click the appropriate policy listed in the table, click **Edit**, and then click **Show details**.

5. (Optional) If you want to add or edit a description, specify the information for the policy in **Description**.
6. Do one of the following:
   - To enable public user access for the policy, select the **Enable communications with public users** check box.
   - To disable public user access for the policy, clear the **Enable communications with public users** check box.
7. Click **Commit**.

To enable public user access, you must also enable support for federation in your organization. For details, see Configure Policies to Control Federated User Access.

If this is a user policy, you must also apply the policy to public users that you want to be able to collaborate with public users. For details, see Assigning Per-User Policies.

Tasks

Create or Edit Public SIP Federated Providers

Other Resources

Manage SIP Federated Providers for Your Organization

1.7.11.1.5 Assign an External User Access Policy to a Lync Enabled User

Assign an External User Access Policy to a Lync Enabled User

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Manage External Access Policy for Your Organization >

Topic Last Modified: *2013-02-22*

If a user has been enabled for Lync Server, you can configure SIP federation, XMPP federation, remote user access, and public instant messaging (IM) connectivity in the Lync Server Control Panel by applying the appropriate policies to specific users. For example, if you created a policy to support remote user access, you must apply it to the user before the user can connect to Lync Server from a remote location and collaborate with internal users from the remote location.

Note:
To support external user access, you must enable support for each type of external user access you want to support, and configure the appropriate policies and other options to control its use. For details, see Configuring Support for External User Access in the Deployment documentation or Managing Federation and External Access to Lync Server 2013 in the Operations documentation.

Use the procedure in this topic to apply a previously created external user access policy to one or more user accounts.

⊟To apply an external user policy to a user account

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync

Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.

3. In the left navigation bar, click **Users**, and then search on the user account that you want to configure.
4. In the table that lists the search results, click the user account, click **Edit**, and then click **Show details**.
5. In **Edit Lync Server User** under **External access policy**, select the user policy that you want to apply.

Note:
The **<Automatic>** settings apply the default server or global policy settings.

Assigning Per-User External Access Policies by Using Windows PowerShell Cmdlets

Per-user external access policies can be assigned by using Windows PowerShell and the Grant-CsExternalAccessPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To assign a per-user external access policy to a single user

- This command assigns the per-user external access policy RedmondExternalAccessPolicy to the user Ken Myer.

```
Grant-CsExternalAccessPolicy -Identity "Ken Myer" -PolicyName "RedmondE
```

⊟To assign a per-user external access policy to multiple users

- This command assigns the per-user external access policy USAExternalAccessPolicy to all the users who have accounts in the UnitedStates OU in Active Directory. For more information on the OU parameter used in this command, see the documentation for the Get-CsUser cmdlet.

```
Get-CsUser -OU "ou=UnitedStates,dc=litwareinc,dc=com" | Grant-CsExterna
```

⊟To unassign a per-user external access policy

- This command unassigns any per-user external access policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsExternalAccessPolicy -Identity "Ken Myer" -PolicyName $Null
```

For more information, see the help topic for the Grant-CsExternalAccessPolicy cmdlet.

1.7.11.1.6 Resetting or Deleting External User Access Policies

Resetting or Deleting External User Access Policies

Managing Users in Lync Server 2013 > User Accounts Enabled for Lync Server 2013 > Manage External Access Policy for Your Organization >

Topic Last Modified: *2012-09-08*

If you have created or configured external user access policies that you no longer want to use, you can do the following:

- Delete any site or user policy that you created.
- Reset the global policy to the default settings. The default global policy settings deny any external user access. The global policy cannot be deleted.
- Delete a Site or User Policy for External User Access
- Reset the Global Policy for External User Access

1.7.11.1.6.1 Delete a Site or User Policy for External User Access

Delete a Site or User Policy for External User Access

User Accounts Enabled for Lync Server 2013 > Manage External Access Policy for Your Organization > Resetting or Deleting External User Access Policies >

Topic Last Modified: *2013-02-22*

You can delete any site or user policy that is listed in Lync Server Control Panel on the **External Access Policy** page. Deleting the global policy does not actually delete it, but only resets it to the default settings, which do not include support for any external user access options. For details about resetting the global policy, see Reset the Global Policy for External User Access.

To delete a site or user policy for external user access

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. Click **External User Access**, click **External Access Policy**.
4. On the **External Access Policy** tab, click the site or user policy you want to delete, click **Edit**, and then click **Delete**.
5. When prompted to confirm the deletion, click **OK**.

Removing PIN Policies by Using Windows PowerShell Cmdlets

External access policies can be deleted by using Windows PowerShell and the Remove-CsExternalAccessPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specific external access policy

- This command removes the external access policy applied to the Redmond site:

```
Remove-CsExternalAccessPolicy -Identity "site:Redmond"
```

To remove all the external access policies applied to the per-user scope

- This command removes all the external access policies configured at the per-user scope:

```
Get-CsExternalAccessPolicy -Filter "tag:*" | Remove-CsExternalAccessPol
```

To remove all the external access policies where outside user access is disabled

- This command deletes all the external access policies where outside user access has been disabled:

```
Get-CsExternalAccessPolicy | Where-Object {$_.EnableOutsideAccess -eq $
```

For more information, see the help topic for the Remove-CsExternalAccessPolicy cmdlet.

1.7.11.1.6.2 Reset the Global Policy for External User Access

Reset the Global Policy for External User Access

User Accounts Enabled for Lync Server 2013 > Manage External Access Policy for Your Organization > Resetting or Deleting External User Access Policies >

Topic Last Modified: *2013-02-22*

You cannot completely delete a global policy. Using the **Delete** option on the global policy only resets the global policy to the default settings, which do not include support for any external user access options.

To reset the global policy to the default settings

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, click **External Access Policy**.
4. On the **External Access Policy** tab, click the global policy, click **Edit**, and then click **Delete**.
5. When prompted to confirm the deletion, click **OK**. A message appears at the top of the page informing you that the global policy has been reset.

Resetting the Global External Access Policy by Using Windows PowerShell Cmdlets

The global external access policy can be reset by using Windows PowerShell and the Remove-CsExternalAccessPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To reset the global external access policy

- This command resets the global external access policy:

```
Remove-CsExternalAccessPolicy -Identity "global"
```

For more information, see the help topic for the Remove-CsExternalAccessPolicy cmdlet.

1.7.11.2 Manage Access Edge Configuration for Your Organization

Manage Access Edge Configuration for Your Organization

Microsoft Lync Server 2013 > Operations > Managing Federation and External Access to Lync Server 2013 >

Topic Last Modified: *2012-11-01*

This is preliminary documentation and is subject to change. Blank topics are included as placeholders.

After deploying one or more Edge Servers, you must enable the types of external domain or provider access, remote user access, and anonymous user access to conferences through the Edge Servers that will be supported for your organization.

These options include the following types of access that can be configured through the **Access Edge Configuration** page:

- **Enable federation and public IM connectivity** Enable this if you want to support user access to federated partner domains. This setting applies to both SIP federation and XMPP federation that are configured for global, site or user scopes on the **External Access Policy** page. For federation settings to apply, you must configure federation support on both pages.
  Two options exist that are optional settings for how federated partners are discovered, and whether archiving disclaimers (notification to federated contacts that you communicate with that your deployment has archiving enabled and that the communications details will be archived) will be sent to contacts
  - **Enable partner domain discovery** Selecting this option enables the automatic discovery of domains that you can federate with. Lync Server 2013 uses Domain Name System (DNS) records to try to discover domains not listed in the allowed domains list, automatically evaluating incoming traffic from discovered federated partners and limiting or blocking that traffic based on trust level, amount of traffic, and administrator settings. If you do not select this option, federated user access is enabled only for users in the domains that you include on the allowed domains list. Whether or not you select this option, you can specify that individual domains to be blocked or allowed, including restricting access to specific servers running the Access Edge service in the federated domain. For details, see Configure Support for Allowed External Domains.
  - **Send archiving disclaimer to federated partners** Selecting this option enables the sending of an archiving disclaimer message to federated partners that advises them that communications details are recorded. If you archive external communications with federated partner domains, you should enable the archiving disclaimer notification to warn partners that their messages and communications details are being archived by your deployment. For details on archiving, see Defining Your Organization's Requirements for Archiving.
- **Enable remote user access** Enable this option if you want users in your organization who are outside your firewall, such as telecommuters and users who are traveling, to be able to connect to Lync Server. For details, see Enable or Disable Remote User Access.
- **Enable anonymous users to access conferences** Enable this option if you want internal users to invite external anonymous users to conferences that

they organize. Enabling this setting only allows anonymous users for conferences. To configure the conferencing experience and options that will define how and what your users can do with conferences and for the inclusion of anonymous users, see details at **Create or Modify Conferencing User Experience for a Site or Users** and Conferencing Policy Settings Reference.

Note:

In addition to enabling external user access support, you also configure policies to control the use of remote user access in your organization before any type of external user access is available to users. For details about creating, configuring, and applying policies for external user access, see Manage External Access Policy for Your Organization.

Viewing Access Edge configuration information by using Windows PowerShell cmdlets

- Access Edge configuration information can be viewed by using Windows PowerShell and the **Get-CsAccessEdgeConfiguration** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

  To view information about all your Access Edge configuration settings, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsAccessEdgeConfiguration
  ```

  That will return information similar to this:

  ```
  Identity                                : Global
  AllowAnonymousUsers                     : False
  AllowFederatedUsers                     : False
  AllowOutsideUsers                       : True
  BeClearingHouse                         : False
  EnablePartnerDiscovery                  : False
  EnableArchivingDisclaimer               : False
  EnableUserReplicator                    : True
  KeepCrlsUpToDateForPeers                : True
  MarkSourceVerifiableOnOutgoingMessages : True
  OutgoingTlsCountForFederatedPartners    : 4
  DiscoveredPartnerStandardRate           : 20
  EnableDiscoveredPartnerContactsLimit    : True
  MaxContactsPerDiscoveredPartner         : 1000
  DiscoveredPartnerReportPeriodMinutes    : 60
  MaxAcceptedCertificatesStored           : 1000
  MaxRejectedCertificatesStored           : 500
  CertificatesDeletedPercentage           : 20
  RoutingMethod                           : UseDnsSrvRouting
  ```

- Enable or Disable Federation and Public IM Connectivity
- Enable or Disable Discovery of Federation Partners
- Enable or Disable Sending an Archiving Disclaimer to Federated Partners
- Enable or Disable Remote User Access
- Enable or Disable Anonymous User Access
- Assign Conferencing Policies to Support Anonymous Users

1.7.11.2.1 Enable or Disable Federation and Public IM Connectivity

Enable or Disable Federation and Public IM Connectivity

Operations > Managing Federation and External Access to Lync Server 2013 > Manage Access Edge Configuration for Your Organization >

Topic Last Modified: *2013-02-23*

Support for federation is required to enable users who have an account with a trusted customer or partner organization, including partner domains and users of public instant messaging (IM) provider users that you support, to collaborate with users in your organization. Federation is also required to use a hosted Exchange service provider to provide voice mail to Enterprise Voice users whose mailboxes are located on a hosted Exchange service such as Microsoft Exchange Online. When you have established a trust relationship with these external domains, you can authorize users in those domains to access your deployment and participate in Lync Server communications. This trust relationship is called a federation and it is not related to, or dependent upon, an Active Directory trust relationship.

To support access by users of federated domains, you must enable federation. If you enable federation for your organization, you must also specify whether to implement the following options:

- **Enable partner domain discovery** If you enable this option, Lync Server uses Domain Name System (DNS) records to try to discover domains not listed in the allowed domains list, automatically evaluating incoming traffic from discovered federated partners and limiting or blocking that traffic based on trust level, amount of traffic, and administrator settings. If you do not select this option, federated user access is enabled only for users in the domains that you include on the allowed domains list. Whether or not you select this option, you can specify that individual domains to be blocked or allowed, including restricting access to specific servers running the Access Edge service in the federated domain. For details about controlling access by federated domains, see Configure Support for Allowed External Domains.
- **Send an archiving disclaimer to federated partners** Disclaimer notice is sent to federated partners that archiving in your deployment is in place. If you support archiving of external communications with federated partner domains, you should enable the archiving disclaimer notification to warn partners that their messages are being archived.

If you later want to temporarily or permanently prevent access by users of federated domains, you can disable federation for your organization. Use the procedure in this section to enable or disable federated user access for your organization, including specifying the appropriate federation options to be supported for your organization.

Note:

Enabling federation for your organization only specifies that your servers running the Access Edge service support routing to federated domains. Users in federated domains cannot participate in IM or conferences in your organization until you also configure at least one policy to support federated user access. Users of public IM service providers cannot participate in IM or conferences in your organization until you also configure at least one policy to support public IM connectivity. Lync Server cannot use a hosted Exchange service to provide call answering, Outlook Voice Access (including voice mail), or auto-attendant services for users whose mailboxes are located on a hosted Exchange service until you configure a hosted voice mail policy that provides routing information. For details about configuring policies for communication with users of federated domains in other organizations, see Manage SIP Federated Domains for Your Organization in the Operations documentation. Additionally, if you want to support communication with users of IM service providers, you must configure policies to support it and also configure support for the individual service providers that you want to support. For details, see Manage SIP Federated Providers for Your Organization in the Operations documentation. For details about creating a hosted voice mail policy, see Manage Hosted Voice Mail Policies in the Deployment documentation.

⊟To enable or disable federated user access for your organization

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.

2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **Access Edge Configuration**.
4. On the **Access Edge Configuration** page, click **Global**, click **Edit**, and then click **Show details**.
5. In **Edit Access Edge Configuration**, do one of the following:
   - To enable federated user access for your organization, select the **Enable communications with federated users** check box.
   - To disable federated user access for your organization, clear the **Enable communications with federated users** check box.
6. If you selected the **Enable communications with federated users** check box, do the following:
   - If you want to support automatic discovery of partner domains, select the **Enable partner domain discovery** check box.
   - If your organization supports archiving of external communications, select the **Send archiving disclaimer to federated partners** check box.
7. Click **Commit**.

To enable federated users to collaborate with users in your Lync Server 2013 deployment, you must also configure at least one external access policy to support federated user access. For details, see Configure Policies to Control Federated User Access in the Deployment documentation or the Operations documentation. To control access for specific federated domains, see Configure Support for Allowed External Domains in the Deployment documentation or Operations documentation.

Enabling or Disabling Federation and Public IM Connectivity by Using Windows PowerShell Cmdlets

Federation and public IM connectivity can also be managed by using Windows PowerShell and the Set-CsAccessEdgeConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable federation and public IM connectivity

- To enable federation and public IM connectivity, set the value of the **AllowFederatedUsers** property to True ($True):

  ```
  Set-CsAccessEdgeConfiguration -AllowFederatedUsers $True
  ```

To disable federation and public IM connectivity

- To disable federation and public IM connectivity, set the value of the **AllowFederatedUsers** property to False ($False):

  ```
  Set-CsAccessEdgeConfiguration -AllowFederatedUsers $True
  ```

1.7.11.2.2 Enable or Disable Discovery of Federation Partners

Enable or Disable Discovery of Federation Partners

Operations > Managing Federation and External Access to Lync Server 2013 > Manage Access

Edge Configuration for Your Organization >

Topic Last Modified: *2013-02-23*

At the time you deployed your Edge Servers and enabled federation for your organization, you should have specified whether to support automatic discovery of federated partner domains. Use the procedure in this topic to change that configuration.

> **Note:**
>
> The following procedure assumes that you have already enabled federation for your organization. For details about enabling federation, see Enable or Disable Remote User Access in the Deployment documentation or the Operations documentation.

To enable or disable automatic discovery of federated domains for your organization

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, click **Access Edge Configuration**.
4. On the **Access Edge Configuration** page, click **Global**, click **Edit**, and then click **Show details**.
5. In **Edit Access Edge Configuration**, under **Enable communications with federated users**, select or clear the **Enable partner domain discovery** check box to enable or disable automatic discovery of partner domains.
6. Click **Commit**.

To enable federated users to collaborate with users in your Lync Server deployment, you must have also configured at least one external access policy to support federated user access. For details, see Enable or Disable Federation and Public IM Connectivity in the Deployment documentation or the Operations documentation. For details about controlling access for specific federated domains, see Manage SIP Federated Domains for Your Organization, Manage SIP Federated Providers for Your Organization and Manage XMPP Federated Partners for Your Organization in the Operations documentation.

Enabling or Disabling Discovery of Federation Partners by Using Windows PowerShell Cmdlets

Discovery of federation partners can be managed by using Windows PowerShell and the Set-CsAccessEdgeConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable discovery of federation partners

- To enable discovery of federation partners, set the value of the **EnablePartnerDiscovery** property to True ($True). Note that you must enable DNS SRV routing in order to change this property value.

  ```
  Set-CsAccessEdgeConfiguration -UseDnsSrvRouting -EnablePartnerDiscovery
  ```

To disable discovery of federation partners

- To disable discovery of federation partners, set the value of the **EnablePartnerDiscovery** property to False ($False):

```
Set-CsAccessEdgeConfiguration -UseDnsSrvRouting -EnablePartnerDiscovery
```

1.7.11.2.3 Enable or Disable Sending an Archiving Disclaimer to Federated Partners

Enable or Disable Sending an Archiving Disclaimer to Federated Partners

Deployment > Deploying Archiving > Configuring Support for Archiving >

Topic Last Modified: *2013-02-23*

At the time you deployed your Edge Servers and enabled federation for your organization, you should have specified whether to automatically send the archiving disclaimer to federated partners. If you archive external communications, you should enable the sending of an archiving disclaimer. Use the procedure in this topic to change that configuration.

Note:

The following procedure assumes that you have already enabled federation for your organization. For details about enabling federation, see Enable or Disable Remote User Access in the Deployment documentation or the Operations documentation.

To enable or disable sending of an archiving disclaimer to federated partners

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, click **Access Edge Configuration**.
4. On the **Access Edge Configuration** tab, click **Global**, click **Edit**, and then click **Show details**.
5. In **Edit Access Edge Configuration**, under **Enable communications with federated users**, select or clear the **Send archiving disclaimer to federated partners** check box to enable or disable automatically sending the archiving disclaimer.
6. Click **Commit**.

To enable federated users to collaborate with users in your Lync Server 2013 deployment, you must have also configured at least one external access policy to support federated user access. For details, see Manage XMPP Federated Partners for Your Organization in the Deployment documentation or the Operations documentation. For details about controlling access for specific federated domains, see Configure Support for Allowed External Domains in the Deployment documentation or Operations documentation.

Enabling or Disabling the Archiving Disclaimer by Using Windows PowerShell

Cmdlets

The use of the archiving disclaimer can be managed by using Windows PowerShell and the Set-CsAccessEdgeConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To enable the archiving disclaimer

- To enable the archiving disclaimer, set the value of the **EnableArchivingDisclaimer** property to True ($True):

```
Set-CsAccessEdgeConfiguration -EnableArchivingDisclaimer $True
```

⊟To disable the archiving disclaimer

- To disable the archiving disclaimer, set the value of the **EnableArchivingDisclaimer** property to False ($False):

```
Set-CsAccessEdgeConfiguration -EnableArchivingDisclaimer $False
```

1.7.11.2.4 Enable or Disable Remote User Access

Enable or Disable Remote User Access

Deployment > Deploying External User Access > Configuring Support for External User Access >

Topic Last Modified: *2013-02-23*

Remote users are users in your organization who have a persistent Active Directory identity within the organization. Remote users often sign in to Lync Server from outside your network by using a virtual private network (VPN) when they are not connected to your organization’s network. Remote users include employees working at home or on the road and other remote workers, such as trusted vendors, who have been granted enterprise credentials. If you enable remote user access for remote users, supported remote users connect over the Internet and do not have to connect using a VPN in order to collaborate with internal users using Lync Server.

To support remote user access, you must enable remote user access. When you enable remote user access, you enable it for your entire organization. If you later want to temporarily or permanently prevent remote user access, you can disable it for your organization. Use the procedure in this section to enable or disable remote user access for your organization.

Note:

Enabling remote user access only specifies that your servers running the Access Edge service support communications with remote users, but remote users cannot participate in instant messaging (IM) or conferences in your organization until you also configure at least one policy to manage the use of remote user access. Lync Server policy settings that are applied at one policy level can override settings that are applied at another policy level. Lync Server policy precedence is: User policy (most influence) overrides a Site policy, and then a Site policy overrides a Global policy (least influence). This means that the closer the policy setting is to the object that the policy is affecting, the more influence it has on the object. For details about configuring policies for the use of remote user access, see Configure Policies to Control Remote User Access.

To enable or disable remote user access for your organization

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Federation and External Access**, and then click **Access Edge Configuration**.
4. On the **Access Edge Configuration** page, click **Global**, click **Edit**, and then click **Show details**.
5. In **Edit Access Edge Configuration**, do one of the following:
    - To enable remote user access for your organization, select the **Enable remote user access** check box.
    - To disable remote user access for your organization, clear the **Enable remote user access** check box.
6. Click **Commit**.

To enable remote users to sign in to your servers running Lync Server, you must also configure at least one external access policy to support remote user access. For details, see Configure Policies to Control Remote User Access in the Deployment documentation or the Operations documentation.

Enabling or Disabling Remote User Access by Using Windows PowerShell Cmdlets

Remote user access can be managed by using Windows PowerShell and the Set-CsAccessEdgeConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable remote user access

- To enable remote user access, set the value of the **AllowOutsideUsers** property to True ($True):

```
Set-CsAccessEdgeConfiguration -AllowOutsideUsers $True
```

To disable remote user access

- To disable remote user access, set the value of the **AllowOutsideUsers** property to False ($False):

```
Set-CsAccessEdgeConfiguration -AllowOutsideUsers $False
```

1.7.11.2.5 Enable or Disable Anonymous User Access

Enable or Disable Anonymous User Access

See Also

Deployment > Deploying External User Access > Configuring Support for External User Access >

Topic Last Modified: *2013-02-23*

Anonymous users are users who do not have a user account in your organization's Active Directory Domain Services (AD DS) or in a supported federated domain, but can be invited to participate remotely in an on-premises conference. By allowing anonymous participation in meetings you enable anonymous users (that is, users whose identity is verified through the meeting or conference key only) to join meetings. Allowing anonymous participation requires enabling it for your organization.

If you later want to temporarily or permanently prevent access by anonymous users, you can disable it for your organization. Use the procedure in this section to enable or disable anonymous user access for your organization.

Note:

By enabling anonymous user access for your organization you are only specifying that your servers running the Access Edge service support access by anonymous users. Anonymous users cannot participate in any meetings in your organization until you also configure at least one conferencing policy and apply it to one or more users or user groups. The only users that can invite anonymous users to meetings are those users that are assigned a conferencing policy that is configured to support anonymous users. For details about configuring conferencing policies to support inviting anonymous users, see Conferencing Policies.

To enable or disable anonymous user access for your organization

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **Access Edge Configuration**.
4. On the **Access Edge Configuration** page, click **Global**, click **Edit**, and then click **Show details**.
5. In **Edit Access Edge Configuration**, do one of the following:
   - To enable anonymous user access for your organization, select the **Enable communications with anonymous users** check box.
   - To disable anonymous user access for your organization, clear the **Enable communications with anonymous users** check box.
6. Click **Commit**.

Enabling or Disabling Anonymous User Access by Using Windows PowerShell Cmdlets

You can manage anonymous user access by using Windows PowerShell and the **Set-CsAccessEdgeConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable anonymous user access

- To enable anonymous user access, set the value of the **AllowAnonymousUsers** property to True ($True):

```
Set-CsAccessEdgeConfiguration -AllowAnonymousUsers $True
```

To disable anonymous user access

- To disable anonymous user access, set the value of the **AllowAnonymousUsers** property to False ($False):

```
Set-CsAccessEdgeConfiguration -AllowAnonymousUsers $False
```

Conferencing Policy Settings Reference

1.7.11.2.6 Assign Conferencing Policies to Support Anonymous Users

Assign Conferencing Policies to Support Anonymous Users

Deployment > Deploying External User Access > Configuring Support for External User Access >

Topic Last Modified: *2012-10-19*

By default, all users are prevented from inviting anonymous users to participate in a meeting. You control who can invite anonymous users by configuring a conferencing policy to support anonymous users, and applying that conferencing policy to specific users. For details about how to configure a conferencing policies to support anonymous users, see Create or Modify a Conferencing Policy and Managing Federation and External Access to Lync Server 2013.

Use the procedure in this section to apply a conferencing policy that you have already created to one or more users or user groups.

Note:

In addition to configuring and applying a policy to enable users to invite anonymous users, you must also enable support for anonymous users for your organization. For details, see Configure Policies to Control Public User Access.

To configure a user policy for anonymous participation in meetings

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Conferencing**, and then do one of the following:
   3.a.To create a new user policy, click **New**, and then click **User policy**. Create a unique name in the **Name** field that indicates what the user policy covers (for example, **EnableAnonymous** for a user policy that enables communications with anonymous users).
   3.b.To configure an existing user policy, click the appropriate policy listed in the table, click **Edit**, and then click **Show details**.
4. In the **Conferencing Policies** dialog box, select the **Allow participants to invite anonymous users** check box.
5. Click **Commit**.
6. In the left navigation bar, click **Users**, search on the user account that you want to configure.
7. In the table that lists the search results, click the user account, click **Edit**, and then click **Show details**.
8. In **Edit Lync Server User** under **Conferencing policy**, select the user policy with the anonymous user access configuration that you want to apply to this

user.

> **Note:**
> The **<Automatic>** settings apply the default server installation settings and are applied automatically by the server.

To enable users to invite anonymous users to conferences, you must also enable support for anonymous users in your organization. For details, see Configure Policies to Control Public User Access in the Deployment documentation or the Operations documentation.

1.7.11.3 Manage SIP Federated Domains for Your Organization

Manage SIP Federated Domains for Your Organization

See Also

Microsoft Lync Server 2013 > Operations > Managing Federation and External Access to Lync Server 2013 >

Topic Last Modified: *2012-10-19*

This is preliminary documentation and is subject to change. Blank topics are included as placeholders.

To manage and configure SIP domains that you can federate with, you can do the following:

- Create or edit an allowed domain list of SIP federated partner domains.
- Create or edit a blocked domain list of SIP federated domains.

To perform these tasks, use the procedures in this this section.

- Configure Support for Allowed External Domains
- Configure Support for Blocked External Domains

See Also

Tasks

Configure Policies to Control Federated User Access
Enable or Disable Federation and Public IM Connectivity
Enable or Disable Discovery of Federation Partners

1.7.11.3.1 Configure Support for Allowed External Domains

Configure Support for Allowed External Domains

Operations > Managing Federation and External Access to Lync Server 2013 > Manage SIP Federated Domains for Your Organization >

Topic Last Modified: *2012-10-19*

If you have configured support for federated partners, you can manage which specific domains can federate with your organization. You configure one or more specific external domains as allowed federated domains. To do this, add each domain to the list of allowed domains. Even if partner discovery is enabled for your organization, do this if the domain is a federated partner that might need to communicate with more than 1,000 of your users or might need to send more than 20 messages per second. If partner discovery is not enabled for your organization, only users of external domains that you add to the allowed domains list can participate in IM and conferencing with users in your organization. If you want to restrict access for a federated domain to a specific server running the Access Edge service of the federated partner, you can specify the domain name of the server running the Access Edge service for each domain in the list of allowed domains.

> **Note:**
>
> This procedure describes how to configure support for specific domains, but implementing support for federated users also requires that you enable support for federated users for your organization, and configure and apply policies to control which users can collaborate with federated users. For details about enabling support for federated users, see Enable or Disable Remote User Access. For details about configuring policies to control federation, see Configure Policies to Control Federated User Access.

⊟To add an external domain to the list of allowed domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, and then click **Federated Domains**.
4. On the **Federated Domains** page, click **New**, and then click **Allowed domain**.
5. In **New Federated Domains**, do the following:
   - In **Domain name (or FQDN)**, type the name of the federated partner domain.

     > **Note:**
     >
     > This name must be unique and cannot already exist as an allowed domain for this server running the Access Edge service. The name cannot exceed 256 characters in length.
     > The search on the federated partner domain name performs a suffix match. For example, if you type **contoso.com**, the search will also return the domain **it.contoso.com**.
     > A federated partner domain cannot simultaneously be blocked and allowed. Lync Server 2013 prevents this from happening so that you do not have to synch up your lists.

   - If you want to restrict access for this federated domain to users of a specific server running the Access Edge service, in **Access Edge service (FQDN)**, type the FQDN of the federated domain’s server running the Access Edge service.
   - If you want to provide additional information, in **Comment**, type information that you want to share with other system administrators about this configuration.
6. Click **Commit**.
7. Repeat steps 4 through 6 for each federated partner domain that you want to allow.

To enable federated user access, you must also enable support for federated user access in your organization. For details, see Enable or Disable Remote User Access.

Additionally, you must configure and apply the policy to users that you want to be able to collaborate with federated users. For details, see Configure Policies to Control Federated User Access.

1.7.11.3.2 Configure Support for Blocked External Domains

Configure Support for Blocked External Domains

Operations > Managing Federation and External Access to Lync Server 2013 > Manage SIP Federated Domains for Your Organization >

Topic Last Modified: *2012-09-08*

If you have configured support for federated partners, you can manage which domains will be blocked from federating with your organization. The list of blocked domains will act as a block list (listing of explicit entries that are not to be allowed) and will apply in federated domain discovery, if you have this option enabled. For details, see Enable or Disable Discovery of Federation Partners.

Block one or more external domains from connecting to your organization. To do this, add the domain to the list of blocked domains.

⊟ To add an external domain to the list of blocked domains

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**.
4. Click **Federated Domains**, click **New**, and then click **Blocked domain**.
5. In **New Federated Domains**, do the following:
   - In **Domain name (or FQDN)**, type the name of the federated partner domain that you want to block.

     > **Note:**
     > The name cannot exceed 256 characters in length.
     > The search on the federated partner domain name performs a suffix match. For example, if you type **contoso.com**, the search will also return the domain **it.contoso.com**.
     > A federated partner domain cannot simultaneously be blocked and allowed. Lync Server 2013 prevents this from happening so that you do not have to synch up your lists.

   - (Optional) In **Comment**, type information that you want to share with other system administrators about this configuration.
6. Click **Commit**.
7. Repeat steps 4 through 6 for each federated partner that you want to block.

To enable federated user access, you must also enable support for federated user access in your organization. For details, see Enable or Disable Remote User Access.

Additionally, you must configure and apply the policy to users that you want to be able to collaborate with federated users. For details, see Configure Policies to Control Federated User Access.

1.7.11.4 Manage SIP Federated Providers for Your Organization

Manage SIP Federated Providers for Your Organization

Microsoft Lync Server 2013 > Operations > Managing Federation and External Access to Lync Server 2013 >

Topic Last Modified: *2012-10-19*

This is preliminary documentation and is subject to change. Blank topics are included as placeholders.

To configure support for users of SIP federated providers, you need to do the following:

- Configure one or more external user access policies to support communicating with SIP federated provider contacts
- Specify which hosted providers you want to support
- Specify which public IM providers you want to support

To perform these tasks, use the procedures in this section.

- Create or Edit Public SIP Federated Providers
- Create or Edit Hosted SIP Federated Providers

1.7.11.4.1 Create or Edit Public SIP Federated Providers

Create or Edit Public SIP Federated Providers

See Also

Operations > Managing Federation and External Access to Lync Server 2013 > Manage SIP Federated Providers for Your Organization >

Topic Last Modified: *2012-10-19*

Public instant messaging (IM) connectivity enables users in your organization to use IM to communicate with users of IM services provided by public IM service providers, including the Windows Live Messenger, Yahoo!, and AOL.

Lync Server 2013 has public provider configurations for America Online, Windows Live and Yahoo! instant messaging. Each public provider is configured with the provider's Edge server fully qualified domain name, and the default verification level **Allow users to communicate only with people on their Contacts list who use this provider**.

As a default setting, none of the public providers are enabled. You should complete license agreement and provisioning work before enabling the public providers. You can enable the provider before completing the licensing and provisioning work. Users will not be able to communicate with contacts on those providers until the pre-requisite work is completed. For details on licensing and provisioning of public providers, see Configure Policies to Control Public User Access.

Use the following procedure to create or edit Public providers:

⊟To create or edit public providers

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Federation and External Access**, and then click **SIP Federated Providers**.
4. If you need to create a new Public provider, click **New** and then click **Public provider**.
5. If you need to edit an entry from the list of Public providers, select a public provider, click **Edit**, then click **Show details**.
6. On the **Edit SIP Federated Provider** page, you can type or edit the following

settings:

- **Enable communications with this provider** Selecting this setting enables IM with this provider's users.
- **Provider name:** A required property, type the name of the provider as it will be reflected in the listing of SIP Federated Providers.
- **Access Edge service (FQDN):** A required property, type the fully qualified domain name of the Access Edge service of the provider that you are configuring. This information is provided as a default item, and should only be changed if the public provider makes a change to the FQDN of the Access Edge service at the public provider.
- **Default verification level:** The default setting, **Allow users to communicate with people on their Contacts list who use this provider** will limit communication to contacts that you have accepted and are in your contact list.

  Selecting **Allow users to communicate with everyone using this provider** removes the restriction that you must have received and accepted a contact invite. This setting does not limit who can contact you from the public provider's network.

7. When you are done configuring the settings, click **Commit** to save, or click **Cancel** to discard your changes.

Tasks

Configure Policies to Control Public User Access
Enable or Disable Federation and Public IM Connectivity

1.7.11.4.2 Create or Edit Hosted SIP Federated Providers

Create or Edit Hosted SIP Federated Providers

See Also

Operations > Managing Federation and External Access to Lync Server 2013 > Manage SIP Federated Providers for Your Organization >

Topic Last Modified: *2012-10-19*

Hosted provider instant messaging (IM) connectivity enables users in your organization to use IM to communicate with users of IM services provided by hosted providers, including the Microsoft Office 365 and Lync Online.

Each hosted provider is configured with the provider's Edge server fully qualified domain name, and the default verification level **Allow users to communicate only with people on their Contacts list who use this provider**.

Use the following procedure to create or edit Hosted providers:

⊟To create or edit hosted providers

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Federation and External Access**, and then click **SIP Federated Providers**.
4. If you need to create a new Hosted provider, click **New** and then click **Hosted provider**.
5. If you need to edit an entry from the list of Hosted providers, select a hosted provider, click **Edit**, then click **Show details**.

6. On the **Edit SIP Federated Provider** page, you can type or edit the following settings:
   - **Enable communications with this provider** Selecting this setting enables communications with this provider's users.
   - **Provider name:** A required property, type the name of the provider as it will be reflected in the listing of SIP Federated Providers.
   - **Access Edge service (FQDN):** A required property, type the fully qualified domain name of the Access Edge service of the hosted provider that you are configuring. This information should be provided by the hosted provider, and should only be changed if the hosted provider makes a change to the FQDN of the Access Edge service at the hosted provider.
   - **Default verification level:** The default setting, **Allow users to communicate with people on their Contacts list who use this provider** will limit communication to contacts that you have accepted and are in your contact list.

     Selecting **Allow users to communicate with everyone using this provider** removes the restriction that you must have received and accepted a contact invite. This setting does not limit who can contact you from the hosted provider's network.
7. When you are done configuring the settings, click **Commit** to save, or click **Cancel** to discard your changes.

Tasks

Configure Policies to Control Public User Access
Enable or Disable Federation and Public IM Connectivity

1.7.11.5 Manage XMPP Federated Partners for Your Organization

Manage XMPP Federated Partners for Your Organization

Microsoft Lync Server 2013 > Operations > Managing Federation and External Access to Lync Server 2013 >

Topic Last Modified: *2012-10-19*

This is preliminary documentation and is subject to change. Blank topics are included as placeholders.

To manage support for users of XMPP federated domains, you need to do the following:

- Configure one or more external access policies to support users of XMPP federated domains.
- Configure Access Edge Configuration policy to support federation.
- Create XMPP Federated Partners definitions.
- Understand negotiation settings available for XMPP federation.

To perform these tasks, use the procedures in this this section.

- Create or Edit XMPP Partner Configuration
- Negotiation Settings for XMPP Federated Partners
- Example XMPP Configuration – XMPP Federation with Google Talk

1.7.11.5.1 Create or Edit XMPP Partner Configuration

Create or Edit XMPP Partner Configuration

Operations > Managing Federation and External Access to Lync Server 2013 > Manage XMPP Federated Partners for Your Organization >

Topic Last Modified: *2012-11-01*

Microsoft Lync Server 2013 integrates an Extensible Messaging and Presence Protocol (XMPP) proxy on the Edge Server and an XMPP Gateway on the Front End Server or Front End pool. To allow connections from other XMPP deployments, you must configure XMPP in the Lync Server Control Panel. You configure settings on an XMPP domain basis. To create a new partner association, you do the following:

⊟To create a new federated partner or edit an existing configuration

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Federation and External Access**, and then click **XMPP Federated Partners**.
4. To create a new configuration, click **New**
5. To edit an existing configuration, select the configuration and click **Edit**
6. To create or edit configurations for **XMPP Federated Partners**, you define the following settings:
7. **Primary domain** (Required). The primary domain is the base domain of the XMPP partner. For example, you would enter **fabrikam.com** for the XMPP partner domain name. This is a required entry.
8. **Description** The description is for notes or other identifying information for this particular configuration. This entry is optional.
9. **Additional domains** Additional domains are domains that are a part of your XMPP partner's domain that should be included as part of the allowed XMPP communication. For example, if the primary domain is **fabrikam.com**, then you would list all other domains that are under fabrikam.com that you will communicate with by way of XMPP. For example, you might enter **corp.fabrikam.com** and **it.fabrikam.com** for the Corporate XMPP domain and the Information Technologies XMPP domain under fabrikam.com's main XMPP domain.
10. **Partner type** The **Partner type** is a required setting and gives you a selection of three choices in a drop-down menu. You must choose one of the following to describe and enforce what contacts can be added. You can select from:
    - **Federated** A **Federated** partner type is a trusted connection between a Lync Server or Office Communications Server 2007 R2 partner deployment.
    - **Public verified** A **Public verified** partner is when contacts that are part of a deployment that are verified by the provider can be added to your user's list of contacts. Invites can be sent from the Lync user or the Lync user can accept invites from the partner contact.
    - **Public unverified** A **Public unverified** relationship implies that there is no established and verifiable status between the two deployments. A Lync user must invite the unverified contact for that contact to be able to add the Lync user to his contact list. For example, Google GTalk is not a public verified XMPP service as it relates to Lync Server. A GTalk user will not be able to add the Lync user as a contact unless there is an explicit invite sent from the Lync user.
11. Notes on stream negotiation and the security methods Transport Layer Security (TLS) and Software Authentication and Security Layer (SASL):

    The **XMPP Standards Foundation** (XSF) and the **Internet Engineering Task Force** (IETF) define a set of rules and standards for using and managing TLS client certificates, TLS server certificates, and the SASL mechanism. Using TLS and SASL is the required process for securing the XMPP stream. From the XMPP Standards document **XEP-0178**, "specifies a recommended protocol flow for use of the SASL EXTERNAL mechanism with PKIX certificates, especially when an XMPP service indicates that TLS is mandatory-to-negotiate." PKIX, as stated in the XSF documentation, refers to public key infrastructure, also known as PKI.

Refer to the XSF document XEP-0178 for more details on the XMPP requirements. For details, refer to "XEP-0178: Best Practices for Use of SASL EXTERNAL with Certificates". http://xmpp.org/extensions/xep-0178.html

Refer to the IETF document "Extensible Messaging and Presence Protocol (XMPP): Core", Section 5.0, STARTTLS Negotiation http://tools.ietf.org/html/rfc6120.

- **TLS Negotiation** Defines the TLS negotiation rules. An XMPP service can require TLS, can make TLS optional, or you define that TLS is not supported. Choosing Optional leaves the requirement up to the XMPP service for a mandatory-to-negotiate decision. To view all possible settings and details for SASL, TLS and Dialback negotiation –including not valid and known error configurations - see Negotiation Settings for XMPP Federated Partners.
  - **Required** The XMPP service requires TLS negotiation.
  - **Optional** The XMPP service indicates that TLS is mandatory-to-negotiate.
  - **Not Supported** The XMPP service does not support TLS.
- **SASL negotiation** Defines the SASL negotiation rules. An XMPP service can require SASL, can make SASL optional, or you define that SASL is not supported. Choosing Optional leaves the requirement up to the partner XMPP service for a mandatory-to-negotiate decision.

  > ⚠**Warning:**
  >
  > SASL requires TLS. To use SASL, TLS must either be required or optional. Any configuration that defines SASL as either required or optional must have TLS support. When clicking **Commit** to save your changes, if you have not set TLS to required or optional, you will be warned that SASL must have TLS support and your changes are not saved. To resolve the error, set TLS to **Required** or **Optional**. If use of SASL is optional and TLS negotiation support is not possible, you must set SASL negotiation to **Not Supported**. Confirm with the XMPP service what the proper negotiation streams must be for TLS and SASL or service interruption will occur.

  - **Required** The XMPP service requires SASL negotiation.
  - **Optional** The XMPP service indicates that SASL is mandatory-to-negotiate.
  - **Not Supported** The XMPP service does not support SASL.
- **Dialback negotiation** Dialback negotiation is defined by the XSF in document **XEP-220 : Server Dialback** http://xmpp.org/extensions/xep-0220.html. The server dialback process uses the domain name system (DNS) and an authoritative server to verify that the request came from a valid XMPP partner. To do this, the originating server creates a message of a specific type with a generated dialback key and looks up the receiving server in DNS. The originating server sends the key in an XML stream to the resulting DNS lookup, presumably the receiving server. On receipt of the key over the XML stream, the receiving server does not respond to the originating server, but sends the key to a known authoritative server. The authoritative server verifies that the key is either valid or not valid. If not valid, the receiving server does not respond to the originating server. If the key is valid, the receiving server informs the originating server that the identity and key is valid and the conversation can commence.

  There are two valid states for **Dialback negotiation**:

  - **True** The XMPP server is configured to use Dialback negotiation if a request should be received from an originating server

- **False** The XMPP server is not configured to use Dialback negotiation and if a request should be received from an originating server, it will be ignored

1.7.11.5.2 Negotiation Settings for XMPP Federated Partners

Negotiation Settings for XMPP Federated Partners

Operations > Managing Federation and External Access to Lync Server 2013 > Manage XMPP Federated Partners for Your Organization >

Topic Last Modified: *2012-10-21*

The settings for the negotiation types in the configuration of an XMPP Partner have a wide variety of possible combinations. Not all of these combinations are valid. The table detailed in this topic will define the valid and not valid settings. Common configurations are presented in the first table, the second table detailing all possible combinations. Note that you cannot have *Simple Authentication and Security Layer* (SASL) **unless** *Transport Layer Security* (TLS) is also available. SASL is sent in an unencrypted (readable) format and should never be transmitted unless protected by another means, such as TLS.

Common XMPP Federation Negotiation Methods

Transport Layer Security (TLS)	Simple Authentication and Security Layer (SASL)	Dialback Authentication	Expected Authentication Method(s)	Notes
Required	Required	False	SASL over TLS	TLS and SASL required helps to ensure that the SASL message stream is secure. Dialback is not available and cannot be used for a fallback method if the XMPP federated partner has not set TLS to required or optional.
Required	Optional	True	SASL over TLS, TLS Dialback, TCP Dialback	By requiring TLS, if the XMPP federated partner has set SASL to optional or required SASL is used. If SASL is not available, Dialback over TLS will be used.
Optional	Optional	True	SASL over TLS, TLS Dialback, TCP Dialback	While very flexible in the negotiation methods offered, these settings

				rely on the XMPP federation partner’s settings. If the partner has TLS optional or required but SASL is not supported, TLS Dialback will be available. If the partner has TLS and SASL set to optional or required, the optimal selection of TLS over SASL is used.
Not Supported	Not Supported	True	TCP Dialback	In many cases, TCP Dialback is the only possible solution. Less desirable than other options, it does provide some level of trust.

XMPP Federation Negotiation Methods Matrix - Complete

Transport Layer Security (TLS)	**Simple Authentication and Security Layer (SASL)**	**Dialback Authentication**	**Expected Authentication Method**	**Notes, Warning or Error for Not Valid Configuration**
Required	Required	True	SASL over TLS	⚠**Warning:** Dialback will not operate if both SASL and TLS are required.
Required	Required	False	SASL over TLS	
Optional	Required	True	SASL over TLS, TLS Dialback, TCP Dialback	⚠**Warning:** SASL requires TLS. Allowing TLS to be optional may result in failed session negotiations.
Optional	Required	False	SASL over TLS	⚠**Warning:** SASL requires TLS. Allowing TLS to be optional may result in failed session negotiations.

Not Supported	Required	True	TCP Dialback	⚠ **Warning:** SASL requires TLS. Allowing TLS to be optional may result in failed session negotiations.
Not Supported	Required	False	⚠ **Warning:** Not Valid Configuration	⚠ **Warning:** Because SASL requires TLS, and TLS is not available, SASL/ TLS cannot succeed. TCP Dialback is set to false, and cannot be used.
Required	Optional	True	SASL over TLS, TLS Dialback	
Required	Optional	False	SASL over TLS	
Optional	Optional	True	SASL over TLS, TLS Dialback, TCP Dialback	⚠ **Warning:** SASL requires TLS. Allowing TLS to be optional may result in failed session negotiations.
Optional	Optional	False	SASL over TLS	⚠ **Warning:** SASL requires TLS. Allowing TLS to be optional may result in failed session negotiations.
Not Supported	Optional	True	TCP Dialback	⚠ **Warning:** SASL requires TLS. Allowing TLS to be optional may result in failed session negotiations.
Not Supported	Optional	False	⚠ **Warning:** Not Valid Configuration	⚠ **Warning:** SASL requires TLS. Allowing TLS to be optional may result in failed session negotiations.
Required	Not Supported	True	TLS Dialback	Configuration

				allows for TLS Dialback.
Required	Not Supported	False	Not Valid Configuration	⚠**Warning:** SASL or Dialback must be enabled.
Optional	Not Supported	True	TLS Dialback, TCP Dialback	Based on negotiation choices of the other end point, TCP or TLS Dialback will be accepted.
Optional	Not Supported	False	Not Valid Configuration	⚠**Warning:** SASL or Dialback must be enabled.
Not Supported	Not Supported	True	TCP Dialback	TCP Dialback is the only negotiation method available
Not Supported	Not Supported	False	Not Valid Configuration	⚠**Warning:** SASL or Dialback must be enabled.

1.7.11.5.3 Example XMPP Configuration â€“ XMPP Federation with Google Talk

Example XMPP Configuration – XMPP Federation with Google Talk

Operations > Managing Federation and External Access to Lync Server 2013 > Manage XMPP Federated Partners for Your Organization >

Topic Last Modified: *2012-11-01*

An example configuration for deploying the XMPP Proxy defines a federation with Google Talk.

⊟Example XMPP configuration – XMPP federation with Google Talk

1. On the Front End Server, open the Lync Server Deployment Wizard. Click **Install** or **Update Lync Server System**, then click **Setup** or **Remove Lync Server Components**. Click **Run Again**.
2. At **Setup Lync Server components**, click **Next**. The summary screen will show actions as they are executed. After the deployment is complete, click **View Log** to view available log files. Click **Finish** to complete the deployment.
3. On the Edge Server, open the Lync Server Deployment Wizard. Click **Install** or **Update Lync Server System**, then click **Setup** or **Remove Lync Server Components**. Click **Run Again**.
4. Add Google Talk as an XMPP allowed partner. Google Talk currently only supports unencrypted, TCP connections for server-to-server XMPP federation and only supports Server Dialback for identity verification. (See http://xmpp.org/extensions/xep-0220.html).

```
New-CsXmppAllowedPartner gmail.com -TlsNegotiation NotSupported -SaslN
```

5. To enable Edge Federation, type the following:

```
Set-CsAccessEdgeConfiguration -AllowFederatedUsers $true
```

6. At **Setup Lync Server components**, click **Next**. The summary screen will show actions as they are executed. After the deployment is done, click **View Log** to view available log files. Click **Finish** to complete the deployment.
7. On the Edge Server, in the Lync Server Deployment Wizard, next to **Step 3: Request, Install, or Assign Certificates**, click **Run again**.

> **Tip:**
>
> If you are deploying the Edge Server for the first time, you will see Run instead of Run Again.

8. On the **Available Certificate Tasks** page, click **Create a new certificate request**.
9. On the **Certificate Request** page, click **External Edge Certificate**.
10. On the **Delayed or Immediate Request** page, select the **Prepare the request now, but send it later** check box.
11. On the **Certificate Request File** page, type the full path and file name of the file to which the request is to be saved (for example, c:\cert_exernal_edge.cer).
12. On the **Specify Alternate Certificate Template** page, to use a template other than the default WebServer template, select the **Use alternative certificate template for the selected certification authority** check box.
13. On the **Name and Security Settings** page, do the following:
    13.a. In **Friendly name**, type a display name for the certificate
    13.b. In **Bit length**, specify the bit length (typically, the default of **2048**)
    13.c. Verify that the **Mark certificate private key as exportable** check box is selected
14. On the **Organization Information** page, type the name for the organization and the organizational unit (for example, a division or department)
15. On the **Geographical Information** page, specify the location information
16. On the **Subject Name/Subject Alternate Names** page, the information to be automatically populated by the wizard is displayed. If additional subject alternative names are needed, you specify them in the next two steps
17. On the **SIP Domain Setting on Subject Alternate Names (SANs)** page, select the domain check box to add a sip. <*sipdomain*> entry to the subject alternative names list.
18. On the **Configure Additional Subject Alternate Names** page, specify any additional subject alternative names that are required.

> **Tip:**
>
> If the XMPP proxy is installed, by default the domain name (such as contoso.com) is populated in the SAN entries. If you require more entries, add them in this step.

19. On the **Request Summary** page, review the certificate information to be used to generate the request.
20. After the commands finish running, you can **View Log**, or click **Next** to continue.
21. On the **Certificate Request File** page, you can view the generated certificate signing request (CSR) file by clicking **View** or exit the Certificate Wizard by clicking **Finish**.
22. Copy the request file and submit to your public certification authority.
23. After receiving, importing and assigning the public certificate, you must stop and restart the Edge Server services. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.. In the Lync Server Management Shell, type:

```
Stop-CsWindowsService
```

```
Start-CsWindowsService
```

24.To configure DNS for XMPP federation, you add the following SRV record to external DNS:_xmpp-server._tcp.<*domain name*> The SRV record will resolve to the access edge FQDN of the Edge server, with a port value of 5269

25.Configure a new External Access Policy to enable all users by opening the Lync Server Management Shell on a Front End Server and typing:

```
New-CsExternalAccessPolicy -Identity FedPic -EnableFederationAcces $tr
Get-CsUser | Grant-CsExternalAccessPolicy -PolicyName FedPic
```

1.7.11.6 Configuring Federation Support for a Lync Online Customer

Configuring Federation Support for a Lync Online Customer

Microsoft Lync Server 2013 > Operations > Managing Federation and External Access to Lync Server 2013 >

Topic Last Modified: *2012-11-01*

You can provide communications services to users in your organization in any of the following ways:

- Deploying Lync Server 2013 in your organization (known as *on-premises services*) and setting up Lync 2013 user accounts in your organization.
- Setting up a Microsoft Lync Online 2010 customer account with a Hosting Provider and setting up user accounts with the Hosting Provider (known as *online services*).

If you deploy Lync 2013 in your organization, you can federate with the domains of one or more Microsoft Lync Online 2010 customers. To enable federation between users of your on-premises Lync 2013 deployment and users of a Lync Online 2010 customer, you must configure support for the domain and users of the Lync Online customer.

Note:

This documentation describes only the procedures for configuring your organization to support federation with an Lync Online 2010 customer. This documentation does not describe the procedures for configuring the Lync Online 2010 customer to support federation. For details about Lync Online services, see Lync Online at http://go.microsoft.com/fwlink/p/?linkId=218941.

- Prerequisites for Federating with a Lync Online Customer
- Configure Federation Support for a Lync Online Domain
- Configure User Access for Federation with a Lync Online Customer
- Verify Communications with a Lync Online Customer

1.7.11.6.1 Prerequisites for Federating with a Lync Online Customer

Prerequisites for Federating with a Lync Online Customer

Operations > Managing Federation and External Access to Lync Server 2013 > Configuring Federation Support for a Lync Online Customer >

Topic Last Modified: *2012-10-19*

To federate with a Lync Online 2010 customer, you should have already completed initial deployment and configuration of Lync Server 2013 in your organization. This includes the following:

- Deploying at least one Standard Edition server or one Enterprise Edition Front End pool in your organization. For details about deploying internal servers, see Deploying Lync Server 2013 in the Deployment documentation.

- Enabling internal user accounts for Lync Server 2013. For details, see Disable or Re-Enable User Account for Lync Server in the Deployment documentation or the Operations documentation.
- Deploying at least one Edge Server and the other components required to support external user access. For details, see Managing Federation and External Access to Lync Server 2013 in the Deployment documentation.
- Enabling federation support within your organization and configuring the appropriate method for controlling access by federated domains. For details, see Enable or Disable Remote User Access and Manage SIP Federated Providers for Your Organization in the Operations documentation.
- Enabling external user access for users in your organization. For details, see Assign an External User Access Policy to a Lync Enabled User and in the Deployment documentation or Operations documentation.

1.7.11.6.2 Configure Federation Support for a Lync Online Domain

Configure Federation Support for a Lync Online Domain

Operations > Managing Federation and External Access to Lync Server 2013 > Configuring Federation Support for a Lync Online Customer >

Topic Last Modified: *2012-11-01*

Federating with a Microsoft Lync Online 2010 customer requires you to complete the following steps:

- Configure support for the domain of the Lync Online 2010 customer (for example, contoso.onmicrosoft.com). As specified in the Prerequisites for Federating with a Lync Online Customer section of this documentation, you should have already enabled federation for your organization. Enabling federation requires specifying the method to be used to control access by federated domains. If you configured your organization to use discovery, adding the domain to your organization’s allowed list is optional. If you did not enable domain discovery, then you must add the domain name of the Lync Online customer to your allowed domains list. You can add a domain name either by using Lync Server Control Panel or by running the **New-CSAllowedDomain** cmdlet. For details about using Lync Server Control Panel, including enabling discovery of domains, see Manage SIP Federated Providers for Your Organization in the Operations documentation. For details about using the **New-CSAllowedDomain** cmdlet to add a domain, see New-CsAllowedDomain in the Operations documentation.

Note:
A Lync Online customer can have multiple domains. If you want to federate with more than one of the domains, you must configure support for each individual domain with which you want to support federation, and the administrator of the Lync Online customer must enable federation for each of the domains to be federated.

- Configure support for the hosting provider of the Lync Online 2010 customer domain with which you want to federate. Use the procedure in this section to configure support for hosting provider.

Note:
This step is required only for federation with a domain of a Lync Online customer, not for federation with any domain that is deployed on-premises at a federated partner’s location.

⊟To configure support for a hosting provider

1. From a Front End Server, Start the Lync Server Management Shell: Click

Start, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.

2. Run the **New-CsHostingProvider** cmdlet to create and configure the hosting provider. For example, run:

```
New-CsHostingProvider -Identity LyncOnline -ProxyFqdn "sipfed.online.l
```

The preceding example sets the following parameters:

- **Identity** specifies a unique string value identifier for the hosting provider that you are creating. Note that the command will fail if an existing provider has already been configured with that Identity.
- **ProxyFQDN** specifies the fully qualified domain name (FQDN) for the proxy server used by the hosting provider. This value cannot be modified. If the hosting provider changes its proxy server you will need to delete and then recreate the entry for that provider.
- **VerificationLevel** specifies how (or if) messages sent from a hosting provider are verified to ensure that they were sent from that provider.
- **Enabled** indicates whether the network connection between your domain and the hosting provider is enabled. Messages cannot be exchanged between the two organizations until this value is set to **True**.
- **EnabledSharedAddressSpace** indicates whether the hosting provider is being used in a shared SIP address space (split domain) scenario.
- **HostsOCSUsers** indicates whether the hosting provider is used to host Lync Server accounts. If **False**, the provider hosts other account types, such as Microsoft Exchange accounts.
- **IsLocal** indicates whether the proxy server used by the hosting provider is contained within your Lync Server topology.

For details about using this cmdlet, see New-CsHostingProvider in the Operations documentation.

1.7.11.6.3 Configure User Access for Federation with a Lync Online Customer

Configure User Access for Federation with a Lync Online Customer

Operations > Managing Federation and External Access to Lync Server 2013 > Configuring Federation Support for a Lync Online Customer >

Topic Last Modified: *2012-11-01*

You must configure the user accounts of all the users in your organization in order for them be allowed to communicate with federated partners. This configuration is applied for all federated partners, including any Microsoft Lync Online 2010 customer domains with which you support federation. For details about configuring federation support for user accounts, see Configure Policies to Control Federated User Access and Assign an External User Access Policy to a Lync Enabled User in the Operations documentation.

1.7.11.6.4 Verify Communications with a Lync Online Customer

Verify Communications with a Lync Online Customer

Operations > Managing Federation and External Access to Lync Server 2013 > Configuring Federation Support for a Lync Online Customer >

Topic Last Modified: *2012-10-08*

To enable Lync users in your organization to communicate with users of a Microsoft Lync

Online 2010 customer, you must have completed the following steps:

- Met all prerequisites. This includes deploying your internal and edge servers, enabling federation support for your organization, and setting up user accounts. For details, see Prerequisites for Federating with a Lync Online Customer.
- Configured domain access support in your internal deployment. This includes creating a host provider entry and configuring your deployment to allow access from the Lync Online customer's domain. For details, see Configure Federation Support for a Lync Online Domain.
- Configured your user accounts to support federation. For details, see Configure User Access for Federation with a Lync Online Customer.

After you complete all of these steps and the administrator of the Lync Online 2010 customer completes all configuration of their online services to support federation with your organization, verify communications by testing communications between an internal user in your organization and a user of the Lync Online customer. If communication is not successful, use the Logging Tool from your Edge Server to capture log and trace files in order to troubleshoot the problem. For details about using the Logging Tool, see Open Lync Server Administrative Tools in the Operations documentation. For details about the Logging Tool, see the Lync Server 2010 Logging Tool documentation on the TechNet Library at http://go.microsoft.com/fwlink/p/?linkId=199265.

1.7.12 Managing Lync Server 2013 Archiving

Managing Lync Server 2013 Archiving

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-10-10*

When you deploy Archiving for your organization, you specify the initial configuration during deployment. However, there may be times when you want to change how you implement archiving support for day-to-day management or to meet new requirements in your organization. For example, you may need to set up archiving support differently for a specific site, pool, or users within your organization. For users homed on Lync Server 2013, you do this be creating and customizing archiving policies and configurations. If you use Microsoft Exchange integration, you must also configure Exchange 2013 settings. This section provides information and procedures to enable you to make changes to your Archiving deployment.

- How Archiving Works
- Managing the Archiving of Internal and External Communications
- Managing Archiving Configuration Options for Your Organization, Sites, and Pools
- Changing Archiving Database Options
- Exporting Archived Data

1.7.12.1 How Archiving Works

How Archiving Works

Microsoft Lync Server 2013 > Planning > Planning for Archiving >

Topic Last Modified: *2013-01-22*

Lync Server 2013 Archiving provides options to help you meet your compliance needs. To implement and maintain it in a way that most effectively meets your organization's requirements, you should understand:

- What information can be archived.
- How to enable and disable Archiving in your deployment.
- The archiving options that you can configure to control how Archiving is implemented.

What Information Can Be Archived?

The following types of content can be archived:

- Peer-to-peer instant messages
- Conferences (meetings), which are multiparty instant messages
- Conference content, including uploaded content (for example, handouts) and event-related content (for example, joining, leaving, uploading sharing, and changes in visibility)
- Whiteboards and polls shared during a conference

The following types of content are not archived:

- Peer-to-peer file transfers
- Audio/video for peer-to-peer instant messages and conferences
- Desktop and application sharing for peer-to-peer instant messages and conferences

Lync Server also does not archive Persistent Chat conversations. To archive Persistent Chat conversations, you must enable and configure the compliance service, which is a component that can be deployed with Microsoft Lync Server 2013, Persistent Chat Server. For details, see Planning for Persistent Chat Server in the Planning documentation.

How Do I Start Using Archiving?

Archiving is automatically installed on each Front End Server when you deploy the server, but Archiving is not enabled until you configure it. How you configure it is determined by how you deploy Archiving:

- **Archiving using Microsoft Exchange integration.** If you have users who are homed on Exchange 2013 and their mailboxes have been put on In-Place Hold, you can select the option to integrate Lync Server 2013 storage with Exchange storage. If you choose the Microsoft Exchange integration option, you use Exchange 2013 policies and configurations to control the archiving of Lync Server 2013 data for those users.
- **Archiving using Lync Server Archiving databases.** If you have users who are not homed on Exchange 2013 or who have not had their mailboxes put on In-Place Hold, or if you don’t want to use Microsoft Exchange integration for any or all users in your deployment, you can deploy Lync Server Archiving databases using SQL Server to store Archiving data for those users. In this case, Lync Server 2013 Archiving policies and configurations determine whether Archiving is enabled and how it is implemented. To use Lync Server 2013, you must add the appropriate SQL Server databases to your topology and publish the topology.

Archiving Setup When Using Microsoft Exchange Integration

If your users are homed on Exchange 2013 and their mailboxes have been put on In-Place Hold, you can choose the **Microsoft Exchange integration** option (as described later in this section) to archive Lync Server 2013 for those users, and then you control archiving for those users by specifying Exchange In-Place Hold policies and settings, as well as Lync Server configurations to control the following:

- Whether to archive IM, conferencing, or both.
- Whether to implement critical mode for your Lync Server deployment.
- Selection of the Microsoft Exchange integration option to use Exchange 2013

for storage of archived data.

These Lync Server 2013 Archiving configuration options are described later in this section. For information about how to configure Exchange In-Place Hold policies and settings to support archiving, see the Exchange 2013 product documentation.

Archiving Setup When Using Lync Server Archiving Database Storage

If you want to use Lync Server Archiving databases (using SQL Server databases) to archive data for any users in your deployment, you can configure Lync Server Archiving policies to control whether Archiving is enabled for those users. In each Archiving policy, you can enable or disable Archiving for either or both of the following:

- Internal communications
- External communications

By default, archiving is not enabled for internal communications or external communications in any Lync Server Archiving policy. You enable and disable communications using Lync Server 2013 Control Panel or using cmdlets in the Lync Server 2013 Management Shell.

Lync Server 2013 Archiving policies include the following:

- **Global Archiving policy**. This is the default Archiving policy and applies to your entire deployment. It is created when you deploy Lync Server 2013 and, by default, disables Archiving for both internal and external communications. You cannot delete this policy. If you choose the delete option, the global policy is reset to the default settings.
- **Site Archiving policy**. Optionally, you can enable or disable Archiving for one or more specific sites by creating and configuring a site-level Archiving policy for the site. When you create a site-level Archiving policy, by default, archiving is not enabled. You can delete any site-level Archiving policy that you create. A site-level Archiving policy overrides the global policy, but only for the site specified in the policy. For example, if you enable Archiving for internal and external communications in your global policy and create a site policy in which you disable Archiving for external communications, only internal communications would be archived for that site.
- **User Archiving policy**. Optionally, you can enable or disable Archiving for one or more specific users and group of users by creating, configuring, and applying a user-level Archiving policy for the specified users and user groups. When you create a user-level Archiving policy, by default, archiving is not enabled. You can delete any user-level Archiving policy that you create, and you can change which users and group of users the Archiving policy applies to. A user-level Archiving policy overrides the global policy and any site policies, but only for the users and user groups to whom the policy is applied. For example, if you disable Archiving for internal and external communications in your global policy, create a site-level policy in which you enable Archiving for internal and external communications, and then create a user-level policy in which you disable Archiving for external communications, the communications would be archived for both external and internal communications for all site users except that, for the users to whom you apply the user-level policy, only internal communications would be archived.

For details about how to set up initial Archiving policies when you deploy Archiving, see Configuring and Assigning Archiving Policies in the Deployment documentation. For details about using Archiving policies to enable and disable communications after deployment, see Managing the Archiving of Internal and External Communications in the Operations documentation.

Note:

If you implement both Lync Server 2013 Archiving databases and enable Microsoft Exchange integration, Exchange 2013 policies override Lync Server Archiving policies, but

> only for users who are homed on Exchange 2013 and have had had their mailboxes put on In-Place Hold. Lync Archiving depends on Microsoft Exchange In-Place Hold policy only.

What Options Do I Have for Configuring Archiving?

In addition to using policies and to enable and disable Archiving, you have other Archiving options that can be configure for your entire deployment and, optionally, for specific sites and pools. You control most Archiving options by using one or more Archiving configurations, which are available in Lync Server 2013 Control Panel, but also have another option that is only available for configuration using Lync Server 2013 Management Shell.

Archiving Configuration Options Available in Lync Server 2013 Control Panel

Each archiving configuration provides the following options:

The global-level configuration is created automatically when you deploy archiving and can be configured, but not deleted. If you select the option to delete the global configuration, the settings are reset to the default values. You can create multiple site and pool configurations that, together with the global configuration, control archiving settings. For the global configuration and each site and pool configuration, you have the following options:

- Disable archiving, enable archiving only for instant messaging (IM), or enable archiving of both IM and conferencing.
- Configure critical mode to block IM and conferencing sessions in the event of a Lync Server failure. Failures include the following:
    - **IM**. A problem with the Lync Server storage service. In this case, IM is blocked for users who are enabled for Archiving.
    - **Conferencing**. A failure could be an unavailable file share or a problem with the storage service. In this case, all active conferences hosted in the pool at the time of failure are switched to restricted mode and new conferences cannot be activated.

    Both IM and conferencing automatically recover after the failures are corrected.
- Specify the use of Microsoft Exchange Server 2013 integration to use Exchange 2013 for storage of archived data, instead of setting up separate SQL Server databases for storage of Lync Server 2013 archiving data.
- Configure purging options for archived data. This includes specifying when to purge archived data, which can be either of the following:
    - After a specific number of days that you specify
    - After the archiving data has been exported (which includes data that has been uploaded to Exchange, if you enable Microsoft Exchange integration).

    > **Note:**
    >
    > If you enable Microsoft Exchange integration, purging for users homed on Exchange 2013 and with their mailboxes put on In-Place Hold is controlled by Exchange. The only qualification is for conferencing files, which are stored on the Lync Server file share. These files are purged from the file share only after the files have been exported (uploaded to Exchange), if you select the option to purge data after the archiving data has been exported, or after the specified maximum number of days, if you specify a maximum number of days for retention.

By default, no archiving options are enabled. You can manage Archiving configurations using Lync Server 2013 Control Panel.

You can specify the following Archiving configurations:

- **Global Archiving configuration**. This is the default Archiving configuration and applies to your entire deployment. It is created when you deploy Lync Server 2013 and, by default, does not enable archiving functionality. You can modify the global configuration, but you cannot delete it. If you choose the delete option for the configuration, the global configuration is reset to the default settings.

- **Site Archiving configuration**. Optionally, you can configure Archiving for one or more specific sites by creating and configuring a site-level Archiving configuration for an individual site. A site-level Archiving configuration exists only if you create it. You can modify or delete any site-level Archiving configuration. A site-level Archiving configuration overrides the global configuration, but only for the site specified in the site-level configuration. For example, if you enable Archiving for only IM in your global configuration and create a site configuration in which you enable Archiving for both IM and conferencing, conferencing would only be archived for the site, not for the remainder of your organization.
- **Pool Archiving configuration**. Optionally, you can specify Archiving settings for one or more specific pools by creating and configuring a pool-level configuration for the individual pool. A pool-level Archiving configuration exists only if you create it. You can modify and delete any pool-level Archiving configuration. A pool-level Archiving configuration overrides the global configuration and any site archiving configuration you may have created. For example, if you enable Archiving for only IM in your global configuration, create a site-level configuration in which you enable Archiving for both IM and conferencing for the site, and then create a pool-level configuration in which you enable Archiving only for IM, the communications would be archived for both IM and conferencing for all users of the site except the users homed in the pool specified in the pool-level configuration. For all other users in your organization, Archiving would be enabled only for IM.

For details about how to set up initial Archiving configurations when you deploy Archiving, see Configuring Archiving Options in the Deployment documentation. For details about using Archiving policies to enable and disable communications after deployment, see Managing Archiving Configuration Options for Your Organization, Sites, and Pools in the Operations documentation.

Archiving Options Available Only in Windows PowerShell

Using Lync Server 2013 Management Shell, you can use cmdlets to implement options that are not available in Lync Server 2013 Control Panel. These options include the following:

- **Archive duplicate messages**. For details, see New-CsArchivingConfiguration and Set-CsArchivingConfiguration in the Operations documentation.
- **Export archived data**. For details, see Export-CsArchivingData

How Do I Access Archived Data?

Access to archived data is dependent on where the data is stored:

- **Microsoft Exchange storage**. If you choose the SharePoint integration option, Lync Server deposits the archiving content in the Exchange 2013 store for all users who are homed on Exchange 2013, and who have had their mailboxes put on In-Place Hold. Archived data is stored in user mailboxes Recoverable items folder, which is generally invisible to users, and can only be searched by users with an Exchange **Discovery Management** role. Exchange enables federated search and discovery, along with SharePoint, if it is deployed. For more details about storage, retention, and discovery of data stored in Exchange, see the Exchange 2013 and SharePoint documentation.
- **Lync Server storage**. If you set up Lync Server 2013 Archiving databases for storage of Lync Server data, Lync Server deposits archiving content in the Lync Server Archiving databases (SQL Server databases) for any users not homed on Exchange 2013, and who have not had their mailboxes put on In-Place Hold. This data is not searchable, but it can be exported to formats that are searchable using other tools. For details about exporting data stored in Archiving databases, see Exporting Archived Data in the Operations documentation.

For more details about how Lync Server 2013 and Exchange 2013 work together, see Exchange Server and SharePoint Integration Support in the Supportability documentation.

1.7.12.2 Managing the Archiving of Internal and External Communications

Managing the Archiving of Internal and External Communications

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Archiving >

Topic Last Modified: *2012-10-09*

In Lync Server 2013, you use Archiving policies to enable and disable archiving for internal communications and external communications if you do not use Microsoft Exchange integration or you have users who are not homed on Exchange 2013 with their mailboxes put on In-Place Hold. This includes the following Archiving policies:

- A global policy that is created by default when you deploy Lync Server 2013.
- Optional site-level and user-level policies that you can create and use to specify how archiving is implemented for specific sites or users.

You initially set up Archiving policies when you deploy Archiving, but you can change, add, and delete policies after deployment. In Lync Server 2013 Control Panel, you can use the **Archiving Policy** page of the **Archiving and Monitoring** group to manage policies at the global level, site level, and user level. If you integrate your Lync Server storage with Exchange 2013 storage, the Exchange user policies take precedence over the Lync Server 2013 archiving policies.

For details about how policies are implemented, including the hierarchy of policies, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

Note:

To control the implementation of Archiving, you must specify options in Archiving configurations, such as whether to archive IM or conferencing, the use of critical mode, and purging options. By default no options are enabled in the global Archiving configuration or any site or pool Archiving configuration. You should specify all appropriate options in the Archiving configurations before enabling Archiving for internal or external communications in the Archiving policies. For details, see Managing Archiving Configuration Options for Your Organization, Sites, and Pools in the Operations documentation.

If you enable Microsoft Exchange integration for your deployment, Exchange policies control whether archiving is enabled for the users who are homed on Exchange 2013 and have their mailboxes put on In-Place Hold. For details, see Setting Up Policies for Archiving When Using Exchange Server Integration in the Deployment documentation.

- Creating an Archiving Policy to Enable or Disable Archiving of Internal or External Communications for Specific Sites or Users
- Changing an Archiving Policy to Enable or Disable Archiving of Internal or External Communications for Your Organization, Sites, or Users
- Applying an Archiving Policy to Users
- Setting Up Policies for Archiving When Using Exchange Server Integration
- Deleting an Archiving Policy

Creating an Archiving Policy to Enable or Disable Archiving of Internal or External Communications for Specific Sites or Users

See Also

Operations > Managing Lync Server 2013 Archiving > Managing the Archiving of Internal and External Communications >

Topic Last Modified: *2013-02-23*

In Lync Server 2013, you use policies to enable and disable archiving for internal communications and external communications for users homed on Lync Server 2013. This includes the following Archiving policies:

- A global policy that is created by default when you deploy Lync Server 2013.
- Optional site-level and user-level policies that you can create and use to specify how archiving is implemented for specific sites or users.

You initially set up Archiving policies when you deploy Archiving, but you can change, add, and delete policies after deployment. In Lync Server 2013 Control Panel, you can use the **Archiving Policy** page of the **Archiving and Monitoring** group to manage policies at the global level, site level, and user level. If you integrate your Lync Server storage with Exchange 2013 storage, the Exchange user policies take precedence over the Lync Server 2013 archiving policies.

For details about how policies are implemented, including the hierarchy of policies, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

Note:

To control the implementation of Archiving, you must specify options in Archiving configurations, such as whether to archive IM or conferencing, the use of critical mode, and purging options. By default no options are enabled in the global Archiving configuration or any site or pool Archiving configuration. You should specify all appropriate options in the Archiving configurations before enabling Archiving for internal or external communications in the Archiving policies. For details, see Managing Archiving Configuration Options for Your Organization, Sites, and Pools in the Operations documentation.

If you enabled Microsoft Exchange integration for your deployment, Exchange policies control whether archiving is enabled for the users who are homed on Exchange 2013 and have their mailboxes put on In-Place Hold. For details, see Setting Up Policies for Archiving When Using Exchange Server Integration in the Deployment documentation.

⊟To create an archiving policy for a site or users

1. From a user account that is assigned to the CsArchivingAdministrator or CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Archiving Policy**.
4. Click **New**, and then do one of the following:
   - To create a site-level archiving policy, click **Site policy** and then, in **Select a site**, click the site to which the policy is to be applied.
   - To create a user-level archiving policy, click **User policy**.

5. In **New Archiving Policy**, do the following:
   - In **Name**, specify a name for the new policy (for example, externalContoso).
   - In **Description**, provide details about what the policy is (for example, External user archiving policy for Contoso).
   - To control archiving of communications with internal users, select or clear the **Archive internal communications** check box.
   - To control archiving of communications with external users, select or clear the **Archive external communications** check box.
6. Click **Commit**.

> **Important:**
> The settings of a user policy only apply to the specific users and user groups to which you apply the policy. For details, see Applying an Archiving Policy to Users

Creating an Archiving Policy by Using Windows PowerShell Cmdlets

Archiving policies can be created by using Windows PowerShell and the **Remove-CsArchivingPolicy** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To create a new archiving policy at the site scope

- This command creates a new archiving policy for the Redmond site:

```
New-CsArchivingPolicy -Identity "site:Redmond"
```

To create a new archiving policy at the per-user scope

- To create a new archiving policy at the per-user scope, simply specify a unique Identity when creating the policy:

```
New-CsArchivingPolicy -Identity "RedmondArchivingPolicy"
```

To create a new archiving policy that enables archiving of internal communication sessions

- Because no parameters (other than the mandatory Identity parameter) were specified in the preceding commands, the new policies will use the default values for all their properties. To create policies that use different property values, simply include the appropriate parameter and parameter value. For example, to create an archiving policy that permits archiving of internal instant messaging sessions use a command like this:

```
New-CsArchivingPolicy -Identity "site:Redmond" -ArchiveInternal $True
```

To create a new archiving policy that enables archiving of both internal and external communication sessions

- Multiple property values can be modified by including multiple parameters. For example, this command configures the new policy to archiving both internal and external instant messaging sessions:

```
New-CsArchivingPolicy -Identity "site:Redmond" -ArchiveInternal $True -
```

For more information, see the help topic for the New-CsArchivingPolicy cmdlet.

Changing an Archiving Policy to Enable or Disable Archiving of Internal or External Communications for Your Organization, Sites, or Users

See Also

Operations > Managing Lync Server 2013 Archiving > Managing the Archiving of Internal and External Communications >

Topic Last Modified: *2013-02-23*

In Lync Server 2013, you use policies to enable and disable archiving for internal communications and external communications for users homed on Lync Server 2013. This includes the following Archiving policies:

- A global policy that is created by default when you deploy Lync Server 2013.
- Optional site-level and user-level policies that you can create and use to specify how archiving is implemented for specific sites or users.

You initially set up Archiving policies when you deploy Archiving, but you can change, add, and delete policies after deployment. In Lync Server 2013 Control Panel, you can use the **Archiving Policy** page of the **Archiving and Monitoring** group to manage policies at the global level, site level, and user level. If you integrate your Lync Server storage with Exchange 2013 storage, the Exchange user policies take precedence over the Lync Server 2013 archiving policies.

For details about how policies are implemented, including the hierarchy of policies, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

Note:

If you enabled Microsoft Exchange integration for your deployment, Exchange policies control whether archiving is enabled for the users who are homed on Exchange 2013 and have their mailboxes put on In-Place Hold. For details, see Setting Up Policies for Archiving When Using Exchange Server Integration in the Deployment documentation. You should specify all appropriate options in the Archiving configurations before enabling Archiving. For details, see Managing Archiving Configuration Options for Your Organization, Sites, and Pools in the Operations documentation.

To change an archiving policy

1. From a user account that is assigned to the CsArchivingAdministrator or CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Archiving Policy**.
4. In the list of policies, do one of the following:
   - To change the policy for your entire deployment, click **Global** in the list of policies, click **Edit**, and then click **Show details**.
   - To change the policy for a single site, click the site name in the list of

policies, click **Edit**, and then click **Show details**.
- To change the policy for a single user or user group, click the user or user group name in the list of policies, click **Edit**, and then click **Show details**.

5. On the **Edit Archiving Policy** page, do the following:
   - To enable or disable internal archiving for the policy, select or clear the **Archive internal communications** check box.
   - To enable or disable external archiving for the policy, select or clear the **Archive external communications** check box.
6. Click **Commit**.

Important:

The settings of a user policy only apply to the specific users and user groups to which you apply the policy. For details, see Applying an Archiving Policy to Users

Enabling and Disabling Archiving by Using Windows PowerShell Cmdlets

Archiving can be enabled and disabled (for both internal and external communication sessions) by using the **Set-CsArchivingPolicy** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable the archiving of internal communication sessions

- To enable archiving of internal communication sessions, set the value of the **ArchiveInternal** property to True ($True). For example:

```
Set-CsArchivingPolicy -Identity "global" -ArchiveInternal $True
```

To enable the archiving of external communication sessions

- To enable archiving of external communication sessions, set the value of the **ArchiveExternal** property to True ($True). For example:

```
Set-CsArchivingPolicy -Identity "global" -ArchiveExternal $True
```

To enable the archiving of both internal and external communication sessions

- To enable archiving of both internal and external communications sessions, set both the **ArchiveInternal** and the **ArchiveExternal** properties to True:

```
Set-CsArchivingPolicy -Identity "global" -ArchiveInternal $True -Archiv
```

To disable archiving

- To disable archiving altogether, set both the **ArchiveInternal** and **ArchiveExternal** properties to False ($False). For example:

```
Set-CsArchivingPolicy -Identity "global" -ArchiveInternal $False -Archi
```

For more information, see the help topic for the Set-CsArchivingPolicy cmdlet.

Managing the Archiving of Internal and External Communications

Applying an Archiving Policy to Users

See Also

Operations > Managing Lync Server 2013 Archiving > Managing the Archiving of Internal and External Communications >

Topic Last Modified: *2013-02-23*

If a user has been enabled for Lync Server 2013 and you have created one or more user policies for archiving for users homed on Lync Server 2013, you can implement archiving support for specific users by applying the appropriate policies to those users or user groups. For example, if you create a policy to support archiving of internal communications, you can apply it to at least one user or user group to support archiving of the user's Lync Server 2013 communications.

Note:

If you enabled Microsoft Exchange integration for your deployment, Exchange In-Place Hold policies control whether archiving is enabled for the users who are homed on Exchange 2013 and have their mailboxes put on In-Place Hold. For details, see Setting Up Policies for Archiving When Using Exchange Server Integration in the Deployment documentation.
You should specify all appropriate options in the Archiving configurations before enabling Archiving. For details, see Managing Archiving Configuration Options for Your Organization, Sites, and Pools in the Operations documentation.

Use the procedure in this topic to apply a previously created Archiving user policy to one or more user accounts or user groups.

⊟To apply an archiving user policy to a user account

1. From a user account that is assigned to the CsArchivingAdministrator or CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**, and then search for the user account that you want to configure.
4. In the table that lists the search results, click the user account, click **Edit**, and then click **Show details**.
5. In **Edit Lync Server User** under **Archiving policy**, select the archiving user policy that you want to apply.

   Note:

   The **<Automatic>** settings apply the default server installation settings. These settings are applied automatically by the server.
6. Click **Commit**.

Assigning a Per-User Archiving Policy by Using Windows PowerShell Cmdlets

Per-user archiving policies can be assigned by using Windows PowerShell and the **Grant-CsArchivingPolicy** cmdlet. You can run this cmdlet from either the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user archiving policy to a single user

- The following command assigns the per-user archiving policy RedmondArchivingPolicy to the user Ken Myer.

```
Grant-CsArchivingPolicy -Identity "Ken Myer" -PolicyName "RedmondArchiv
```

To assign a per-user archiving policy to multiple users

- This command assigns the per-user archiving policy RedmondArchivingPolicy to all users who have accounts homed on the Registrar pool atl-cs-001.litwareinc.com. For details about the Filter parameter used in this command, see the Get-CsUser cmdlet documentation.

```
Get-CsUser -Filter {RegistrarPool -eq "atl-cs-001.litwareinc.com"} | Gr
```

To assign a per-user archiving policy

- The following command unassigns any per-user archiving policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsArchivingPolicy -Identity "Ken Myer" -PolicyName $Null
```

For details, see the Grant-CsArchivingPolicy cmdlet documentation.

Assigning Per-User Policies

1.7.12.2.4 Setting Up Policies for Archiving When Using Exchange Server Integration

Setting Up Policies for Archiving When Using Exchange Server Integration

Configuring Support for Archiving > Configuring and Assigning Archiving Policies > Setting Up Archiving Policies for Users >

Topic Last Modified: *2012-10-09*

If users homed on Exchange 2013 have their mailboxes put on In-Place Hold, Exchange In-Place Hold policies control archiving for those users. If you use Microsoft Exchange integration for your deployment, Exchange 2013 policies override Lync Server Archiving policies for users who are homed on Exchange 2013. For information about configuring Exchange Archiving policies, see the Exchange 2013 documentation. For details about setting up user policies for users homed on Lync Server 2013, see Setting Up User Policies for Archiving in Lync Server in the Deployment documentation. For details about how policies work, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

Note:

If you deploy Exchange 2013 and Lync Server 2013 in the same forest, your Exchange 2013 In-Place Hold policies control archiving. If you deploy Exchange 2013 and Lync Server 2013 in separate forests, see “Deploying Lync Server and Microsoft Exchange in Different Forests” in Deployment Checklist for Archiving.

Deleting an Archiving Policy

See Also

Operations > Managing Lync Server 2013 Archiving > Managing the Archiving of Internal and External Communications >

Topic Last Modified: *2013-02-23*

You can delete a user policy or site policy. The global policy cannot be removed. If you try to delete the global policy, Lync Server 2013 automatically resets the policy to the default values.

> **Note:**
>
> If you enabled Microsoft Exchange integration for your deployment, Exchange policies control whether archiving is enabled for the users who are homed on Exchange 2013 and have their mailboxes put on In-Place Hold. For details, see Setting Up Policies for Archiving When Using Exchange Server Integration in the Deployment documentation.

To delete a user or site policy for archiving

1. From a user account that is assigned to the CsArchivingAdministrator or CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Archiving Policy**.
4. In the list of archiving policies, click the user or site policy that you want to delete, click **Edit**, and then click **Delete**.
5. Click **Commit**.

Removing Archiving Policies by Using Windows PowerShell Cmdlets

Archiving policies can be deleted by using Windows PowerShell and the **Remove-CsArchivingPolicy** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specified archiving policy

- As an example, **Remove-CsArchivingPolicy** deletes the policy with the Identity site:Redmond. Note that, when a policy configured at the site scope is deleted, users previously managed by the site policy will automatically be governed by the global archiving policy instead. The following command removes the archiving applied to the Redmond site:

```
Remove-CsArchivingPolicy -Identity site:Redmond
```

To remove all the archiving policies applied to the per-user scope

- This command removes all the archiving policies applied to the per-user scope:

```
Get-CsArchivingPolicy -Filter "tag:*" | Remove-CsArchivingPolicy
```

To remove all the archiving policies that disable internal archiving

- This command removes all the archiving policies where internal archiving has been disabled:

```
Get-CsArchivingPolicy | Where-Object {$_.ArchiveInternal -eq $False} |
```

For more information, see the help topic for the Remove-CsArchivingPolicy cmdlet.

Topic Last Modified: *2012-11-01*

In Lync Server 2013 Control Panel, you use Archiving configurations to specify how archiving is implemented. This includes the following Archiving configurations:

- A global configuration that is created by default when you deploy Lync Server 2013.
- Optional site-level and pool-level configurations that you can create and use to specify how archiving is implemented for specific sites or pools.

You initially set up Archiving configurations when you deploy Archiving, but you can change, add, and delete configurations after deployment. In Lync Server 2013 Control Panel, you can use the **Archiving Configuration** page of the **Archiving and Monitoring** group to manage configurations at the global level, site level, and pool level. For details about how Archiving configurations are implemented, including which options you can specify, and the hierarchy of Archiving configurations, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

Note:

To use archiving, you must configure Archiving policies to specify whether to enable archiving for internal communications, for external communications, or for both for all users homed on Lync Server 2013. By default, archiving is not enabled for either internal or external communications. If you use Microsoft Exchange integration, you must enable and configure Exchange 2013 to support archiving for all users homed on Exchange 2013 who have had their mailboxes put on In-Place Hold.

Prior to enabling Archiving, you should specify the appropriate Archiving configurations for your deployment and, optionally, for specific sites and pools, as described in this section. For details about enabling Archiving, see Configuring and Assigning Archiving Policies in the Deployment documentation.

To view archiving configuration information by using Windows PowerShell cmdlets

- You can view Archiving configuration information by using Windows PowerShell and the **Get-CsArchivingConfiguration** cmdlet. You can run this cmdlet from either the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

  In the Lync Server Management Shell, use the following command to view information about all of your archiving configuration settings:

```
Get-CsArchivingConfiguration
```

- Creating an Archiving Configuration to Manage Archiving for Specific Sites or Pools
- Enabling or Disabling Archiving of IM or Conferencing Sessions
- Enabling or Disabling the Purging of Archived Data
- Enabling or Disabling Critical Mode to Block or Allow IM and Web Conferencing Sessions If Archiving Fails
- Enable or Disable Sending an Archiving Disclaimer to Federated Partners
- Enabling or Disabling Integration with Exchange Storage
- Deleting an Archiving Configuration

Managing Lync Server 2013 Archiving

1.7.12.3.1 Creating an Archiving Configuration to Manage Archiving for Specific Sites or Pools

Creating an Archiving Configuration to Manage Archiving for Specific Sites or Pools

See Also

Operations > Managing Lync Server 2013 Archiving > Managing Archiving Configuration Options for Your Organization, Sites, and Pools >

***Topic Last Modified:** 2013-02-23*

In Lync Server 2013 Control Panel, you use Archiving configurations to control how archiving is implemented in your deployment. This includes the following Archiving configurations:

- A global configuration that is created by default when you deploy Lync Server 2013.
- Optional site-level and pool-level configurations that you can create and use to specify how archiving is implemented for specific sites or pools.

You initially set up Archiving configurations when you deploy Archiving, but you can change, add, and delete configurations after deployment. For details about how Archiving configurations are implemented, including which options you can specify and the hierarchy of Archiving configurations, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

Note:

To use archiving, you must configure Archiving policies to specify whether to enable archiving for internal communications, for external communications, or for both for users homed on Lync Server 2013. By default, archiving is not enabled for either internal or external communications. Before enabling Archiving in any policies, you should specify the appropriate Archiving configurations for your deployment and, optionally, for specific sites and pools, as described in this section. For details about enabling Archiving, see Configuring and Assigning Archiving Policies in the Deployment documentation.
If you decide after you deploy Archiving that you want to use Microsoft Exchange integration to store archiving data and files on Exchange 2013 servers and all your users are homed on your Exchange 2013 servers, you should remove the SQL Server database configuration from your topology. You must use Topology Builder to do this. For details, see Changing Archiving Database Options in the Operations documentation.

⊟To create an archiving configuration for a site or pool

1. From a user account that is assigned to the CsArchivingAdministrator or CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Archiving Configuration**.
4. On the **Archiving Configuration** page, click **New**, and then do one of the following:
   - To create a site archiving configuration, click **Site Configuration** and then, in **Select a site**, select the site to be configured for archiving.
   - To create a pool archiving configuration, click **Pool Configuration** and then, in **Select a pool**, select the pool to be configured for archiving.
5. In **New Archiving Setting**, in the **Archiving setting** drop-down list box, do one of the following:
   - To enable archiving only for instant messaging (IM) sessions, click **Archive IM sessions**.
   - To enable archiving for both IM sessions and web conferences, click **Archive IM and web conferencing sessions**.
   - To disable archiving for the policy, click **Disable archiving**.
6. Also in **New Archiving Setting**, do the following:
   - To block activity when archiving is not available, select the **Block instant messaging (IM) or web conferencing sessions if archiving fails** check box.
   - To use Microsoft Exchange Server to store archiving data, click the **Microsoft Exchange integration** check box.
   - To enable data purging, select the **Enable purging of archiving data** check box, and then do one of the following:
     - To specify purging after a specific number of days, click **Purge exported archiving data and stored archiving data after maximum duration (days)**, and then specify the number of days.
     - To limit purging to archiving data that has been exported, click **Purge exported archiving data only**.
7. Click **Commit**.

Creating Archiving Configuration Settings by Using Windows PowerShell Cmdlets

Archiving configuration settings can be created by using Windows PowerShell and the New-CsArchivingConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To create a new collection of archiving configuration settings for a site

- The following command creates a new collection of archiving configuration settings for the Redmond site:

  ```
  New-CsArchivingConfiguration -Identity "site:Redmond"
  ```

⊟To create a new collection of archiving configuration settings that only allow IM archiving

- Because no parameters (other than the mandatory Identity parameter) were specified in the preceding command, the new collection of configuration settings will use the default values for all its properties. To create settings that use different property values, simply include the appropriate parameter and parameter value. For example, to create a collection of archiving configuration settings that, by default, allow archiving of instant messaging sessions, only use a command like this:

```
New-CsArchivingConfiguration -Identity "site:Redmond" -EnableArchiving
```

To specify multiple property values when creating archiving configuration settings

- Multiple property values can be modified by including multiple parameters. For example, this command configures the new settings to archive instant messaging sessions and to block instant messaging of the archiving service is not available:

```
New-CsArchivingConfiguration -Identity "site:Redmond" -EnableArchiving
```

For more information, see the help topic for the New-CsArchivingConfiguration cmdlet.

In Lync Server 2013 Control Panel, you use Archiving configurations to enable and disable archiving of IM, conferencing sessions, or both. This includes the following Archiving configurations:

- A global configuration that is created by default when you deploy Lync Server 2013.
- Optional site-level and pool-level configurations that you can create and use to specify how archiving is implemented for specific sites or pools.

You initially set up Archiving configurations when you deploy Archiving, but you can change, add, and delete configurations after deployment. For details about how Archiving configurations are implemented, including which options you can specify and the hierarchy of Archiving configurations, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

Note:

To use archiving, you must configure Archiving policies to specify whether to enable archiving for internal communications, for external communications, or for both for users homed on Lync Server 2013. By default, archiving is not enabled for either internal or external communications. Before enabling Archiving in any policies, you should specify the appropriate Archiving configurations for your deployment and, optionally, for specific sites and pools, as described in this section. For details about enabling Archiving, see Configuring and Assigning Archiving Policies in the Deployment documentation.
If you decide after you deploy Archiving that you want to use Microsoft Exchange integration to store archiving data and files on Exchange 2013 servers and all your users

are homed on your Exchange 2013 servers, you should remove the SQL Server database configuration from your topology. You must use Topology Builder to do this. For details, see Changing Archiving Database Options in the Operations documentation.

⊟To enable or disable archiving of IM or conferencing sessions

1. From a user account that is assigned to the CsArchivingAdministrator or CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Archiving Configuration**.
4. Select the appropriate global, site, or pool configuration from the list of archiving configurations, click **Edit**, click **Show details**, and then do the following:
   - To enable archiving only for instant messaging (IM) sessions, click **Archive IM sessions**.
   - To enable archiving for both IM sessions and conferences, click **Archive IM and conferencing sessions**.
   - To disable archiving for the policy, click **Disable archiving**.
5. Click **Commit**.

Operations > Managing Lync Server 2013 Archiving > Managing Archiving Configuration Options for Your Organization, Sites, and Pools >

Topic Last Modified: *2013-02-23*

In Lync Server 2013 Control Panel, you use Archiving configurations to enable and disable purging and configure how purging is implemented. This includes the following Archiving configurations:

- A global configuration that is created by default when you deploy Lync Server 2013.
- Optional site-level and pool-level configurations that you can create and use to specify how archiving is implemented for specific sites or pools.

You initially set up Archiving configurations when you deploy Archiving, but you can change, add, and delete configurations after deployment. For details about how Archiving configurations are implemented, including which options you can specify and the hierarchy of Archiving configurations, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

Note:

To use archiving for users who are homed on Lync Server 2013 you must configure Archiving policies to specify whether to enable archiving for internal communications, for external communications, or for both. By default, archiving is not enabled for either internal or external communications. Prior to enabling Archiving in any policies, you should specify the appropriate Archiving configurations for your deployment and, optionally, for specific sites and pools, as described in this section. For details about enabling Archiving,

see Configuring and Assigning Archiving Policies in the Deployment documentation.
If you decide after you deploy Archiving that you want to use Microsoft Exchange integration to store archiving data and files on Exchange 2013 servers and all your users are homed on your Exchange 2013 servers, you should remove the SQL Server database configuration from your topology. You must use Topology Builder to do this. For details, see Changing Archiving Database Options in the Operations documentation.

To enable or disable purging for archiving

1. From a user account that is assigned to the CsArchivingAdministrator or CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Archiving Configuration**.
4. Click the name of the appropriate global, site, or pool configuration in the list of archiving configurations, click **Edit**, click **Show details**, and then do the following:
   - To enable purging, select the **Enable purging of archiving data** check box and then do one of the following:
     - To purge all records, click the **Purge exported archiving data and stored archiving data after maximum duration (days)**, and then specify the number of days.
     - To purge only the data that has been exported, click **Purge exported archiving data only**.
   - To disable purging, clear the **Enable purging of archiving data** check box.
5. Click **Commit**.

Enabling or Disabling the Purging of Archiving Data by Using Windows PowerShell Cmdlets

Enabling and disabling the automated purging of archiving data can be managed by using Windows PowerShell and the **Set-CsArchivingConfiguration** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable the purging of all archiving data

- To enable the purging of all archiving data set the **EnablePurging** property to true ($True). For example:

  ```
  Set-CsArchivingConfiguration -Identity "site:Redmond" -EnablePurging $T
  ```

  After this command is run, then every day Lync Server will purge all archiving records older than the value specified for the **KeepArchivingDataForDays** property.

To enable the purging only of exported archiving data

- To limit purging to archiving records that have been exported to a data file (by using the Export-CsArchivingData cmdlet) you must also set the PurgeExportedArchivesOnly property to True ($True). For example:

  ```
  Set-CsArchivingConfiguration -Identity "site:Redmond" -EnablePurging $T
  ```

After this command is run, Lync Server will only purge archiving records that meet two criteria: 1) they are older than the value specified for the **KeepArchivingDataForDays** property; and, 2) they have been exported by using the **Export-CsArchivingData** cmdlet.

To disable the purging of all archiving data

- To disable the automated purging of archiving records, set the **EnablePurging** property to False ($False). For example:

```
Set-CsArchivingConfiguration -Identity "site:Redmond" -EnablePurging $F
```

For more information, including additional options for purging archiving data, see the help topic for the Set-CsArchivingConfiguration cmdlet.

In Lync Server 2013 Control Panel, you use Archiving configurations to enable and disable critical mode. This includes the following Archiving configurations:

- A global configuration that is created by default when you deploy Lync Server 2013.
- Optional site-level and pool-level configurations that you can create and use to specify how archiving is implemented for specific sites or pools.

You initially set up Archiving configurations when you deploy Archiving, but you can change, add, and delete configurations after deployment. For details about how Archiving configurations are implemented, including which options you can specify and the hierarchy of Archiving configurations, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

Note:

To use archiving, you must configure Archiving policies to specify whether to enable archiving for internal communications, for external communications, or for both for users homed on Lync Server 2013. By default, archiving is not enabled for either internal or external communications. Prior to enabling Archiving in any policies, you should specify the appropriate Archiving configurations for your deployment and, optionally, for specific sites and pools, as described in this section. For details about enabling Archiving, see Configuring and Assigning Archiving Policies in the Deployment documentation.
If you decide after you deploy Archiving that you want to use Exchange Server integration to store archiving data and files on Exchange 2013 servers and all your users

are homed on your Exchange 2013 servers, you should remove the SQL Server database configuration from your topology. You must use Topology Builder to do this. For details, see Changing Archiving Database Options in the Operations documentation.

To enable or disable blocking of IM and web conferencing sessions if archiving fails

1. From a user account that is assigned to the CsArchivingAdministrator or CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Archiving Configuration**.
4. Click the name of the appropriate global, site, or pool configuration in the list of archiving configurations, click **Edit**, click **Show details**, and then do the following:
5. To set how archiving behaves when a failure occurs, select or clear the **Block instant messaging (IM) or web conferencing sessions if archiving fails** check box.
6. Click **Commit**.

Enabling and Disabling Critical Mode by Using Windows PowerShell Cmdlets

You can enable or disable critical mode using the **Set-CsArchivingConfiguration** cmdlet. You can run this cmdlet from either the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable critical mode

- To enable critical mode, set the value of the BlockOnArchiveFailure property to True ($True). For example:

```
Set-CsArchivingConfiguration -Identity "site:Redmond" -BlockOnArchiveFa
```

To disable critical mode

- To disable critical mode, set the value of the BlockOnArchiveFailure property to False ($False). For example:

```
Set-CsArchivingConfiguration -Identity "site:Redmond" -BlockOnArchiveFa
```

For more information, see the Help topic for the Set-CsArchivingConfiguration cmdlet.

Managing Archiving Configuration Options for Your Organization, Sites, and Pools

Enable or Disable Sending an Archiving Disclaimer to Federated Partners

Deployment > Deploying Archiving > Configuring Support for Archiving >

Topic Last Modified: *2013-02-23*

At the time you deployed your Edge Servers and enabled federation for your organization, you should have specified whether to automatically send the archiving disclaimer to federated partners. If you archive external communications, you should enable the sending of an archiving disclaimer. Use the procedure in this topic to change that configuration.

> **Note:**
>
> The following procedure assumes that you have already enabled federation for your organization. For details about enabling federation, see Enable or Disable Remote User Access in the Deployment documentation or the Operations documentation.

⊟To enable or disable sending of an archiving disclaimer to federated partners

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **External User Access**, click **Access Edge Configuration**.
4. On the **Access Edge Configuration** tab, click **Global**, click **Edit**, and then click **Show details**.
5. In **Edit Access Edge Configuration**, under **Enable communications with federated users**, select or clear the **Send archiving disclaimer to federated partners** check box to enable or disable automatically sending the archiving disclaimer.
6. Click **Commit**.

To enable federated users to collaborate with users in your Lync Server 2013 deployment, you must have also configured at least one external access policy to support federated user access. For details, see Manage XMPP Federated Partners for Your Organization in the Deployment documentation or the Operations documentation. For details about controlling access for specific federated domains, see Configure Support for Allowed External Domains in the Deployment documentation or Operations documentation.

Enabling or Disabling the Archiving Disclaimer by Using Windows PowerShell Cmdlets

The use of the archiving disclaimer can be managed by using Windows PowerShell and the Set-CsAccessEdgeConfiguration cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable the archiving disclaimer

- To enable the archiving disclaimer, set the value of the **EnableArchivingDisclaimer** property to True ($True):

```
Set-CsAccessEdgeConfiguration -EnableArchivingDisclaimer $True
```

To disable the archiving disclaimer

- To disable the archiving disclaimer, set the value of the **EnableArchivingDisclaimer** property to False ($False):

```
Set-CsAccessEdgeConfiguration -EnableArchivingDisclaimer $False
```

Deleting an Archiving Configuration

See Also

Operations > Managing Lync Server 2013 Archiving > Managing Archiving Configuration Options for Your Organization, Sites, and Pools >

Topic Last Modified: *2013-02-23*

You can delete a site configuration or pool configuration. The global configuration cannot be removed. If you delete the global configuration, it is automatically reset to the default values. For details about how Archiving configurations are implemented, including which options you can specify and the hierarchy of Archiving configurations, see How Archiving Works in the Planning documentation, Deployment documentation, or Operations documentation.

To delete a site or pool configuration for archiving

1. From a user account that is assigned to the CsArchivingAdministrator or CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Archiving Configuration**.
4. In the list of archiving configurations, click the site or pool configuration that you want to delete, click **Edit**, and then click **Delete**.
5. Click **Commit**.

Removing Archiving Configuration Settings by Using Windows PowerShell Cmdlets

Archiving configuration settings can be deleted by using Windows PowerShell and the **Remove-CsArchivingConfiguration** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specified collection of archiving configuration settings

- The following command removes the archiving configuration settings applied to the Redmond site:

```
Remove-CsArchivingConfiguration -Identity "site:Redmond"
```

To remove all the archiving configuration settings applied to the site scope

- This command removes all the archiving configuration settings applied to the service scope:

```
Get-CsArchivingConfiguration -Filter "site:*" | Remove-CsArchivingConfi
```

To remove archiving configuration settings based on a specified property value

- This command removes all the archiving configuration settings where

Exchange archiving has been disabled:

```
Get-CsArchivingConfiguration | Where-Object {$_.EnableExchangeArchiving
```

For more information, see the help topic for the Remove-CsArchivingConfiguration cmdlet.

1.7.12.4 Changing Archiving Database Options

Changing Archiving Database Options

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Archiving >

Topic Last Modified: *2012-11-01*

If you deploy Archiving using SQL Server storage for archiving storage for any of your users, you can make the following database storage changes:

- Use a different SQL Server database for archiving storage. This includes the primary Archiving database and any database you use for SQL Server mirroring.
- Switch to Microsoft Exchange integration to store archiving data and files on Exchange 2013 servers. If all your users are homed on your Exchange 2013 servers and you want to use Microsoft Exchange storage for all users in your deployment, you should remove the SQL Server store databases from your topology.

To make either of these changes, you must run Topology Builder, make the changes, and then publish the topology again. You can use Topology Builder to do this. Do not specify **Archiving SQL Server store** or **Enable SQL Server store mirroring** information, unless you have Lync users who are not homed on Exchange 2013 servers.

⊟To change your archiving database option

1. On a computer that is running Lync Server 2013, or on which the Lync Server administrative tools are installed, log on by using an account that is a member of the local Users group (or an account with equivalent user rights).

   > **Note:**
   > You can define a topology by using an account that is a member of the local Users group, but to publish a topology, which is required to add a component to the topology, you must use an account that is a member of the **Domain Admins** group and the **RTCUniversalServerAdmins** group, and that has full control permissions (that is, read, write, and modify) on the file share that you are using for the Lync Server 2013 file store (that is, so that Topology Builder can configure the required discretionary access control lists (DACLs), or an account with equivalent rights.

2. Start Topology Builder.
3. In the console tree, navigate to the Front End pool in which you deployed Archiving, and then click the name of the Front End pool where you want to change the database options.
4. In the **Action** menu, click **Edit Properties**.
5. In the **Edit Properties** dialog box, click **General**.
6. Scroll down to **Archiving**.

7. In **Archiving**, do the following:
   - To change to a different existing SQL Server store, under **Archiving SQL Server store**, in the drop-down list box, do the following:
     - To use an existing SQL Server store, in the drop-down list box, click the name of the SQL Server store that you want to use.
     - To specify a new SQL Server store, click **New**, and then in the **Define New SQL Server store** dialog box, do the following:
       - To use an existing SQL Server store, in the drop-down list box, click the name of the SQL Server store that you want to use.
       - To specify a new SQL Server store, click **New**, and then in the **Define New SQL Server Store** dialog box, do the following:
         - In **SQL Server FQDN**, specify the FQDN of the server on which you want to create the new SQL Server store.
         - Either click **Default Instance** to use the default instance, or, to specify a different instance, click **Named instance**, and then specify the instance you want to use.
         - If the specified SQL Server instance is in a mirroring relationship, select the **This SQL instance is in mirroring relation** check box, and then, in **Mirror port number**, specify the port number.
   - To add SQL Server store for mirroring or change to a different existing SQL Server store for SQL Server store mirroring, select **Enable SQL Server store mirroring**, and then do the following:
     - To use an existing SQL Server store for mirroring, in the **Archiving SQL Server store mirror** drop-down list box, click the name of the SQL Server store that you want to use for mirroring.
     - To specify a new SQL Server store for mirroring, click **New**, and then in the **Define New SQL Server Store** dialog box, do one of the following:
       - In **SQL Server FQDN**, specify the FQDN of the SQL Server on which you want to create the new SQL Server store.
       - Either click **Default Instance** to use the default instance, or, to specify a different instance, click **Named Instance**, and then specify the instance you want to use.
       - If the specified SQL Server instance is in a mirroring relationship, select the **This SQL instance is in mirroring relation** check box, and then, in **Mirror port number**, specify the port number.
     - If you enable SQL Server mirroring and want to add or change a SQL Server mirroring witness (a third, separate SQL Server instance that can detect the health of the primary SQL Server server and mirror instances), select the **Use SQL Server mirroring witness to enable automatic failover** check box, and then do one of the following:
       - In **SQL Server FQDN**, specify the FQDN of the server on which you want to create the new SQL Server mirroring witness.
       - Either click **Default Instance** to use the default instance, or, to specify a different instance, click **Named Instance**, and then specify the instance you want to use for the mirroring witness.
       - If the specified SQL Server instance is in a mirroring relationship, select the **This SQL instance is in mirroring relation** check box, and then, in **Mirror port number**, specify the port number.
   - To switch to Microsoft Exchange integration to store archiving data and files on Exchange 2013 servers (if all users in your deployment are homed on your Exchange 2013 servers), delete all information for Archiving databases.

   ◆Important:

   If you have any Lync users who are not homed on Exchange 2013 servers, do not delete the SQL Server store information.

8. To save the configuration, click **OK**.

   ◆Important:

The changes you make in Topology Builder do not take effect until you publish the new topology. For details, see Publishing the Updated Topology to Add Archiving Databases in the Deployment documentation.

Topic Last Modified: *2013-02-23*

Data archived in Archiving databases is not searchable or in a readable format, but you can use the Export-CsArchivingData cmdlet to extract records from the database and save them as an Outlook Electronic Mail (EML) file. For details about exporting archived data, see Export-CsArchivingData in the Operations documentation.

If you enable Microsoft Exchange integration, data is archived in Exchange 2013 stores. Data archived in Exchange 2013 is searchable and discoverable. For details about support for integrated communications for Exchange 2013 and Lync Server 2013, see Exchange Server and SharePoint Integration Support in the Supportability documentation. For details about accessing data that is archived in Exchange, see the Exchange 2013 documentation.

Exporting Archiving Data by Using Windows PowerShell Cmdlets

Archiving data can be exported by using the Export-CSArchivingData cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To export archiving data

- This command exports all the archiving data written to the archiving database atl-sql-001.litwareinc.com since June 1, 2012. The resulting output file will be stored in the folder C:\ArchivingExports.

```
Export-CsArchivingData -Identity "ArchivingDatabase:atl-sql-001.litware
```

To export archiving data for a single user

- The following command exports archiving data for a single user: kenmyer@litwareinc.com. This is done by including the UserUri parameter followed by the user’s SIP address. For example:

```
Export-CsArchivingData -Identity "ArchivingDatabase:atl-sql-001.litware
```

For more information, see the help topic for the Export-CsArchivingData cmdlet.

Topic Last Modified: *2012-11-13*

Audio/Video (A/V) communications is a key component of Microsoft Lync Server 2013. Features such as application sharing and audio and video conferencing rely on the certificates assigned to the A/V Edge service, specifically the A/V Authentication service.

Important:

1. This new feature is designed to work for the A/V Edge service and the *OAuthTokenIssuer* certificate. Other certificate types can be provisioned along with the A/V Edge service and OAuth certificate type, but will not benefit from the coexistence behavior that the A/V Edge service certificate will.
2. The Lync Server Management Shell PowerShell cmdlets used to manage Microsoft Lync Server 2013 certificates refers to the A/V Edge service certificate as the *AudioVideoAuthentication* certificate type and the OAuthServer certificate as type *OAuthTokenIssuer*. For the rest of this topic and to uniquely identify the certificates, they will be referred to by the same

identifier type, *AudioVideoAuthentication* and *OAuthTokenIssuer*.

The A/V Authentication service is responsible for issuing tokens that are used by clients and other A/V consumers. The tokens are generated from attributes on the certificate, and when the certificate expires, loss of connection and requirement to rejoin with a new token generated by the new certificate will result. A new feature in Lync Server 2013 will alleviate this problem – the ability to stage a new certificate in advance of the old one expiring and allowing both certificates to continue to function for a period of time. This feature uses updated functionality in the Set-CsCertificate Lync Server Management Shell cmdlet. The new parameter –Roll, with the existing parameter –EffectiveDate, will place the new AudioVideoAuthentication certificate in the certificate store. The older AudioVideoAuthentication certificate will still remain for issued tokens to be validated against. Beginning with putting the new AudioVideoAuthentication certificate in place, the following series of events will occur:

Tip:

Using the Lync Server Management Shell cmdlets for managing certificates, you can request separate and distinct certificates for each purpose on the Edge Server. Using the Certificate Wizard in the Lync Server Deployment Wizard assists you in creating certificates, but is typically of the **default** type which couples all certificate uses for the Edge Server onto a single certificate. The recommended practice if you are going to use the rolling certificate feature is to decouple the AudioVideoAuthentication certificate from the other certificate purposes. You can provision and stage a certificate of the Default type, but only the AudioVideoAuthentication portion of the combined certificate will benefit from the staging. A user involved in (for example) an instant messaging conversation when the certificate expires will need to log out and log back in to make use of the new certificate associated with the Access Edge service. Similar behavior will occur for a user involved in a Web conference using the Web Conferencing Edge service. The OAuthTokenIssuer certificate is a specific type that is shared across all servers. You create and manage the certificate in one place and the certificate is stored in the Central Management store for all other servers.

Additional detail is needed to fully understand your options and requirements when using the Set-CsCertificate cmdlet and using it to stage certificates prior to the current certificate expiring. The –Roll parameter is important, but essentially single purpose. If you define it as a parameter, you are telling Set-CsCertificate that you will be providing information about the certificate that will be affected defined by –Type (for example AudioVideoAuthentication and OAuthTokenIssuer), when the certificate will become effective defined by –EffectiveDate.

-Roll: The –Roll parameter is required and has dependencies that must be supplied along with it. Required parameters to fully define which certificates will be affected and how they will be applied:

-EffectiveDate: The parameter –EffectiveDate defines when the new certificate will become co-active with the current certificate. The –EffectiveDate can be close to the expiry time of the current certificate, or it can be a longer period of time. A recommended minimum –EffectiveDate for the AudioVideoAuthentication certificate would be 8 hours, which is the default token lifetime for AV Edge service tokens issued using the AudioVideoAuthentication certificate.

When staging OAuthTokenIssuer certificates, there are different requirements for the lead time before the certificate can become effective. The minimum time that the OAuthTokenIssuer certificate should have for its lead time is 24 hours before the expiration time of the current certificate. The extended lead time for the coexistence is because of other server roles that are dependent on the OAuthTokenIssuer certificate (Exchange Server, for example) which has a longer retention time for certificate created authentication and encryption key materials.

-Thumbprint: The thumbprint is an attribute on the certificate that is unique to that certificate. The –Thumbprint parameter is used to identify the certificate that will be affected by the actions of the Set-CsCertificate cmdlet.

-Type: The –Type parameter can accept a single certificate usage type or a comma separated list of certificate usage types. The certificate types are those that identify to the cmdlet and to the server what the purpose of the certificate is. For example, type AudioVideoAuthentication is for use by the A/V Edge service and the AV Authentication service. If you decide to stage and provision certificates of a different type at the same time, you must consider the longest required minimum effective lead time for the certificates. For example, you need to stage certificates of type AudioVideoAuthentication and OAuthTokenIssuer. Your minimum –EffectiveDate must be the greater of the two certificates, in this case the OAuthTokenIssuer, which has a minimum lead time of 24 hours. If you do not want to stage the AudioVideoAuthentication certificate with a lead time of 24 hours, stage it separately with an EffectiveDate that is more to your requirements.

To update or renew an A/V Edge service certificate with a –Roll and -EffectiveDate parameters

1. Log on to the local computer as a member of the Administrators group.
2. Request a renewal or new AudioVideoAuthentication certificate with exportable private key for the existing certificate on the A/V Edge service.
3. Import the new AudioVideoAuthentication certificate to the Edge Server and all other Edge Server in your pool (if you have a pool deployed).
4. Configure the imported certificate with the Set-CsCertificate cmdlet and use the –Roll parameter with the –EffectiveDate parameter. The effective date should be defined as the current certificate expire time (14:00:00, or 2:00:00 PM) minus token lifetime (by default eight hours). This gives us a time that the certificate must be set to active, and is the –EffectiveDate <string>: “7/22/2012 6:00:00 AM”.

   Important:

   For an Edge pool, you must have all AudioVideoAuthentication certificates deployed and provisioned by the date and time defined by the –EffectiveDate parameter of the first certificate deployed to avoid possible A/V communications disruption due to the older certificate expiring before all client and consumer tokens have been renewed using the new certificate.

   The Set-CsCertificate command with the –Roll and –EffectiveTime parameter:

   ```
   Set-CsCertificate -Type AudioVideoAuthentication -Thumbprint <thumb pr
   ```

   An example Set-CsCertificate command:

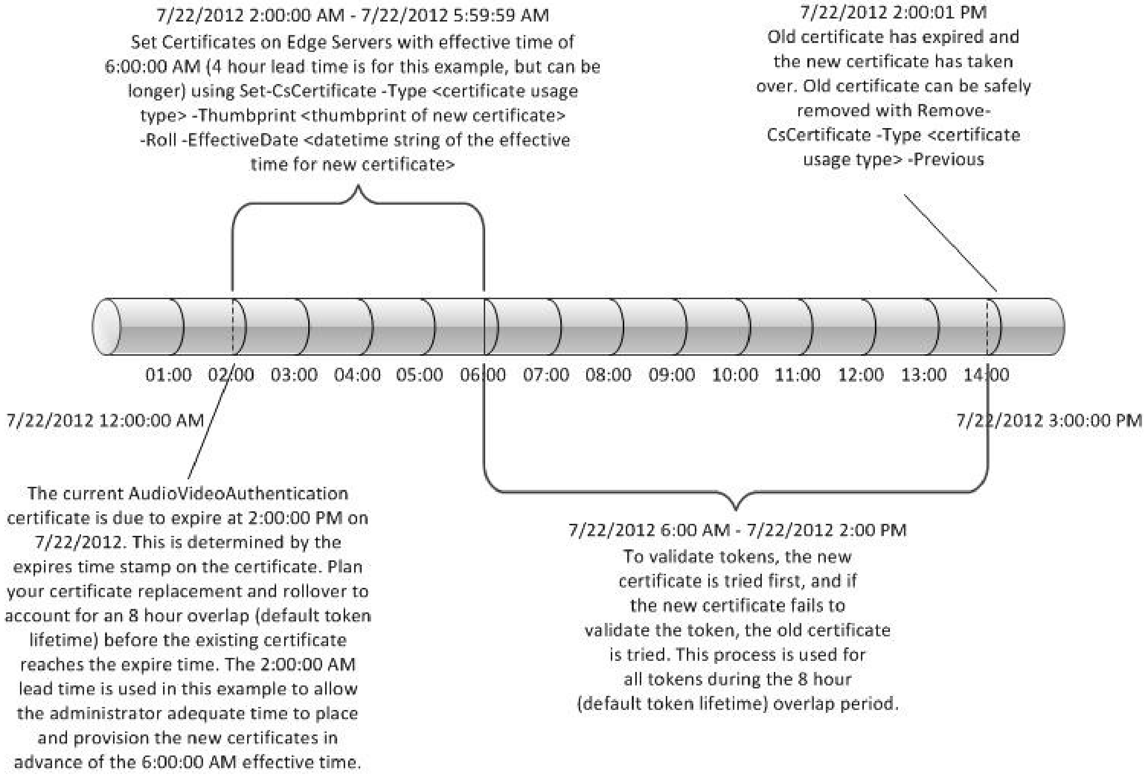
   ```
   Set-CsCertificate -Type AudioVideoAuthentication -Thumbprint "B142918E
   ```

   Important:

   The EffectiveDate must be formatted to match your server’s region and language settings. The example uses the US English Region and Language settings

To further understand the process that Set-CsCertificate, -Roll, and –EffectiveDate use to stage a new certificate for issuing new AudioVideoAuthentication tokens while still using an existing certificate to validate AudioVideoAuthentication that are in use by consumers, a visual timeline is an effective means of understanding the process.

In the following example, the administrator determines that the A/V Edge service certificate is due to expire at 2:00:00 PM on 07/22/2012. He requests and receives a new certificate and imports it to each Edge Server in his pool. At 2 AM on 07/22/2012, he begins running Get-CsCertificate with –Roll, -Thumbprint equal to the thumbprint string of the new certificate, and –EffectiveTime set to 07/22/2012 6:00:00 AM. He runs this command on each Edge Server.



7/22/2012 2:00:00 AM - 7/22/2012 5:59:59 AM
Set Certificates on Edge Servers with effective time of 6:00:00 AM (4 hour lead time is for this example, but can be longer) using Set-CsCertificate -Type <certificate usage type> -Thumbprint <thumbprint of new certificate> -Roll -EffectiveDate <datetime string of the effective time for new certificate>

7/22/2012 2:00:01 PM
Old certificate has expired and the new certificate has taken over. Old certificate can be safely removed with Remove-CsCertificate -Type <certificate usage type> -Previous

The current AudioVideoAuthentication certificate is due to expire at 2:00:00 PM on 7/22/2012. This is determined by the expires time stamp on the certificate. Plan your certificate replacement and rollover to account for an 8 hour overlap (default token lifetime) before the existing certificate reaches the expire time. The 2:00:00 AM lead time is used in this example to allow the administrator adequate time to place and provision the new certificates in advance of the 6:00:00 AM effective time.

7/22/2012 6:00 AM - 7/22/2012 2:00 PM
To validate tokens, the new certificate is tried first, and if the new certificate fails to validate the token, the old certificate is tried. This process is used for all tokens during the 8 hour (default token lifetime) overlap period.

When the effective time is reached (7/22/2012 6:00:00 AM), all new tokens are issued by the new certificate. When validating tokens, tokens will first be validated against the new certificate. If the validation fails, the old certificate is tried. The process of trying the new and falling back to the old certificate will continue until the expiry time of the old certificate. Once the old certificate has expired (7/22/2012 2:00:00 PM), tokens will only be validated by the new certificate. The old certificate can be safely removed using the Remove-CsCertificate cmdlet with the –Previous parameter.

```
Remove-CsCertificate -Type AudioVideoAuthentication -Previous
```

⊟To update or renew an OAuthTokenIssuer certificate with a –Roll and -EffectiveDate parameters

1. Log on to the local computer as a member of the Administrators group.
2. Request a renewal or new OAuthTokenIssuer certificate with exportable private key for the existing certificate on the A/V Edge service.
3. Import the new OAuthTokenIssuer certificate to a Front End Server in your pool (if you have a pool deployed). The OAuthTokenIssuer certificate is replicated globally and only needs to be updated and renewed at any server in your deployment. The Front End Server is used as an example.
4. Configure the imported certificate with the Set-CsCertificate cmdlet and use the –Roll parameter with the –EffectiveDate parameter. The effective date should be defined as the current certificate expire time (14:00:00, or 2:00:00 PM) minus a minimum of 24 hours.

   The Set-CsCertificate command with the –Roll and –EffectiveTime parameter:

   ```
   Set-CsCertificate -Type OAuthTokenIssuer -Thumbprint <thumb print of n
   ```

   An example Set-CsCertificate command:

   ```
   Set-CsCertificate -Type OAuthTokenIssuer -Thumbprint "B142918E463981A7
   ```

◆Important:

The EffectiveDate must be formatted to match your server's region and language settings. The example uses the US English Region and Language settings

When the effective time is reached (7/21/2012 1:00:00 AM), all new tokens are issued by the new certificate. When validating tokens, tokens will first be validated against the new certificate. If the validation fails, the old certificate is tried. The process of trying the new and falling back to the old certificate will continue until the expiry time of the old certificate. Once the old certificate has expired (7/22/2012 2:00:00 PM), tokens will only be validated by the new certificate. The old certificate can be safely removed using the Remove-CsCertificate cmdlet with the –Previous parameter.

```
Remove-CsCertificate -Type OAuthTokenIssuer -Previous
```

Microsoft Lync Server 2013 > Deployment >

Topic Last Modified: *2013-01-22*

Microsoft Lync Server 2013 must be able to securely, and seamlessly, communicate with other applications and server products. For example, you can configure Lync Server 2013 so that contact data and/or archiving data is stored in Microsoft Exchange Server 2013; however, this can only be done if Lync Server and Exchange are able to securely communicate with one another. Likewise, you can schedule a Lync Server conference from within Microsoft SharePoint Server; again, however, this can only be done if the two servers (SharePoint and Lync Server) trust one another. Although it's possible to use one authentication mechanism for Lync-to-Exchange communication and a separate mechanism for Lync-to-SharePoint communication, a better and more efficient approach is to use a standardized method for all server-to-server authentication and authorization.

Using a single, standardized method for server-to-server authentication is the approach taken by Lync Server 2013. For the 2013 release, Lync Server 2013 (as well as other Microsoft Server products, including Exchange 2013 and Microsoft SharePoint Server) support the OAuth (Open Authorization) protocol for server-to-server authentication and authorization. With OAuth, a standard authorization protocol used by a number of major websites, user credentials and passwords are not passed from one computer to another. Instead, authentication and authorization is based on the exchange of security tokens; these tokens grant access to a specific set of resources for a specific amount of time.

OAuth authentication typically involves three parties: a single authorization server and the two realms that need to communicate with one another. (You can also do server-to-server authentication without using an authorization server, a process that will be discussed later in this document.) Security tokens are issued by the authorization server (also known as a security token server) to the two realms that need to communicate;

these tokens verify that communications originating from one realm should be trusted by the other realm. For example, the authorization server might issue tokens that verify that users from a specific Lync Server 2013 realm are able to access a specified Exchange 2013 realm, and vice-versa.

Note:

A realm is simply a security container. By default, Lync Server 2013 uses your default SIP domain as its OAuth realm.

Lync Server 2013 supports three server-to-server authentication scenarios. With Lync Server 2013 you can:

- Configure server-to-server authentication between an on-premise installation of Lync Server 2013 and an on-premises installation of Exchange 2013 and/or Microsoft SharePoint Server.
- Configure server-to-server authentication between a pair of Office 365 components (for example, between Microsoft Exchange 365 and Microsoft Lync Server 365, or between Microsoft Lync Server 365 and Microsoft SharePoint 365).
- Configure server-to-server authentication in a cross-premises environment (that is, server-to-server authentication between an on-premises server and an Office 365 component).

Note that, at this point in time, only Exchange 2013, SharePoint Server, and Lync Server 2013 support server-to-server authentication; if you are not running one of these servers then you will not be able to fully implement OAuth authentication.

It should also be pointed out that you do not need to use server-to-server authentication: server-to-server authentication is not required in order to deploy Lync Server 2013. If Lync Server 2013 does not need to communicate with other servers (such as Exchange 2013) then server-to-server authentication is not needed.

However, server-to-server authentication is required if you want to use some of Lync Server's new features, such as the "unified contact store." With unified contact store, Lync Server 2013 contact information is stored in Exchange 2013 instead of in Lync Server; this enables users to have a single set of contacts that is readily accessible from within Lync, Microsoft Outlook, or Microsoft Outlook Web Access. Because the unified contact store requires Lync Server 2013 to share information with Exchange 2013, you must use server-to-server authentication in order to deploy the feature. Server-to-server authentication is also required if you choose to use Exchange archiving, in which the transcripts of instant messaging sessions are saved as Exchange 2013 emails rather than as individual database records.

For the Office 365 version of Lync Server to communicate with its Exchange counterpart, Lync Server 2013 must first obtain a security token from the authorization server. Lync Server then uses that security token to identify itself to Exchange 365. The Office 365 version of Exchange must go through the same process in order to communicate with Lync Server 2013.

However, for on-premises server-to-server authentication between two Microsoft servers there is no need to use a third-party token server. Server products such as Lync Server 2013 and Exchange 2013 have a built-in token server that can be used for authentication purposes with other Microsoft servers (such as SharePoint server) that support server-to-server authentication. For example, Lync Server 2013 can issue and sign a security token by itself, then use that token to communicate with Exchange 2013. In a case like this, there is no need for a third-party token server.

In order to configure server-to-server authentication for an on-premises implementation of Lync Server 2013 you must do two things:

- Assign a certificate to Lync Server's built-in token issuer.

- Configure the server that Lync Server 2013 will communicate with to be a "partner application." For example, if Lync Server 2013 needs to communicate with Exchange 2013 then you will need to configure Exchange to be a partner application.

> **Note:**
> A "partner application" is any application that Lync Server 2013 can directly exchange security tokens with, without having to go through a third-party security token server.

Assigning a Server-to-Server Authentication Certificate to Microsoft Lync Server 2013
Configuring Microsoft Lync Server 2013 in a Cross-Premises Environment

1.7.13.2.1 Assigning a Server-to-Server Authentication Certificate to Microsoft Lync Server 2013

Assigning a Server-to-Server Authentication Certificate to Microsoft Lync Server 2013

Microsoft Lync Server 2013 > Deployment > Managing Server-to-Server Authentication (Oauth) and Partner Applications >

Topic Last Modified: *2012-10-01*

To determine whether or not a server-to-server authentication certificate has already been assigned to Microsoft Lync Server 2013, run the following command from the Lync Server 2013 Management Shell:

```
Get-CsCertificate -Type OAuthTokenIssuer
```

If no certificate information is returned you must assign a token issuer certificate before you can use server-to-server authentication. As a general rule, any Lync Server 2013 certificate can be used as your OAuthTokenIssuer certificate; for example, your Lync Server 2013 default certificate can also be used as the OAuthTokenIssuer certificate. (The OAUthTokenIssuer certificate can also be any Web server certificate that includes the name of your SIP domain in the Subject field.) The primary two requirements for the certificate used for server-to-server authentication are these: 1)the same certificate must be configured as the OAuthTokenIssuer certificate on all of your Front End Servers; and, 2) the certificate must be at least 2048 bits.

If you do not have a certificate that can be used for server-to-server authentication you can obtain a new certificate, import the new certificate, and then use that certificate for server-to-server authentication. After you have requested and obtained the new certificate you can then log on to any one of your Front End Servers and use a Windows PowerShell command similar to this one to import and assign that certificate:

```
Import-CsCertificate -Identity global -Type OAuthTokenIssuer -Path C:\Certificate
```

In the preceding command the Path parameter represents the full path to the certificate file, and the Password parameter represents the password that was assigned to the certificate. This procedure should be run just one time: Lync Server's replication service will then automatically create a set of scheduled tasks that will decrypt and deploy the certificate to all your Front End Servers.

Alternatively, you can use an existing certificate as your server-to-server authentication certificate. (As noted, the default certificate can be used as the server-to-server authentication certificate.) The following pair of Windows PowerShell commands retrieve the value of the default certificate's Thumbprint property, then use that value to make the default certificate the server-to-server authentication certificate:

```
$x = (Get-CsCertificate -Type Default).Thumbprint
```

```
Set-CsCertificate -Identity global -Type OAuthTokenIssuer -Thumbprint $x
```

In the preceding command, the retrieved certificate is configured to function as the global server-to-server authentication certificate; that means that the certificate will be replicated to, and used by, all your Front End Servers. Again, this command should only be run one time, and only on one of your Front End Servers. Although all Front End Servers must use the same certificate, you should not configure the OAuthTokenIssuer certificate on each Front End Server. Instead, configure the certificate once, then let Lync Server's replication server take care of copying that certificate to each server.

The Set-CsCertificate cmdlet takes the certificate in question and immediately configures that certificate to act as the current OAuthTokenIssuer certificate. (Lync Server 2013 keeps two copies of a certificate type: the current certificate and the previous certificate.) If you need the new certificate to immediately begin to act as the OAuthTokenIssuer certificate then you should use the Set-CsCertificate cmdlet.

You can also use the Set-CsCertificate cmdlet to "roll" a new certificate. "Rolling" a certificate simply means that you configure a new certificate to become the current OAuthTokenIssuer certificate at a specified point in time. For example, this command retrieves the default certificate and then configure that certificate to take over as the current OAuthTokenIssuer certificate as of July 1, 2012:

```
$x = (Get-CsCertificate -Type Default).Thumbprint
Set-CsCertificate -Identity global -Type OAuthTokenIssuer -Thumbprint $x -Effecti
```

On July 1, 2012 the new certificate will be configured as the current OAuthTokenIssuer certificate and the "old" OAuthTokenIssuer certificate will be configured as the previous certificate.

If you do not want to use Windows PowerShell you can also use the Certificates MMC console to export a certificate from one Front End Server and then import that same certificate on all your other Front End Servers. If you do this, make sure that you export the private key along with the certificate itself.

Caution:

In this case, the procedure must be performed on each Front End Server. When exporting and importing certificates in this manner Lync Server 2013 will not replicate that certificate to each Front End Server.

After the certificate has been imported to all your Front End Servers, that certificate can then be assigned by using the Lync Server Deployment Wizard instead of Windows PowerShell. To assign a certificate by using the Deployment Wizard, complete the following steps on a computer where the Deployment Wizard has been installed:

1. Click Start, click All Programs, click **Microsoft Lync Server 2013 (Technical Preview)**, and then click **Lync Server Deployment Wizard**.
2. In the Deployment Wizard, click **Install or Update Lync Server System**.
3. On the **Lync Server 2013 (Technical Preview)** page, click the **Run** button under the heading **Step 3: Request, Install or Assign Certificates**. (Note: If you have already installed certificates on this computer then the **Run** button will be labeled **Run Again**.)
4. In the Certificate Wizard, select the **OAuthTokenIssuer** certificate and then click **Assign**.
5. In the Certificate Assignment wizard, on the **Certificate Assignment** page, click **Next**.
6. On the **Certificate Store** page, select the certificate to be used for server-to-server authentication and then click **Next**.
7. On the Certificate Assignment Summary page, click **Next**.
8. On the Executing Commands page, click **Finish**.
9. Close the Certificate Wizard and the Deployment Wizard.

Configuring an On-Premises Partner Application for Microsoft Lync Server 2013

Microsoft Lync Server 2013 > Deployment > Managing Server-to-Server Authentication (Oauth) and Partner Applications >

Topic Last Modified: *2013-02-04*

After you have assigned the OAuthTokenIssuer certificate you must then configure your Microsoft Lync Server 2013 partner applications. (The procedure about to be discussed configures both Microsoft Exchange Server 2013 and Microsoft SharePoint to act as partner applications.) To configure an on-premises partner application, you must start by copying the following Windows PowerShell script and pasting the code into Notepad (or any other text editor):

```
if ((Get-CsPartnerApplication -ErrorAction SilentlyContinue) -ne $Null)
   {
       Remove-CsPartnerApplication app
   }
$exch = Get-CsPartnerApplication microsoft.exchange -ErrorAction SilentlyContinue
if ($exch -eq $null)
   {
      New-CsPartnerApplication -Identity microsoft.exchange -MetadataUrl https://
    }
else
    {
       if ($exch.ApplicationIdentifier -ne "00000002-0000-0ff1-ce00-000000000000"
          {
             Remove-CsPartnerApplication microsoft.exchange
New-CsPartnerApplication -Identity microsoft.exchange -MetadataUrl https://atl-ex
           }
        else
           {
             Set-CsPartnerApplication -Identity microsoft.exchange -ApplicationTr
           }
     }
$shp = Get-CsPartnerApplication microsoft.sharepoint -ErrorAction SilentlyContinu
if ($shp -eq $null)
   {
      New-CsPartnerApplication -Identity microsoft.sharepoint -MetadataUrl http:/
    }
else
    {
       if ($shp.ApplicationIdentifier -ne "00000003-0000-0ff1-ce00-000000000000")
          {
             Remove-CsPartnerApplication microsoft.sharepoint
             New-CsPartnerApplication -Identity microsoft.sharepoint -MetadataUrl
           }
        else
           {
             Set-CsPartnerApplication -Identity microsoft.sharepoint -Application
            }
   }
Set-CsOAuthConfiguration -ServiceName 00000004-0000-0ff1-ce00-000000000000
```

After copying the code, save the script using a .PS1 file extension (for example, C:\Scripts \ServerToServerAuth.ps1). Note that, before you run this script, you must replace the metadata URLs https://atl-exchange-001.litwareinc.com/autodiscover/metadata/json/1 and http://atl-sharepoint-001.litwareinc.com/jsonmetadata.ashx with the metadata URLs used by your Exchange 2013 and SharePoint servers, respectively. See the product documentation for Exchange 2013 and SharePoint for information on how you can identify the respective product's metadata URL.

If you look at the last line of the script you will notice that the Set-CsOAuthConfiguration cmdlet is called using this syntax:

```
Set-CsOAuthConfiguration -ServiceName 00000004-0000-0ff1-ce00-000000000000
```

Because the Realm parameter was not used when calling Set-CsOAuthConfiguration the realm will automatically be set to the fully qualified domain name (FQDN) of your organization (for example, litwareinc.com). If your realm name is different from your organization name then you should include the realm name, like this:

```
Set-CsOAuthConfiguration -ServiceName 00000004-0000-0ff1-ce00-000000000000 -Realm
```

After making these changes you can then execute the script, and configure both Exchange 2013 and SharePoint as partner applications, by running the script file from within the Lync Server 2013 Management Shell. For example:

```
C:\Scripts\ServerToServerAuth.ps1
```

Note that you can run this script even if you do not have both Exchange 2013 and SharePoint Server installed:, no problems will occur if you, say, configure SharePoint Server as a partner application even though you do not have SharePoint Server installed.

When you run this script you might receive an error message similar to the following:

```
New-CsPartnerApplication : Cannot bind parameter 'MetadataUrl' to the target. Exc
```

This error message typically means one of two things: 1) that one of the URLs specified in the script is not valid (that is, one of your metadata URLs is not an actual metadata URL); or, 2) one of the metadata URLs could not be contacted. If this happens, verify that the URLs are correct and are accessible, and the re-run the script.

After creating the partner application for Lync Server 2013 you must then configure Lync Server to be a partner application for Exchange 2013. You can configure partner applications for Exchange 2013 by running the script Configure-EnterprisePartnerApplication.ps1; all you need to do is specify the metadata URL for Lync Server and indicate that Lync Server is the new partner application.

To configure Lync Server as a partner application for Exchange, open the Exchange Management Shell and run a command similar to this

```
"c:\Program Files\Microsoft\Exchange Server\V15\Scripts\Configure-EnterprisePartn
```

1.7.13.2.3 Configuring Microsoft Lync Server 2013 in a Cross-Premises Environment

Configuring Microsoft Lync Server 2013 in a Cross-Premises Environment

Microsoft Lync Server 2013 > Deployment > Managing Server-to-Server Authentication (Oauth) and Partner Applications >

Topic Last Modified: *2012-10-02*

In a cross-premise configuration, some of your users are homed on an on-premises installation of Microsoft Lync Server 2013 while other users are homed on the Office 365 version of Lync Server. In order to configure server-to-server authentication in a cross-premises environment, you must first configure your on-premises installation of Lync Server 2013 to trust the Office 365 Authorization server. The initial step in this process can be carried out by running the following Lync Server Management Shell script:

```
$TenantID = (Get-CsTenant -DisplayName "Fabrikam.com").TenantId
$sts = Get-CsOAuthServer microsoft.sts -ErrorAction SilentlyContinue
   if ($sts -eq $null)
      {
         New-CsOAuthServer microsoft.sts -MetadataUrl "https://accounts.accesscon
      }
   else
      {
         if ($sts.MetadataUrl -ne  "https://accounts.accesscontrol.windows.net/$T
            {
               Remove-CsOAuthServer microsoft.sts
               New-CsOAuthServer microsoft.sts -MetadataUrl "https://accounts.acc
            }
        }
$exch = Get-CsPartnerApplication microsoft.exchange -ErrorAction SilentlyContinue
if ($exch -eq $null)
   {
      New-CsPartnerApplication -Identity microsoft.exchange -ApplicationIdentifie
    }
else
    {
       if ($exch.ApplicationIdentifier -ne "00000002-0000-0ff1-ce00-000000000000"
          {
             Remove-CsPartnerApplication microsoft.exchange
             New-CsPartnerApplication -Identity microsoft.exchange -ApplicationId
          }
       else
          {
             Set-CsPartnerApplication -Identity microsoft.exchange -ApplicationTr
          }
   }
Set-CsOAuthConfiguration -ServiceName 00000004-0000-0ff1-ce00-000000000000
```

Keep in mind that the realm name for a tenant is typically different than the organization name; in fact, the realm name is almost always the same as the tenant ID. Because of that, the first line in the script is used to return the value of the TenantId property for the specified tenant (in this case, fabrikam.com) and then assign that name to the variable $TenantId:

```
$TenantID = (Get-CsTenant -DisplayName "Fabrikam.com").TenantId
```

After the script completes you must then configure a trust relationship between Lync Server 2013 and the authorization server, and a second trust relationship between Exchange 2013 and the authorization server. This can only be done by using the Microsoft Online Services cmdlets.

Note:

If you have not installed the Microsoft Online Services cmdlets you will need to do two things before proceeding. First, download and install the 64-bit version of the Microsoft Online Services Sign-in Assistant. After installation is complete, download and install the 64-bit version of the Microsoft Online Services Module for Windows PowerShell. Detailed information for installing and using the Microsoft Online Services Module can be found on the Office 365 web site. These instructions will also tell you how to configure single sign-on, federation, and synchronization between Office 365 and Active Directory.

After you have configured Office 365, and after you have created Office 365 service principals for Lync Server 2013 and Exchange 2013, you will then need to register your credentials with these service principals. In order to do this, you must first obtain an X.509 Base64 saved as a .CER file. This certificate will then be applied to the Office 365 service principals.

When you have obtained the X.509 certificate, start the Microsoft Online Services Module (click **Start**, click **All Programs**, click **Microsoft Online Services**, and then click **Microsoft Online Services Module for Windows PowerShell**). After the Services Module opens, type the following to import the Microsoft Online Windows PowerShell module containing the cmdlets that can be used to manage service principals:

```
Import-Module MSOnlineExtended
```

When the module has been imported, type the following command and then press ENTER in order to connect to Office 365:

```
Connect-MsolService
```

After you press ENTER, a credentials dialog box will appear. Enter your Office 365 user name and password in the dialog box, and then click OK.

As soon as you are connected to Office 365 you can then run the following command in order to return information about your service principals:

```
Get-MsolServicePrincipal
```

You should get back information similar to this for all your service principals:

```
ExtensionData        : System.Runtime.Serialization.ExtensionDataObject
AccountEnabled       : True
Addresses            : {}
AppPrincipalId       : 00000004-0000-0ff1-ce00-000000000000
DisplayName          : Microsoft Lync Server
ObjectId             : aada5fbd-c0ae-442a-8c0b-36fec40602e2
ServicePrincipalName : LyncServer/litwareinc.com
TrustedForDelegation : True
```

The next step is to import, encode, and assign the X.509 certificate. To import and encode the certificate, use the following Windows PowerShell commands, being sure to specify the complete file path to your .CER file when you call the Import method:

```
$certificate = New-Object System.Security.Cryptography.X509Certificates.X509Certi
$certificate.Import("C:\Certificates\Office365.cer")
$binaryValue = $certificate.GetRawCertData()
$credentialsValue = [System.Convert]::ToBase64String($binaryValue)
```

After the certificate has been imported and encoded, you can then assign the certificate to your Office 365 service principals. To do that, first use the Get-MsolServicePrincipal to retrieve the value of the AppPrincipalId property for both the Lync Server and the Microsoft Exchange service principals; the value of the AppPrincipalId property will be used to identify the service principal being assigned the certificate. With the AppPrincipalId property value for Lync Server 2013 in hand, use the following command to assign the certificate to the Office 365 version of Lync Server (the StartDate and EndDate properties should correspond to the validity period for the certificate):

```
New-MsolServicePrincipalCredential -AppPrincipalId 00000004-0000-0ff1-ce00-000000
```

You should then repeat the command, this time using the AppPrincipalId property value for Exchange 2013.

If you later need to delete that certificate, you can do so by first retrieving the KeyId for the certificate:

```
Get-MsolServicePrincipalCredential -AppPrincipalId 00000004-0000-0ff1-ce00-000000
```

That command will return data like this one:

```
Type      : Asymmetric
Value     :
KeyId     : bc2795f3-2387-4543-a95d-f92c85c7a1b0
StartDate : 6/1/2012 8:00:00 AM
EndDate   : 5/31/2013 8:00:00 AM
Usage     : Verify
```

You can then delete the certificate by using a command similar to this:

```
Remove-MsolServicePrincipalCredential -AppPrincipalId 00000004-0000-0ff1-ce00-000
```

In addition to assigning a certificate you must also configure the Exchange Online Service Principal and configure your on-premise version of Lync Server 2013 as an Office 365 service principal. That can be done by carrying out the following two commands:

```
Set-MSOLServicePrincipal -AppPrincipalID 00000002-0000-0ff1-ce00-000000000000 -Ac
$lyncSP = Get-MSOLServicePrincipal -AppPrincipalID 00000004-0000-0ff1-ce00-000000
$lyncSP.ServicePrincipalNames.Add("00000004-0000-0ff1-ce00-000000000000/lync.cont
Set-MSOLServicePrincipal -AppPrincipalID 00000004-0000-0ff1-ce00-000000000000 -Se
```

Managing Meetings and Conferences

1.7.13.3.1 Create Registrar Configuration Settings

Create Registrar Configuration Settings

Operations > Managing Lync Server 2013 Security and Authentication > Configuring Security >

Topic Last Modified: *2012-11-01*

You can use the Registrar to configure proxy server authentication methods. The authentication protocol you specify determines which type of challenges the servers in the pool issue to clients. The available protocols are:

- **Kerberos** This is the strongest password-based authentication scheme available to clients, but it is normally available only to enterprise clients because it requires client connection to a Key Distribution Center (Kerberos domain controller). This setting is appropriate if the server authenticates only enterprise clients.
- **NTLM** This is the password-based authentication available to clients that use a challenge-response hashing scheme on the password. This is the only form of authentication available to clients without connectivity to a Key Distribution Center (Kerberos domain controller), such as remote users. If a server authenticates only remote users, you should choose NTLM.
- **Certificate authentication** This is the new authentication method when the

server needs to obtain certificates from Lync Phone Edition clients, common area phones and Lync 2013. On Lync Phone Edition clients, after a user signs in and is successfully authenticated by providing a personal identification number (PIN), Lync Server 2013 then provisions the SIP URI to the phone and provisions a Lync Server signed certificate or a user certificate that identifies Joe (Ex: SN=joe@contoso.com) to the phone. This certificate is used for authenticating with the Registrar and Web Services.

Note:

We recommend that you enable both Kerberos and NTLM when a server supports authentication for both remote and enterprise clients. The Edge Server and internal servers communicate to ensure that only NTLM authentication is offered to remote clients. If only Kerberos is enabled on these servers, they cannot authenticate remote users. If enterprise users also authenticate against the server, Kerberos is used.

Follow these steps to create a new Registrar.

⊟To create new Registrar configuration settings

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Security** and then click **Registrar**.
4. On the **Registrar** page, click **New**
5. In **Select a Service**, click the service to which the Registrar is to be applied and then click **OK**.
6. In **New Registrar Setting**, select one or more of the following depending on the capabilities of the clients and support in your environment:
   - **Enable Kerberos authentication** to have the servers in the pool issue challenges using Kerberos authentication.
   - **Enable NTLM authentication** to have the servers in the pool issue challenges using NTLM.
   - **Enable certificate authentication** to have the servers in the pool issue certificates to clients.
7. Click **Commit**.

1.7.13.3.2 Modify Existing Registrar Configuration Settings

Modify Existing Registrar Configuration Settings

Operations > Managing Lync Server 2013 Security and Authentication > Configuring Security >

Topic Last Modified: *2012-11-01*

You can use the Registrar to configure proxy server authentication protocols. For information about the available protocols, see Create Registrar Configuration Settings.

Note:

We recommend that you enable both Kerberos and NTLM when a server supports authentication for both remote and enterprise clients. The Edge Server and internal servers communicate to ensure that only NTLM authentication is offered to remote clients. If only Kerberos is enabled on these servers, they cannot authenticate remote users. If enterprise users also authenticate against the server, Kerberos is used.

Follow these steps to modify an existing Registrar.

⊟To modify existing registrar configuration settings

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Security** and then click **Registrar**.
4. On the **Registrar** page, click a service, click **Edit**, and then click **Show details**.
5. In **Edit Registrar Setting**, select one or more of the following depending on the capabilities of the clients and support in your environment:
   - **Enable Kerberos authentication** to have the servers in the pool issue challenges using Kerberos authentication.
   - **Enable NTLM authentication** to have the servers in the pool issue challenges using NTLM.
   - **Enable certificate authentication** to have the servers in the pool issue certificates to clients.
6. Click **Commit**.

1.7.13.3.3 Delete Existing Registrar Configuration Settings

Delete Existing Registrar Configuration Settings

Operations > Managing Lync Server 2013 Security and Authentication > Configuring Security >

Topic Last Modified: *2013-02-23*

Follow these steps to delete a Registrar.

⊟To delete Registrar configuration settings

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Security** and then click **Registrar**.
4. On the **Registrar** page, and in the search field, type all or part of the name of the Registrar you want to delete.
5. In the list, click the Registrar that you want, click **Edit**, and then click **Delete**.
6. Click **OK**.

Removing Registrar Configuration Settings by Using Windows PowerShell Cmdlets

You can delete the Registrar configuration settings by using Windows PowerShell and the **Remove-CsProxyConfiguration** cmdlet. You can run this cmdlet from the Lync Server

2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To remove a specific set of Registrar security settings

- The following command removes the Registrar security settings applied to the edge Server atl-edge-011.litwareinc.com:

```
Remove-CsProxyConfiguration -Identity service:EdgeServer:atl-edge-011.l
```

⊟To remove all of the Registrar security settings applied to the site scope

- The following command removes all the Registrar security settings applied to the Registrar service:

```
Get-CsProxyConfiguration -Filter "service:Registrar:*" | Remove-CsProxy
```

⊟To remove all of the Registrar security settings that allow NTLM authentication

- The following command deletes all the Registrar security settings that allow the use of NTLM for client authentication:

```
Get-CsProxyConfiguration | Where-Object {$_.UseNtlmForClientToProxyAuth
```

For details, see Remove-CsProxyConfiguration.

1.7.13.3.4 Create New Web Service Configuration Settings

Create New Web Service Configuration Settings

Operations > Managing Lync Server 2013 Security and Authentication > Configuring Security >

Topic Last Modified: *2012-11-01*

You can use the **Web Service** page to configure the authentication methods for accessing Lync Server 2013 related web servers and Web Services.

Follow these steps to create a new Web Service policy.

⊟To create new web service configuration settings

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Security** and then click **Web Service**.
4. On the **Web Service** page, click **New**, and then do one of the following:
   - To configure the Web Service for a site, click **Site configuration**. In **Select a Site**, click the site to which the Web Service policy will be applied a site and click **OK**.
   - To configure the Web Service for a pool, click **Pool configuration**. In **Select a Service**, click the service to which the Web Service policy will be applied and click **OK**.
5. In **New Web Service Setting**, in **Integrated Windows authentication**, select **Negotiate**, **Integrated Windows authentication**, or **None**.

6. Select one or more of the following depending on the capabilities of the clients and support in your environment:
   - **Enable PIN Authentication** to enable clients to be authenticated using PIN numbers.
   - **Enable certificate authentication** to have the servers in the pool issue certificates to clients.
   - **Enable certificate chain download** to have servers presented with an authentication certificate download the certificate chain for that certificate.

7. Click **Commit**.

1.7.13.3.5 Modify Existing Web Service Configuration Settings

Modify Existing Web Service Configuration Settings

Operations > Managing Lync Server 2013 Security and Authentication > Configuring Security >

Topic Last Modified: *2013-02-23*

Follow these steps to delete web service configuration settings.

To delete web service configuration settings

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Security** and then click **Web Service**.
4. On the **Web Service** page, and in the search field, type all or part of the name of the policy you want to delete.
5. In the list of policies, click the policy that you want, click **Edit**, and then click **Delete**.
6. Click **OK**.

Deleting Web Service Configuration Settings by Using Windows PowerShell Cmdlets

You can delete web service configuration settings by using Windows PowerShell and the **Remove-CsWebServiceConfiguration** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To delete a specific collection of web service configuration settings

- The following command removes the Web Service security settings applied to the Redmond site:

```
Remove-CsWebServiceConfiguration -Identity "site:Redmond"
```

To delete all of the web service configuration settings applied to the site scope

- The following command removes all of the Web Service security settings applied to the service scope:

```
Get-CsWebServiceConfiguration -Filter "service:*" | Remove-CsWebService
```

To delete all of the web service configuration settings that allow certificate authentication

- The following command removes all the Web Service security settings that allow the use of certificate authentication:

```
Get-CsWebServiceConfiguration | Where-Object {$_.UseCertificateAuth -eq
```

For details, see Remove-CsWebServiceConfiguration.

View PIN Policy Inforrmation

See Also

Managing Lync Server 2013 Security and Authentication > Managing PIN Settings > Managing PIN Policies >

Topic Last Modified: *2013-02-23*

You can use the **PIN Policy** tab to view personal identification number (PIN) authentication of users who are connecting to Lync 2013 with IP Phones. To use PIN authentication, make sure that **Enable PIN Authentication** is selected in Web Service settings. For details, see Modify Existing Web Service Configuration Settings.

Follow these steps to modify a user-level or a site-level PIN policy.

⊟To view information about a PIN policy in Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins

group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Security** and then click **PIN Policy**.
4. On the **PIN Policy** page, click a policy, click **Edit**, and then click **Show details**.

Viewing PIN Policies by Using Windows PowerShell Cmdlets

You can also view PIN policies by using Windows PowerShell and the Get-CsPinPolicy cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view PIN policies

- To view information about all your PIN policies, type the following command in the Lync Server Management Shell and then press ENTER:

```
Get-CsPinPolicy
```

That will return information similar to this:

```
Identity             : Global
Description          :
MinPasswordLength    : 5
PINHistoryCount      : 0
AllowCommonPatterns  : False
PINLifetime          : 0
MaximumLogonAttempts :
```

For more information, see the help topic for the Get-CsPinPolicy cmdlet.

Create a New PIN Policy

1.7.13.4.1.2 Create a New PIN Policy

Create a New PIN Policy

Managing Lync Server 2013 Security and Authentication > Managing PIN Settings > Managing PIN Policies >

Topic Last Modified: *2012-06-19*

You can use the **PIN Policy** page to provide personal identification number (PIN) authentication to users who are connecting to Lync 2013 with IP Phones. To use PIN authentication, make sure that **Enable PIN Authentication** is selected in Web Service settings. For details, see Modify Existing Web Service Configuration Settings.

Follow these steps to create a user-level or a site-level PIN policy.

To create a user or site PIN policy

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Security** and then click **PIN Policy**.
4. On the **PIN Policy** page, click **New**, and then do one of the following:
   - To create a user-level policy, click **User policy**. In **New PIN Policy**, in **Name**, type a name that describes the policy.
   - To create a site-level policy, click **Site policy**. In the **Select a Site** search field, type all or part of the name of the site for which you want to create a policy. In the resulting list of sites, click the site you want, and then click **OK**.
5. In the **Description** field, type a description of the PIN policy.
6. In the **Minimum PIN length** field, type or select the minimum PIN length that you want to allow. The default minimum length is five digits.
7. To be able to specify the maximum number of logon attempts before a user is locked out, select the **Specify maximum logon attempts** check box. If you do not select this option, the maximum number of allowed attempts is automatically determined based on the PIN length. By default, the maximum number of attempts is automatically determined.
8. If you selected the **Specify maximum logon attempts** check box, in **Maximum logon attempts**, type or select the maximum number of logon attempts that you want to allow.
9. To have PINs expire, select the **Enable PIN expiration** check box. If you do not select this option, PINs will never expire. By default, PINs never expire.
10. If you selected the **Enable PIN expiration** check box, in **PIN expires after (days)**, type or select the number of days after which PINs expire.
11. In **PIN history count**, type the number of PINs that a user must create before the user can reuse a PIN. By default, users can reuse their PINs.
12. To allow common patterns of digits in PINs, such as sequential numbers and repetitive sets of numbers, select the **Allow common patterns** check box. If you do not select this option, only complex patterns of digits are allowed. By default, only complex patterns of digits are allowed.

Important:
We recommend that you do not allow common patterns.

13. Click **Commit**.

1.7.13.4.1.3 Modify an Existing PIN Policy

Modify an Existing PIN Policy

Managing Lync Server 2013 Security and Authentication > Managing PIN Settings > Managing PIN Policies >

Topic Last Modified: *2012-06-19*

You can use the **PIN Policy** tab to provide personal identification number (PIN) authentication to users who are connecting to Lync 2013 with IP Phones. To use PIN authentication, make sure that **Enable PIN Authentication** is selected in Web Service settings. For details, see Modify Existing Web Service Configuration Settings.

Follow these steps to modify a user-level or a site-level PIN policy.

⊟To modify an existing PIN policy

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Security** and then click **PIN Policy**.
4. On the **PIN Policy** page, click a policy, click **Edit**, and then click **Show details**.
5. In **Edit PIN Policy**, in **Minimum PIN length**, type or select the minimum PIN length that you want to allow. The default minimum length is five digits.
6. To be able to specify the maximum number of logon attempts before a user is locked out, select the **Specify maximum logon attempts** check box. If you do not select this option, the maximum number of allowed attempts is automatically determined based on the PIN length. By default, the maximum number of attempts is automatically determined.
7. If you selected the **Specify maximum logon attempts** check box, in **Maximum logon attempts**, type or select the maximum number of logon attempts that you want to allow.
8. To have PINs expire, select the **Enable PIN expiration** check box. If you do not select this option, PINs will never expire. By default, PINs never expire.
9. If you selected the **Enable PIN expiration** check box, in **PIN expires after (days)**, type or select the number of days after which PINs expire.
10. In **PIN history count**, type the number of PINs that a user must create before the user can reuse a PIN. By default, users can reuse their PINs.
11. To allow common patterns of digits in PINs, such as sequential numbers and repetitive sets of numbers, select the **Allow common patterns** check box. If you do not select this option, only complex patterns of digits are allowed. By default, only complex patterns of digits are allowed.

Important:
We recommend that you do not allow common patterns.

12. Click **Commit**.

1.7.13.4.1.4 Delete a PIN Policy

Delete a PIN Policy

Managing Lync Server 2013 Security and Authentication > Managing PIN Settings > Managing PIN Policies >

Topic Last Modified: *2013-02-23*

Follow these steps to delete a personal identification number (PIN) policy.

Note:
You cannot delete the global PIN policy.

⊟To delete a PIN policy in Lync Server 2013 Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Security** and then click **PIN Policy**.
4. On the **PIN Policy** page, and in the search field, type all or part of the name

of the policy you want to delete.

5. In the list of policies, click the policy that you want, click **Edit**, and then click **Delete**.
6. Click **OK**.

Removing PIN Policies by Using Windows PowerShell Cmdlets

You can delete PIN policies by using Windows PowerShell and the Remove-CsPinPolicy cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specific PIN policy

- This command removes the PIN policy with the Identity RedmondPinPolicy:

```
Remove-CsPinPolicy -Identity "RedmondPinPolicy"
```

To remove all the PIN policies applied to the site scope

- This command removes all the PIN policies configured at the site scope:

```
Get-CsPinPolicy -Filter "site:*" | Remove-CsPinPolicy
```

To remove all the PIN policies that allow the use of common patterns

- And this one removes all the PIN policies that allow the use of common patterns:G

```
et-CsPinPolicy | Where-Object {$_.AllowCommonPatterns -eq $True} | Remo
```

For more information, see the help topic for the Remove-CsPinPolicy cmdlet.

1.7.13.4.1.5 Assign a Per-User PIN Policy

Assign a Per-User PIN Policy

See Also

[Managing Users in Lync Server 2013](#) > [User Accounts Enabled for Lync Server 2013](#) > [Assigning Per-User Policies](#) >

Topic Last Modified: *2013-02-22*

The dial-in conferencing personal identification number (PIN) policy is one of the individual settings of a user account that can be configured in the Lync Server 2013 Control Panel.

Deploying one or more per-user PIN policies is optional. You can also deploy only a global-level PIN policy or site-level PIN policy. If you do deploy per-user policies, you must explicitly assign them to users, groups, or contact object. User rights and permissions regarding the use of PINs for dial-in conferencing automatically default to those defined in the global-level PIN policy when no specific site-level or per-user policy is assigned.

After creating at least one per-user PIN policy, use the procedures in this topic to assign the policy that specifies the constraints you want the server to impose on the PINs created by and used by a particular user.

For details about creating per-user dial-in conferencing PIN policies, see [Create or Modify](#)

Dial-in Conferencing PIN Settings for a Site or Group of Users.

To assign a per-user PIN policy

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

     > **Tip:**
     > To add additional search clauses to your query, click **Add Filter**.

   - Click **Find**.
6. Click a user in the search results, click **Action**, and then click **Assign policies**.

   > **Tip:**
   > If you want the same per-user PIN policy to apply to multiple users, select multiple users in the search results, then click **Actions**, and then click **Assign policies**.

7. In **Assign Policies**, under **PIN policy**, do one of the following:

   > **Note:**
   > Because there are multiple policies that you can configure by using the **Assign Policies** dialog box, **<Keep as is>** is selected by default for every policy in the dialog box. Continue using the policy previously assigned to the user by making no changes to this setting.

   - Allow Lync Server 2013 to automatically choose either the global-level policy or, if defined, the site-level policy.
   - Click the name of a per-user PIN policy you previously defined on the **PIN Policy** page.

     > **Tip:**
     > To help you decide the policy you want to assign, after you click a policy name, click **View** to view the user rights and permissions defined in the policy.

8. When you are finished, click **OK**.

Assigning a Per-User PIN Policy by Using Windows PowerShell Cmdlets

You can assign per-user PIN policies by using Windows PowerShell and the **Grant-**

CsPinPolicy cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To assign a per-user PIN policy to a single user

- The following command assigns the per-user PIN policy RedmondPinPolicy to the user Ken Myer.

```
Grant-CsPinPolicy -Identity "Ken Myer" -PolicyName "RedmondPinPolicy"
```

To assign a per-user PIN policy to multiple users

- The following command assigns the per-user PIN policy RedmondUsersPinPolicy to all the users who work in the city of Redmond. For details about the LdapFilter parameter used in this command, see Get-CsUser.

```
Get-CsUser -LdapFilter "l=Redmond" | Grant-CsPinPolicy -PolicyName "Red
```

To unassign a per-user PIN policy

- The following command unassigns any per-user PIN policy previously assigned to Ken Myer. After the per-user policy is unassigned, Ken Myer will automatically be managed by using the global policy or, if one exists, his local site policy. A site policy takes precedence over the global policy.

```
Grant-CsPinPolicy -Identity "Ken Myer" -PolicyName $Null
```

For details, see Grant-CsPinPolicy.

Topic Last Modified: *2013-02-23*

To join a dial-in conference as an authenticated user, a Lync Server 2013 user with Active Directory Domain Services (AD DS) credentials requires a personal identification number (PIN). If a user forgets the dial-in conferencing PIN or has not set the PIN by using Lync Server, you can set the user’s PIN from Lync Server Control Panel. You can automatically generate the PIN or create one manually.

Note:

Specific characteristics of the PIN, such as its minimum length, can be configured as a policy. In addition to the global policy, you can configure a PIN policy for individual sites or users. For details about configuring a PIN policy, see Configure Dial-in Conferencing Personal Identification Number (PIN) Rules.

⊟To set a user’s PIN

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria that you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

     Tip:

     To add additional search clauses to your query, click **Add Filter**.
   - Click **Find**.

   Note:

   If the PIN is locked, you must unlock the PIN before you can set it. To unlock the PIN, click the user, click **Action**, and then click **Unlock PIN**.
6. Click a user in the search results, click **Action**, and then click **Set PIN**.
7. In the **Set PIN** dialog box, do one of the following:
   - To allow Lync Server 2013 to generate the user’s PIN, select **Automatically generate a valid PIN** (the default).
   - To create your own PIN, click **Manually enter a specific PIN**, click the text

box, and then type a PIN that meets the PIN requirements specified in your PIN policy settings.

8. Click **OK**.
9. In **Set PIN**, do one of the following:
    - Select the **Show PIN** check box to see the PIN, and then copy the PIN and communicate it to the user using your organization's preferred method.
    - Click **Open my email application to send the new PIN to the user** to send the PIN by email. If Microsoft Office Outlook is your email client, the PIN is automatically copied into a new email message. If you use a different email client, select the **Show PIN** check box to see the PIN and then copy it into your email message.
10. Click **Close**.

Assigning a User PIN by Using Windows PowerShell Cmdlets

You can assign PIN numbers can also be assigned by using the Set-CsClientPin cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To auto-assign a PIN number to a user

- The following command assigns a PIN number to the user Ken Myer. Because the Pin parameter is not included, Lync Server will automatically generate and assign the PIN number.

```
Set-CsClientPin -Identity "Ken Myer" -Pin 18723834
```

To assign a specific PIN number to a user

- This command uses the Pin parameter to assign the PIN number 121989 to the user Ken Myer.

```
Set-CsClientPin -Identity "Ken Myer" -Pin 121989
```

For more information, see the help topic for the Set-CsClientPin cmdlet.

To join a dial-in conference as an authenticated user, a Lync Server 2013 user with Active Directory Domain Services (AD DS) credentials requires a personal identification number

(PIN). You can view a user’s PIN information from Lync Server 2013 Control Panel.

Note:

You can view PIN status information such as whether the PIN has been set or when the PIN was last changed, but you cannot see the current PIN by looking at the PIN status. If a user has lost their PIN, you can reset it by following the procedures in Set a User's Dial-in Conferencing PIN

To view a user’s PIN in Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria that you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

     Tip:

     To add additional search clauses to your query, click **Add Filter**.
   - Click **Find**.

   Note:

   If the PIN is locked, you must unlock the PIN before you can set it. To unlock the PIN, click the user, click **Action**, and then click **Unlock PIN**.
6. Click a user in the search results, click **Action**, and then click **View PIN status**.

Viewing User PIN Information by Using Windows PowerShell cmdlets

You can view user PIN information by using the Get-CsClientPinInfo cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view user PIN information

- To view PIN information for a user, type a command similar to the following in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsClientPinInfo -Identity "Ken Myer"
  ```

  That will return information similar to this:

```
Identity           : sip:kenmyer@litwareinc.com
IsPinSet           : False
IsLockedOut        : False
LastPinChangeTime  : 9/25/2012 1:35:03 PM
PinExpirationTime  :
```

For more information, see the help topic for the Get-CsConferenceDisclaimer cmdlet.

You can lock or unlock a user's PIN from the **Users** section of Lync Server 2013 Control Panel.

To lock a user's PIN in Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
   - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
   - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
   - Click **Add Filter**.
   - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
   - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
   - Depending on the user property you selected, enter the criteria that you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

Tip:
To add additional search clauses to your query, click **Add Filter**.

   - Click **Find**.
   - Click the user, click **Action**, and then click **Lock PIN**.

To unlock a user's PIN in Lync Server Control Panel

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync

Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.

3. In the left navigation bar, click **Users**.
4. Use one of the following methods to locate a user:
    - In the **Search users** box, type all or the first portion of the display name, first name, last name, Security Accounts Manager (SAM) account name, SIP address, or line Uniform Resource Identifier (URI) of the user account, and then click **Find**.
    - If you have a saved query, click the **Open query** icon, use the **Open** dialog box to retrieve the query (a .usf file), and then click **Find**.
5. (Optional) Specify additional search criteria to narrow the results:
    - Click **Add Filter**.
    - Enter the user property by typing it or by clicking the arrow in the drop-down list to select the property.
    - In the **Equal to** drop-down list, click the operator (for example, **Equal to** or **Not equal to**).
    - Depending on the user property you selected, enter the criteria that you want to use to filter the search results by typing it or by clicking the arrow in the drop-down list.

> **Tip:**
> To add additional search clauses to your query, click **Add Filter**.

- Click **Find**.
- Click the user, click **Action**, and then click **Unlock PIN**.

Locking and Unlocking User PINs by Using Windows PowerShell Cmdlets

You can lock and unlock user PINs by using Windows PowerShell and the Lock-CsClientPin and Unlock-CsClientPin cmdlets. You can run these cmdlets either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To lock a user PIN

- To lock a user’s PIN, use the Lock-CsClientPin cmdlet. For example:

```
Lock-CsClientPin -Identity "Ken Myer"
```

⊟To unlock a user PIN

- To unlock a user’s PIN, use the Unlock-CsClientPin cmdlet. For example:

```
Unlock-CsClientPin -Identity "Ken Myer"
```

For more information, see the help topic for the Lock-CsClientPin and Unlock-CsClientPin cmdlets.

1.7.14 Managing the Lync Server 2013 Network Infrastructure

Managing the Lync Server 2013 Network Infrastructure

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-10-15*

Microsoft Lync Server 2013 includes support for call admission control (CAC) and media bypass. To implement these features you must configure a network of regions, sites, subnets, and so on that will allow you to manage bandwidth in situations where audio and video transmissions need to be restricted. You can also use the Quality of Service (QoS) networking technology to help provide an optimal end-user experience for audio and video communications.

You can use the Lync Server Control Panel to set up and manage CAC, media bypass, and QoS. The following topics provide steps for how to do this.

- Managing Quality of Service (QoS)
- Managing Call Admission Control
- Lync Server 2013 Network Interfaces
- Prevent New Connections to Lync Server for Server Maintenance

1.7.14.1 Managing Quality of Service (QoS)

Managing Quality of Service (QoS)

Microsoft Lync Server 2013 > Planning > Network Planning for Lync Server >

Topic Last Modified: *2013-02-21*

Quality of Service (QoS) is a networking technology used in some organizations to help provide an optimal end-user experience for audio and video communications. QoS is most-commonly used on networks where bandwidth is limited: with a large number of network packets competing for a relatively small amount of available bandwidth, Quality of Service provides a way for administrators to assign higher priorities to packets carrying audio or video data. By giving these packets a higher priority, audio and video communications are likely to complete faster, and with less interruption, than network sessions involving things like file transfers, web browsing, or database backups. That's because network packets used for file transfers or database backups are assigned a "best effort" priority.

> **Note:**
>
> As a general rule, Quality of Service applies only to communication sessions on your internal network. When you implement QoS, you configure your servers and routers to support packet marking; however, you configure these devices to support packet marking in a particular manner. You cannot assume that Quality of Service will be supported on the Internet or on other networks. Even if Quality if Service is supported on other networks, there is no guarantee that QoS will be configured the same way that you configured the service on your network.

Microsoft Lync Server 2013 does not require Quality of Service; if you do not currently use QoS there is no requirement that you install the service before installing Lync Server 2013. If you experience a considerable amount of packet loss on your network the recommended way to alleviate this problem is to add additional bandwidth. If adding more bandwidth is not possible, then you might want to implement Quality of Service instead.

Lync Server 2013 offers full support for Quality of Service: that means that organizations that are already using QoS can easily integrate Lync Server into their existing network infrastructure. In order to do this you must perform the following tasks:

- Enabling QoS for Devices that Are Not Based on Windows. By default, QoS is disabled for computers and other devices (such as iPhones) that run other operating systems. Although you can use Lync Server to enable and disable Quality of Service for devices, you typically cannot use the product to modify the DSCP codes used by these devices.
- Configuring Port Ranges for Your Conferencing, Application, and Mediation

Servers. You must reserve a unique set of ports for different packet types, such as audio and video. With Lync Server 2013 you do not enable or disable Quality of Service by, say, setting a property value to True or to False. Instead, you enable Quality of Service by configuring port ranges and then creating and applying Group Policy. If you later decide not to use QoS you can “disable” Quality of Service simply by removing the appropriate Group Policy objects.

- Configuring Port Ranges for Your Edge Servers. Although not required, you can configure your Edge servers to use the same port ranges as your other servers.
- Configuring Port Ranges for Your Microsoft Lync Clients. These port ranges apply only to client computers and are typically not the same as the port ranges configured on your servers.
- Configuring a Quality of Service Policy for Your Conferencing, Application, and Mediation Servers. These policies determine the DSCP codes that are applied to different packet types.
- Configuring a Quality of Service Policy for Your A/V Edge Servers. This should only be done for the internal side of your Edge servers. That's because Quality of Service is designed for use on your internal network and not on the Internet.
- Configuring Quality of Service Policies for Clients Running on Windows 7 or Windows 8. Note that Microsoft Lync Server 2013 does not support QoS for other Windows operating systems, such as Windows Vista or Windows XP.
- Configuring Quality of Service on Microsoft Lync Phone Edition Devices. By default, QoS is enabled for Lync Phone Edition devices. However, you might want to change the default DSCP value in order to ensure that all audio packets in your organization use the same DSCP code.

Note:

If you are using Microsoft Windows Server 2012 you might be interested in the new set of Windows PowerShell cmdlets available for managing Quality of Service on that platform. For more information, see Network Quality of Service Cmdlets in Windows PowerShell at http://go.microsoft.com/fwlink/p/?LinkId=285379.

1.7.14.1.1 Enabling QoS for Devices that Are Not Based on Windows

Enabling QoS for Devices that Are Not Based on Windows

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Quality of Service (QoS) >

Topic Last Modified: *2012-11-01*

When you install Microsoft Lync Server 2013, Quality of Service (QoS) will not be enabled for any devices used in your organization that use an operating system other than Windows. You can verify this by running the following command from within the Lync Server 2013 Management Shell:

```
Get-CsMediaConfiguration
```

Assuming you have not made any changes to your media configuration settings you should get back information similar to this:

```
Identity                          : Global
EnableQoS                         : False
EncryptionLevel                   : RequireEncryption
EnableSiren                       : False
MaxVideoRateAllowed               : VGA600K
EnableG722StereoCodec             : True
EnableH264Codec                   : True
```

```
EnableAdaptiveBandwidthEstimation : True
```

If the EnableQoS property is set to False (as in the preceding output) that means that Quality of Service is not enabled for computers and devices that use an operating system other than Windows. QoS is enabled by default for Lync Phone Edition devices; however, it is possible to disable Quality of Service for Lync Phone Edition.

To enable Quality of Service at the global scope, run the following command from within the Lync Server Management Shell:

```
Set-CsMediaConfiguration -EnableQoS $True
```

The preceding command enables QoS at the global scope; however, it's important to note that media configuration settings can also be applied to the site scope. If you need to enable Quality of Service for a site you must include the Identity of the configuration settings when calling Set-CsMediaConfiguration. For example, this command enables QoS for the Redmond site:

```
Set-CsMediaConfiguration -Identity site:Redmond -EnableQoS $True
```

Note:

Do you need to enable QoS at the site scope? That depends. Settings assigned to the site scope take precedence over settings assigned to the global scope. Suppose you have QoS enabled at the global scope but disabled at the site scope (for the Redmond site.) In that case, Quality of Service will be disabled for the Redmond site; that's because the site settings take precedence. To enable QoS for the Redmond site you will have to do so using the media configuration settings applied to that site.

If you want to simultaneously enable QoS for all your media configuration settings (regardless of scope) then run this command from within the Lync Server Management Shell:

```
Get-CsMediaConfiguration | Set-CsMediaConfiguration -EnableQoS $True
```

You can disable QoS for devices that use an operating system other than Windows by setting the value of the EnableQoS property to False. For example:

```
Set-CsMediaConfiguration -Identity site:Redmond -EnableQoS $False
```

This gives you the ability to implement QoS on some portions of your network (for example, on the Redmond site) while leaving Quality of Service disabled on other portions of your network.

QoS can only be enabled and disabled by using Windows PowerShell These options are not available in the Lync Server Control Panel.

1.7.14.1.2 Configuring Port Ranges for Your Conferencing, Application, and Mediation Servers

Configuring Port Ranges for Your Conferencing, Application, and Mediation Servers

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Quality of Service (QoS) >

Topic Last Modified: *2012-11-01*

In order to implement Quality of Service, you should configure identical port ranges for audio, video, and application sharing on your Conferencing, Application, and Mediation servers; furthermore, those port ranges must not overlap in any way. To use a simple example, suppose you use ports 10000 through 10999 for video on your Conferencing servers. That means that you must also reserve ports 10000 through 10999 for video on your Application and Mediation servers. If you do not, QoS will not work as expected.

Similarly, suppose you reserve ports 10000 through 10999 for video, but then reserve ports 10500 through 11999 for audio. This can create problems for Quality of Service, because the port ranges overlap. With QoS, each modality must have a unique set of ports: if you use ports 10000 through 10999 for video, then you'll have to use a different range (for example, 11000 through 11999 for audio).

By default, audio and video port ranges do not overlap in Microsoft Lync Server 2013; however, the port ranges assigned to application sharing overlap with both the audio and video port ranges. (Which, in turn, means that none of these ranges are unique.) You can verify the existing port ranges for your Conferencing, Application, and Mediation servers by running the following three commands from within the Lync Server 2013 Management Shell:

```
Get-CsService -ConferencingServer | Select-Object Identity, AudioPortStart, Audio
Get-CsService -ApplicationServer | Select-Object Identity, AudioPortStart, AudioP
Get-CsService -MediationServer | Select-Object Identity, AudioPortStart, AudioPor
```

Warning:

As you can see in the preceding commands, each port type – audio, video, and application sharing – is assigned two separate property values: the port start and the port count. The port start indicates the first port used for that modality; for example, if the audio port start is equal to 50000 that means that the first port used for audio traffic is port 50000. If the audio port count is 2 (which is not a valid value, but is used here for illustration purposes) that means that only 2 ports are allocated for audio. If the first port is port 50000 and there are a total of two ports, that means the second port must be port 50001 (port ranges have to be contiguous). As a result, the port range for audio would be ports 50000 through 50001, inclusive.
Note, too that Application server and Mediation server only support QoS for audio; you do not need to change video or application sharing ports in your Application servers or Mediation servers.

If you run the preceding three commands you'll see that that the default port values for Lync Server 2013 are configured like this:

Property	Conferencing Server	Application Server	Mediation Server
AudioPortStart	49152	49152	49152
AudioPortCount	8348	8348	8348
VideoPortStart	57501	--	--
VideoPortCount	8034	--	--
ApplicationSharingPortStart	49152	--	--
ApplicationSharingPortCount	16383	--	--

As noted previously, when configuring Lync Server ports for QoS, you should ensure that: 1) audio port settings are identical across yours Conferencing, Application, and Mediation servers; and, 2) port ranges do not overlap. If you look closely at the preceding table, you will see that the port ranges are identical across the three server types. For example, the starting audio port is set to port 49152 on each server type, and the total number of ports reserved for audio in each server is also identical: 8348. However, the port ranges overlap: audio ports start at port 49152, but so do the ports set aside for application sharing. In order to make optimal use of Quality of Service, application sharing should be reconfigured to use a unique port range. For example, you could configure application sharing to start at port 40803 and to use 8348 ports. (Why 8348 ports? If you add those values together -- 40803 + 8348 -- that means that application sharing will use ports 40803 through port 49151. Because audio ports do not begin until port 49152, you will no longer have any overlapping port ranges.)

After you have selected the new port range for application sharing you can make your change by using the Set-CsConferencingServer cmdlet. This change does not need to be made on your Application servers or on your Mediation servers, because these servers do not handle application sharing traffic. You only need to change port values on these servers if you decide to reassign the ports used for audio traffic.

To modify the port values for application sharing on a single Conferencing server run a command similar to this from within the Lync Server Management Shell:

```
Set-CsConferenceServer -Identity ConferencingServer:atl-cs-001.litwareinc.com -Ap
```

If you want to make these changes on all your Conferencing servers you can run this command instead:

```
Get-CsService -ConferencingServer | ForEach-Object {Set-CsConferencingServer -Ide
```

After changing port settings you should stop and then restart each service affected by the changes.

It is not mandatory that your Conferencing servers, Application servers, and Mediation servers share the exact same port range; the only true requirement is that you set aside unique port ranges on all your servers. However, administration will typically be easier if you use the same set of ports on all your servers.

1.7.14.1.3 Configuring Port Ranges for Your Edge Servers

Configuring Port Ranges for Your Edge Servers

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Quality of Service (QoS) >

Topic Last Modified: *2012-10-19*

With Edge servers you do not have to configure separate port ranges for audio, video, and application sharing; likewise, the port ranges used for Edge servers do not have to match the port ranges used with your Conferencing, Application, and Mediation servers. However, to make administration easier you might want to go ahead and change your Edge server port ranges to match the port ranges on your other servers. For example, suppose you have configured your Conferencing, Application, and Mediation servers to use these port ranges:

Packet Type	Starting Port	Number of Ports Reserved
Application sharing	40803	8348
Audio	49152	8348
Video	57501	8034
Totals	--	24730

As you can see, your port ranges for audio, video, and application sharing start at port

40803 and encompass a total of 24730 ports. If you prefer, you can configure a given Edge Server to use these overall port values by running a command similar to this one from within the Lync Server Management Shell:

```
Set-CsEdgeServer -Identity EdgeServer:atl-edge-001.litwareinc.com -MediaCommunica
```

Or, use the following command to simultaneously configure all the Edge Servers in your organization:

```
Get-CsService -EdgeServer | ForEach-Object {Set-CsEdgeServer -Identity $_.Identit
```

You can verify the current port settings for your Edge Servers by using this Lync Server Management Shell command:

```
Get-CsService -EdgeServer | Select-Object Identity, MediaCommunicationPortStart,
```

1.7.14.1.4 Configuring Port Ranges for Your Microsoft Lync Clients

Configuring Port Ranges for Your Microsoft Lync Clients

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Quality of Service (QoS) >

Topic Last Modified: *2013-01-22*

By default, Lync client applications can use any port between ports 1024 and 65535 when involved in a communication session; this is because specific port ranges are not automatically enabled for clients. In order to use Quality of Service, however, you will need to reassign the various traffic types (audio, video, media, application sharing, and file transfer) to a series of unique port ranges. This can be done by using the Set-CsConferencingConfiguration cmdlet.

You can determine which port ranges are currently used for communication sessions by running the following command from within the Microsoft Lync Server 2013 Management Shell:

```
Get-CsConferencingConfiguration
```

Assuming that you have not made any changes to your conferencing settings since you installed Lync Server 2013, you should get back information that includes these property values:

```
ClientMediaPortRangeEnabled : False
ClientAudioPort             : 5350
ClientAudioPortRange        : 40
ClientVideoPort             : 5350
ClientVideoPortRange        : 40
ClientAppSharingPort        : 5350
ClientAppSharingPortRange   : 40
ClientFileTransferPort      : 5350
ClientTransferPortRange     : 40
```

If you look closely at the preceding output, you'll see two things of importance. First, the ClientMediaPortRangeEnabled property is set to False:

```
ClientMediaPortRangeEnabled : False
```

That's important because, when this property is set to False, Lync clients will use any available port between ports 1024 and 65535 when involved in a communication session; this is true regardless of any other port settings (for example, ClientMediaPort or ClientVideoPort). If you want to restrict usage to a specified set of ports (and this is something you do want to do if you plan on implementing Quality of Service) then you must first enable client media port ranges. That can be done using the following Windows PowerShell command:

```
Set-CsConferencingConfiguration -ClientMediaPortRangeEnabled $True
```

The preceding command enables client media port ranges for the global collection of conferencing configuration settings; however, these settings can also be applied to the site scope and/or the service scope (for the Conferencing Server service only). To enable client media port ranges for a specific site or server, specify the Identity of that site or server when calling Set-CsConferencingConfiguration:

```
Set-CsConferencingConfiguration -Identity "site:Redmond" -ClientMediaPortRangeEna
```

Alternatively, you can use this command to simultaneously enable port ranges for all your conferencing configuration settings:

```
Get-CsConferencingConfiguration | Set-CsConferencingConfiguration  -ClientMediaPo
```

The second thing of importance you will notice is that the sample output shows that, by default, the media port ranges set for each type of network traffic are identical:

```
ClientAudioPort            : 5350
ClientVideoPort            : 5350
ClientAppSharingPort       : 5350
ClientFileTransferPort     : 5350
```

In order to implement QoS, each of these port ranges will need to be unique. For example, you might configure the port ranges like this:

Client Traffic Type	Port Start	Port Range
Audio	50020	20
Video	58000	20
Application sharing	42000	20
File transfer	42020	20

In the preceding table, client port ranges represent a subset of the port ranges configured for your servers. For example, on the servers, application sharing was configured to use ports 40803 through 49151; on the client computers, application sharing is configured to use ports 42000 through 42019. This, too is done primarily to make administration of QoS easier: client ports do not have to represent a subset of the ports used on the server. (For example, on the client computers you could configure application sharing to use, say, ports 10000 through 10019.) However, it is recommended that you make your client port ranges a subset of your server port ranges.

In addition, you might have noticed that 8348 ports were set aside for application sharing on the servers, but only 20 ports were set aside for application sharing on the clients. This, too is recommended, but is not a hard-and-fast rule. In general, you can consider each available port to represent a single communication session: if you have 100 ports available in a port range that means that the computer in question could participate in, at most, 100 communication sessions at any given time. Because servers will likely take part in many more conversations than clients, it makes sense to open many more ports on servers than on clients. Setting aside 20 ports for application sharing on a client means that a user could participate in 20 application sharing sessions on the specified device, and all at the same time. That should prove sufficient for the vast majority of your users.

To assign the preceding port ranges to your global collection of conferencing configuration settings you can use the following Lync Server Management Shell command:

```
Set-CsConferencingConfiguration -Identity global -ClientAudioPort 50020 -ClientAu
```

Or, use this command to assign these same port ranges for all your conferencing configuration settings:

```
Get-CsConferencingConfiguration | Set-CsConferencingConfiguration-ClientAudioPort
```

Individual users must log off from Lync and then log back on before these changes will actually take effect.

Note:

You can also enable client media port ranges, and then assign those port ranges, using a single command. For example:

```
Set-CsConferencingConfiguration -ClientMediaPortRangeEnabled $True-
ClientAudioPort 50020 -ClientAudioPortRange 20 -ClientVideoPort 58000
-ClientVideoPortRange 20 -ClientAppSharingPort 42000 -
ClientAppSharingPortRange 20 - ClientFileTransferPort 42020 -
ClientFileTransferPortRange 20
```

1.7.14.1.5 Configuring a Quality of Service Policy for Your Conferencing, Application, and Mediation Servers

Configuring a Quality of Service Policy for Your Conferencing, Application, and Mediation Servers

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Quality of Service (QoS) >

Topic Last Modified: *2013-01-22*

Configuring port ranges facilitates the use of Quality of Service by ensuring that all traffic of a specified type (for example, all audio traffic) travels through the same set of ports. This makes it easy for the system to identify and mark a given packet: if port 49152 is reserved for audio traffic, then any packet traveling through port 49152 can be marked with a DSCP code that indicates that this is an audio packet. In turn, this enables routers to identify the packet as an audio packet, and give it higher priority than unmarked packets (such as packets used to copy a file from one server to another).

However, simply restricting a set of ports to a specific type of traffic does not result in packets traveling through those ports being marked with the appropriate DSCP code. In addition to defining port ranges you must also create Quality of Service policies that specify the DSCP code to be associated with each port range. For Microsoft Lync Server 2013 that typically means creating two policies: one for audio and one for video.

Quality of Service policies are most-easily created, and managed, by using Group Policy. (These same policies can also be created by using local security policies. However, that requires you to repeat the same procedure on each and every computer.) Your initial set of QoS policies (one for audio and one for video) should be applied only to Lync Server computers running the Conferencing server, Application server, and/or Mediation server services. If all of these computers are located in the same Active Directory OU then you can simply assign the new Group Policy object (GPO) to that OU. Alternatively, you can take other steps to target the new policy to the specified computers; for example, you can place the appropriate computers in a security group, then use Group Policy security filtering to apply the GPO just to that security group.

In order to create a Quality of Service policy for managing audio, log on to a computer where Group Policy Management has been installed. Open Group Policy Management (click **Start**, point to **Administrative Tools**, and then click **Group Policy Management**) and then complete the following procedure:

1. In Group Policy Management, locate the container where the new policy should be created. For example, if all your Lync Server computers are located in an OU named Lync Server then the new policy should be created in the Lync Server OU.
2. Right-click the appropriate container and then click **Create a GPO in this domain, and Link it here**.
3. In the **New GPO** dialog box, type a name for the new Group Policy object in the **Name** box (for example, **Lync Server Audio**) and then click **OK**.
4. Right-click the newly-created policy and then click **Edit**.
5. In the Group Policy Management Editor, expand **Computer Configuration**, expand **Policies**, expand **Windows Settings**, right-click **Policy-based QoS**, and then click **Create new policy**.
6. In the **Policy-based QoS** dialog box, on the opening page, type a name for the new policy (e.g., **Lync Server Audio**) in the **Name** box. Select **Specify DSCP Value** and set the value to **46**. Leave **Specify Outbound Throttle Rate** unselected, and then click **Next**.
7. On the next page, make sure that **All applications** is selected and then click **Next**. This simply ensures that all applications will match packets from the specified port range with the specified DSCP code.
8. On the third page, make sure that both **Any source IP address and Any destination IP address** are selected and then click **Next**. These two settings ensure that packets will be managed regardless of which computer (IP address) sent those packets and which computer (IP address) will receive those packets.
9. On page four, select **TCP and UDP** from the **Select the protocol this QoS policy applies to** dropdown list. TCP (Transmission Control Protocol) and UDP (User Datagram Protocol) are the two networking protocols most-commonly used by Lync Server and its client applications.
10. Under the heading **Specify the source port number**, select **From this source port or range**. In the accompanying text box, type the port range reserved for audio transmissions. For example, if you reserved ports 49152 through ports 57500 for audio traffic enter the port range using this format: **49152:57500**. Click **Finish**.

Note:

The DSCP value of 46 is somewhat arbitrary: although DSCP 46 is often used for marking audio packets, you do not have to use DSCP 46 for audio communications. If you have already implemented QoS and you are using a different DSCP code for audio (for example, DSCP 40) then you should configure your Quality of Service policy to use that same code (i.e., 40 for audio). If you are just now implementing Quality of Service, then it is recommended that you use DSCP 46 for audio, simply because that value is commonly used to mark audio packets.

After you have created the QoS policy for audio traffic you should then create a second policy for video traffic (and, optionally, a third policy for managing application sharing traffic). To create a policy for video, follow the same basic procedure you followed when creating the audio policy, making these substitutions:

- Use a different (and unique) policy name (for example, **Lync Server Video**).
- Set the DSCP value to **34** instead of 46. (Note that you do not have to use a DSCP value of 34. The only requirement is that you use a different DSCP value for video than you used for audio.)
- Use the previously-configured port range for video traffic. For example, if you have reserved ports 57501 through 65535 for video, then set the port range to this: **57501:65535**.

If you decide to create a policy for managing application sharing traffic you must create a third policy, making the following substitutions:

- Use a different (and unique) policy name (for example, **Lync Server**

Application Sharing).

- Set the DSCP value to **24** instead of 46. (Again, you do not have to use a DSCP value of 24. The only requirement is that you use a different DSCP value for application sharing than you used for audio or for video.)
- Use the previously-configured port range for video traffic. For example, if you have reserved ports 40803 through 49151 for application sharing, then set the port range to this: **40803:49151**.

The new policies you have created will not take effect until Group Policy has been refreshed on your Lync Server computers. Although Group Policy periodically refreshes on its own, you can force an immediate refresh by running the following command on each computer where Group Policy needs to be refreshed:

```
Gpupdate.exe /force
```

This command can be run from within the Lync Server Management Shell or from any command window that is running under administrator credentials. To run a command window under administrator credentials, click **Start**, right-click **Command Prompt**, and then click **Run as administrator**.

To verify that the new QoS policies have been applied, do the following:

1. On a Lync Server computer, click **Start** and then click **Run**.
2. In the **Run** dialog box, type **regedit** and then press ENTER.
3. In Registry Editor, expand **Computer**, expand **HKEY_LOCAL_MACHINE**, expand **SOFTWARE**, expand **Policies**, expand **Microsoft**, expand **Windows**, and then click **QoS**. Under **QoS** you should see registry keys for each of the QoS policies you just created. For example, if you created two new policies (one named Lync Server Audio and the other named Lync Server Video) you should registry entries for Lync Server Audio and Lync Server Video.

To help ensure that network packets are marked with the appropriate DSCP value, you should also create a new registry entry on each computer by completing the following procedure:

1. Click **Start** and then click **Run**.
2. In the **Run** dialog box, type **regedit** and then press ENTER.
3. In the Registry Editor, expand **HKEY_LOCAL_MACHINE**, expand **SYSTEM**, expand **CurrentControlSet**, expand **services**, and then expand **Tcpip**.
4. Right-click **Tcpip**, point to **New**, and then click **Key**. After the new registry key is created, type **QoS** and then press ENTER to rename the key.
5. Right-click **QoS**, point to **New**, and then click **String Value**. After the new registry value is created, type **Do not use NLA** and then press ENTER to rename the value.
6. Double-click **Do no use NLA**. In the **Edit String** dialog box, type **1** in the **Value data** box and then click **OK**.
7. Close the Registry Editor and then reboot your computer.

1.7.14.1.6 Configuring a Quality of Service Policy for Your A/V Edge Servers

Configuring a Quality of Service Policy for Your A/V Edge Servers

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Quality of Service (QoS) >

Topic Last Modified: *2012-10-19*

In addition to creating QoS policies for your Conferencing, Application, and Mediation servers, you must also create both audio and video policies for the internal side of your A/V Edge servers. However, the policies used on your Edge servers are different from the policies used on your Conferencing, Application, and Mediation servers. For the Conferencing, Application, and Mediation servers you specified a source port range; with Edge servers, you need to specify a destination port range. Because of that you cannot simply apply the Conferencing, Application, and Mediation server QoS policies to your Edge servers: these policies simply won't work. Instead, you must create new policies and apply those policies to your Edge servers only.

The following procedure describes the process for creating Active Directory Group Policy objects that can be used to manage Quality of Service on Edge Servers. Of course, it's possible that your Edge servers are stand-alone servers that do not have Active Directory accounts. If that's the case, you can use local Group Policy instead of Active Directory Group Policy: the only difference is that you must create these local policies using the Local Group Policy Editor, and must individually create the same set of policies on each Edge Server. To start the Local Group Policy Editor on an Edge server do the following:

1. Click **Start** and then click **Run**.
2. In the **Run** dialog box, type **gpedit.msc** and then press ENTER.

If you are creating Active Directory-based policies, then you should log on to a computer where Group Policy Management has been installed. In that case, open Group Policy Management (click **Start**, point to **Administrative Tools**, and then click **Group Policy Management**) and then complete the following steps:

1. In Group Policy Management, locate the container where the new policy should be created. For example, if all your Lync Server computers are located in an OU named Lync Server then the new policy should be created in the Lync Server OU.
2. Right-click the appropriate container and then click **Create a GPO in this domain, and Link it here**.
3. In the **New GPO** dialog box, type a name for the new Group Policy object in the **Name** box (for example, **Lync Server Audio**) and then click **OK**.
4. Right-click the newly-created policy and then click **Edit**.

From here the process is identical regardless of whether you are creating an Active Directory policy or a local policy:

1. In the Group Policy Management Editor or the Local Group Policy Editor, expand **Computer Configuration**, expand **Policies**, expand **Windows Settings**, right-click **Policy-based QoS**, and then click **Create new policy**.
2. In the **Policy-based QoS** dialog box, on the opening page, type a name for the new policy (e.g., **Lync Server Audio**) in the **Name** box. Select **Specify DSCP Value** and set the value to **46**. Leave **Specify Outbound Throttle Rate** unselected, and then click **Next**.
3. On the next page, make sure that **All applications** is selected and then click **Next**. This setting instructs the network to look for all packets with a DSCP marking of 46, not just packets created by a specific application.
4. On the third page, make sure that both **Any source IP address** and **Any destination IP address** are selected and then click **Next**. These two settings ensure that packets will be managed regardless of which computer (IP address) sent those packets and which computer (IP address) will receive those packets.
5. On page four, select **TCP and UDP** from the **Select the protocol this QoS policy applies to** dropdown list. TCP (Transmission Control Protocol) and UDP (User Datagram Protocol) are the two networking protocols most-commonly used by Lync Server and its client applications.
6. Under the heading **Specify the destination port number**, select **From this destination port or range**. In the accompanying text box, type the port range reserved for audio transmissions. For example, if you reserved ports 49152 through ports 57500 for audio traffic then enter the port range using this format: **49152:57500**. Click **Finish**.

After you have created the QoS policy for audio traffic you should create a second policy for video traffic. To create a policy for video, follow the same basic procedure you followed when creating the audio policy, making these substitutions:

- Use a different (and unique) policy name (for example, **Lync Server Video**).
- Set the DSCP value to **34** instead of 46. (Note that you do not have to use a DSCP value of 34. The only requirement is that you use a different DSCP value for video than you used for audio.)
- Use the previously-configured port range for video traffic. For example, if you have reserved ports 57501 through 65535 for video, then set the port range to this: **57501:65535**. Again, this should be configured as the destination port range.

If you decide to create a policy for managing application sharing traffic you must create a third policy, making the following substitutions:

- Use a different (and unique) policy name (for example, **Lync Server Application Sharing**).
- Set the DSCP value to **24** instead of 46. (Again, you do not have to use a DSCP value of 24. The only requirement is that you use a different DSCP value for application sharing than you used for audio or for video.)
- Use the previously-configured port range for video traffic. For example, if you have reserved ports 40803 through 49151 for application sharing, then set the port range to this: **40803:49151**.

The new policies you have created will not take effect until Group Policy has been refreshed on your Edge servers. Although Group Policy periodically refreshes on its own, you can force an immediate refresh by running the following command on each computer where Group Policy needs to be refreshed:

```
Gpudate.exe /force
```

This command can be run from within the Lync Server or from any command window that is running under administrator credentials. To run a command window under administrator credentials, click **Start**, right-click **Command Prompt**, and then click **Run as administrator**. Note that you might need to restart the Edge server even after running Gpudate.exe.

To help ensure that network packets are marked with the appropriate DSCP value, you should also create a new registry entry on each computer by completing the following procedure:

1. Click **Start** and then click **Run**.
2. In the **Run** dialog box, type **regedit** and then press ENTER.
3. In the Registry Editor, expand **HKEY_LOCAL_MACHINE**, expand **SYSTEM**, expand **CurrentControlSet**, expand **services**, and then expand **Tcpip**.
4. Right-click **Tcpip**, point to **New**, and then click **Key**. After the new registry key is created, type **QoS** and then press ENTER to rename the key.
5. Right-click **QoS**, point to **New**, and then click **String Value**. After the new registry value is created, type **Do not use NLA** and then press ENTER to rename the value.
6. Double-click **Do no use NLA**. In the **Edit String** dialog box, type **1** in the **Value data** box and then click **OK**.
7. Close the Registry Editor and then reboot your computer.

1.7.14.1.7 Configuring Quality of Service Policies for Clients Running on Windows 7 or Windows 8

Configuring Quality of Service Policies for Clients Running on Windows 7 or Windows 8

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Quality of Service (QoS) >

Topic Last Modified: *2012-11-01*

In addition to specifying port ranges for use by your Lync clients you must also create separate Quality of Service policies that will be applied to client computers. (The Quality of Service policies created for Conferencing, Application, and Mediation servers should not be applied to client computers.) Keep in mind that only computers running Windows 7 or Windows 8 can use Quality of Service in Microsoft Lync Server 2013; computers running other Windows operating systems, such as Windows XP or Windows Server 2003, are not supported.

The following example uses this set of port ranges to create an audio policy and a video policy:

Client Traffic Type	Port Start	Port Range
Audio	50020	20
Video	58000	20
Application sharing	42000	20
File transfer	42020	20

To create a Quality of Service audio policy for Windows 7 or Windows 8 computers, first log on to a computer where Group Policy Management has been installed. Open Group Policy Management (click **Start**, point to **Administrative Tools**, and then click **Group Policy Management**) and then complete the following procedure:

1. In Group Policy Management, locate the container where the new policy should be created. For example, if all your client computers are located in an OU named Clients then the new policy should be created in the Client OU.
2. Right-click the appropriate container and then click **Create a GPO in this domain, and Link it here**.
3. In the **New GPO** dialog box, type a name for the new Group Policy object in the **Name** box (for example, **Lync Audio**) and then click **OK**.
4. Right-click the newly-created policy and then click **Edit**.
5. In the Group Policy Management Editor, expand **Computer Configuration**, expand **Policies**, expand **Windows Settings**, right-click **Policy-based QoS**, and then click **Create new policy**.
6. In the **Policy-based QoS** dialog box, on the opening page, type a name for the new policy (e.g., **Lync Audio**) in the **Name** box. Select **Specify DSCP Value** and set the value to **46**. Leave **Specify Outbound Throttle Rate** unselected, and then click **Next**.
7. On the next page, make sure that **All applications** is selected and then click **Next**. This setting instructs the network to look for all packets with a DSCP marking of 46, not just packets created by a specific application.
8. On the third page, make sure that both **Any source IP address** and **Any destination IP address** are selected and then click **Next**. These two settings ensure that packets will be managed regardless of which computer (IP address) sent those packets and which computer (IP address) will receive those packets.
9. On page four, select **TCP and UDP** from the **Select the protocol this QoS policy applies to** dropdown list. TCP (Transmission Control Protocol) and UDP (User Datagram Protocol) are the two networking protocols most-commonly used by Lync Server and its client applications.
10. Under the heading **Specify the source port number**, select **From this source port or range**. In the accompanying text box, type the port range reserved for audio transmissions. For example, if you reserved ports 50020 through ports 50039 for audio traffic enter the port range using this format: **50020:50039**. Click **Finish**.

After you have created the QoS policy for audio you should then create a second policy for video. To create a policy for video, follow the same basic procedure you followed when creating the audio policy, making these substitutions:

- Use a different (and unique) policy name (for example, **Lync Video**).
- Set the DSCP value to **34** instead of 46. (As noted previously, you do not have to use the DSCP value 34; you simply must assign a different DSCP value than the one used for audio.)
- Use the previously-configured port range for video traffic. For example, if you have reserved ports 58000 through 58019 for video, then set the port range to this: **58000:58019**.

If you decide to create a policy for managing application sharing traffic make these substitutions:

- Use a different (and unique) policy name (for example, **Lync Server Application Sharing**).
- Set the DSCP value to **24** instead of 46. (Again, this value does not have to be 24; it simply must be different than the DSCP values used for audio and for video.)
- Use the previously-configured port range for video traffic. For example, if you have reserved ports 42000 through 42019 for application sharing, then set the port range to this: **42000:42019**.

For a file transfer policy:

- Use a different (and unique) policy name (for example, **Lync Server File Transfers**).
- Set the DSCP value to **14**. (Again, this value does not have to be 14; it simply must be a unique DSCP code.)
- Use the previously-configured port range for application. For example, if you have reserved ports 42020 through 42039 for application sharing, then set the port range to this: **42020:42039**.

The new policies you have created will not take effect until Group Policy has been refreshed on your client computers. Although Group Policy periodically refreshes on its own, you can force an immediate refresh by running the following command on each computer where Group Policy needs to be refreshed:

```
Gpudate.exe /force
```

This command can be run from any command window that is running under administrator credentials. To run a command window under administrator credentials, click **Start**, right-click **Command Prompt**, and then click **Run as administrator**.

Keep in mind that these policies should be targeted towards your client computers. They should not be applied to servers running Lync Server.

To help ensure that network packets are marked with the appropriate DSCP value, you should also create a new registry entry on each computer by completing the following procedure:

1. Click **Start** and then click **Run**.
2. In the **Run** dialog box, type **regedit** and then press ENTER.
3. In the Registry Editor, expand **HKEY_LOCAL_MACHINE**, expand **SYSTEM**, expand **CurrentControlSet**, expand **services**, and then expand **Tcpip**.
4. Right-click **Tcpip**, point to **New**, and then click **Key**. After the new registry key is created, type **QoS** and then press ENTER to rename the key.
5. Right-click **QoS**, point to **New**, and then click **String Value**. After the new registry value is created, type **Do not use NLA** and then press ENTER to rename the value.
6. Double-click **Do no use NLA**. In the **Edit String** dialog box, type **1** in the **Value data** box and then click **OK**.

7. Close the Registry Editor and then reboot your computer.

Configuring Quality of Service on Computers with Multiple Network Adapters

If you have a computer that has multiple network adapters you might occasionally run into issues where DSCP values are shown as 0x00 rather than the configured value. This will typically occur on computers where one or more of the network adapters are not able to access your Active Directory domain (for example, if these adapters are used for a private network). In cases like that, DSCP values will be tagged for the adapters that can access the domain, but will not be tagged for adapters that cannot access the domain.

If you would like to tag DSCP values for all the network adapters in a computer, including adapters that do not have access to your domain, then you will need to add and configure a value to the registry. That can be done by completing the following procedure:

1. Click **Start** and then click **Run**.
2. In the **Run** dialog box, type **regedit** and then press ENTER.
3. In the Registry Editor, expand **HKEY_LOCAL_MACHINE**, expand **SYSTEM**, expand **CurrentControlSet**, expand **services**, and then expand **Tcpip**.
4. If you do not see a registry key labeled **QoS** then right-click **Tcpip**, point to **New**, and then click **Key**. After the new key is created, type **QoS** and then press ENTER to rename the key.
5. Right-click **QoS**, point to **New**, and then click **String Value**. After the new registry value is created, type **Do not use NLA** and then press ENTER to rename the value.
6. Double-click **Do not use NLA**. In the **Edit String** dialog box, type **1** in the **Value data** box and then click **OK**.

After creating and configuring the new registry value you will need to reboot your computer in order for the changes to take effect.

1.7.14.1.8 Configuring Quality of Service on Microsoft Lync Phone Edition Devices

Configuring Quality of Service on Microsoft Lync Phone Edition Devices

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Quality of Service (QoS) >

Topic Last Modified: *2012-11-01*

Although Quality of Service (QoS) is not enabled by default for devices such as iPhones, QoS is enabled by default for devices running Lync Phone Edition. (These devices are commonly referred to as UC or Unified Communication phones.) To verify this, run the following Windows PowerShell command from within the Lync Server Management Shell:

```
Get-CsUCPhoneConfiguration
```

If you have not made any changes to your UC phone configuration settings then you will get back information that looks like this:

```
Identity            : Global
CalendarPollInterval : 00:03:00
EnforcePhoneLock     : True
PhoneLockTimeout     : 00:10:00
MinPhonePinLength    : 6
```

```
SIPSecurityMode       : High
VoiceDiffServTag      : 40
Voice8021p            : 0
LoggingLevel          : Off
```

For Quality of Service purposes, only one of these properties is of interest: VoiceDiffServTag. The VoiceDiffServTag represents the DSCP value assigned to voice traffic emanating from a Lync Phone Edition device.

Note:

The Voice8021p parameter is no longer supported in Lync Server 2013. The parameter is still valid for backward compatibility with Microsoft Lync Server 2010; however, it has no effect on devices used with Lync Server 2013.

In most networks, marking Lync Phone Edition packets with a VoiceDiffServTag of 40 should not cause any problems. However, 40 is not the value typically used for audio traffic; instead, audio traffic is almost always marked with the DSCP code 46. In order to maintain consistency throughout your network, you might want to change the VoiceDiffServTag property of your UC phones to 46.

To do that, you can use either Windows PowerShell or the Lync Server Control Panel. To modify the VoiceDiffServTag value by using Windows PowerShell, run the following command from within the Lync Server Management Shell:

```
Set-CsUCPhoneConfiguration -VoiceDiffServTag 46
```

The preceding command modifies the global collection of UC phone configuration settings. Note, however, that UC phone settings can also be assigned to the site scope. To modify UC phone configuration settings at the site scope, you must specify the site Identity. For example:

```
Set-CsUCPhoneConfiguration -Identity "site:Redmond" -VoiceDiffServTag 46
```

You can also use the following command to simultaneously modify all your UC phone configuration settings:

```
Get-CsUCPhoneConfiguration | Set-CsUCPhoneConfiguration -VoiceDiffServTag 46
```

If you prefer to make this change using Lync Server Control Panel, then start the Control Panel and then complete the following procedure:

1. Click **Clients** and then click **Device Configuration**.
2. On the **Device Configuration** tab, double-click the collection of settings you want to modify (for example, **Global**).
3. In the **Edit Device Configuration** dialog box, set the value of the **Voice Quality of Service (QoS)** box to **46** and then click **Commit**.

If you have multiple collections you will need to repeat this process for each collection of UC phone settings. Lync Server Control Panel will not allow you to simultaneously modify multiple setting collections.

If you have devices that are not based on the Windows operating system (such as iPhones) in your organization these devices will not be affected by changing the VoiceDiffServTag setting. If you want to change DSCP values on those devices you will need to refer to the administration manual for each of your device types.

1.7.14.1.9 Configure Voice Quality of Service for Lync Phone Edition

Configure Voice Quality of Service for Lync Phone Edition

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Quality of Service (QoS) >

Topic Last Modified: *2012-09-29*

You can configure voice Quality of Service (QoS) requirements for Lync Phone Edition devices in a pool by setting the QoS level for IP phones that connect to Lync Server 2013.

⊟To configure voice Quality of Service for Lync Phone Edition

1. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
2. In the left navigation bar, click **Clients**, and then click **Device Configuration**.
3. On the **Device Configuration** page, in the list of device configurations, double-click the configuration for which you want to change QoS settings.
4. In **Edit Device Configuration**, under **Voice quality of service**, specify the QoS level. The default level is **40**.

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Call Admission Control >

Topic Last Modified: *2012-11-01*

Call admission control (CAC) is a network of regions, sites, and subnets that enable you to place restrictions on audio and video transmissions based on available bandwidth. After you configure the CAC network, you must enable CAC to enforce the bandwidth limitations. You can use Lync Server Control Panel to do this.

To enable CAC from Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Global**.
4. On the **Global** page, click the **Global** configuration.

   > **Note:**
   > Only one network can be configured for any Microsoft Lync Server 2013 deployment, so there will never be more than one network configuration in the list. You cannot rename the Global configuration.

5. On the **Edit** menu, click **Show details**.
6. On the **Edit Global Setting** page, select the **Enable call admission control** check box, and then click **Commit**.

When you click **Commit**, you run a test of the configuration. The **Edit Global Settings** dialog box closes, returning you to the **Global** page. You will receive a warning if any errors or inconsistencies are discovered in your network configuration that will prevent it from working correctly (for example, if every region is not connected to every other region through an interregion route).

If you make changes to your network configuration, you can run the validation check again by opening the Global configuration and clicking **Commit**. You do not need to disable CAC first: leave the check box checked and click **Commit**. You can do this at any time without making any configuration changes.

***Topic Last Modified:** 2013-02-23*

As part of call admission control (CAC), a bandwidth policy is used to define bandwidth limitations for certain modalities. In Microsoft Lync Server 2013, only audio and video modalities can be assigned bandwidth limitations. You can set overall bandwidth limitations and session limitations. You can use the Lync Server Control Panel to create, modify, or delete a container profile for these policies. Each bandwidth policy profile can be associated with one or more network sites. Use the following procedures to view a bandwidth policy profile. To create or modify a bandwidth policy profile, see Creating or Modifying Bandwidth Policy Profiles.

⊟To view a bandwidth policy profile

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Bandwidth Policy**.
4. On the **Bandwidth Policy** page, click the bandwidth policy profile that you want to view.
5. On the **Edit** menu, click **Show details**.

Viewing Network Bandwidth Policy Profile Information by Using Windows PowerShell Cmdlets

Network bandwidth profiles can be viewed by using Windows PowerShell and the Get-CsNetworkBandwidthPolicyProfile cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view network bandwidth policy profile information

- To view information about all your network bandwidth policy profiles, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsNetworkBandwidthPolicyProfile
  ```

  That will return information similar to this:

  ```
  Identity           : RedmondBandwidthPolicy
  BWPolicy           : {BWLimit=200;BWSessionLimit=200;
                        BWPolicyModality=Audio,
                        BWLimit=1400;BWSessionLimit=500;
                        BWPolicyModality=Video}
  BWPolicyProfileID : RedmondBandwidthPolicy
  Description        :
  ```

For more information, see the help topic for the Get-CsNetworkBandwidthPolicyProfile cmdlet.

As part of call admission control (CAC), a bandwidth policy is used to define bandwidth limitations for certain modalities. In Microsoft Lync Server 2013, only audio and video modalities can be assigned bandwidth limitations. You can set overall bandwidth limitations and session limitations. You can use the Lync Server Control Panel to create, modify, or delete a container profile for these policies. Each bandwidth policy profile can be associated with one or more network sites. Use the following procedures to create or modify a bandwidth policy profile. To delete a bandwidth policy profile, see Deleting Network Bandwidth Policy Profiles

To create a new bandwidth policy profile

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Bandwidth Policy**.
4. On the **Bandwidth Policy** page, click **New**.
5. In **New Bandwidth Policy Profile**, type a name in the **Name** field. This name must be unique among all bandwidth policy profiles.

6. In the **Audio limit** field, type a numeric value. This value is the maximum amount of bandwidth to allocate for all audio connections, expressed in kbps.
7. Enter a numeric value in the **Audio session limit** field. This value is the maximum amount of bandwidth to allocate for an individual audio connection, expressed in kbps. This value must be 40 or higher.
8. Enter a numeric value in the **Video limit** field. This value is the maximum amount of bandwidth to allocate for all video connections, expressed in kbps.
9. Enter a numeric value in the **Video session limit** field. This value is the maximum amount of bandwidth to allocate for an individual video connection, expressed in kbps. This value must be 100 or higher.
10. (Optional) Type a value in the **Description** field to provide more information about this bandwidth policy profile that cannot be expressed by the name alone.
11. Click **Commit**.

Note:
Creating a new bandwidth policy profile does not automatically enforce bandwidth restrictions. You must first associate the policy profile with a site. For details about how to associate a policy profile with a site, see Creating or Modifying Network Sites.

To modify a bandwidth policy profile

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Bandwidth Policy**.
4. On the **Bandwidth Policy** page, click the bandwidth policy profile that you want to modify.
5. On the **Edit** menu, click **Show details**.
6. On the **Edit Bandwidth Policy Profile** page, modify the fields as necessary (for details, see the "To create a bandwidth policy profile" section earlier in this topic).
7. Click **Commit**.

Note:
When you modify the bandwidth policy profile, it will immediately update the bandwidth limitations of all network sites associated with this bandwidth policy profile.

1.7.14.2.3 Network Regions

Network Regions

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Call Admission Control >

Topic Last Modified: *2013-02-21*

Network regions are the network hubs or backbones used in the configuration of call admission control, E9-1-1, and media bypass. Use the following procedures to view, create, or modify network regions. For example, if you have already created network regions for one Voice feature, you do not need to create new network regions; other advanced Enterprise Voice features will use those same network regions. You may, however, need to modify an existing network region definition to apply feature-specific settings. For example, if you have created network regions for E9-1-1 (which do not require an associated central site) and you then deploy call admission control, you need to modify the network region definitions to specify a central site. For details, see

Configure Network Regions for CAC.

Note:
Any feature-specific requirements for network region definitions are documented in the Deployment topics for the feature.

A network region interconnects various parts of a network across multiple geographic areas. Every network region must be associated with a central site. The central site is the data center site on which the call admission control (CAC) bandwidth policy service is running. You can use Lync Server Control Panel to view network regions. Network regions include settings that determine whether alternate paths through the Internet are allowed for audio and video connections. Use this topic to view existing network regions. For details about creating or modifying existing network regions, see Creating or Modifying Network Regions.

To view information about a network region with Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region**.
4. On the **Region** page, click the region you want to view.

   Note:
   You can only view one region at a time.
5. On the **Edit** menu, click **Show details**.

Viewing Network Region Information by Using Windows PowerShell Cmdlets

You can view network region information by using Windows PowerShell and the **Get-CsNetworkRegion** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view network region information

- To view information about all your network regions, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsNetworkRegion
  ```

  That will return information similar to this:

  ```
  Identity          : Pacific Northwest
  Description       :
  BypassID          : 3b232b84-2c1d-4da2-8181-e9330bafebe9
  CentralSite       : Site:Redmond1
  BWAlternatePaths  : {BWPolicyModality=Audio;AlternatePath=True,
                      BWPolicyModality=Video;AlternatePath=True}
  NetworkRegionID   : Pacific Northwest
  ```

For more information, see the help topic for the Get-CsNetworkRegion cmdlet.

Topic Last Modified: *2012-11-01*

A network region interconnects various parts of a network across multiple geographic areas. Every network region must be associated with a central site. The central site is the data center site on which the call admission control (CAC) bandwidth policy service is running. You can use Lync Server Control Panel to configure network regions. Network regions include settings that determine whether alternate paths through the Internet are allowed for audio and video connections. From the Lync Server Control Panel, you can create, modify, or delete a network region. Use this topic to create and modify network regions. For details about deleting existing network regions, see Deleting Existing Network Regions.

To create a network region

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region**.
4. On the **Region** page, click **New**.
5. In the **New Region** page, type a value in the **Name** field. This value must be unique within your Microsoft Lync Server 2013 deployment.
6. From the **Central site** drop-down list, select the central site for this network region.
7. The **Enable audio alternate path** check box is checked by default. This field determines whether audio calls will be routed through an alternate path if

adequate bandwidth does not exist in the primary path. Clear this check box only if you need to turn off the offload to the Internet. If any of your calls will be Internet calls, this check box must be checked, regardless of bandwidth settings.

8. The **Enable video alternate path** check box is checked by default. This field determines whether video calls will be routed through an alternate path if adequate bandwidth does not exist in the primary path. Clear this check box only if you need to turn off the offload to the Internet. If any of your calls will be Internet calls, this check box must be checked, regardless of bandwidth settings.
9. (Optional) Type a value in the **Description** field to provide more information about this region that cannot be expressed by the name alone.
10. Click **Commit**.

The **Associated sites** table is not used for creating a network region. You associate a site with a region when you create or modify the site. For details, see Creating or Modifying Network Sites.

⊟To modify a network region

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region**.
4. On the **Region** page, click the region that you want to modify.
5. On the **Edit** menu, click **Show details**.
6. On the **Edit Region** page, you can modify the settings for enabling and disabling audio and video alternate paths, and change the description (for details, see the "To create a network region" section earlier in this topic.
7. Click **Commit**.

You cannot modify the **Associated sites** on this page. The list of associated sites is provided for reference so you are aware of which sites will be affected when you modify the region settings.

Topic Last Modified: *2013-02-21*

A network region interconnects various parts of a network across multiple geographic areas. Every network region must be associated with a central site. The central site is the data center site on which the call admission control (CAC) bandwidth policy service is running. You can use Lync Server Control Panel to configure network regions. Network regions include settings that determine whether alternate paths through the Internet are allowed for audio and video connections. From the Lync Server Control Panel, you can create, modify, or delete a network region. Use this topic to delete existing network regions. For details about creating or modifying existing network regions, see Creating or Modifying Network Regions.

⊟To delete a network region

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region**.
4. On the **Region** page, click the region you want to delete.

> **Note:**
> You can delete more than one region at a time. To do this, press CTRL and select multiple regions while holding down the CTRL key. Or, to select all regions, click **Select all** on the **Edit** menu.

5. On the **Edit** menu, click **Delete**.
6. Click **OK**.

> ⚠**Warning:**
> A network region cannot be removed if it is associated with a network site. If you attempt to remove a region associated with a site you will receive an error message. To see if a region is associated with any sites, select the region and then click **Show details** on the **Edit** menu.

1.7.14.2.4 Network Region Routes

Network Region Routes

Operations > Managing the Lync Server 2013 Network Infrastructure > Managing Call Admission Control >

Topic Last Modified: *2013-02-21*

A *network region route* defines the route between a pair of network regions. Each pair of network regions in your call admission control deployment requires a network region route. This enables every network region within the deployment to access every other region. Use the procedures in this section to view, create, modify, or delete network region routes.

- Creating or Modifying Network Regions
- Viewing Network Region Route Information
- Deleting Existing Network Region Routes

1.7.14.2.4.1 Viewing Network Region Route Information

Viewing Network Region Route Information

See Also

Managing the Lync Server 2013 Network Infrastructure > Managing Call Admission Control > Network Region Routes >

Topic Last Modified: *2013-02-23*

Every region within a call admission control (CAC) configuration must have some way to access every other region. While region links set bandwidth limitations on the connections between regions and also represent the physical links, a route determines which linked path the connection will traverse from one region to another. Use the following procedures to view existing network region routes in Lync Server 2013 Control Panel or Lync Server 2013 Management Shell. For details about creating or modifying network region routes, see Creating or Modifying Network Region Routes.

⊟To view network region route information in Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region Route**.
4. On the **Region Route** page, click the region route that you want to view.

   Note:
   You can only view one region route at a time.
5. On the **Edit** menu, click **Show details**.

Viewing Network Region Route Information by Using Windows PowerShell Cmdlets

Network region route information can be viewed by using Windows PowerShell and the Get-CsNetworkInterRegionRoute cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To view network region route information

- To view information about all your network region routes, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsNetworkInterRegionRoute
  ```

  That will return information similar to this:

  ```
  Identity                   : TransAmericaRoute
  NetworkRegionLinks         : {NorthwestToNortheast}
  InterNetworkRegionRouteID  : TransAmericaRoute
  NetworkRegionID1           : Pacific Northwest
  NetworkRegionID2           : Northeast
  ```

For more information, see the help topic for the Get-CsNetworkInterRegionRoute cmdlet.

Every region within a call admission control (CAC) configuration must have some way to access every other region. While region links set bandwidth limitations on the connections between regions and also represent the physical links, a route determines which linked path the connection will traverse from one region to another. You can use Lync Server Control Panel to configure network region routes. From Lync Server Control Panel, you can create, modify, or delete a network region route. Use this topic to create or modify a network region route. For details about deleting an existing network region routes, see Deleting Existing Network Region Routes.

⊟To create a network region route

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region Route**.
4. On the **Region Route** page, click **New**.
5. In **New Region Route**, type a value in the **Name** field.

   > **Note:**
   > This value must be unique within your Microsoft Lync Server 2013 deployment.

6. From the **Network region #1** drop-down list, select one of the two regions to be connected by this route.
7. From the **Network region #2** drop-down list, select the other region for this route. This region must be different from the region selected for Network region #1.
8. Use the **Network region links** list box to add region links to the route. Click the **Add** button to display the **Region Link** page. Click a region link to add to this route, and then click **OK**.

   > **Note:**
   > Continue to click the **Add** button to add more links, or select a link and click **Remove** to remove a link.

9. Click **Commit**.

⊟To modify a network region route

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region Route**.
4. On the **Region Route** page, click the region route that you want to modify.
5. On the **Edit** menu, click **Show details**.
6. In **Edit Region Route**, you can modify the regions joined by this route and the region links associated with the route.
7. Click **Commit**.

Configuring Network Site Links

See Also

Managing the Lync Server 2013 Network Infrastructure > Managing Call Admission Control > Call Admission Control for Sites >

Topic Last Modified: *2012-11-01*

Within a call admission control (CAC) configuration, you can create network inter-site policies that define bandwidth limitations between sites that are directly linked. When network sites share a direct link, bandwidth limitations for audio and video connections can be defined between those two sites. You cannot use the Lync Server Control Panel to configure network site policies, this can be done only by using cmdlets from the Lync Server Management Shell. You can create, modify, and remove a network site link (also known as a network inter-site policy) from the Lync Server Management Shell.

To create a network site link

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. From the command prompt, type the following command, substituting values that are valid for your configuration:

   ```
   New-CsNetworkInterSitePolicy -Identity Reno_Portland -NetworkSiteID1 R
   ```

   This example creates a new network site link named Reno_Portland that sets bandwidth limitations between the Reno and Portland network sites. The network sites and the bandwidth policy profile must already exist before running this command.

For detailed parameter descriptions, see New-CsNetworkInterSitePolicy in the Lync Server Management Shell documentation. To retrieve a list of bandwidth policy profiles that can be applied to the network site link, call the **Get-CsNetworkBandwidthPolicyProfile** cmdlet. For details, see Get-CsNetworkBandwidthPolicyProfile in the Lync Server Management Shell documentation.

To modify a network site link

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Use the **Set-CsNetworkInterSitePolicy** cmdlet to modify the properties of a given network site link. You can modify either (or both) or the connected sites, and you can modify the bandwidth policy profile associated with the link. Here is an example of modifying the bandwidth policy profile of a site link named Reno_Portland:

```
Set-CsNetworkInterSitePolicy -Identity Reno_Portland -BWPolicyProfileI
```

For detailed parameter descriptions, see Set-CsNetworkInterSitePolicy in the Lync Server Management Shell documentation.

To delete a network site link

1. Log on to the computer where Lync Server Management Shell is installed as a member of the RTCUniversalServerAdmins group or with the necessary user rights as described in Delegate Setup Permissions.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Use the **Remove-CsNetworkInterSitePolicy** cmdlet to remove a network site link. The following example deletes the Reno_Portland network site link:

```
Remove-CsNetworkInterSitePolicy -Identity Reno_Portland
```

For detailed parameter descriptions, see Remove-CsNetworkInterSitePolicy in the Lync Server Management Shell documentation.

Topic Last Modified: *2013-02-23*

Network sites are the offices or locations configured within each region of a call admission control (CAC) or Enhanced 9-1-1 deployment. You can view network site information in either Lync Server 2013 Control Panel or Lync Server Management Shell . For details about creating or modifying network sites, see Creating or Modifying Network Sites.

To view network site information in Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Site**.
4. On the **Site** page, click the site that you want to view.

   Note:

   You can only view information for one site at a time.
5. On the **Edit** menu, click **Show details**.

Viewing Network Site Information by Using Windows PowerShell Cmdlets

You can view network site information by using Windows PowerShell and the Get-CsNetworkSite cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view network site information

- To view information about all your network sites, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsNetworkSite
  ```

  That will return information similar to this:

  ```
  Identity           : Redmond
  NetworkSiteID      : Redmond
  Description        :
  NetworkRegionID    : Pacific Northwest
  BypassID           : 3b232b84-2c1d-4da2-8181-e9330bafebe9
  BWPolicyProfileID :
  LocationPolicy     :
  ```

For more information, see the help topic for the Get-CsNetworkSite cmdlet.

Topic Last Modified: *2012-10-08*

Network sites are the offices or locations configured within each region of a call admission control (CAC) or Enhanced 9-1-1 deployment. You can use the Microsoft Lync Server 2013 Control Panel to configure sites and associate them with regions. For example, a network region for North America might be associated with networks sites such as Chicago, Redmond, and Vancouver. A CAC network site must be created for every site within an organization, even if that site has no bandwidth limitations. From the Lync Server Control Panel you can create, modify, and delete network sites. Use the following procedures to create or modify a network site. For details on deleting an existing network site, see Deleting an Existing Network Site.

⊟To create a network site

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Site**.
4. On the **Site** page, click **New**.
5. In **New Site**, type a name for this site in the **Name** field.

Note:
Site names must be unique within the Lync Server 2013 deployment.

6. In the **Region** drop-down list, select a network region to associate with this site.
7. (Optional) If you want to place bandwidth limitations on audio or video calls to this site, select the bandwidth policy profile with the appropriate settings from the **Bandwidth policy** drop-down list.

Note:
You can view the details of the available bandwidth policy profiles, or create a new bandwidth policy profile, on the **Policy Profile** page of the **Network Configuration** group. For details, see Creating or Modifying Bandwidth Policy Profiles.

8. (Optional) If you want to provide location settings for this site, select a location policy from the **Location policy** drop-down list.

Note:
The location policy assigns specific Enhanced 9-1-1 (E9-1-1) and client location settings to the site. You can view the details of the available location policies, or create a new location policy, from the **Location Policy** page of the **Network Configuration** group. For details, see Viewing Location Policy Information.

9. (Optional) Type a value in the **Description** field to provide more information about this site that cannot be expressed by the name alone.
10. Click **Commit**.

Note:
You do not use the **Associated Subnets** table when you create a new

network site. You associate a subnet with a site when you create or modify the subnet. For details, see Create or Modify Network Subnets.

⊟To modify a network site

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Site**.
4. On the **Site** page, click the site that you want to modify.
5. On the **Edit** menu, click **Show details**.
6. On the **Edit Site** page, you can modify the description, region, bandwidth policy profile, and location policy associated with the site. For details, see "To create a network site" section earlier in this topic.
7. Click **Commit**.

You cannot modify the **Associated Subnets** table on this page. The list of associated subnets is provided for reference so that you are aware of what subnets will be affected when you modify the site settings.

⊟To delete a network site

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Site**.
4. On the **Site** page, click the site that you want to delete.

Note:

You can delete more than one site at a time. To do this, press CTRL and select multiple sites while holding down the CTRL key. Or, to select all sites, click **Select all** on the **Edit** menu.

5. On the **Edit** menu, click **Delete**.
6. Click **OK**.

⚠**Warning:**

You cannot remove a network site if it is associated with a network subnet. If you attempt to remove a site associated with a subnet you will receive an error message. To see if a site is associated with any subnets, click the site and then click **Show details** on the **Edit** menu.

Enabling Network Media Bypass

See Also

Managing the Lync Server 2013 Network Infrastructure > Managing Call Admission Control > Enabling and Disabling Media Bypass >

Topic Last Modified: *2012-11-01*

Media bypass settings apply globally across a Microsoft Lync Server 2013 deployment. Media bypass allows calls to bypass the Mediation Server. For details about when to use Media bypass, see Planning for Media Bypass in the Planning section.

You can enable and configure media bypass from the Lync Server Control Panel.

⊟To enable and configure media bypass

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Global**.
4. On the **Global** page, click the **Global** configuration. There is always only one configuration, and it is always named Global.
5. On the **Edit** menu, click **View details**.
6. On the **Edit Global Setting** page, click the **Enable media bypass** check box.
7. Select one of the following options:
   - **Always bypass**   Select this option to attempt media bypass on all calls. This option will be unavailable if call admission control (CAC) is enabled. If CAC is not enabled, select this option in the following situations:
     - There is no need for bandwidth control.
     - There is no need for fine-grained configuration to determine when bypass should happen.
     - There is full connectivity between gateways and clients.
   - **Use sites and region configuration**   If CAC is enabled, this option is selected by default and cannot be changed. When this option is selected, network configuration sites and regions will be used to determine when media bypass is possible. If you select this option, you can choose to enable bypass for sites that are not mapped. Click the **Enable bypass for non-mapped sites** check box only if you have one or more large sites associated with the same region that do not have bandwidth constraints (for example, a large central site) and you also have some branch sites associated with the same region that do have bandwidth constraints. When you enable bypass for non-mapped sites, configuration is streamlined because you specify only the subnets associated with the branch sites rather than needing to specify all subnets associated with all sites. We recommend that you do not select the **Enable bypass for non-mapped sites** check box if CAC is enabled.
8. Click **Commit** to save your changes.

Topic Last Modified: *2013-02-23*

You can view links between two network regions as part of call admission control (CAC). Regions within a network are linked through physical wide area network (WAN) connectivity. You can use the Lync Server Control Panel to view an existing link between two network regions. For details about creating or modifying network region link, see Configuring Network Region Links.

To view a network region link in Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region Link**.
4. On the **Region Link** page, click the region link that you want to view.

   > **Note:**
   > You can only view information about one region link at a time.

5. From the **Edit** menu, select **Show details**.

Viewing Network Region Link Information by Using Windows PowerShell Cmdlets

You can view network region links by using Windows PowerShell and the **Get-CsNetworkRegionLink** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view network region link information

- To view information about all your network region links, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsNetworkRegionLink
  ```

  This command returns information similar to the following:

  ```
  Identity            : NorthwestToCalifornia
  BWPolicyProfileID   :
  NetworkRegionLinkID : NorthwestToCalifornia
  NetworkRegionID1    : Pacific Northwest
  NetworkRegionID2    : California
  ```

For details, see Get-CsNetworkRegionLink.

You can configure links between two network regions as part of call admission control (CAC). Regions within a network are linked through physical wide area network (WAN) connectivity. You can use the Lync Server Control Panel to define a link between two network regions and set the bandwidth limitations on audio and video connections between these regions. For details about deleting an existing network region link, see Deleting Network Region Links.

⊟To create a network region link

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region Link**.
4. On the **Region Link** page, click **New**.
5. In **New Region Link**, type a value in the **Name** field.

Note:
This value must be unique within your Lync Server 2013 deployment.

6. From the **Network region #1** drop-down list, select one of the two regions to be linked.
7. From the **Network region #2** drop-down list, select the other region to be linked. This region must be different from the region selected for Network region #1.
8. (Optional) If you want to place bandwidth limitations on audio or video calls between these regions, select a bandwidth policy profile from the **Bandwidth policy** drop-down list.
9. Click **Commit**.

⊟To modify a network region link

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Region Link**.
4. On the **Region Link** page, click the region link that you want to modify.
5. On the **Edit** menu, click **Show details**.
6. In **Edit Region Link**, you can modify the regions that are linked or the bandwidth policy profile for this link.

7. Click **Commit**.

You can use the following procedure to view a network subnet. From the Lync Server Control Panel, you can create, modify, or delete a network subnet. For details about creating or modifying network subnets, see Create or Modify Network Subnets.

⊟To view a network subnet

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Subnet**.
4. On the **Subnet** page, click the subnet that you want to view.

> **Note:**
>
> You can only view one subnet at a time.

5. On the **Edit** menu, click **Show details...**.

Viewing Network Subnet Configuration Information by Using Windows PowerShell Cmdlets

Network subnet information can be viewed by using Windows PowerShell and the Get-CsNetworkSubnet cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To view network subnet information

- To view information about all your network subnets, type the following command in the Lync Server Management Shell and then press ENTER:

```
Get-CsNetworkSubnet
```

That will return information similar to this:

```
Identity      : 172.11.15.0
MaskBits      : 28
Description   :
NetworkSiteID : Redmond
SubnetID      : 172.11.15.0
```

For more information, see the help topic for the Get-CsNetworkSubnet cmdlet.

A network subnet must be associated with a network site for the purposes of determining the geographic location of the host belonging to this subnet. You can use Lync Server Control Panel to configure subnets. From the Lync Server Control Panel, you can create, modify, or delete a network subnet. For details about deleting network subnets, see Deleting Network Subnets.

In most deployments of Microsoft Lync Server 2013 where call admission control (CAC) is implemented, there will typically be a large number of subnets. Because of this, it is often best to configure subnets from the Lync Server Management Shell. From there you can call **New-CsNetworkSubnet** in conjunction with the Windows PowerShell cmdlet **Import-CSV**. By using these cmdlets together, you can read in subnet settings from a comma-separated values (.csv) file and create multiple subnets at the same time. For examples of how to create subnets from a .csv file, see New-CsNetworkSubnet.

⊟To create a network subnet

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Subnet**.
4. On the **Subnet** page, click **New**.
5. In **New Subnet**, enter a value in the **Subnet ID** field. This must be an IP address (for example, 174.11.12.0), and it must be the first address in the IP address range defined by the subnet.
6. In the **Mask** field, enter a numeric value from 1 through 32.

Note:
This value is the bitmask that is to be applied to the subnet being created.

7. In **Network site ID**, select the site to which this subnet belongs.
8. (Optional) Type a value in the **Description** field to provide more information about this subnet that cannot be expressed by the name alone.

9. Click **Commit**.

⊟To modify a network subnet

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Subnet**.
4. On the **Subnet** page, click the subnet that you want to modify.
5. On the **Edit** menu, click **Show details**.
6. On the **Edit Subnet** page, you can modify the bitmask, associated network site, or description. If you modify the bitmask, keep in mind that the Subnet ID must still be the first address in the IP address range defined by the subnet.
7. Click **Commit**.

Viewing Network Interface Information

Operations > Managing the Lync Server 2013 Network Infrastructure > Lync Server 2013 Network Interfaces >

Topic Last Modified: *2013-02-23*

You can view network interface information by using Windows PowerShell and the **Get-CsNetworkInterface** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To view network interface information

- To view network interface information, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsNetworkInterface
  ```

  This command returns information similar to the following for each network interface:

  ```
  Identity              : dc.vdomain.com/Primary/1
  ComputerFqdn          : dc.vdomain.com
  IPAddress             : 0.0.0.0
  IPv6Address           :
  Interface             : Primary
  InterfaceNumber       : 1
  ConfiguredFqdn        :
  ConfiguredIPAddress   :
  ConfiguredIPv6Address :
  ```

  For details, see Get-CsNetworkInterface.

1.7.14.4 Prevent New Connections to Lync Server for Server Maintenance

Prevent New Connections to Lync Server for Server Maintenance

Microsoft Lync Server 2013 > Operations > Managing the Lync Server 2013 Network Infrastructure >

Topic Last Modified: *2012-11-01*

Lync Server enables you to take a server offline (for example, to apply software or hardware upgrades) without any loss of service to users.

When you specify the option to prevent new connections or calls to a server in a pool, it stops taking any new connections and calls as soon as you implement this option. These new connections and calls are routed through other servers in the pool. A server that is preventing new connections allows its sessions on existing connections to continue until they naturally end. When all existing sessions have ended, the server is ready to be taken offline.

When you prevent new connections to a Front End Server, some Lync Server features and services rely on DNS load balancing to ensure that it functions properly. If you are not using DNS load balancing on the pool, connections through these services may not be re-routed to other servers during the period that the server is preventing new connections, and thus when the server is taken offline some sessions and calls may be interrupted. The features that rely on DNS load balancing to ensure that this option operates properly are as follows:

- Attendant
- Conferencing Announcement application
- Response Group application
- Announcement application
- Call Park application

For details about DNS load balancing, see DNS Load Balancing in the Planning documentation.

In addition to preventing new connections for all services on a server running Lync Server, you can also prevent new connections for individual Lync Server services. For example, this method is useful in a situation where you need to apply a Lync Server update that does not require the whole server to be shut down. Note that when you prevent connections for one service, you must select a service as it is grouped and displayed in the Windows list of services. For example, the Lync Server Front-End service and the data collection agent for Monitoring are separate Lync Server services, but in the Windows services list they are consolidated and shown as the Lync Server Front End service. You can prevent new connections for the Lync Server Front End service, but you cannot prevent new connections for these two individual underlying Lync Server services separately.

Important:

When you set a server to prevent new connections, and then restart the server, by default the server will immediately begin accepting new connections after it starts. To prevent this, set the server to only pause and resume manually, before you restart the server.

⊟To prevent new connections to Lync Server:

1. Log on to the local computer as a member of the Administrators group.
2. Open the Services snap-in console: Click **Start**, point to **All Programs**, point to **Administrative Tools**, and then click **Services**.

3. In the list, double-click the Lync Server Windows service to which you want to prevent new connections.
4. In the Properties dialog box, under **Service status: Started**, click **Pause**.
5. Optionally, but recommended, next to **Startup type**, click **Manual**.

Important:
When you set a server to prevent new connections, and then restart the server, by default the server will immediately begin accepting new connections after it starts. To prevent this, set the server to only pause and resume manually, before you restart the server.

6. When you are finished, click **OK**.

1.7.15 Managing Enhanced 9-1-1 and the Location Service

Managing Enhanced 9-1-1 and the Location Service

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-11-01*

Lync Server 2013 supports Enhanced 9-1-1 (E9-1-1) calling from Lync clients and Lync Phone Edition devices. When you configure Lync Server 2013 for E9-1-1, emergency calls placed from Lync 2013 or Lync Phone Edition include Emergency Response Location (ERL) information from the Location Information service database. Use the procedures in this section to manage location policy.

Note:
For details on deploying advanced Enterprise Voice features, such as E9-1-1 and the Location Information service, see Deploying Advanced Enterprise Voice Features.

Operations > Managing Enhanced 9-1-1 and the Location Service > Managing Location Policy >

Topic Last Modified: *2012-11-01*

In Lync Server 2013, you can use the location policy to apply settings that relate to Enhanced 9-1-1 (E9-1-1) functionality and to location settings for users or contacts. The location policy determines whether a user is enabled for E9-1-1, and if so what the behavior is of an emergency call. For example, you can use the location policy to define what number constitutes an emergency call (for example, 911 in the United States), whether corporate security should be automatically notified, and how the call should be routed.

You can configure location policies from the **Network Configuration** group in Lync Server 2013 Control Panel. From Lync Server Control Panel you can view, create, modify, or delete location policies. Use the following procedure to view information about location policies. For details on creating or modifying location policies, see Creating or Modifying a Location Policy.

⊟To view information about a location policy

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Location Policy**.
4. On the **Location Policy** page, select the location policy that you want to modify.
5. On the **Edit** menu, click **Show details**.

Note:
You can only view information about one location policy at a time.

A single policy, called Global, exists by default and cannot be deleted or renamed. However, you can modify the Global policy. This policy will apply to all users and contacts, unless you create site policies or per-user policies. Per-user policies must be applied to specific users.

Operations > Managing Enhanced 9-1-1 and the Location Service > Managing Location Policy >

***Topic Last Modified:** 2012-11-01*

In Lync Server 2013, you can use the location policy to apply settings that relate to Enhanced 9-1-1 (E9-1-1) functionality and to location settings for users or contacts. The location policy determines whether a user is enabled for E9-1-1, and if so what the behavior is of an emergency call. For example, you can use the location policy to define what number constitutes an emergency call (for example, 911 in the United States), whether corporate security should be automatically notified, and how the call should be routed.

You can configure location policies from the **Network Configuration** group in Lync Server 2013 Control Panel. From Lync Server Control Panel you can view, create, modify, or delete location policies. Use the procedures in this section to create or modify a location policy. For details on deleting location policies, see Deleting a Location Policy.

In Lync Server 2013, you can override the default amount of time between client requests for a location update from the Location Information service. The default value is 4 hours. Use the **Set-CsLocationPolicy** cmdlet with the LocationRefreshInterval parameter to override the default value.

⊟To create a new location policy in Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Location Policy**.
4. On the **Location Policy** page, click **New** and then select the type of policy you want to create:
   - To create a site policy, click **Site policy**. In **Select a Site**, choose the site to which you want the policy applied and click **OK**. On the **New Location Policy** page, the **Scope** field contains the value **Site**, and the **Name** field contains the name of the site you chose. You cannot modify either of these fields. A site policy is automatically applied to all users on the specified site and overrides the global policy for those users.
   - To create a **User policy**, click **User policy**. In the **New Location Policy**, the **Scope** field contains the value **User**. You cannot modify this value. In the **Name** field, type the name you want to give this policy. A user policy does not automatically apply to any users. After creating the user policy, you must manually grant the policy to the users or network sites to which you want to policy to apply.
5. Fill in the remaining fields as follows:
   - **Enable enhanced emergency services**   Select this check box to enable the users associated with this policy for E9-1-1. When emergency services are enabled, Lync Server clients will retrieve location information on registration and include that information when an emergency call is made.
   - **Location**   Specify one of the following values:
     - **Required**   The user will be prompted to input location information when the client registers at a new location. The user can dismiss the prompt

  without entering any information. If information is entered, an emergency call will first be answered by the emergency services provider to verify the location before being routed to the Public Safety Answering Point (PSAP) operator (that is, the 911 operator).
  - **Not Required** The user will not be prompted for a location. When a call is made with no location information, the emergency services provider will answer the call and ask for a location.
  - **Disclaimer** This option is the same as **Required** except that the user cannot dismiss the prompt without entering location information. The user can still complete an emergency call, but no other calls can be completed without entering the information. In addition, disclaimer text will be displayed to the user that can alert them to the consequences of declining to enter location information. To set the disclaimer text, you must use Lync Server Management Shell to run the **Set-CsLocationPolicy** cmdlet or the **New-CsLocationPolicy** cmdlet with the EnhancedEmergencyServiceDisclaimer parameter. For details, see Set-CsLocationPolicy or New-CsLocationPolicy in the Lync Server Management Shell documentation.

> **Note:**
> In Lync Server 2013, you can use location policy to set different disclaimers for different locales or different sets of users, unlike in Lync Server 2010 where you could specify only a global disclaimer for the entire organization.

- **Use location for emergency services only** Lync can use location information for various reasons (for example, to notify teammates of your current location). Select this check box to ensure location information is available only for use with an emergency call.
- **PSTN usage** The public switched telephone network (PSTN) usage that will be used to determine which voice route will be used to route emergency calls from clients using this profile. The route associated with this usage should point to a SIP trunk dedicated to emergency calls or to an Emergency Location Identification Number (ELIN) gateway that routes emergency calls to the nearest Public Safety Answering Point (PSAP).
- **Emergency dial number** The number that is dialed to reach emergency services. In the United States this value is 911. The string must be made of the digits 0 through 9 and can be from 1 to 10 digits in length.
- **Emergency dial mask** A number that you want to translate into the value of the emergency dial number value when it is dialed. For example, if you enter a value of 212 in this field and the emergency dial number field has a value of 911, if a user dials 212 the call will be made to 911. This allows for alternate emergency numbers to be dialed and still have the call reach emergency services (for example, if someone from a country or region with a different emergency number attempts to dial that country or region’s number rather than the number for the country or region they are currently in). You can define multiple emergency dial masks by separating the values with semicolons. For example, 212;414. Maximum length of the string is 100 characters. Each character must be a digit 0 through 9.

> **Important:**
> Ensure that the specified dial mask value is not the same as a number in a call park orbit range. Call park routing will take precedence over emergency dial string conversion. To see the existing call park orbit ranges, click **Voice Features** in the left navigation bar and then click **Call Park**. For details, see Configure Phone Number Extensions for Parking Calls.

- **Notification URI** One or more SIP Uniform Resource Identifiers (URIs) to be notified when an emergency call is made. For example, the company security office could be notified through an instant message whenever an emergency call is made. If the caller's location is available that location will be included in the notification. Multiple SIP URIs can be included as a comma-separated list. For example, "sip:security@litwareinc.com","sip:kmyer@litwareinc.com". Distribution lists are supported. The string must be from 1 to 256 characters in length and must begin with the prefix "sip:". Before you click in the Notification URI field an example is displayed.

- **Conference URI** The SIP URI, in this case the telephone number, of a third party that will be conferenced in to any emergency calls that are made. For example, the company security office could receive a call when an emergency call is made and listen in or participate in that call (depending on the value supplied in the **Conference mode** field). The string must be from 1 to 256 characters in length and must begin with the prefix sip:. An example is displayed until you click inside this field.
- **Conference mode** If you specify a value in the **Conference URI** field, the **Conference mode** determines whether a third party can participate in the call or can only listen in. Specify one of the following options:
  - **One-way** A third party can only listen to the conversation between the caller and the PSAP operator.
  - **Two-way** A third party can listen in and participate in the call between the caller and the PSAP operator.

6. Click **Commit**.

> **Important:**
>
> When you create a user policy, initially that policy does not apply to any users or network sites. To apply the policy to a user, click **Users** in the left navigation bar. Find the user to which you want to apply the policy. On the **Edit** menu, click **Show details**. On the **Edit Lync Server User** page, select the new location policy from the **Location policy** drop-down list and then click **Commit**.
>
> To apply the policy to a network site, click **Network Configuration** in the left navigation bar and then click **Site**. Find the network site to which you want to apply the policy. On the **Edit** menu, click **Show details**. In **Edit Site**, select the new location policy from the **Location policy** drop-down list and then click **Commit**.

⊟To modify a location policy in Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Location Policy**.
4. On the **Location Policy** page, select the location policy that you want to modify.
5. On the **Edit** menu, click **Show details**.
6. On the **Edit Location Policy** page, modify the fields as necessary (for details, see Step 5 in the "To create a new location policy" procedures earlier in this topic).
7. Click **Commit**.

Operations > Managing Enhanced 9-1-1 and the Location Service > Managing Location Policy >

Topic Last Modified: *2012-10-10*

In Lync Server 2013, you can use the location policy to apply settings that relate to Enhanced 9-1-1 (E9-1-1) functionality and to location settings for users or contacts. The location policy determines whether a user is enabled for E9-1-1, and if so what the behavior is of an emergency call. For example, you can use the location policy to define what number constitutes an emergency call (for example, 911 in the United States), whether corporate security should be automatically notified, and how the call should be routed.

You can configure location policies from the **Network Configuration** group in Lync Server 2013 Control Panel. From Lync Server Control Panel you can view, create, modify, or delete location policies. Use the following procedures delete a location policy. For details on creating or modifying location policies, see Creating or Modifying a Location Policy.

⊟To delete a location policy

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or is assigned to the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Network Configuration** and then click **Location Policy**.
4. On the **Location Policy** page, select the location policy that you want to delete.

   > **Note:**
   > You can delete more than one location policy at a time. To do this, press CTRL and select multiple policies while holding down the CTRL key. Or, to select all policies, click **Select all** on the **Edit** menu.

5. On the **Edit** menu, click **Delete**.
6. Click **OK**.

   > **Important:**
   > You cannot delete the Global location policy. If you attempt to delete the Global policy you will receive a warning message and that policy will be reset to its default values.

1.7.16 Managing Lync Server 2013 Services and Server Roles

Managing Lync Server 2013 Services and Server Roles

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-10-15*

You can use the procedures in this section to manage the various services and server roles in Lync Server 2013.

- Audio/Video (A/V) Edge Servers
- Configure a New Trusted Application Server
- Managing Lync Server 2013 Services
- Administering the Address Book Service
- Change the Web Services URL

1.7.16.1 Audio/Video (A/V) Edge Servers

Audio/Video (A/V) Edge Servers

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Services and Server Roles >

Topic Last Modified: *2012-11-01*

The A/V Edge service provide a way for your internal users (users who are logged on to your organizational network) to share audio and video with external users (users who are not logged on to your organizational network). In addition to audio and video, the A/V Edge service also provides support for such things desktop sharing and file transfer.

The A/V Edge service is primarily managed by using A/V Edge configuration; these settings enable you to manage the maximum amount of bandwidth to be allocated per port and per user, and to specify the length of time that an authentication token can be used before that token must be renewed. A/V Edge configuration settings can be applied to sites or to individual A/V Edge servers. When determining which collection of settings will take priority, use the following guide:

- Settings configured at the service scope (that is, on an individual server) take priority over everything.
- Settings configured at the site scope take priority over settings configured at the global scope. However, service scope settings will also supersede site-scope settings.
- Settings at the global scope will be used only if there are no service settings configured on the individual server and if there are no site settings for the site where that server is located.

The A/V Edge service can only be managed by using Lync Server PowerShell and the CsAVEdgeConfiguration cmdlets.

- Return A/V Edge Server Configuration Information
- Create or Modify a Collection of A/V Edge Server Configuration Settings
- Delete an Existing Collection of A/V Edge Server Configuration Settings

1.7.16.1.1 Return A/V Edge Server Configuration Information

Return A/V Edge Server Configuration Information

See Also

Operations > Managing Lync Server 2013 Services and Server Roles > Audio/Video (A/V) Edge Servers >

Topic Last Modified: *2012-11-01*

The A/V Edge service provide a way for your internal users (users who are logged on to your organizational network) to share audio and video with external users (users who are not logged on to your organizational network). The A/V Edge service is primarily managed by using A/V Edge configuration settings, setting that can be configured at the site scope or at the service scope (that is, can be configured for an individual A/V Edge server).

To return information about the A/V Edge configuration settings in use in your organization, you must use Windows PowerShell and the Get-CsAVEdgeConfiguration cmdlet. For more information, see the help topic for the Get-CsAVEdgeConfiguration cmdlet.

Information returned from the Get-CsAVEdgeConfiguration cmdlet will look similar to this:

```
Identity                 : Global
MaxTokenLifetime         : 08:00:00
MaxBandwidthPerUserKb : 10000
MaxBandwidthPerPortKb : 3000
```

To return information for all your A/V Edge configuration settings

- The following command returns information about all the A/V Edge configuration settings currently in use in your organization:

```
Get-CsAVEdgeConfiguration
```

To return information for site-scoped A/V Edge configuration settings

- To return information about a specific collection of A/V Edge configuration settings, specify the Identity of that collection when running the Get-CsAVEdgeConfiguration cmdlet. For example, this command returns information only for the settings applied to the Redmond site:

```
Get-CsAVEdgeConfiguration -Identity "site:Redmond"
```

To return information for service-scoped A/V Edge configuration settings

- And this command returns information only for settings applied the a specific A/V Edge server:

```
Get-CsAVEdgeConfiguration -Identity "service:EdgeServer:atl-edge-001.li
```

Tasks

Operations > Managing Lync Server 2013 Services and Server Roles > Audio/Video (A/V) Edge Servers >

***Topic Last Modified:** 2012-11-01*

The A/V Edge service provide a way for your internal users (users who are logged on to your organizational network) to share audio and video with external users (users who are not logged on to your organizational network). The A/V Edge service is primarily managed by using A/V Edge configuration settings, setting that can be configured at the site scope or at the service scope (that is, can be configured for an individual A/V Edge server).

When you install Lync Server, a global collection of A/V Edge configuration settings is created for you. In addition to that, you can use the Windows PowerShell and the New-CsAVEdgeConfiguration cmdlet to create new settings at the site scope or the service scope (that is, for an individual A/V Edge server). If you create new settings keep in mind that:

- Settings configured at the service scope (that is, on an individual server) take priority over everything.
- Settings configured at the site scope take priority over settings configured at the global scope. However, service scope settings will also supersede site-scope settings.
- Settings at the global scope will be used only if there are no service settings configured on the individual server and if there are no site settings for the site where that server is located.

Any of your settings can then be modified by using the Set-CsAVEdgeConfiguration cmdlet. For more information, see the help topics for the New-CsAVEdgeConfiguration and the Set-CsAVEdgeConfiguration cmdlets.

To create new A/V Edge configuration settings at the site scope

- The following command creates a new collection of A/V Edge configuration settings for the Redmond site:

```
New-CsAVEdgeConfiguration -Identity "site:Redmond"
```

To create custom A/V Edge configuration settings at the site scope

- Because no additional parameters were included, these new settings will use the default values for the A/V Edge service. Alternatively, you can add additional parameters and parameter values to create a custom collection. For example, this command sets the MaxTokenLifetime property to 4 hours (04 hours : 00 minutes : 00 seconds):

```
New-CsAVEdgeConfiguration -Identity "site:Redmond" -MaxTokenLifetime "0
```

To create custom A/V Edge configuration settings at the service scope

- This command creates a similar collection applied to the A/V Edge server atl-edge-001.litwareinc.com:

```
New-CsAVEdgeConfiguration -Identity "service:EdgeServer:atl-edge-001.li
```

To modify existing A/V Edge configuration settings

- In this example, the Set-CsAVEdgeConfiguration cmdlet is used to change the maximum token lifetime for the Redmond site to 12 hours:

```
Set-CsAVEdgeConfiguration -Identity "site:Redmond" -MaxTokenLifetime "1
```

Operations > Managing Lync Server 2013 Services and Server Roles > Audio/Video (A/V) Edge Servers >

Topic Last Modified: *2012-11-01*

The A/V Edge service provide a way for your internal users (users who are logged on to your organizational network) to share audio and video with external users (users who are not logged on to your organizational network). The A/V Edge service is primarily managed by using A/V Edge configuration settings, setting that can be configured at the site scope or at the service scope (that is, can be configured for an individual A/V Edge server).

When you install Lync Server, a global collection of A/V Edge configuration settings is created for you. This global collection cannot be deleted. However, you can use the Windows PowerShell and the Remove-CsAVEdgeConfiguration cmdlet to "reset" the global collection; that simply means that all the property values in the global collection will be reset to their default value. For example, if you have set the MaxTokenLifetime property for 16 hours, that property will be reset to its default value of 8 hours.

However, custom settings collections that you have created at either the site scope or the service scope can be deleted by using the Remove-CsAVEdgeConfiguration cmdlet. If you delete site settings then A/V Edge servers in that site will be managed by the global settings. If you delete service-scope settings,, that server will then be managed by its site settings, if they exist, or by the global settings if no site settings are available.

For more information, see the help topic for the Remove-CsAVEdgeConfiguration cmdlet.

⊟To reset the global collection

- The following command resets the global collection of A/V Edge configuration settings:

```
Remove-CsAVEdgeConfiguration -Identity "global"
```

⊟To remove a collection from the site scope

- This command removes the A/V Edge configuration settings applied to the Redmond site:

```
Remove-CsAVEdgeConfiguration -Identity "site:Redmond"
```

⊟To remove a collection from the service scope

- This command removes the settings applied to the A/V Edge server atl-edge-001.litwareinc.com:

```
Remove-CsAVEdgeConfiguration -Identity "service:EdgeServer:atl-edge-001
```

1.7.16.2 Configure a New Trusted Application Server

Configure a New Trusted Application Server

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Services and Server Roles >

Topic Last Modified: *2012-11-01*

A trusted application is an application based on Microsoft Unified Communications Managed API (UCMA) 3.0 Core SDK that is trusted by Microsoft Lync Server 2013. For details about UCMA applications, see "Unified Communications Managed API 3.0 Core SDK Documentation" at http://go.microsoft.com/fwlink/p/?linkId=210320.

For information about configuring Microsoft Outlook Web Access (OWA) and Lync Server 2013, see "Configure Outlook Web App and Lync Server 2010 Integration" at the Microsoft Exchange Server 2013 documentation.

To successfully publish, enable, or disable a topology when adding or removing a server role, you should be logged on as a user who is a member of the RTCUniversalServerAdmins and Domain Admins groups. It is also possible to delegate the proper administrator permissions and rights for adding server roles. For details, see Delegate Setup Permissions in the Deployment documentation. For other configuration changes, only membership in the RTCUniversalServerAdmins group is required.

⊟To configure a trusted application server

1. Log on to the computer where Topology Builder is installed as a member of the Domain Admins group and the RTCUniversalServerAdmins group.
2. Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Topology Builder**.
3. Select **Download topology from existing deployment**, and then click **OK**.
4. In the **Save Topology As** dialog box, click the Topology Builder file you want to use, and then click **Save**.
5. In the left pane, right-click **Trusted application servers**, and then click **New Trusted Application Pool**.
6. Enter the **Pool FQDN** of the trusted application pool, select whether it will be a single-server or multiple-server, and then click **Next**.
7. On the **Select the next hop** page, from the list, select the Lync Server 2013 Front End pool.
8. Click **Finish**.
9. Select the top node **Lync Server 2013**, and then, from the **Actions** menu, click **Publish Topology**.

   The **Trusted Application Pool** should have been created successfully and associated with the correct Front End pool.

1.7.16.3 Managing Lync Server 2013 Services

Managing Lync Server 2013 Services

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Services and Server Roles >

Topic Last Modified: *2013-02-21*

Use the procedures in this section to manage Lync Server 2013 services from the **Topology** page.

- View the Status of Services Running on a Computer

1.7.16.3.1 View the Status of Services Running on a Computer

Microsoft Lync Server 2013 > Operations > Managing the Lync Server 2013 Topology >

Topic Last Modified: *2013-02-22*

You can use Lync Server 2013 Control Panel to view all the services that are running on a specific computer in your Lync Server topology and see the status of each service.

To view the status of services running on a computer

1. From a user account that is assigned to the CsUserAdministrator role or the CsAdministrator role, log on to any computer in your internal deployment.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Topology**.
4. On the **Status** page, sort or search the list, as required, to find the computer you’re interested in, and then click the computer name.
5. Do any of the following:
   - To see the latest status of services running on the computer, click **Get service status**.
   - To see a list of specific services running on the computer and the status of each service, click **Properties**, and then click **Close** to return to the list.

Viewing Service Status by Using Windows PowerShell Cmdlets

You can also view service status by using Windows PowerShell and the **Get-CsWindowsService** cmdlet. You can run this cmdlet from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view service status

- To view service status on a computer, type a command similar to the following in the Lync Server Management Shell and then press Enter:

  ```
  Get-CsWindowsService -ComputerName atl-cs-001.litwareinc.com | Select-C
  ```

  This command returns information similar to the following:

  ```
  RoleName                                  Status
  --------                                  ------
  {W3SVC}                                   Running
  {CentralManagement}                       Running
  {ClsAgent}                                Running
  {Registrar, UserServer, EdgeServer}       Running
  {ApplicationServer}                       Running
  {ConferencingServer}                      Running
  {MediationServer}                         Running
  ```

For details, see Get-CsWindowsService.

1.7.16.4 Administering the Address Book Service

Administering the Address Book Service

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Services and Server Roles >

***Topic Last Modified:** 2012-11-01*

As a part of the deployment of Lync Server, Enterprise Edition or Standard Edition server, the Address Book Service is installed by default. The database used by the Address Book Service – RTCab – is created on the SQL Server (for Enterprise Edition, this is the back-end SQL Server; for Standard Edition server, the collocated SQL Server).

Address Book Server Phone Number Normalization

Lync Server requires standardized RFC 3966/E.164 phone numbers. To use phone numbers that are unstructured or inconsistently formatted, Lync Server relies on the Address Book Server to preprocess phone numbers before they are handed off to the normalization rules. When a phone number is used from the address book and the normalization rule is applied, clients, such as Lync Phone Edition and Lync Mobile, can use these normalized numbers.

The normalization rules that were used in previous versions may not work properly without some adjustments. Because the white space and non-mandatory characters are removed prior to the normalization rules, if your regex expression is specifically looking for a dash or other character that was removed, your normalization rule might fail. You should review your normalization rules to ensure that either they are not looking for these non-mandatory characters, or that the rule can fail gracefully and continue in the event that the character is not present where the rule anticipates it will be.

User Replicator and Address Book Server

The Address Book Server uses data provided by User Replicator to update the information that it initially obtains from the global address list (GAL). User Replicator writes the Active Directory Domain Services (AD DS) attributes for each user, contact, and group into the AbUserEntry table in the database and the Address Book Server syncs the user data from the database into files in the Address Book Server file store and into the Address Book database RTCab. The schema for the AbUserEntry table uses two columns, **UserGuid** and **UserData**. **UserGuid** is the index column and contains the 16-byte GUID of the Active Directory object. **UserData** is an image column which contains all of the previously mentioned Active Directory Domain Services (AD DS) attributes for that contact.

User Replicator determines which Active Directory attributes to write by reading a configuration table located in the same SQL Server-based instance as the AbUserEntry table. The AbAttribute table contains three columns, **ID**, **Name**, **Flags**, and **Enable**. The table is created during database setup. If the AbAttribute table is empty, User Replicator skips its AbUserEntry table processing logic. Address Book Server attributes are dynamic and are retrieved from the AbAttribute table, which is initially written by the Address Book Server when the Address Book Server is activated.

Address Book Server activation populates the AbAttribute table with the values needed to support Lync Server. The following table shows those current values.

ID	Name	Flags
1	givenName	0x01400000
2	Sn	0x02400000
3	displayName	0x03420000
4	Title	0x04000000
5	mailNickname	0x05400000
6	Company	0x06000000
7	physicalDeliveryOfficeName	0x07000000
8	msRTCSIP-PrimaryUserAddress	0x08520C00
9	telephoneNumber	0x09022800
10	homePhone	0x0A302800
11	Mobile	0x0B622800
12	otherTelephone	0x0C302000
13	ipPhone	0x0D302000
14	Mail	0x0E500000
15	groupType	0x0F010800
16	Department	0x10000000
17	Description	0x11000100
18	Manager	0x12040001
19	proxyAddress	0x00500105
20	msExchHideFromAddressLists	0xFF000003
99	entryID	0x99000000

The numbers in the **ID** column must be unique and should never be reused. Also, keeping the ID values under 256 saves space in the output files written by the Address Book Server. However, the maximum ID value is 65535. The **Name** column corresponds to the Active Directory attribute name that User Replicator should put in the AbUserEntry table for each contact. The value in the **Flags** column is used to define the type of attribute. The following types of Address Book Server attributes are recognized by User Replicator, indicated by the low byte of the value in the **Flags** column.

Attribute	Description
0x0	A string attribute. User Replicator converts this type to UTF-8 before storing it in the AbUserEntry table.
0x1	A binary attribute. User Replicator stores this in the blob without any conversion.

0x2	A string attribute, but is included only if the attribute value begins with "tel:". This is primarily for multi-valued string attributes, specifically **proxyAddresses**. In this case, Address Book Server is interested only in **proxyAddresses** entries that begin with "tel:". Therefore, in the interest of saving space, User Replicator stores only the entries that begin with "tel:".
0x3	A Boolean string attribute, which if TRUE causes User Replicator to not include this contact in the AbUserEntry table. If FALSE, it causes User Replicator to include the attributes for this contact in the AbUserEntry table, but not the particular attribute with this flag. This is another special case type that is primarily for the **msExchHideFromAddressLists** attribute.
0x4	A string attribute, but is included only if the attribute value begins with "smtp:" and includes the "@" symbol.
0x5	A string attribute, but is included only if the attribute value begins with either "tel:" or "smtp:" and includes the "@" symbol.
0x100	If set, this is a multi-valued attribute that can appear more than once for each contact.
0x400	If set, this identifies the email user account name attribute for a contact. Address Book Server uses this flag to identify which attribute value to show in the phone normalization event log entry.
0x800	If set, this identifies a required attribute for a contact. Address Book Server includes a user in the AbUserEntry table only if there is a value for this attribute in Active Directory. If there is more than one required attribute, only one of them is required to have a value to include the user in the AbUserEntry table.
0x1000	If set, Address Book Server always normalizes the value of this attribute.
0x2000	If set, Address Book Server uses the normalized number from **proxyAddresses**, if the **UseNormalizationRules** CMS setting is FALSE; otherwise it behaves the same as when the flag bit is 0x1000.
0x4000	If set, Address Book Server does not include objects in the AbUserEntry table that have this value for the specified attribute. For example, if the **msRTCSIP-PrimaryUserAddress** attribute has this flag bit set, then contacts that have this

	attribute are not written to the database.
0x8000	If set, Address Book Server does not include objects in the AbUserEntry table that do not have this value for the specified attribute. If both the 0x4000 and 0x8000 flag bits are set on an object, the attribute with the flag bit value set to 0x4000 takes precedence, and the object is excluded from the AbUserEntry table.
0x10000	If set, this represents a group object. User Replicator uses this flag bit to include contacts with the **groupType** attribute whose presence indicates a group (for example, a distribution list or security group).
0x20000	If set, User Replicator uses this flag bit to include this attribute in device-specific Address Book Server files (that is, files with a .dabs extension).

In previous versions of Lync Server, when applying a change to Active Directory, the administrator would be required to run **Update -CSUserDatabase** and **Update –CSAddressBook** Windows PowerShell cmdlets to persist the change to the Lync Server user database and RTCab database immediately. In Lync Server 2013, Lync Server User Replicator will pick up the changes from Active Directory and update the Lync Server user database based on a configured interval. Lync Server User Replicator will also propagate the changes to the RTCab database quickly without the administrator having to run Update-CSAddressBook. If Address Book Web query is enabled, then the changes will be reflected in search results by Lync clients. Administrators will only need to run Update -CSAddressBook if the Address Book file download is enabled.

Note:

By default Lync Server User Replicator runs automatically every 5 minutes. You can configure this interval by using Set -CSUserReplicatorConfiguration -ReplicationCycleInterval <>.

Filtering the Address Book

The users populated in the Address Book Server files can be controlled based on certain Active Directory Domain Services (AD DS) attributes listed in the AbAttribute table. One such attribute used for filtering is the **msExchangeHideFromAddressBook** attribute. This is a user attribute added by the Exchange schema. If the value of this attribute is TRUE, Exchange Server uses this attribute to hide the contact from the Outlook Global Address List (GAL). Similarly, if the value of this attribute is TRUE, User Replicator does not include that user in the AbUserEntry table and this user will not be in the Address Book Server files.

You can use some flag bits to define a filter to use on Address Book Server attributes. For example, the presence of certain flag bits can identify an attribute as an include attribute or an exclude attribute. User Replicator filters out contacts that contain an exclude attribute and filters out contains that do not contain an include attribute.

Currently, there are three different filters. The following table lists these filters.

Attribute	Description
0x800	If set, this identifies a required attribute for

	a contact. User Replicator uses this flag bit to filter out contacts that do not contain at least one required attribute. The OuPathId is a required attribute, which is always set. So at least one of other required attributes should be set. Otherwise, contact (that is, with value of required attribute OuPathId) will still not be written to database. For example, if **telephoneNumber** and **homePhone** are defined as required attributes, only the contacts that have at least one of these attributes are written to the database.
0x4000	If set, this identifies an exclude attribute. User Replicator uses this flag bit to filter out contacts that contain this attribute. For example, if **msRTCSIP-PrimaryUserAddress** is defined as an exclude attribute, contacts that have this attribute are not written to the database.
0x8000	If set, this identifies an include attribute. User Replicator uses this flag bit to filter out contacts that do not contain this attribute. For example, if **msRTCSIP-PrimaryUserAddress** is defined as an include attribute, only the contacts that have this attribute are written to the database.

Note:

If both the 0x4000 (exclude attribute) and 0x8000 (include attribute) flag bits are set, the 0x4000 bit overrides the 0x8000 bit and the contact is excluded.

Although you can filter the Address Book to include only certain users, limiting entries does not limit other users' ability to contact the filtered users or to see their presence status. Users can always find, manually send instant messages, or manually initiate calls to users not in the Address Book by entering a user's complete sign-in name. Also, contact information for a user could also be found in Outlook.

While having full contact records in the Address Book files enables you to use Lync 2010 to initiate email, telephone, or Enterprise Voice calls (that is, if Enterprise Voice is enabled on the server) with users that are not configured for Session Initiation Protocol (SIP), some organizations prefer to include only SIP-enabled users in their Address Book Server entries. You can filter the Address Book to include only SIP-enabled users by clearing the 0x800 bit in the **Flags** column of the following required attributes: **mailNickname**, **telephoneNumber**, **homePhone**, and **mobile**. You can also filter the Address Book to include only SIP-enabled users by setting the 0x8000 (include attribute) in the **Flags** column of the **msRTCSIP-PrimaryUserAddress** attribute. This also helps to exclude service accounts from the Address Book files.

After you modify the AbAttribute table, you can refresh the data in the AbUserEntry table by running the cmdlet **Update-CsUserDatabase** command. After UR replication completes, you can update the file in the Address Book Server file store by manually running the cmdlet **UpdateCsAddressBook** command.

Note:

The Front End Server that the Address Book Server is placed is not administratively configurable. One is chosen during deployment—typically, the first Front End Server deployed. In the event of failure, the Address Book Service will move to another Front End Server, and requires no administrative attention.

Important:

If you have consolidated or otherwise modified your infrastructure from a multi-forest deployment or a parent/child deployment (such as consolidating your infrastructure before moving to Lync Server), you may find that the Address Book service download and the Address Book Web Query fails for some users. When in a deployment that had multiple domains or forests, the attribute **MsRTCSIP-OriginatorSid** is populated on the user objects that are exhibiting the issue. The **MsRTCSIP-OriginatorSid** attribute must be set to NULL on these objects to resolve the issue.

1.7.16.4.1 Windows PowerShell Cmdlets for Address Book Management

Windows PowerShell Cmdlets for Address Book Services

See Also

Operations > Managing Lync Server 2013 Services and Server Roles > Administering the Address Book Service >

Topic Last Modified: *2012-11-01*

Lync Server provides a number of Windows PowerShell command-line interface cmdlets to manage and configure the Address Book service. Some of these cmdlets are replacements for the ABServer.exe commands used in previous versions of Office Communications Server. In the following topics are the cmdlets that are used to set, create, and retrieve information about the Address Book service, its configuration and information about the Web services that the Address Book service uses when clients retrieve Address Book service files and settings.

All of these cmdlets are issued through the Lync Server Management Shell found in the Lync Server tools on a server or workstation where the administration tools have been installed.

- New-CsAddressBookConfiguration for Address Book Management
- Set-CsAddressBookConfiguration for Address Book Management
- Get-CsAddressBookConfiguration for Address Book Management
- Remove-CsAddressBookConfiguration for Address Book Management
- Test-CsAddressBookService for Address Book Management
- Test-CsAddressBookWebQuery for Address Book Management
- Update-CsAddressBook for Address Book Management
- New-CsClientPolicy for Address Book Management
- Set-CsClientPolicy for Address Book Management
- Get-CsService for Address Book Management
- New-CsWebServiceConfiguration for Address Book Management
- Get-CsWebServiceConfiguration for Address Book Management
- Set-CsWebServiceConfiguration for Address Book Management
- Remove-CsWebServiceConfiguration for Address Book Management

Managing Lync Server 2013 Services and Server Roles > Administering the Address Book Service > Windows PowerShell Cmdlets for Address Book Services >

Topic Last Modified: *2012-11-01*

Who can run this cmdlet: By default, members of the following groups are authorized to run the New-CsAddressBookConfiguration cmdlet locally: RTCUniversalServerAdmins. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "New-CsAddressBookConfiguration
```

The New-CsAddressBookConfiguration cmdlet creates a new configuration to manage the behavior of the Address book. Specific to this cmdlet is the ability to define if the Address Book Service creates the client download files, how and if normalization rules are used, how long to retain delta and compact delta files, delta file size before incorporating a new full file creation, what time of day the full file Address Book is created, and what the internal should be for synchronization of information in the User database.

For example:

```
New-CsAddressBookConfiguration -Identity site:Redmond -KeepDuration 15 -Synchroni
```

Who can run this cmdlet: By default, members of the following groups are authorized to run the Set-CsAddressBookConfiguration cmdlet locally: RTCUniversalServerAdmins. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Set-CsAddressBookConfiguration
```

Set-CsAddressBookConfiguration is similar to the New-CsAddressBookConfiguration cmdlet, except it is used to modify an existing configuration.

For example:

```
Set-CsAddressBookConfiguration -identity site:Redmond -RunTimeOfDay 23:00
```

***Topic Last Modified:** 2012-11-01*

Who can run this cmdlet: By default, members of the following groups are authorized to run the Get-CsAddressBookConfiguration cmdlet locally: RTCUniversalServerAdmins. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Get-CsAddressBookConfiguration
```

The cmdlet Get-CsAddressBookConfiguration returns information about a configuration that already exists.

For example:

```
Get-CsAddressBookConfiguration -Identity site:Redmond
```

Combining the functionality of Get-CsAddressBookConfiguration and Set-CsAddressBookConfiguration allows the administrator to define which configurations to modify and then apply the modifications. For example, this combined:

```
Get-CsAddressBookConfiguration -Filter site:* | Set-CsAddressBookConfiguration -R
```

Returns all configurations in all sites and applies the RunTimeOfDay of 23:00 hours to the configurations.

Topic Last Modified: *2012-11-01*

Who can run this cmdlet: By default, members of the following groups are authorized to run the Test-CsAddressBookService cmdlet: RTCUniversalServerAdmins. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Test-CsAddressBookService"}
```

Lync Server 2013 contains a number of cmdlets that initiate synthetic commands to confirm that a specific function or feature is working properly. Test-CsAddressBookService confirms that a defined user can connect and request the local files from the Address Book Web service.

For example:

```
Test-CsAddressBookService -TargetFqdn atl-cs-001.contoso.com -UserCredential cont
```

Other Resources

Test-CsAddressBookService

1.7.16.4.1.6 Test-CsAddressBookWebQuery for Address Book Management

Test-CsAddressBookWebQuery for Address Book Management

Managing Lync Server 2013 Services and Server Roles > Administering the Address Book Service > Windows PowerShell Cmdlets for Address Book Services >

Topic Last Modified: *2012-11-01*

Who can run this cmdlet: By default, members of the following groups are authorized to run the Test-CsAddressBookWebQuery cmdlet: RTCUniversalServerAdmins. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Test-CsAddressBookService"}
```

Similar to the Test-CsAddressBookService synthetic transaction, Test-CsAddressBookWebQuery performs a query against the Address Book Web Query to ensure that it is operating properly. The cmdlet will connect to the Web Ticket authentication and present the credentials specified in –UserCredential. If authenticated, the cmdlet then present the –TargetSipAddress information. The cmdlet should report success if it was able to retrieve the information about the contact.

For example:

```
Test-CsAddressBookWebQuery -TargetFqdn atl-cs-001.contoso.com -UserCredential con
```

Who can run this cmdlet: By default, members of the following groups are authorized to run the Update-CsAddressBook cmdlet locally: RTCUniversalUserAdmins, RTCUniversalServerAdmins. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Update-CsAddressBook"}
```

The Update-CsAddressBook cmdlet replaces the **abserver.exe –syncNow** command from Office Communications Server. The cmdlet's purpose is to initiate a synchronization immediately rather than waiting for the scheduled time. The first example command updates all Address Books in the organization. The second updates only the Address Book associated with the defined server.

Note:

In Lync Server 2013, Lync Server User Replicator will pick up the changes from Active Directory and update the Lync Server user database based on a configured interval. Lync Server User Replicator will also propagate the changes to the RTCab database quickly without the administrator having to run Update-CSAddressBook. Administrators will only need to run Update -CSAddressBook if the Address Book file download is enabled.

For example:

```
Update-CsAddressBook
```

```
Update-CsAddressBook -Fqdn atl-abs-001.contoso.com
```

Topic Last Modified: *2012-11-01*

Who can run this cmdlet: By default, members of the following groups are authorized to run the New-CsClientPolicy cmdlet: RTCUniversalServerAdmins. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "New-CsClientPolicy"}
```

The cmdlet New-CsClientPolicy defines a large number of settings for provisioning clients for features that are available in Lync Server 2013. For the Address Book Service, the parameter AddressBookAvailability is of interest. This parameter, which directly impacts the options available to clients, has three possible options:

- WebSearchAndFileDownload
- WebSearchOnly
- FileDownloadOnly

When defined, it determines how the Address Book is accessed by clients. If you define this parameter, you must define one of the options. If you do not modify this setting, the default WebSearchAndFileDownload remains in effect.

For example:

```
New-CsClientPolicy -Identity RedmondClientPolicy -DisableCalendarPresence $True -
```

Other Resources

New-CsClientPolicy

Who can run this cmdlet: By default, members of the following groups are authorized to run the Get-CsService cmdlet locally: RTCUniversalUserAdmins, RTCUniversalServerAdmins. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Get-CsService"}
```

Get-CsService is valuable to retrieve and display the current configuration of your infrastructure’s defined Web Services. By defining the pool’s fully qualified domain name (FQDN) and the parameter WebServer, the cmdlet returns the web-based services offered by your server, including the Address Book handler and distribution list expansion URIs.

For example:

```
Get-CsService -PoolFqdn "fe01.contoso.net" -WebServer
```

This cmdlet returns the following:

Identity : WebServer:pool01.contoso.net

FileStore : FileStore:dc01.contoso.net

UserServer : UserServer:pool01.contoso.net

PrimaryHttpPort : 80

PrimaryHttpsPort : 443

Who can run this cmdlet: By default, members of the following groups are authorized to run the New-CsWebServiceConfiguration cmdlet locally: RTCUniversalServerAdmins. To return a list of all the role-based access control (RBAC) roles this cmdlet has been assigned to (including any custom RBAC roles you have created yourself), run the following command from the Windows PowerShell prompt:

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "New-CsWebServiceConfiguration"}
```

The cmdlet New-CsWebServiceConfiguration defines a new configuration for Web Services in your organization. The scope for the Web Services configuration can only be at the site or service level. It cannot create a new Web Services configuration at the global level. Specifically of interest to the Address Book is the EnableGroupExansion attribute. If set to True, the Web Services can respond to requests for group expansion.

For example:

```
New-CsWebServiceConfiguration -Identity site:Redmond -EnableGroupExpansion $False
```

Other Resources

New-CsWebServiceConfiguration

```
Get-CsAdminRole | Where-Object {$_.Cmdlets -match "Remove-CsWebServiceConfigurati
```

The Remove-CsWebServiceConfiguration cmdlet allows an administrator to remove a previously created Web Services configuration. The cmdlet cannot remove the global Web Services configuration.

For example:

```
Remove-CsWebServiceConfiguration -Identity site:Redmond
```

Other Resources

Remove-CsWebServiceConfiguration

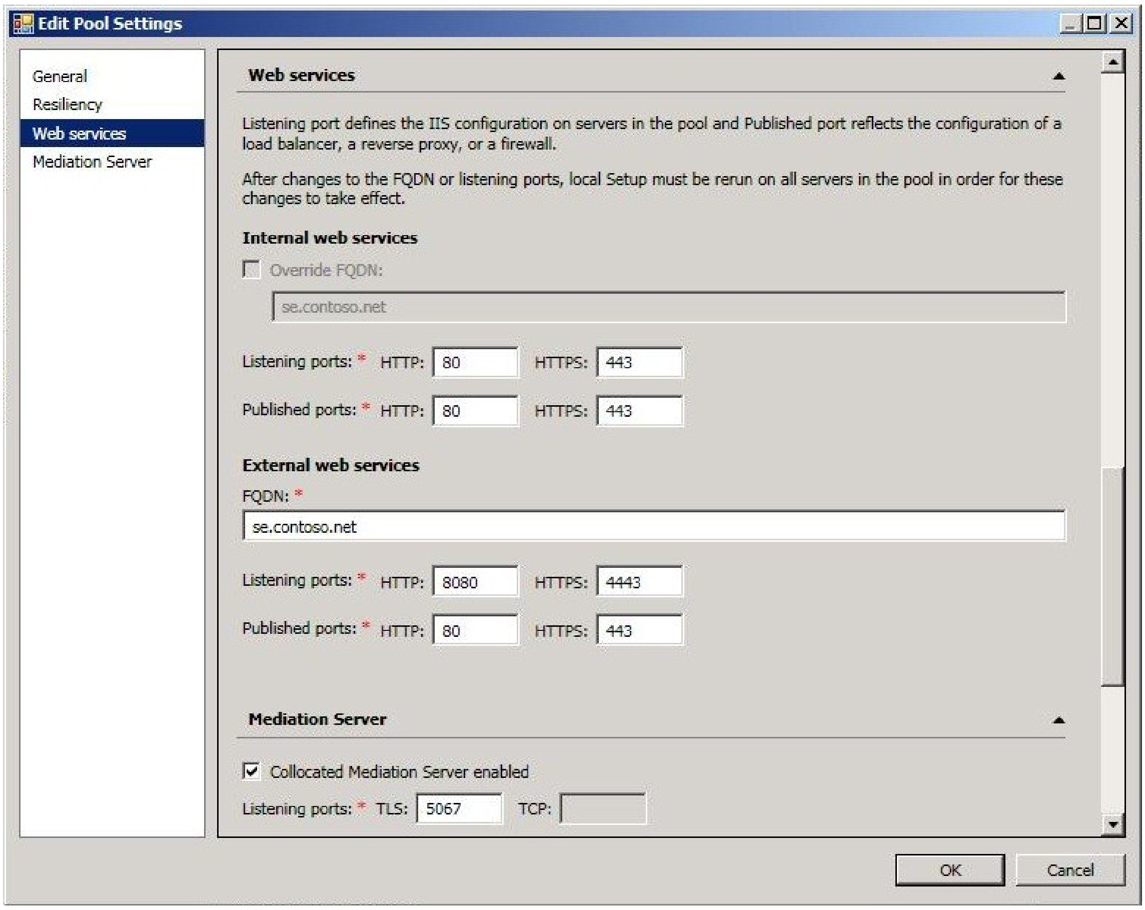
1.7.16.5 Change the Web Services URL

Change the Web Services URL

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Services and Server Roles >

Topic Last Modified: *2012-11-01*

When you set up your Front End pools and Standard Edition servers, you have the option to configure an external Web farm fully qualified domain name (FQDN) and associated ports. If you did not configure this URL when you ran the Lync Server Deployment Wizard, you need to manually configure these settings. An administrator typically does not need to modify these settings, as these are the recommended and default ports.



Web services

Listening port defines the IIS configuration on servers in the pool and Published port reflects the configuration of a load balancer, a reverse proxy, or a firewall.

After changes to the FQDN or listening ports, local Setup must be rerun on all servers in the pool in order for these changes to take effect.

Internal web services

□ Override FQDN:

se.contoso.net

Listening ports: * HTTP: 80 HTTPS: 443

Published ports: * HTTP: 80 HTTPS: 443

External web services

FQDN: *

se.contoso.net

Listening ports: * HTTP: 8080 HTTPS: 4443

Published ports: * HTTP: 80 HTTPS: 443

Mediation Server

☑ Collocated Mediation Server enabled

Listening ports: * TLS: 5067 TCP:

To configure web services

1. Log on to the computer where Topology Builder is installed as a member of the Domain Admins group and the RTCUniversalServerAdmins group.
2. Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Topology Builder**.
3. In Topology Builder, in the console tree under **Standard Edition Front End Servers**, **Enterprise Edition Front End pools**, and **Directory pools**, select the pool name. Right-click the name, click **Edit Properties**, and then click **Web Services**.
4. Add or edit the **External Web Services FQDN**, and then click **OK**.

Warning:

If you have more than one Front End pool or Front End Server the external Web services FQDN must be unique. For example, if you define the external Web services FQDN of a Front End Server as **pool01.contoso.com**, you cannot use **pool01.contoso.com** for another Front End pool or Front End Server. If you are also deploying Directors, the external Web services FQDN defined for any Director or Director pool must be unique from any other Director or Director pool as well as any Front End pool or Front End Server.

5. Verify the listening and published ports are configured correctly for your environment.
6. Repeat these steps for all Standard Edition servers, Front End Pools, and Director pools in your environment.
7. In the console tree, click **Lync Server 2013**, and then, in the **Actions** pane, click **Publish Topology**.

There are a few requirements you should be aware of when configuring the Listening and Publishing ports:

- The listening ports shown are the ports that are configured for Internet Information Server (IIS) on each Front End Server.
- The internal and external listening ports must be different for IIS. For the external listening ports, these are typically the same because one represents the hardware load balancer for internal web traffic and one represents the reverse proxy server for external web traffic.
- You can override the Internal web services on a Front End pool, Director or a Director pool and define your own FQDN.

  ⚠**Warning:**

  If decide to override the Internal web services with a self-defined FQDN, each FQDN must be unique from any other Front End pool, Director or a Director pool.

- The published ports must be configured on the reverse proxy or hardware load balancer as listening ports.
- For an Front End pool (not shown in the example), the internal SIP pool FQDN must be different from the internal web services FQDN, because web traffic comes through the hardware load balancer and the internal SIP pool traffic travels comes through the DNS load balancer. This requirement must be met.
- A Lync Server Standard Edition deployment does not need or allow an internal web services FQDN to be overridden because this server cannot be load balanced.
- If you have a hardware load balancer in your environment that you use for both internal SIP and web traffic, the Topology Builder cannot make the distinction.

The external web services works in conjunction with a reverse proxy in the perimeter network. It provides clients external access to by using these web services. The FQDNs configured here are sent to clients when they log on, and are used to make an HTTPS connection back to the reverse proxy when connecting remotely. The reverse-proxy server forwards the external web service FQDN to an internal hardware load balancer, or directly to the pool. The reverse proxy must be able to resolve the external web services FQDN to the IP address of the internal Web server. The external web services FDQN must be resolvable in the public Internet.

If your internal server is a Standard Edition server, the internal FQDN is the Standard Edition server FQDN. If your internal server is a Front End pool, the FQDN is a hardware load balancer virtual IP (VIP) that load balances the internal web farm servers. A hardware load balancer is required in a Front End pool with more than one Enterprise Edition server. A load balancer is not required for a Standard Edition server or a single Enterprise Edition Front End Server.

Configure a New Trusted Application Server

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Services and Server Roles >

Topic Last Modified: *2012-11-01*

A trusted application is an application based on Microsoft Unified Communications Managed API (UCMA) 3.0 Core SDK that is trusted by Microsoft Lync Server 2013. For details about UCMA applications, see "Unified Communications Managed API 3.0 Core SDK Documentation" at http://go.microsoft.com/fwlink/p/?linkId=210320.

For information about configuring Microsoft Outlook Web Access (OWA) and Lync Server 2013, see "Configure Outlook Web App and Lync Server 2010 Integration" at the Microsoft Exchange Server 2013 documentation.

To successfully publish, enable, or disable a topology when adding or removing a server role, you should be logged on as a user who is a member of the RTCUniversalServerAdmins and Domain Admins groups. It is also possible to delegate the proper administrator permissions and rights for adding server roles. For details, see Delegate Setup Permissions in the Deployment documentation. For other configuration changes, only membership in the RTCUniversalServerAdmins group is required.

⊟To configure a trusted application server

1. Log on to the computer where Topology Builder is installed as a member of the Domain Admins group and the RTCUniversalServerAdmins group.
2. Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Topology Builder**.
3. Select **Download topology from existing deployment**, and then click **OK**.
4. In the **Save Topology As** dialog box, click the Topology Builder file you want to use, and then click **Save**.
5. In the left pane, right-click **Trusted application servers**, and then click **New Trusted Application Pool**.
6. Enter the **Pool FQDN** of the trusted application pool, select whether it will be a single-server or multiple-server, and then click **Next**.
7. On the **Select the next hop** page, from the list, select the Lync Server 2013 Front End pool.
8. Click **Finish**.
9. Select the top node **Lync Server 2013**, and then, from the **Actions** menu, click **Publish Topology**.

   The **Trusted Application Pool** should have been created successfully and associated with the correct Front End pool.

You can use Lync Server 2013 Control Panel to view a list of the trusted applications that you have deployed in your Lync Server 2013 environment. A trusted application is an application based on Microsoft Unified Communications Managed API (UCMA) 3.0 Core SDK that is trusted by Lync Server 2013. This trust relationship is summarized in the following list:

- Trusted applications are not challenged for authentication by Lync Server.
- Trusted applications are not throttled by Lync Server for SIP transactions, connections or outgoing Voice over Internet Protocol (VoIP) calls.
- Trusted applications can impersonate any user and can join conferences without appearing in rosters.
- Trusted applications are highly available and resilient.

In Lync Server Control Panel, you can see the name of the applications, the pool where they run, and the port they use.

⊟To view a list of trusted applications

1. From a user account that is assigned to the CsServerAdministrator, CsAdministrator, CsHelpDesk, or CsViewOnlyAdministrator role, log on to any

computer in your internal deployment. For details about the predefined administrative roles available in Lync Server 2013, see Planning for Role-Based Access Control.

2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Topology** and the click **Trusted Application**.
4. On the **Trusted Application** page, click a column heading to sort the applications, if needed.

Topic Last Modified: *2013-02-23*

You can view information about your trusted applications by using Windows PowerShell and the **Get-CsTrustedApplication** cmdlet. This cmdlet can be run either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

⊟To view trusted applications

- To view all of your trusted applications, type the following command in the Lync Server Management Shell and then press ENTER:

```
Get-CsConferenceDisclaimer
```

This command returns information similar to the following for each trusted application:

```
Identity                : CN={5dedf4b0-a590-49b3-80cf-f16f914bbef9},CN=A

1.7.18 Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service

Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service

See Also

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-11-12*

This section contains procedures for disaster recovery operations, as well as for maintaining the Backup Service which synchronizes the data in paired Front End pools.

Disaster recovery procedures, both failover and failback, are manual. If there is a disaster, the administrator must manually invoke the failover procedures. The same applies to failback after the pool is repaired.

The disaster recovery procedures in the rest of this section assume the following:

- You have a deployment with paired Front End pools, located in different sites, as described in Planning for High Availability and Disaster Recovery. The Backup Service has been running on these paired pools to keep them synchronized.
- If the Central Management store is hosted on either pool, it is installed and running on both of the paired pools, with one of those pools hosting the active master and the other pool hosting the standby.

> **Important:**
>
> In the following procedures, the *PoolFQDN* parameter refers to the FQDN of the pool that is affected by disaster, not the pool that affected users are being redirected from. For the same set of affected users, it refers to the same pool in both failover and failback cmdlets (that is, the pool that first homed the users before the failover).
> For example, assume a case in which all users homed on a pool P1 were failed over to the backup pool, P2. If the administrator wants to move all the users currently serviced by P2 to be serviced by P1, the administrator must perform the following steps:
>
> 1. Fail back all the users originally homed on P1 from P2 to P1 using the failback cmdlet. In this case, the *PoolFQDN* is P1’s FQDN.
> 2. Fail over all the users originally homed on P2 to P1 using the failover cmdlet. In this case, the *PoolFQDN* is P2’s FQDN.
> 3. If the administrator later wants to fail back those P2 users back to P2, the *PoolFQDN* is P2’s FQDN.
>
> Note that step 1 above must be performed before step 2 to preserve pool integrity. If you try step 2 before step 1, the step 2 cmdlet will fail.

Planning for High Availability and Disaster Recovery

1.7.18.1 Configuring and Monitoring the Backup Service

Configuring and Monitoring the Backup Service

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service >

Topic Last Modified: *2012-11-01*

You can use the following Lync Server Management Shell commands to configure and monitor the Backup Service.

Note:

The RTCUniversalServerAdmins group is the only group that has permissions to run **Get-CsBackupServiceStatus** by default. To use this cmdlet, log on as a member of this group. Or, you can grant access to this command to other groups (for example, CSAdministrator) by using the **Set-CsBackupServiceConfiguration** cmdlet.

To see the Backup Service configuration

Run the following cmdlet:

```
Get-CsBackupServiceConfiguration
```

The default for SyncInterval is two minutes.

To set the Backup Service sync interval

Run the following cmdlet:

```
Set-CsBackupServiceConfiguration -SyncInterval interval
```

For example, the following sets the interval to three minutes.

```
Set-CsBackupServiceConfiguration -SyncInterval 00:03:00
```

Important:

Although you can use this cmdlet to change the default sync interval for the Backup Service, you should not do so unless it is absolutely necessary, as the sync interval has a great impact on the Backup Service performance and the recovery point objective (RPO).

To get the Backup Service status for a particular pool

Run the following cmdlet:

```
Get-CsBackupServiceStatus -PoolFqdn <pool-FQDN>
```

Note:

The Backup Service sync status is defined unidirectionally from a pool (P1) to its backup pool (P2). The sync status from P1 to P2 can be different than the one from P2 to P1. For P1 to P2, Backup Service is in a “steady” state if all the changes made in P1 are completely replicated over to P2 within the sync interval. It is in the “final” state if there are no more changes to be synchronized from P1 to P2. Both states indicate a snapshot of the Backup Service at the time the cmdlet is executed. It does not imply that the state returned will stay as is afterwards. In particular, the “final” state will continue to hold only if P1 does not generate any changes after the cmdlet is executed. This is true in the case of failing P1 over to P2 after P1 is placed into the read-only mode as part of the

Invoke-CsPoolfailover execution logic.

To get information about the backup relationship for a particular pool

Run the following cmdlet:

```
Get-CsPoolBackupRelationship -PoolFQDN <poolFQDN>
```

To force a Backup Service sync

Run the following cmdlet:

```
Invoke-CsBackupServiceSync -PoolFqdn <poolFqdn> [-BackupModule  {All|PresenceFocu
```

1.7.18.2 Failing Over a Pool

Failing Over a Pool

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service >

Topic Last Modified: *2012-11-01*

If a single Front End pool has failed and needs to be failed over, use the following procedure. In this procedure, Datacenter1 contains Pool1, and Pool1 has failed. You are failing over to Pool2 located in Datacenter2.

Most of the work for the pool failover involves failing over the Central Management store, if it is required. This is important because the Central Management store must be functional when the pool's users are failed over.

Additionally, if a Front End pool fails but the Edge pool at that site is still running, you must know whether the Edge pool uses the failed pool as a next hop pool. If it does, you must change the Edge pool to use a different Front End pool before failing over the failed Front End pool. How you change the next hop setting depends on whether the Edge will use a pool at the same site as the Edge pool, or a different site.

To Set an Edge Pool to Use a Next Hop Pool at the Same Site

1. Open Topology Builder, right-click the Edge pool that needs to be changed, and click **Edit Properties**.
2. Click **Next Hop**. From the **Next hop pool:** list, select the pool which will now serve as the next hop pool.
3. Click **OK**, and then publish the changes.

To Set an Edge Pool to Use a Next Hop Pool at a Different Site

1. Open a Lync Server Management Shell window and type the following cmdlet:

   ```
   Set-CsEdgeServer -Identity EdgeServer:<edge server FQDN> -Registrar Re
   ```

To Fail Over a Pool in a Disaster

1. Find which pool is the host for the Central Management Server by typing the following cmdlet on a Front End server in Pool2:

   ```
   Invoke-CsManagementServerFailover -Whatif
   ```

   The results of this cmdlet show which pool currently hosts the Central Management Server. In the rest of this procedure, this pool is known as CMS_Pool.
2. Use Topology Builder to find the version of Lync Server running on the CMS_Pool. If it is running Lync Server 2013, use the following cmdlet to find the backup pool of Pool 1.

```
Get-CsPoolBackupRelationship -PoolFQDN <CMS_Pool FQDN>
```

Let Backup_Pool be the backup pool.

3. Check the status of the Central Management store with the following cmdlet:

   ```
   Get-CsManagementStoreReplicationStatus -CentralManagementStoreStatus
   ```

   This cmdlet should show that both ActiveMasterFQDN and ActiveFileTransferAgents are pointing to the FQDN of CMS_Pool. If they are empty, the Central Management Server is not available and you must fail it over.
4. If the Central Management store is not available or if the Central Management store was running on Pool1 (that is, the pool that has failed), you must fail over the Central Management Server before failing over the pool. If you need to fail over the Central Management Server that was hosted on a pool running Lync Server 2013, use the cmdlet in step 5 of this procedure. If you need to fail over the Central Management Server that was hosted on a pool running Lync Server 2010, use the cmdlet in step 6 of this procedure. If you do not need to fail over the Central Management Server, skip to step 7 of this procedure.
5. To fail over the Central Management store on a pool running Lync Server 2013, do the following:
   - First, check which Back End Server in Backup_Pool runs the principal instance of the Central Management store by typing the following:

     ```
     Get-CsDatabaseMirrorState -DatabaseType CMS -PoolFqdn <Backu
     ```

   - If the primary Back End Server in Backup_Pool is the principal, type:

     ```
     Invoke-CSManagementServerFailover -BackupSQLServerFqdn <Back
     ```

     If the mirror Back End Server in Backup_Pool is the principal, type:

     ```
     Invoke-CSManagementServerFailover -MirrorSQLServerFqdn <Back
     ```

   - Validate that the Central Management Server failover is complete. Type the following:

     ```
     Get-CsManagementStoreReplicationStatus -CentralManagementSto
     ```

     Check that both ActiveMasterFQDN and ActiveFileTransferAgents are pointing to the FQDN of Backup_Pool.
   - Finally, check the replica status for all Front End Servers by typing the following:

     ```
     Get-CsManagementStoreReplicationStatus
     ```

     Check that all replicas have a value of True.
     Skip to step 7 in this procedure.
6. Install the Central Management store on the Back End Server of Backup_Pool.
   - First, run the following command:

     ```
     Install-CsDatabase -CentralManagementDatabase -Clean -SqlSer
     ```

   - Run the next command on one of the Front End Servers of Backup_Pool to force the move of the Central Management store:

     ```
     Move-CsManagementServer -ConfigurationFileName c:\CsConfigur
     ```

   - Validate the move is complete:

     ```
     Get-CsManagementStoreReplicationStatus -CentralManagementSto
     ```

     Check that both ActiveMasterFQDN and ActiveFileTransferAgents are pointing to the FQDN of Backup_Pool.
   - Check the replica status for all Front End Servers by typing the following:

     ```
     Get-CsManagementStoreReplicationStatus
     ```

     Check that all replicas have a value of True.

- Install the Central Management Server service on the rest of the Front End Servers in Backup_Pool. To do so, run the following command on all the Front End Servers, except the one you used when forcing the Central Management store move earlier in this procedure:

```
Bootstrapper /Setup
```

7. Fail over the users from Pool1 to Pool2 by running the following cmdlet in a Lync Server Management Shell window:

```
Invoke-CsPoolFailover -PoolFQDN <Pool1 FQDN> -DisasterMode -Verbose
```

Because the steps taken in the previous parts of this procedure to check the Central Management store status are not universal, there is still a chance this cmdlet will fail because the Central Management store is not yet fully failed over. In this case, you must fix the Central Management store based on the error messages that you see, and then run this cmdlet again.

If you see the following error message, then you need to change the Edge pool at this site to use a different pool as its next hop before failing over the pool. For details, see the procedures at the beginning of this topic.

```
Invoke-CsPoolFailOver : This Front-end pool "pool1.contoso.com" is spe
topology as the next hop for the Edge server. Failing over this pool m
access/Federation/Split-domain/XMPP features to stop working. Please u
change the Edge internal next hop setting to point to a different Fron

proceed.
```

1.7.18.3 Failing Back a Pool

Failing Back a Pool

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service >

Topic Last Modified: *2012-11-01*

After the pool that experienced the disaster is back online (that is, Pool1 in this example), take the following steps to restore your deployment to regular working status.

Note that the failback process takes several minute to complete. For reference, it is expected to take up to 60 minutes for a pool of 20,000 users.

1. Fail back the users who were originally homed in Pool1 and have been failed over to Pool2 by typing the following cmdlet:

```
Invoke-CsPoolFailback -PoolFQDN <Pool1 FQDN> -Verbose
```

No other steps are necessary. If you failed over the Central Management Server, you can leave it in Pool2.

1.7.18.4 Failing Over a Mirrored Database

Failing Over a Mirrored Database

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service >

Topic Last Modified: *2012-11-01*

If you have configured your back-end database to use synchronized mirroring with a witness, failover is automatic. If you have configured synchronized mirroring without a witness, you can use the following procedures to failover and failback your database. You can also use these procedures to manually failover and failback your databases even if you have configured a witness.

To fail over your back-end database

1. Before failing over, determine which back-end database is the principal and which is the mirror by typing the following cmdlet:

   ```
   Get-CsDatabaseMirrorState -PoolFqdn <poolFQDN> -DatabaseType User
   ```

2. If the Central Management store is hosted in this pool, type the following cmdlet to determine which is the principal and which is the mirror for the Central Management store:

   ```
   Get-CsDatabaseMirrorState -PoolFqdn <poolFQDN> -DatabaseType CMS
   ```

3. Perform the failover of the user database:
   - If the primary has failed and you are failing over to the mirror, type:

     ```
     Invoke-CsDatabaseFailover -PoolFqdn <poolFQDN> -DatabaseType
     ```

   - If the mirror has failed and you are failing over to the primary, type:

     ```
     Invoke-CsDatabaseFailover -PoolFqdn <poolFQDN> -DatabaseType
     ```

4. If the pool hosts the Central Management Server, perform the failover of the Central Management store.
   - If the primary has failed and you are failing over to the mirror, type:

     ```
     Invoke-CsDatabaseFailover -PoolFqdn <poolFQDN> -DatabaseType
     ```

   - If the mirror has failed and you are failing over to the primary, type:

     ```
     Invoke-CsDatabaseFailover -PoolFqdn <poolFQDN> -DatabaseType
     ```

1.7.18.5 Failing Over the Edge Pool Used for Lync Server Federation

Failing Over the Edge Pool Used for Lync Server Federation

See Also

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service >

Topic Last Modified: *2012-09-17*

If the Edge pool where you have Lync Server federation configured goes down, you must change federation to use a different Edge pool for federation to work.

⊟Failing Over the Edge Pool Used for Lync Server Federation

1. On a Front End server, open Topology Builder. Expand **Edge pools**, then right click the Edge server or Edge server pool that is currently configured for Federation. Select **Edit properties**.
2. In **Edit Properties** under **General**, clear **Enable federation for this Edge pool (Port 5061)**. Click **OK**.
3. Expand **Edge pools**, then right click the Edge server or Edge server pool that you now want to use for Federation. Select **Edit properties**.
4. In **Edit Properties** under **General**, select **Enable federation for this Edge pool (Port 5061)**. Click **OK**.
5. Click **Action**, select **Topology**, select **Publish**. When prompted on **Publish the topology**, click **Next**. When the Publish is finished, click **Finish**.
6. On the Edge server, open the Lync Server Deployment wizard. Click **Install or Update Lync Server System**, then click **Setup or Remove Lync Server**

Components. Click **Run Again**.

7. At Setup Lync Server components, click **Next**. The summary screen will show actions as they are executed. Once the deployment is done, click **View Log** to view available log files. Click **Finish** to complete the deployment.

   If the site containing the failed Edge pool contains Front End Servers that are still running, you must update the Web Conferencing Service and A/V Conferencing Service on these Front End pools to use an Edge pool in a remote site that is still running. For more information, see Changing the Edge Pool Associated with a Front End Pool.

Tasks

Failing Over the Edge Pool Used for XMPP Federation
Failing Back the Edge Pool Used for Lync Server Federation or XMPP Federation

Concepts

Edge Server High Availability and Disaster Recovery

1.7.18.6 Failing Over the Edge Pool Used for XMPP Federation

Failing Over the Edge Pool Used for XMPP Federation

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service >

Topic Last Modified: *2012-10-19*

In your organization, there is one Edge pool designated as the pool to use for XMPP federation. If this pool goes down, you must fail over XMPP federation to use a different Edge pool before XMPP federation can work again.

When you first install Edge pools and enable XMPP Federation, you can simplify the disaster recovery process by setting up external DNS SRV records for all of your Edge pools for XMPP federation, instead of just one. Each of these SRV records must have a different priority set. All XMPP federation traffic goes through the pool with the SRV record with the highest priority. For more information on enabling and setting up XMPP federation, see Setting Up XMPP Federation.

In the following procedure, EdgePool1 is the pool which originally hosted XMPP federation, and EdgePool2 is the pool which will now host XMPP federation.

⊟Failing Over the Edge Pool Used for XMPP Federation

1. If you don't already have another Edge pool deployed (besides the one which is currently down), deploy that pool. For details, see Deploying External User Access.
2. On each Edge Server in the new Edge pool which will now host XMPP federation (EdgePool2), run the following cmdlet:

   ```
   Stop-CsWindowsService
   ```

3. Run the following cmdlet to repoint the XMPP federation route to EdgePool2:

   ```
   Set-CsSite Site2 -XmppExternalFederationRoute EdgeServer2.contoso.com
   ```

   In this example, Site2 is the site containing the Edge pool which will now host the XMPP federation route, and EdgeServer2.contoso.com is the FQDN of an Edge Server in that pool.
4. On the external DNS server, change the DNS A record for XMPP federation to point to EdgeServer2.contoso.com.
5. If you do not already have a DNS SRV record for XMPP federation which resolves to the Edge pool which will now host XMPP federation, you must add it, as in the following example. This SRV record must have a port value of 5269.

```
_xmpp-server._tcp.contoso.com
```

6. Verify that the Edge pool which will now host XMPP federation has port 5269 open externally.
7. Start the services on all Edge Servers in the Edge pool which will now host XMPP federation:

```

Start-CsWindowsService
```

1.7.18.7 Failing Back the Edge Pool Used for Lync Server Federation or XMPP Federation

Failing Back the Edge Pool Used for Lync Server Federation or XMPP Federation

See Also

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service >

Topic Last Modified: *2012-11-01*

After a failed Edge pool that used to host federation has been brought back online, use this procedure to fail back the Lync Server federation route and/or the XMPP federation route to again use this restored Edge pool.

Failing Back Federation to a Restored Edge Pool

1. On the Edge pool that is now available again, start the Edge Services.
2. If you want to fail back the Lync Server federation route to use the restored Edge Server, do the following:
   - On a Front End server, open Topology Builder. Expand **Edge pools**, then right click the Edge server or Edge server pool that is currently configured for Federation. Select **Edit properties**.
   - In **Edit Properties** under **General**, clear **Enable federation for this Edge pool (Port 5061)**. Click **OK**.
   - Expand **Edge pools**, then right click the original Edge server or Edge server pool that you again want to use for Federation. Select **Edit properties**.
   - In **Edit Properties** under **General**, select **Enable federation for this Edge pool (Port 5061)**. Click **OK**.
   - Click **Action**, select **Topology**, select **Publish**. When prompted on **Publish the topology**, click **Next**. When the Publish is finished, click **Finish**.
   - On the Edge server, open the Lync Server Deployment wizard. Click **Install or Update Lync Server System**, then click **Setup or Remove Lync Server Components**. Click **Run Again**.
   - At Setup Lync Server components, click **Next**. The summary screen will show actions as they are executed. Once the deployment is done, click **View Log** to view available log files. Click **Finish** to complete the deployment.
3. If you want to fail back the XMPP federation route to use the restored Edge Server, do the following:
   - Run the following cmdlet to repoint the XMPP federation route to the Edge pool which will now host XMPP federation (in this example, EdgeServer1):

     ```
     Set-CsSite Site1 -XmppExternalFederationRoute EdgeServer1.c
     ```

     In this example, Site1 is the site containing the Edge pool which will now host the XMPP federation route, and EdgeServer1.contoso.com is the FQDN of an Edge Server in that pool.
   - If you do not already have a DNS SRV record for XMPP federation which

resolves to the Edge pool which will now host XMPP federation, you must add it, as in the following example. This SRV record must have a port value of 5269.

```
_xmpp-server._tcp.contoso.com
```

- On the external DNS server, change the DNS A record for XMPP federation to point to EdgeServer2.contoso.com.
- Verify that the Edge pool which will now host XMPP federation has port 5269 open externally.

4. If the Front End pools remained running in the site containing the Edge pool that failed and has been restored, you should update the Web Conferencing Service and A/V Conferencing Service on these Front End pools to again use the Edge pools at their local site. For more information, see Changing the Edge Pool Associated with a Front End Pool.
5. If the Front End pool at the same site as the failed Edge pool also failed, you can now use Invoke–CsPoolFailback to fail back the Front End pool.

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service >

Topic Last Modified: *2012-09-21*

If an Edge pool goes down but the Front End pool at the same site is still running, you will need to set the Front End pool to use an Edge pool at a different site until the failed Edge pool is restored.

Changing the Edge Pool Associated with a Front End Pool

1. In Topology Builder, navigate to the name of the Front End pool you need to change.
2. Right-click the pool, and then click **Edit Properties**.
3. In the **Associations** section, under **Associate Edge Pool (for media components)**, use the drop down box to select the Edge pool you want to associate this Front End pool with.
4. Click **OK**.

Edge Server High Availability and Disaster Recovery

1.7.18.9 Restoring Conference Contents Using the Backup Service

Restoring Conference Contents Using the Backup Service

Microsoft Lync Server 2013 > Operations > Managing Lync Server 2013 Disaster Recovery, High Availability, and Backup Service >

Topic Last Modified: *2012-11-01*

If the conference information stored in the file store of a Front End pool becomes unavailable. you must restore this information so that users homed on the pool retain their conference data. If the Front End pool which has lost conference data is paired with another Front End pool, you can use the Backup Service to restore the data.

You must also perform this task if an entire pool has failed and you have to fail over its users to a backup pool. When these users are failed back over to their original pool, you must use this procedure to copy their conference content back to their original pool as well.

Assume that Pool1 is paired with Pool2, and the conference data in Pool1 is lost. You can use the following cmdlet to invoke the Backup Service to restore the contents:

```
Invoke-CsBackupServiceSync -PoolFqdn <Pool2 FQDN> -BackupModule ConfServices.Data
```

Restoring the conference contents may take some time, depending on their size. You can use the following cmdlet to check the process status:

```
Get-CsBackupServiceStatus -PoolFqdn <Pool2 FQDN> -BackupModule ConfServices.DataC
```

The process is done when this cmdlet returns a value of Steady State for the data conference module.

1.7.19 Backing Up and Restoring Lync Server 2013

Backing Up and Restoring Lync Server 2013

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2013-02-21*

In this section, you'll find the best practices for backing up your Lync Server 2013 data, and for restoring it if you have a failure. These best practices apply to the following situations:

- An entire Lync Server pool of any type (Front End Server, Edge Server, Mediation Server, Persistent Chat Server, or Director), or an individual server in one of these pools.
- The Central Management Server
- A Standard Edition server
- An Enterprise Edition Back End Server
- A File Store
- An Archiving database, Monitoring database, or Persistent Chat database

This section does not include information about restoring an entire site or for developing a standby site. For details about developing a disaster recovery solution with paired Front End pools, see Planning for High Availability and Disaster Recovery. This is the recommended method for planning for disaster recovery.

If you have deployed paired Front End pools, if one of these pools fails and becomes unrecoverable, you can restore this pool with a new fully qualified domain name (FQDN) from its paired pool. For details on the steps to perform this recovery, see Failing Over a Pool. Additionally, if you later want to recreate a failed and unrecoverable pool that was part of a Front End pair, you can use the steps in Performing an ABC Front End Pool Failover.

The methodology described in this document involves special considerations during the planning phase. For details, see Establishing a Backup and Restoration Plan.

1.7.19.1 Preparing for Lync Server Backup and Restoration

Preparing for Lync Server Backup and Restoration

Microsoft Lync Server 2013 > Operations > Backing Up and Restoring Lync Server 2013 >

Topic Last Modified: *2013-02-17*

The following topics describe the settings, configuration, and other data that you need to back up, in order to be able to restore servers and databases in the event of a failure or outage.

- Backup and Restoration Requirements: Data
- Backup and Restoration Requirements: Tools and Permissions
- Backup and Restoration Process Overview
- Developing a Backup and Restoration Strategy and Plan
- Best Practices for Backup and Restoration

1.7.19.1.1 Backup and Restoration Requirements: Data

Backup and Restoration Requirements: Data

Operations > Backing Up and Restoring Lync Server 2013 > Preparing for Lync Server Backup and Restoration >

Topic Last Modified: *2013-02-21*

Lync Server uses settings and configuration information that are stored in databases, and data that is stored in databases and file stores. This topic describes the data that you need to back up to be able to restore service if your organization experiences a failure or outage, and also identifies the data and components used by Lync Server that you need to back up separately.

Settings and Configuration Requirements

This topic includes procedures for backing up and restoring the settings and configuration information that is required for recovery of Lync Server service. The configuration information is located in the Central Management store or on another back-end database or on Standard Edition server.

The following table identifies the settings and configuration information that you need to back up and restore.

Settings and Configuration Data

Type of data	Where stored	Description / When to back up
Topology configuration information	Central Management store (database: Xds.mdf)	Topology, policy, and configuration settings.

		Back up with your regular backups and after you use Lync Server Control Panel or cmdlets to modify your configuration or policies.
Location information	Central Management store (database: Lis.mdf)	Enterprise Voice Enhanced 9-1-1 (E9-1-1) configuration information. This information is generally static. Back up with your regular backups.
Response Group configuration information	Back End Server or Standard Edition server (database: RgsConfig.mdf)	Response Group agent groups, queues, and workflows. Back up with your regular backups and after you add or change agent groups, queues, or workflows.

Data Requirements

Here is a list of the Lync Server data that you need to back up so that you can restore Lync Server service in the event of a failure.

Note that some types of data are not required for recovery. This topic does not contain procedures for backing up these types of data, which include the following:

- Transient user data, such as endpoints and subscriptions, active conferencing servers, and transient conferencing states (database: RtcDyn.mdf)
- Address Book data (databases: Rtcab.mdf and Rtcab1.mdf). The Address Book database is regenerated automatically from Active Directory Domain Services (AD DS).
- Dynamic information for the Call Park application (database: CpsDyn.mdf)
- Transient Response Group data, such as agent sign-in state and call waiting information (database: RgsDyn.mdf)
- The compliance database for Persistent Chat (database: MgcComp.mdf). If you have Persistent Chat compliance enabled, the information in the Persistent Chat Compliance database is transient as long as you have an adapter configured to read information from the database and convert it to an alternate format. Hence the compliance database for Persistent Chat is considered transient.
  Lync Server 2013 Persistent Chat Server ships with an XML adapter. You can also install custom adapters that take this data and move it to other sources, such as Exchange Hosted Archives.

The following table identifies the data that you need to back up and restore.

Data Stored in Databases

Type of data	**Where stored**	**Description / When to back up**
Persistent user data	Back End Server or Standard Edition server (database: RTCXDS.mdf)	User rights, user Contacts lists, server or pool data, scheduled conferences, and

		so on. This user data does not include content uploaded to a conference. Back up with your regular backups. This information is dynamic, but the loss of updates is not catastrophic to Lync Server if you need to restore to your last regular backup. If Contacts lists are critical to your organization, you can back up this data more frequently.
Archiving data	Archiving database (database: LcsLog.mdf) This data may be stored on Exchange 2013, if you have enabled the Microsoft Exchange integration option. Otherwise, this data is kept in a Lync Server Archiving database, which may be collocated with another Lync Server database, or stand-alone on a separate database server.	Instant messaging (IM) and meeting content. This data is not critical to Lync Server, but it may be critical to your organization for regulatory purposes. Determine your back up schedule accordingly. Lync Server supports only the Simple Recovery model for Archiving databases. With the Simple Recovery model, databases are recovered to the point of last full backup, which means that you cannot restore a database to the point of failure or to a specific point in time.
Monitoring data	Monitoring databases (LcsCDR.mdf and QoeMetrics.mdf) These databases may be collocated with another Lync Server database, or stand-alone on a separate database server.	Call detail records (LcsCDR.mdf) and Quality of Experience (QoE) metrics (QoeMetrics.mdf). Call detail records are dynamic and may be critical to your business. Determine your back up schedule by considering whether you need these records for regulatory reasons. Quality of experience information is dynamic. Loss of QoE data is not critical for the operation of Lync Server, but it may be critical to your business. Determine your back up schedule based on how critical this information is to your organization.

		Lync Server supports only the Simple Recovery model for Monitoring databases. With the Simple Recovery model, databases are recovered to the point of last full backup, which means that you cannot restore a database to the point of failure or to a specific point in time.
Persistent Chat data	Persistent Chat database (mgd.mdf). This database may be collocated with another Lync Server database, or stand-alone on a separate database server.	Persistent Chat Data is actual chat content being posted in chat rooms. This data is often business critical. You can choose to use SQL Server backup, or export the database by using the **Export-CsPersistentChatData** cmdlet that is provided in Lync Server. For recovery of the data, you can import and restore the database to the point of the last full backup, which means you cannot restore the database to the point of failure.

File Store Data Requirements

In an Enterprise Edition deployment, the Lync Server file store is typically located on a file server. In a Standard Edition deployment, the Lync Server file store is located by default on the Standard Edition server. Typically, there is one Lync Server file store that is shared for a site. The Persistent Chat file store uses the same file share as the Lync Server file store.

File store locations are identified as \\server\share name. To find the specific locations of your file stores, open Topology Builder and look in the **File stores** node.

The following table identifies the file stores you need to back up and restore.

File Stores

Type of data	Where stored	Description / when to back up
Lync Server file store	Typically on a file server, file cluster, or a Standard Edition server	Meeting content, meeting content metadata, meeting compliance logs, application data files, update files for device updates, audio files for Response Group, Call Park, and Announcement applications, and files posted into Persistent Chat rooms.

		Back up with your regular backups.

Additional Backup Requirements

To help ensure your ability to restore Lync Server services in the event of a failure, you must back up some necessary components that are not part of Lync Server itself. The following components are not backed up or restored as part of the Lync Server backup and restoration process described in this document:

- **Active Directory Domain Services (AD DS)** You need to back up AD DS by using Active Directory tools at the same time that you back up Lync Server. It is important to keep AD DS synchronized with Lync Server, to avoid problems that can occur when Lync Server expects contact objects that do not match those in AD DS. AD DS stores the following settings which are used by Lync Server:
  - User SIP URI and other user settings.
  - Contact objects for applications such as Response Group and Conferencing Attendant.
  - A pointer to the Central Management Store.
  - Kerberos Authentication Account (an optional computer object) and Lync Server security groups.

  For details about backing up and restoring AD DS in Windows Server 2008, see "AD DS Backup and Recovery Step-by-Step Guide" at http://go.microsoft.com/fwlink/p/?linkId=209105.
- **Certification authority and certificates** Use your organization's policy for backing up your certification authority (CA) and certificates. If you use exportable private keys, you can back up the certificate and the private key, and then export them if you use the procedures in this document to restore Lync Server. If you use an internal CA, you can re-enroll if you need to restore Lync Server. It is important that you retain the private key in a secure location where it will be available if a computer fails.
- **System Center Operations Manager** If you use Microsoft System Center Operations Manager (formerly Microsoft Operations Manager) to monitor your Lync Server deployment, you can optionally back up the data it creates while it is monitoring Lync Server. Use your standard SQL Server backup process to back up System Center Operations Manager files. These files are not restored during recovery.
- **Public switched telephone network (PSTN) gateway configuration** If you use Enterprise Voice or Survivable Branch Appliances, you need to back up the PSTN gateway configuration. See your vendor for details about backing up and restoring PSTN gateway configurations.
- **Coexisting versions of Lync Server or Office Communications Server** If your Lync Server 2013 deployment coexists with Lync Server 2010 or an earlier version of Office Communications Server, you can’t use the procedures in this document for backing up or restoring the earlier version. Instead, you must use the backup and restoration procedures documented specifically for your earlier version. For details about backing up and restoring Lync Server 2010, see http://go.microsoft.com/fwlink/p/?linkId=265417 . For details about backing up and restoring Microsoft Office Communications Server 2007 R2, see http://go.microsoft.com/fwlink/p/?linkId=168162.
- **Infrastructure information** You need to back up information about your infrastructure, such as your firewall configuration, load balancing configuration, Internet Information Services (IIS) configuration, Domain Name System (DNS) records and IP addresses, and Dynamic Host Configuraton Protocol (DHCP) configuration. For details about backing up these components, check with their respective vendors.
- **Microsoft Exchange and Exchange Unified Messaging (UM)** Backup and

restore Microsoft Exchange and Exchange UM as described in the Microsoft Exchange documentation. For details about backing up and restoring Exchange Server 2013, see http://go.microsoft.com/fwlink/?LinkId=285384. For details about backing up and restoring Exchange Server 2010, see http://go.microsoft.com/fwlink/p/?linkId=209179.
Note that Lync Server 2013 introduces the ability to have user contact lists, high definition user photos, and archiving data stored in Exchange 2013. See the following list to see how to back up these types of data:

- **High definition photos** are backed up as part of the Exchange Server backup.
- **Unified contact store** is introduced in Lync Server 2013. Unified contact store enables users to keep all their contact information in Exchange 2013.

  You should make sure that backups are up-to-date for users in terms of whether their user contacts are stored in the unified contact store or on the Lync Back End Server. The following scenarios illustrate where migrating user contacts to the unified contact store can cause issues for the backup and restore process.
  Scenario 1: User contacts are migrated to the unified contact store, and a restore is performed from a Lync Server backup taken prior to the migration of user contacts. In this scenario, the user will have a state of outdated contacts for up to one day until Lync Server Migration Task begins migrating user contacts to Exchange. (Note that because the user contacts were previously migrated to the unified contact store, the Exchange contact information will be used). No administrator intervention is needed in this scenario.
  Scenario 2: User contacts were previously stored in the unified contact store, but then rolled back. A restore is performed from a Lync Server backup taken when the user contacts were stored in the unified contact store. In this scenario, an error message of `Error: Incorrect Exchange Version` in the client or Lyss server logs may indicate this as an issue. The user will be able to access their contact list in Lync 2013 directly from Exchange, but client's state will not match the Lync Server state. To fix this, an administrator will need to run the **Invoke-CsUCSRollback** cmdlets for the affected users.
- **Archiving Data** can be stored in Exchange 2013. This data is not critical to Lync Server, but it may be critical to your organization for regulatory purposes. If archiving data is stored in Exchange and is critical to your organization, then follow Exchange backup and restore procedures. Note that archiving data stored in Exchange cannot be moved back to Lync Server. Additionally, there is no way to move data already stored in the Lync archiving database to Exchange.

1.7.19.1.2 Backup and Restoration Requirements: Tools and Permissions

Backup and Restoration Requirements: Tools and Permissions

Operations > Backing Up and Restoring Lync Server 2013 > Preparing for Lync Server Backup and Restoration >

Topic Last Modified: *2013-02-17*

This topic identifies the tools that you can use to back up and restore Lync Server 2013, the permissions that you need, and whether you can run commands remotely or locally. Specifically, this topic focuses on tools that are provided with Lync Server for backup and restoration.

Backups

To back up Lync Server, use the tools identified in the following table. All the commands that you need to back up Lync Server can be scripted and can be run remotely.

Tools for Backing Up Lync Server

To back up this:	**Use this tool or cmdlet:**
Topology configuration data (Xds.mdf)	Export-CsConfiguration
Location information service (E9-1-1) data (Lis.mdf)	Export-CsLisConfiguration
Response Group configuration data (RgsConfig.mdf)	Export-CsRgsConfiguration
Persistent user data (Rtcxds.mdf database) Conference IDs	Export-CsUserData
• Archiving database (LcsLog.mdf) • Monitoring call detail record database (LcsCDR.mdf) • Monitoring QoE database (QoEMetrics.mdf)	SQL Server database tool, such as SQL Server Management Studio
Persistent Chat database (Mgc.mdf)	SQL Server backup procedures or Export-CsPersistentChatData. Export-CsPersistentChatData exports Persistent Chat data as a file.
All file stores: Lync Server file store, Archiving file store **Note:** Files named **Meeting.Active** should not be backed up. These files are in use and locked while a meeting takes place.	Standard file system management tool, such as Robocopy.

Restoration

To restore Lync Server, use the tools in the following table. All the commands that you need to restore Lync Server can be scripted. Some can be run remotely, but others need to be run locally, as specified in the following table.

Tools for Restoring Lync Server

To do this:	**Use this tool or cmdlet:**
Build a new or clean computer	• Windows operating system installation software • SQL Server installation software • Certificates Microsoft Management Console (MMC) snap-in, if restoring certificates with an exportable private key
Restore file store data	Standard file system management tool, such as Robocopy

Recreate empty databases and set permissions for the following: • Central Management store • Back End Server • Monitoring database • Archiving database	Install-CsDatabase
Restore the Active Directory Domain Services (AD DS) pointer to the Central Management store **Note:** If you lose the service connection point at any time, you can rerun this cmdlet.	Set-CsConfigurationStoreLocation
Import the topology, policies, and configuration settings to the Central Management store (Xds.mdf)	Import-CsConfiguration
Publish and enable the topology	Topology Builder -or- Publish-CsTopology and Enable-CsTopology
Enable the last published topology	Enable-CsTopology
Reinstall Lync Server components	Lync Server Setup **Note:** Located in the Lync Server installation folder or media at \setup\amd64\Setup.exe.
Restore location information (E9-1-1) data (Lis.mdf)	Import-CsLisConfiguration
Restore persistent user data (Rtcxds.mdf)	Import-CsUserData
Restore Response Group configuration data (RgsConfig.mdf)	Import-CsRgsConfiguration **Note:** If the configuration is being restored in a newly deployed pool that has no Response Group data in the database, then you should use the –OverwriteOwner option. Use this option even if the data being restored is in a pool with the same fully qualified domain name (FQDN). Otherwise, the import will not succeed, due to the contact objects to the Response Groups already existing in Active Directory.
Restore the following databases: • Archiving database (LcsLog.mdf) • Monitoring databases: call detail record database (LcsCDR.mdf) and QoE database (QoEMetrics.mdf)	SQL Server database management tools
Persistent Chat database (Mgs.mdf)	SQL Server restore procedures or Import-CsPersistentChatData. You can use Import-CsPersistentChatData with a file created by Export-CsPersistentChatData, and the data will be imported into the Persistent Chat

	database.

Required Permissions

Users must be a member of the **RTCUniversalServerAdmins** group to perform all the commands described in this topic. Most backup and restore commands do not support role-based access control (RBAC). Two exceptions are the Persistent Chat cmdlets Export-CsPersistentChatData and Import-CsPersistentChatData, which must be run by a user who is a member of the CsPersistentChatAdministrator group. To run Lync Server Deployment Wizard, a user must also be a member of the Local Adminstrators group.

1.7.19.1.3 Backup and Restoration Process Overview

Backup and Restoration Process Overview

Operations > Backing Up and Restoring Lync Server 2013 > Preparing for Lync Server Backup and Restoration >

Topic Last Modified: *2013-02-21*

This section provides an overview of how the backup and restoration process works for Lync Server 2013. You use the same process for all Standard Edition servers and Enterprise Edition servers, regardless of their location.

In general, the backup process works as follows:

- You create a backup location as a shared folder on a stand-alone computer that is not part of any pool. The location of the backup is referenced in **$Backup**.
- On a regular, scheduled basis, you back up all the Lync Server databases and all the file stores that are described in Backup and Restoration Requirements: Data by following the procedures described in Backing Up Lync Server The Central Management store includes all the server settings and configurations.
- Each time you run a subsequent backup, you create a new shared folder and change the path that **$Backup** references.

In general, the restoration process works as follows:

- When a failure or outage occurs, you restore the data in the location referenced by **$Backup** to new or clean computers.

Important:
This restoration process does not restore data onto an existing server state. That is, this process requires that the server is clean or new.

- To enable your user and conference information to be recoverable to the point of failure, you can implement a disaster recovery topology with paired Front End pools, as described in Planning for High Availability and Disaster Recovery. Aside from this option, Lync Server supports only the Simple Recovery model for its databases. With the Simple Recovery model, databases are recovered to the point of last full backup, which means that you cannot restore a database to the point of failure or to a specific point in time. For many organizations the Simple Recovery model is optimal, because the Lync Server back-end database (RTCXDS.mdf) is actually smaller than the transaction log files, and is significantly smaller than those of typical line-of-business database applications.
- All Domain Name System (DNS) configuration, Dynamic Host Configuration Protocol (DHCP) configuration, domain names, computer fully qualified domain names (FQDNs), file store paths, and so on must be the same at the time of

restoration that they were at the time of back up.

If a server running Lync Server fails, recovery includes the following steps:

- Install the operating system on a new or clean computer with the same FQDN as the failed computer.
- Reinstall certificates.
- If the server hosted a database, install Microsoft SQL Server 2012 or Microsoft SQL Server 2008 R2.
- In general, if the server hosted a database, run Topology Builder to create and install the database and set up access control lists (ACLs).
- In general, if the server hosted a server role, run step 1 through step 4 of the Lync Server Deployment Wizard to install the local configuration files, install the server role components, assign certificates, and start the services.

  Note:

  If the server hosted a database collocated with the server role, running step 2 of the Lync Server Deployment Wizard recreates the database.
- If the server hosted a database, restore the backed up data.

1.7.19.1.4 Developing a Backup and Restoration Strategy and Plan

Developing a Backup and Restoration Strategy and Plan

Operations > Backing Up and Restoring Lync Server 2013 > Preparing for Lync Server Backup and Restoration >

Topic Last Modified: *2013-02-17*

The effectiveness of your Lync Server backup and restoration operations depends on your backup and restoration strategy and plan. You should establish a strategy for backing up and restoring Lync Server that fits with your organization's overall strategy, and a comprehensive, concise plan for backing up data and settings, and, in the event of an outage, a plan for restoring service.

For the most robust disaster recovery of a Front End Pool, use the paired-pool disaster recovery topology introduced in Lync Server 2013. For more information, see Planning for High Availability and Disaster Recovery.

- Establishing a Backup and Restoration Strategy
- Establishing a Backup and Restoration Plan
- Setting Up a Backup Location

1.7.19.1.4.1 Establishing a Backup and Restoration Strategy

Establishing a Backup and Restoration Strategy

Backing Up and Restoring Lync Server 2013 > Preparing for Lync Server Backup and Restoration > Developing a Backup and Restoration Strategy and Plan >

Topic Last Modified: *2013-02-17*

Before you can develop a backup and restoration plan for Lync Server, you need to develop a strategy that fits with your organization's goals. To develop an effective backup and restoration strategy, you will need to:

- Establish business priorities.
- Identify backup and restoration requirements.

Establishing Business Priorities

Evaluate the business priorities of your organization. Typically, the primary business priorities that affect your backup and restoration strategy are the following:

- Business continuity requirements
- Data completeness
- Data criticality
- Portability requirements
- Cost constraints

Business needs such as these help to determine the service level agreements (SLAs) that you develop with your customers. Service level agreements greatly influence your backup and recovery strategy.

Identifying Backup and Restoration Requirements

Your business priorities and service level agreements act in determining your organizations' requirements for backing up and restoring Lync Server. Identify and document your requirements for the following:

- **Frequency of backups** Keep in mind that, except for Front End pools in paired relationships as described in Planning for High Availability and Disaster Recovery, Lync Server supports only the Simple Recovery model, which means that you restore to the last full backup. Plan thoroughly for how often you need to take a full backup. For details about best practices for backup frequency, see Best Practices for Backup and Restoration.
- **Backup and restoration tools** Include who is to use the tools, and on which computers. For details about the tools discussed in this topic and necessary permissions, see Backup and Restoration Requirements: Tools and Permissions.
- **Backup location** Identify whether the backups are kept locally or remotely, taking security and accessibility into consideration. Specify the media to be used for the backups.
- **Hardware and software requirements** Identify and document your specific hardware and software requirements, including the hardware for backup storage and restoration of specific components and any software and network connectivity required to support backup and restoration. As you develop your hardware and software requirements, keep in mind the various restoration scenarios that follow.
- **Restoration scenarios** Here are the restoration processes for the following scenarios:
  - A Lync Server pool fails. This scenario requires rebuilding each server in the pool.
  - A Standard Edition server fails. This scenario requires rebuilding the server on a new or clean computer and restoring databases.
  - Loss of the Central Management store. At a minimum, this scenario requires restoring and publishing the Central Management store.
  - Loss of a Back End Server when the Central Management store is still functioning normally. This scenario requires rebuilding the server on a new or clean computer and restoring databases.
  - A server that is a member of a Lync Server pool fails. This scenario requires rebuilding the server on a new or clean computer.
  - A File Store fails. This scenario requires restoring the file server or file cluster.
  - An Archiving, Monitoring, or Persistent Chat database fails. This scenario requires recreating the databases, and, if the data is critical to your

organization, restoring the data. Archiving, Monitoring, and Persistent Chat data is not required to get Lync Server back up and running.

1.7.19.1.4.2 Establishing a Backup and Restoration Plan

Establishing a Backup and Restoration Plan

Backing Up and Restoring Lync Server 2013 > Preparing for Lync Server Backup and Restoration > Developing a Backup and Restoration Strategy and Plan >

Topic Last Modified: *2013-02-17*

Creating a backup and restoration plan involves the following steps:

- Developing the plan.
- Implementing the plan.
- Maintaining the plan.

Developing a Backup and Restoration Plan

After you develop your backup and restoration strategy for Lync Server, use it to document a detailed backup and restoration plan. Your plan should clearly convey the priorities and requirements for backing up data and settings. You can use the information in Establishing a Backup and Restoration Strategy and the worksheets in Backup and Restoration Worksheets to facilitate the documentation of your strategy. Your plan should also contain criteria for deciding when and how to restore service.

As you develop your plan, you need to consider, and account for, the following:

- How you will recover servers on new hardware.
- How you will recover services that require action on the part of multiple business areas or departments.
- How you can acquire spare servers quickly.
- The time it takes to recover by using your strategy. Consider your organization’s requirements for recovery time objective (RTO).

Modify the backup and restoration procedures in this topic, adding and deleting procedures as appropriate, to reflect the servers and components in your deployment. You can also add appropriate details, such as the backup schedule, to the appropriate procedures to make sure that the information is not overlooked.

Note:
It is good practice to create scripts for as many steps as possible, to help ensure the quality and reproducibility of procedures.

In your plan, specify who is responsible for reviewing the plan, who is responsible for testing and validating any new procedures or tools, and who must approve any changes to the plan and related procedures.

To make sure that your backup and restoration plan fully meets all established goals and priorities, get the approval of the appropriate business decision makers and technical decision makers in your organization before you implement the plan.

Implementing the Backup and Restoration Plan

Implementing a backup and restoration plan requires the following steps:

- Testing and validating the plan.

- Communicating the plan.
- Validating backup and restoration operations.

Testing and Validating the Plan

The procedures described here have been tested and validated in a lab environment. To make sure that these or any other procedures work in your environment, you should test and validate each procedure you intend to implement. Complete the testing and the validation before you submit your plan for final approval.

Communicating the Plan

Your backup and restoration plan should clearly describe who implements procedures and step-by-step instructions for carrying out the procedures. You should make sure that everyone responsible for any aspect of backup and restoration understands the plan, how it is to be implemented, and what their role is. This includes all implementation requirements for the following:

- Pool and server backup.
- Restoration of service.

Pool and server backup

The backup and restoration plan should include all information required to complete backup procedures on an ongoing basis. The primary information to be communicated to responsible team members includes the following:

- Team or person (specified as an individual or role) responsible for backing up each server.
- Specific schedules for backing up each server.
- Backup locations for each type of data (settings, database, and file shares).
- Backup procedures to be used, including the tools required to complete each procedure.
- Information required to complete backups, as covered in Backup and Restoration Worksheets.
- Validation methods to be used to help ensure that data and settings are appropriately backed up and available for restoration, which can include periodic audits and test restorations.

Restoration of service

The backup and restoration plan should include all information required to restore service, in case one or more servers experience a loss that makes service unavailable. The primary information to be communicated to responsible team members includes the following:

- Team or person (specified as an individual or a role) that is responsible for determining when restoration of service is required and the procedures to be used to restore service, and also the team or person responsible for implementing procedures for each restoration scenario.
- Criteria for determining which restoration procedures are most appropriate for a specific situation.
- Time estimates for restoration of service and recovery time objective (RTO) in each restoration scenario.
- Restoration procedures to be used, including the tools required to complete each procedure.
- Information required to restore data and settings. Worksheets are provided in Backup and Restoration Worksheets.

Validating Backup and Restoration Operations

After completing initial backup efforts in your production environment and at specified intervals (as covered in your backup and restoration plan), you should verify the following:

- Backups are occurring as required.

- Backed-up data and settings are accessible.
- Restoration procedures can be performed within the recovery time objective (RTO) times specified in the backup and restoration plan, and the results meet all business requirements.
- Backup worksheets have been completed and verified, and they are stored in a secure location. These worksheets are provided in Backup and Restoration Worksheets.
- Restoration procedures have been tested and verified to work as expected, as specified in your backup and restoration plan.

Maintaining the Backup and Restoration Plan

A Lync Server topology is a dynamic environment that changes with your organization. Reassess your backup and restoration plan as your organization changes, and review it periodically to make sure that it continues to meet the needs of your business.

1.7.19.1.4.3 Setting Up a Backup Location

Setting Up a Backup Location

Backing Up and Restoring Lync Server 2013 > Preparing for Lync Server Backup and Restoration > Developing a Backup and Restoration Strategy and Plan >

Topic Last Modified: *2013-02-17*

Before you take your first backup of Lync Server, set up the hardware and software that you need in order to store and maintain the backups. You need to obtain access to the media and content, as appropriate, and provide network connectivity between each server to be backed up and the backup media. The media and location that you use should be defined in your backup and restoration strategy. The location that you use for regular backups can be local or remote, but it must be secure, and it must be accessible for both backup and restoration. We recommend using a remote location to protect against a catastrophic event at your primary site.

After you set up and test the individual components, verify accessibility to the backups from each server.

1.7.19.1.5 Best Practices for Backup and Restoration

Best Practices for Backup and Restoration

Operations > Backing Up and Restoring Lync Server 2013 > Preparing for Lync Server Backup and Restoration >

Topic Last Modified: *2013-02-21*

This section includes two types of best practices:

- Best practices for backup and restoration.
- Best practices for minimizing the impact of a disaster.

Best Practices for Backup and Restoration

To facilitate your backup and restoration process, apply the following best practices when you back up or restore your data:

- Perform regular backups at appropriate intervals. The simplest and most commonly used backup type and rotation schedule is a full, nightly backup of the entire SQL Server database. Then, if restoration is necessary, the restoration process requires only one backup, and no more than a day's data should be lost.
- If you use cmdlets or the Lync Server Control Panel to make configuration changes, use the **Export-CsConfiguration** cmdlet to take a snapshot backup of the topology configuration file (Xds.mdf) after you make the changes, so that you won't lose the changes if you need to restore your databases. Note that this configuration is backed up in XML format and compressed as a ZIP file.
- Make sure that the shared folder you plan to use for backing up Lync Server has sufficient disk space to hold all the backed up data.
- Schedule backups when Lync Server usage is typically low, to improve server performance and user experience.
- Make sure that the location where you back up data is secure (we recommend a remote location).
- Keep the backup files where they will be available, in case you need to restore the data.
- Plan for and schedule periodic testing of the restoration processes that are supported by your organization.
- Validate your backup and restoration processes in advance to make sure that they work as expected.

Best Practices for Minimizing the Impact of a Disaster

The best strategy for dealing with disastrous service interruptions (caused by unmanageable events such as power outages or sudden hardware failures) is to assume they will happen, and to plan accordingly.

If Lync services, with a minimum of disruption and outage, are business-critical for your organization, you should consider implementing paired pools of Front End Servers, as described in Planning for High Availability and Disaster Recovery. Then, if one of these pools has a disaster, an administrator can switch the users of that pool to be served by the other pool, with a minimum of downtime.

The disaster management plans that you develop as part of your backup and restoration strategy should include the following:

- Keeping your software media, and your software and firmware updates, readily available.
- Maintaining hardware and software records.
- Backing up your data regularly and monitoring the integrity of your backups.
- Training your staff in disaster recovery, documenting procedures, and implementing disaster recovery simulation drills.
- Keeping spare hardware available, or, if you have a service level agreement (SLA), contracting with hardware vendors and suppliers for prompt replacements.
- Separating the location of your transaction log files (.ldf files) and database files (.mdf files).

1.7.19.2 Backing Up Lync Server

Backing Up Lync Server

Microsoft Lync Server 2013 > Operations > Backing Up and Restoring Lync Server 2013 >

Topic Last Modified: *2013-02-17*

The procedures in this section describe how to back up Lync Server so that you can recover service in the event of an outage or failure.

You should develop a backup and recovery strategy and plan for your organization, as described in Developing a Backup and Restoration Strategy and Plan. This strategy and plan should include the specific procedures that you plan to use. Use the procedures included in the topics in this section, along with the worksheets in Backup and Restoration Worksheets, to document how you plan to back up your specific Lync Server deployment.

- Verifying Backup Prerequisites
- Backing Up Data and Settings

1.7.19.2.1 Verifying Backup Prerequisites

Verifying Backup Prerequisites

Operations > Backing Up and Restoring Lync Server 2013 > Backing Up Lync Server >

Topic Last Modified: *2013-02-17*

Before you begin backing up Lync Server, verify that you are prepared with the following:

- Backup tools. For details, see Backup and Restoration Requirements: Tools and Permissions.
- Permissions. For details, see Backup and Restoration Requirements: Tools and Permissions.
- Location for storing backups. For details, see Setting Up a Backup Location.
- Media for the backups. For details, see Setting Up a Backup Location.

1.7.19.2.2 Backing Up Data and Settings

Backing Up Data and Settings

Operations > Backing Up and Restoring Lync Server 2013 > Backing Up Lync Server >

Topic Last Modified: *2013-02-17*

The backup procedures described in the following topics apply to all Enterprise Edition servers and Standard Edition servers, regardless of their location.

- Backing up Core Data and Settings
- Backing Up Archiving and Monitoring Databases
- Backing Up Persistent Chat Databases
- Backing Up File Stores

1.7.19.2.2.1 Backing up Core Data and Settings

Backing up Core Data and Settings

Backing Up and Restoring Lync Server 2013 > Backing Up Lync Server > Backing Up Data and Settings >

Topic Last Modified: *2013-02-17*

The following procedures use Lync Server Management Shell cmdlets to create backup files for settings and data for core services. For details about the tools used in this section, including where they are located, see Backup and Restoration Requirements: Tools and Permissions. For details about backing up Archiving and Monitoring data, see Backing Up Archiving and Monitoring Databases.

Note:
The step in this section to back up the Central Management store includes the settings and configuration for Archiving and Monitoring.

You can run the cmdlets described in this section locally or remotely.

To back up core data and settings

1. From a user account that is a member of the RTCUniversalServerAdmins group, log on to any computer in your internal deployment.
2. To store the backups you create in the following steps, create a new shared folder and update the path referenced by **$Backup** to the new shared folder.
3. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
4. Back up the Central Management store configuration file. At the command line, type the following:

   ```
   Export-CsConfiguration -FileName <path and file name for backup>
   ```

   For example:

   ```
   Export-CsConfiguration -FileName "C:\Config.zip"
   ```

   Note:
   This step exports your Lync Server topology, policies, and configuration settings to a file. No other step is required to backup topology data.
5. Copy the backed-up Central Management store configuration file to $Backup\.
6. Back up Location Information service data. At the command line, type the following:

   ```
   Export-CsLisConfiguration -FileName <path and file name for backup>
   ```

   For example:

   ```
   Export-CsLisConfiguration -FileName "C:\E911Config.zip"
   ```
7. Copy the backed-up Location Information service configuration file to $Backup \.
8. Back up user data on every back-end database of a Front End pool and every Standard Edition server. At the command line, type the following:

   ```
   Export -CsUserData -PoolFQDN <Fqdn> =FileName <String>
   ```

   For example:

   ```
   Export -CsUserData -PoolFQDN "atl-cs-001.litwareinc.com" =FileName "C:
   ```
9. Copy the backed up user file to $Backup\.
10. On every pool that runs the Response Group application, back up the Response Group configuration. Do the following:

    10.a. At the command line, type:

    ```
    Export-CsRgsConfiguration -Source "service:ApplicationServe
    ```

    For example:

    ```
    Export-CsRgsConfiguration -Source ApplicationServer:pool01.
    ```
11. Copy the backed up Response Group configuration file to $Backup\.

1.7.19.2.2.2 Backing Up Archiving and Monitoring Databases

Backing Up Archiving and Monitoring Databases

Backing Up and Restoring Lync Server 2013 > Backing Up Lync Server > Backing Up Data and Settings >

Topic Last Modified: *2013-02-17*

If you deployed Archiving or Monitoring, you need to back up these databases according to your organization's SQL Server backup policy.

Note:
The settings for Archiving and Monitoring are backed up when you back up the Central Management store. For details, see Backing up Core Data and Settings.

For Archiving and Monitoring, you can use a SQL Server tool such as SQL Server Management Studio to perform a manual backup, or you can use SQL Server management tools to schedule regular, automatic backups.

1.7.19.2.2.3 Backing Up Persistent Chat Databases

Backing Up Persistent Chat Databases

Backing Up and Restoring Lync Server 2013 > Backing Up Lync Server > Backing Up Data and Settings >

Topic Last Modified: *2013-02-17*

Persistent Chat room content is stored in the Persistent Chat database (Mgc.mdf). This is business-critical data that should be backed up regularly. In addition to the chat room content, the Persistent Chat database also stores information about the principals (such as users and user groups), and the roles and access that they have to chat rooms and chat room.

There are two ways of backing up Persistent Chat data.

- SQL Server Backup
- The `Export-CsPersistentChatData` cmdlet, which exports Persistent Chat data as a file

Data that is created by using SQL Server backup requires significantly more disk space—possibly 20 times more—than that created by `Export-CsPersistentChatData`, but SQL Server backup is more likely to be a procedure that administrators are familiar with.

1.7.19.2.2.4 Backing Up File Stores

Backing Up File Stores

Backing Up and Restoring Lync Server 2013 > Backing Up Lync Server > Backing Up Data and Settings >

Topic Last Modified: *2013-02-17*

Backing up the Lync Server File Stores includes all the files and folders used by Lync Server components.

⊟To back up File Stores

1. To find the specific locations of your Lync Server File Stores, open Topology Builder and look in the **File stores** node.
2. Use Robocopy or another file system management tool to copy each File Store to $Backup\filestore.

1.7.19.3 Restoring Data and Settings

Restoring Data and Settings

Microsoft Lync Server 2013 > Operations > Backing Up and Restoring Lync Server 2013 >

Topic Last Modified: *2013-02-17*

If you have implemented a disaster recovery topology with paired pools, and one of those Front End pools has gone down and you need to quickly restore service to your users, see Failing Over a Pool. Otherwise, use the information in the following topics, along with the worksheets in Backup and Restoration Worksheets, to restore Lync Server after a failure or outage.

> **Note:**
> To reduce downtime and potential data loss, perform the restoration procedures described in this document only if troubleshooting procedures are not effective in identifying and correcting the problem. During troubleshooting, try to minimize the impact on other servers and components as you shut down and restart servers.

- Preparing to Restore Lync Server
- Restoring a Standard Edition Server
- Restoring the Server Hosting the Central Management Store
- Restoring an Enterprise Edition Back End Server
- Restoring an Enterprise Edition Member Server
- Restoring a Lync Server Pool
- Performing an ABC Front End Pool Failover
- Restoring a File Store
- Restoring Monitoring or Archiving Data
- Restoring Persistent Chat Data

1.7.19.3.1 Preparing to Restore Lync Server

Preparing to Restore Lync Server

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-21*

Before you begin restoring servers and databases after a failure, you need to determine the following:

- What needs to be restored.
- The hardware, software, data, and tools you need for restoration.

Determining What to Restore

This topic describes how to restore Lync Server outages that occur at the server, pool, or Central Management store level. If the Central Management store fails, your Lync Server deployment continues to function, but you cannot make any configuration changes. If a Back End Server or Standard Edition server fails, the user pool stops functioning. If any other server fails, the magnitude of the failure depends on the server role the server is running and whether the server hosts one or more databases.

What to Restore

If this failed	See this section:
Standard Edition server	Restoring a Standard Edition Server

Central Management store	Restoring the Server Hosting the Central Management Store
Enterprise Edition Back End	Restoring an Enterprise Edition Back End Server
Enterprise Edition Mirrored Back End Primary Server	Restoring a Mirrored Enterprise Edition Back End Server - Primary
Enterprise Edition Mirrored Back End Secondary Server	Restoring a Mirrored Enterprise Edition Back End Server - Mirror
Any Enterprise Edition server running a server role, such as a Front End Server, Edge Server, Director, Mediation Server,.or Persistent Chat Server.	Restoring an Enterprise Edition Member Server
An entire Lync Server pool	Restoring a Lync Server Pool
Enterprise Edition File Store	Restoring a File Store
A standalone Monitoring database or Archiving database	Restoring Monitoring or Archiving Data
A stand-alone Persistent Chat database	Restoring Persistent Chat Data

Gathering Hardware, Software, and Tools

When you restore a server, you need to start with a new or clean computer. Additionally, you must have the following hardware and software available:

- A clean or new server with the same fully qualified domain name (FQDN) as the server that failed.

  > **Important:**
  >
  > When you install the operating system, make sure that you do not delete the computer account in Active Directory Domain Services (AD DS), and verify that the group permissions for the account are retained.

- Installation software for the operating system. To install the operating system, use the server deployment procedures and configurations established by your organization. You should have these procedures and configuration requirements available when you restore service.
- Installation software for SQL Server 2012 or SQL Server 2008 R2. To install a database server, use the appropriate version of SQL Server and the database server deployment procedures and configurations established by your organization. You should have these procedures and configuration requirements available when you restore service.

  > **Note:**
  >
  > The Lync Server Deployment Wizard automatically installs SQL Server 2012 Express on each Standard Edition server and on any other Lync Server server when a local configuration store is installed, unless you have preinstalled SQL Server 2012 or SQL Server 2008 R2 on the server.

- Software for taking system images.

  > **Tip:**
  >
  > We recommend that you take an image copy of the system after you install the operating system and SQL Server, and before you start restoration, so that you can use this image as a rollback point in case something goes wrong during restoration.

- Lync Server 2013 installation software. The Lync Server Deployment Wizard is located in the Lync Server installation folder or media at \setup\amd64 \Setup.exe.

During restoration, you use the following tools:

- Lync Server Management Shell cmdlets
- Import-CsUserData
- Tools for restoring Windows folders
- Topology Builder
- SQL Server database utilities, such as SQL Server Management Studio

Preparing to Restore a Server

Before you restore the server, you must perform the following steps:

1. Install the operating system.
2. If the server is a Back End Server, install SQL Server 2012 or SQL Server 2008 R2.
3. Restore or reenroll your certificates. For details about certificates, see "Additional Backup Requirements" in Backup and Restoration Requirements: Data.
4. Take an image of the system before starting restoration to use as a rollback point, in case something goes wrong during restoration.

Note:

The Lync Server Deployment Wizard and cmdlets described in the procedures in this topic, and related topics, set all required access control lists (ACLs).

Verify that the hardware and the software that you need for the components that you plan to restore are available before you start restoration. After you install the operating system and SQL Server, most of the steps in the following restoration procedures can be run remotely. The exceptions are noted in the procedures.

You should also have your organization's backup and restoration plan and the information from your last backup, such as the information in the worksheets in this document (for details, see Backup and Restoration Worksheets), available before you begin restoration.

1.7.19.3.2 Restoring a Standard Edition Server

Restoring a Standard Edition Server

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-21*

If a Standard Edition server that does not host the Central Management store fails, follow the procedures in this section. If the Central Management store fails, see Restoring the Server Hosting the Central Management Store.

Tip:

We recommend that you take an image copy of the system before you start restoration. You can use this image as a rollback point, in case something goes wrong during restoration. You might want to take the image copy after you install the operating system and SQL Server, and restore or re-enroll the certificates.

To restore a Standard Edition server

1. Start with a clean or new server that has the same fully qualified domain name (FQDN) as the failed computer, install the operating system, and then restore or reenroll the certificates.

Note:
Follow your organization's server deployment procedures to perform this step.

2. From a user account that is a member of the RTCUniversalServerAdmins group and the Local Administrators group, log on to the server that you are restoring.
3. Restore the File Store by copying the appropriate File Store from $Backup to the File Store location on the server and share the folder.

Important:
The path and file name for the restored File Store should be exactly the same as the backed up File Store so that components that use the files can access them.

4. Run Topology Builder:
   - 4.a. Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Topology Builder**.
   - 4.b. Click **Download Topology from existing deployment**, and then click **OK**.
   - 4.c. Select the topology, and then click **Save**. Click **Yes** to confirm your selection.
5. Browse to the Lync Server installation folder or media, and then start the Lync Server Deployment Wizard located at \setup\amd64\Setup.exe. Use the Lync Server Deployment Wizard to do the following:
   - 5.a. Run **Step 1: Install Local Configuration Store** to install the local configuration files.
   - 5.b. Run **Step 2: Setup or Remove Lync Server Components** to install the Lync Server server roles.
   - 5.c. Run **Step 3: Request, Install or Assign Certificates** to assign the certificates.
   - 5.d. Run **Step 4: Start Services** to start services on the server.

   For details about running the Deployment Wizard, see the Deployment documentation for the server role you are restoring.
6. Restore user data by performing the following:
   - 6.a. Copy ExportedUserData.zip from $Backup\ to a local directory.
   - 6.b. Before you restore the user data, you must stop Lync services. To do so, type:

     ```
     Stop-CsWindowsService
     ```

   - 6.c. To restore the user data, at the command line, type:

     ```
     Import-CsUserData -PoolFqdn <Fqdn> -FileName <String>
     ```

     For example:

     ```
     Import-CsUserData -PoolFqdn "atl0cs-001.litwareinc.com" -Fi
     ```

   - 6.d. Restart Lync services by typing:

     ```
     Start-CsWindowsService
     ```

7. If you deployed Response Group on this Standard Edition server, restore the Response Group configuration data. For details, see Restoring Response Group Settings.
8. If you deployed Persistent Chat on this Standard Edition server, restore the Persistent Chat database (mgc.mdf).

   If you used SQL Server Backup to back up the Persistent Chat database, use SQL Server restore procedures to restore it.

   If you used the Export-CsPersistentChatData cmdlet to back it up, use the Import-CsPersistentChatData to restore it.

Restoring the Server Hosting the Central Management Store

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

***Topic Last Modified:** 2013-02-21*

A Lync Server deployment has a single Central Management store, a copy of which is replicated to each server running a Lync Server server role. This topic describes how to restore a Back End Server or Standard Edition server that hosts the Central Management store.

To find the pool where the Central Management Server is located, open Topology Builder, click **Lync Server**, and look in the right pane under **Central Management Server**.

If the Back End Server that hosts the Central Management store is in a mirrored setup and the mirror database is still functional, we recommend that you make a backup of this still-functioning mirror, and then perform a full restore on both the primary database and the mirror database, using this backup, by following the restoration procedure below. This is necessary because Back End restore requires modifying and publishing the topology, and this can be done only if the primary database hosting CMS is operational. Also note that the primary and mirror database roles cannot be interchanged if the topology cannot be published.

Note:

If a Back End Server or Standard Edition server that does not host the Central Management store failed, see Restoring an Enterprise Edition Back End Server or Restoring a Standard Edition Server. If a Back End Server that hosts the Central Management store is in a mirrored configuration and only the mirror failed, see Restoring a Mirrored Enterprise Edition Back End Server - Mirror. If any other server failed, see Restoring an Enterprise Edition Member Server.

Tip:

We recommend that you take an image copy of the system before you start restoration. You can use this image as a rollback point, in case something goes wrong during restoration. You might want to take the image copy after you install the operating system and SQL Server, and restore or reenroll the certificates.

⊟To restore the Central Management store

1. Start with a clean or new server that has the same fully qualified domain name (FQDN) as the failed computer, install the operating system, and then restore or reenroll the certificates.

   Note:

   Follow your organization's server deployment procedures to perform this step.

2. From a user account that is a member of the RTCUniversalServerAdmins group and the Local Administrators group, log on to the server that you are restoring.
3. If you are restoring a Standard Edition server, restore the File Store by copying the appropriate File Store from $Backup to the File Store location on the server, and then share the folder.

   Important:

   The path and file name for the restored File Store should be exactly the same as the backed up File Store so that components that use the files can access them.

4. Do one of the following:

- If you are installing a Standard Edition server, browse to the Lync Server installation folder or media, and then start the Lync Server Deployment Wizard located at \setup\amd64\Setup.exe. In the Deployment Wizard, click **Prepare first Standard Edition server** and follow the wizard to install the Central Management store.
- If you are installing an Enterprise Back End Server, install SQL Server 2012 or SQL Server 2008 R2, keeping the instance names the same as before the failure.

> **Note:**
> Depending on the server that you are restoring and on your deployment, the server might include multiple collocated or separate databases. Follow the same procedure to install SQL Server that you used originally to deploy the server, including SQL Server permissions and logins.

5. From a Front End Server, Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
6. Re-create the Central Management store. At the command line, type:

```
Install-CsDatabase -CentralManagementDatabase -Clean -SqlServerFqdn <F
```

For example:

```
Install-CsDatabase -CentralManagementDatabase -Clean -SqlServerFqdn Se
```

7. Set the Active Directory Domain Services (AD DS) control point for the Central Management store. At the command line, type:

```
Set-CsConfigurationStoreLocation -SqlServerFqdn <FQDN> -SqlInstanceNam
```

For example:

```
Set-CsConfigurationStoreLocation -SqlServerFqdn Server01.contoso.com -
```

> **Note:**
> If you lose the connection point, you can rerun this cmdlet.

8. Import the Central Management store data from $Backup. At the command line, type:

```
Import-CsConfiguration -FileName <CMS backup file name>
```

For example:

```
Import-CsConfiguration -FileName "C:\Config.zip"
```

9. Enable the changes you have just made. At the command line, type:

```
Enable-CsTopology
```

> **Note:**
> After you enable the topology, you can find the topology document in the database.

10. If you are restoring an Enterprise Edition Back End Server that also hosted the CMS, or if you need to re-create a mirror of the CMS, then follow this step. Otherwise, skip to step 11.
    Install the stand-alone databases by doing the following:
    - Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Topology Builder**.
    - Click **Download Topology from existing deployment**, and then click **OK**.
    - Select the topology, and then click **Save**. Click **Yes** to confirm your selection.
    - Right-click the **Lync Server 2013** node, and then click **Install Database**.
    - Follow the **Install Database** wizard. If you are restoring a database other than the Central Management store on this server, on the **Create databases** page, select the databases you want to recreate.

Note:

Only stand-alone databases are displayed on the **Create databases** page. Collocated databases are created when you run the Lync Server Deployment Wizard.

- If you are restoring a mirrored Back End Server, continue to follow the rest of the wizard until you come to a prompt of Create Mirror Database. Select the database you want to install, and complete the process.
- Follow the rest of the wizard, and then click **Finish**.

Tip:

Instead of running Topology Builder, you can use the **Install-CsDatabase** cmdlet to create each database, and the **Install-CsMirrorDatabase** cmdlet to configure mirroring. For details, see Install-CsDatabase and Install-CsMirrorDatabase.

11. If you are restoring a Standard Edition server, browse to the Lync Server installation folder or media, and start the Lync Server Deployment Wizard located at \setup\amd64\Setup.exe. Use the Lync Server Deployment Wizard to do the following:
    - Run **Step 1: Install Local Configuration Store** to install the local configuration files.
    - Run **Step 2: Setup or Remove Lync Server Components** to install the Lync Server server roles.
    - Run **Step 3: Request, Install or Assign Certificates** to assign the certificates.
    - Run **Step 4: Start Services** to start services on the server.

    For details about running the Deployment Wizard, see the Deployment documentation for the server role that you are restoring.
12. Restore user data by performing the following:
    - Copy ExportedUserData.zip from $Backup\ to a local directory.
    - Before you restore the user data, you must stop Lync services. To do so, type:

      ```
      Stop-CsWindowsService
      ```

    - To restore the user data, at the command line, type:

      ```
      Import-CsUserData -PoolFqdn <Fqdn> -FileName <String>
      ```

      For example:

      ```
      Import-CsUserData -PoolFqdn "atl0cs-001.litwareinc.com" -Fi
      ```

    - Restart Lync services by typing:

      ```
      Start-CsWindowsService
      ```

13. Restore Location Information data to the Central Management store. At the command line, type:

    ```
    Import-CsLisConfiguration -FileName <LIS backup file name>
    ```

    For example:

    ```
    Import-CsLisConfiguration -FileName "D:\E911Config.zip"
    ```

14. If you deployed Response Group on this pool or Standard Edition server, restore the Response Group configuration data. For details, see Restoring Response Group Settings.
15. If you are restoring a Back End Server that includes Archiving or Monitoring databases, restore the Archiving or Monitoring data by using a SQL Server management tool, such as SQL Server Management Studio. For details, see Restoring Monitoring or Archiving Data.

Restoring an Enterprise Edition Back End Server

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-18*

Use the procedure described in this topic in the following two cases:

- Both the primary and mirror databases of a mirrored Enterprise Edition Back End Server fail.
- An Enterprise Edition Back End Server that is not mirrored fails.

If you have a mirrored Enterprise Edition Back End and only the mirror or primary database fails, see Restoring a Mirrored Enterprise Edition Back End Server - Primary for restoring the primary database, and Restoring a Mirrored Enterprise Edition Back End Server - Mirror for restoring the mirror.

If the Central Management store fails, see Restoring the Server Hosting the Central Management Store. If an Enterprise Edition member server that is not the Back End Server fails, see Restoring an Enterprise Edition Member Server.

Tip:

We recommend that you take an image copy of the system before you start restoration. You can use this image as a rollback point, in case something goes wrong during restoration. You might want to take the image copy after you install the operating system and SQL Server, and restore or reenroll the certificates.

⊟To restore an Enterprise Edition Back End Server

1. Start with a clean or new server that has the same fully qualified domain name (FQDN) as the failed computer, install the operating system, and then restore or reenroll the certificates.

   Note:

   Follow your organization's server deployment procedures to perform this step.

2. From a user account that is a member of the RTCUniversalServerAdmins group, log on to the server that you are restoring.
3. Install SQL Server 2012 or SQL Server 2008 R2, keeping the instance names the same as before the failure.

   Note:

   Depending on your deployment, the Back End Server might include multiple collocated or separate databases. Follow the same procedure to install SQL Server that you used originally to deploy the server, including SQL Server permissions and logins.

4. After you install SQL Server, perform the following:

   4.a. Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Topology Builder**.

   4.b. Click **Download Topology from existing deployment**, and then click **OK**.

   4.c. Select the topology, and then click **Save**. Click **Yes** to confirm your selection.

   4.d. Right-click the **Lync Server 2013** node, and then click **Publish Topology**.

   4.e. Follow the **Publish the Topology** wizard. On the **Create databases** page, select the databases that you want to re-create.

   Note:

   Only stand-alone databases are displayed on the **Create databases** page.

4.f.If you are restoring a Back End that was mirrored, continue to follow the rest of the wizard until the prompt **Create Mirror Database** appears. Select the database that you want to install, and complete the process.
4.g.Follow the rest of the wizard, and then click **Finish**.

Tip:
Instead of running Topology Builder, you can use the **Install-CsDatabase** cmdlet to create each database, and the **Install-CsMirrorDatabase** cmdlet to configure mirroring. For details, see the Lync Server Management Shell documentation.

5. Restore user data by performing the following:
5.a.Copy ExportedUserData.zip from $Backup\ to a local directory.
5.b.Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
5.c.Before you restore the user data, you must stop Lync services. To do so, type:

```
Stop-CsWindowsService
```

5.d.To restore the user data, at the command line, type:

```
Import-CsUserData -PoolFqdn <Fqdn> -FileName <String>
```

For example:

```
Import-CsUserData -PoolFqdn "atl0cs-001.litwareinc.com" -Fi
```

5.e.Restart Lync Services by typing:

```
Start-CsWindowsService
```

6. If you deployed Response Group on this pool, restore the Response Group configuration data. For details, see Restoring Response Group Settings.
7. If you are restoring a Back End Server that included Archiving or Monitoring databases, restore the Archiving or Monitoring data by using a SQL Server tool, such as SQL Server Management Studio. For details, see Restoring Monitoring or Archiving Data.

1.7.19.3.4.1 Restoring a Mirrored Enterprise Edition Back End Server - Primary

Restoring a Mirrored Enterprise Edition Back End Server - Primary

Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings > Restoring an Enterprise Edition Back End Server >

Topic Last Modified: *2013-02-17*

If you have an Enterprise Edition Back End Server in a mirrored configuration and only the primary database fails, follow the procedures in this section. If both the primary database and mirror fail, see Restoring an Enterprise Edition Back End Server. If only the mirror fails, see Restoring a Mirrored Enterprise Edition Back End Server - Mirror. If the database hosting the Central Management store fails, see Restoring the Server Hosting the Central Management Store. If an Enterprise Edition member server that is not the Back End Server fails, see Restoring an Enterprise Edition Member Server.

We recommend that you take an image copy of the system before you start restoration. You can use this image as a rollback point, in case something goes wrong during restoration. You might want to take the image copy after you install the operating system and SQL Server, and restore or reenroll the certificates.

In this topic, the example primary database will have a fully qualified domain name (FQDN) of BE1.contoso.com, and the mirror database will have an FQDN of BE2.contoso.com.

To restore an Enterprise Edition Back End Server Primary Database

1. From a user account that is a member of the RTCUniversalServerAdmins group, log on to a Front End Server.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Force all of the configured databases to fail over to the Mirror. For each of the database types that you have configured on this server, type the following cmdlet:

   ```
   Invoke-CsDataBaseFailover -PoolFqdn <Pool FQDN> -DatabaseType <Configu
   ```

   For example:

   ```
   Invoke-CsDataBaseFailover -PoolFqdn pool0.vdomain.com -DatabaseType Us
   ```

   > ⚠**Warning:**
   >
   > If you have configured your back-end database to use synchronized mirroring with a witness, failover is automatic.

4. After completing failover, perform the following:
   - Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Topology Builder**.
   - Disable mirroring on the Back End Server: Right-click on the pool under **Enterprise Edition Front End pools** and select **Edit Properties**. On the **General** tab, under **Associations**, clear the **Enable SQL Server store mirroring** check box. Do this for Archiving and Monitoring as necessary. Then click **OK**.
   - Right-click the Lync Server 2013 node, click **Topology**, and then click **Publish**.
   - Select the still functioning backend (BE2.contoso.com) to be the new SQL store. To do this, right-click on the pool under **Enterprise Edition Front End pools** and select **Edit Properties**. On the **General** tab, under **Associations**, type the FQDN of the functioning backend in the **SQL Server store** field (in our example, BE2.contoso.com).
   - Right-click the Lync Server 2013 node, click **Topology**, and then click **Publish**.
   - Restart services so that each server can read the new topology. From a Lync Server Management Shell, run the following cmdlets on each Front End Server that belongs to this pool:

     ```
     Stop-CsWindowsService
     Start-CsWindowsService
     ```

5. Uninstall mirroring. From a Lync Server Management Shell, run the following cmdlet:

   ```
   Uninstall-CsMirrorDatabase -DatabaseType User -SqlServerFqdn <MirrorSe
   ```

   For example:

   ```
   Uninstall-CsMirrorDatabase -DatabaseType User -SqlServerFqdn DB2.conto
   ```

   Do this for all database types on this server.
6. Create a clean or new server that has the same FQDN (in this example, DB1.contoso.com) as the failed computer, install the operating system, and then restore or reenroll the certificates. This server will function as the new mirror.
7. From a user account that is a member of the RTCUniversalServerAdmins group, log on to the new server.
8. Install SQL Server 2012 or SQL Server 2008 R2, keeping the instance names the same as before the failure.
9. From a user account that is a member of the RTCUniversalServerAdmins group, log on to a Front End Server.

10. Use Topology Builder to install mirror DB. Perform the following steps:
    - Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Topology Builder**.
    - Enable mirroring on the Back End Server. To do so, right-click on the pool under **Enterprise Edition Front End pools** and select **Edit Properties**. On the **General** tab, under **Associations**, select the **Enable SQL Server store mirroring** check box. Also do this for Archiving and Monitoring, if necessary. Then, in the **Mirroring SQL Server store** field, type the FQDN of the new server (n this example, BE1.contoso.com). Then click **OK**.
    - Right-click the Lync Server 2013 node, click **Topology**, and then click **Install Database**.
    - Follow the **Install Database** wizard. On the **Create databases** page, select the databases that you want to recreate.
    - Follow the wizard until you come to the prompt, **Create Mirror Database**. Select the database that you want to install, and complete this process.

1.7.19.3.4.2 Restoring a Mirrored Enterprise Edition Back End Server - Mirror

Restoring a Mirrored Enterprise Edition Back End Server - Mirror

Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings > Restoring an Enterprise Edition Back End Server >

***Topic Last Modified:** 2013-02-19*

If you have an Enterprise Edition Back End Server in a mirrored configuration and only the mirror fails, follow the procedures in this section. If both the primary database and mirror fail, see Restoring an Enterprise Edition Back End Server. If only the primary fails, see Restoring a Mirrored Enterprise Edition Back End Server - Primary. If the database hosting the Central Management store fails, see Restoring the Server Hosting the Central Management Store. If an Enterprise Edition member server that is not the Back End Server fails, see Restoring an Enterprise Edition Member Server.

We recommend that you take an image copy of the system before you start restoration. You can use this image as a rollback point, in case something goes wrong during restoration. You might want to take the image copy after you install the operating system and SQL Server, and restore or reenroll the certificates.

⊟To restore an Enterprise Edition Back End Server Mirror Database

1. From a user account that is a member of the RTCUniversalServerAdmins group, log on to a Front End Server.
2. Start the Lync Server Management Shell: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Management Shell**.
3. Uninstall mirroring. First, type the following cmdlet:

   ```
   Uninstall -CsMirrorDatabase -DatabaseType User -SqlServerFqdn <Primary
   ```

   For example:

   ```
   Uninstall -CsMirrorDatabase -DatabaseType User -SqlServerFqdn server4.
   ```

   Do this for all database types on this server.
4. Create a clean or new server that has the same fully qualified domain name (FQDN) (DB1.contoso.com) as the failed computer, install the operating system, and then restore or reenroll the certificates. This server will function as the new mirror.
5. From a user account that is a member of the RTCUniversalServerAdmins group, log on to the new server.

6. Install SQL Server 2012 or SQL Server 2008 R2, keeping the instance names the same as before the failure.
7. From a user account that is a member of the RTCUniversalServerAdmins group, log on to a Front End Server.
8. Use Topology Builder to install the mirror database. Perform the following:
   - Start Topology Builder: Click **Start**, click **All Programs**, click **Microsoft Lync Server 2013**, and then click **Lync Server Topology Builder**.
   - Right-click the Lync Server 2013 node, click **Topology**, and then click **Install Database**.
   - Follow the **Install Database** wizard. On the **Create databases** page, select the databases that you want to recreate.
   - Follow the wizard until a prompt of **Create Mirror Database** appears. Select the database that you want to install and complete this process.

Tip:

Instead of running Topology Builder, you can use the **Install-CsMirrorDatabase** cmdlet to configure mirroring. For details, see the Lync Server Management Shell documentation.

1.7.19.3.5 Restoring Response Group Settings

Restoring Response Group Settings

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-18*

If you deployed the Response Group application and you need to restore a Back End Server or a Standard Edition server, you also need to restore the Response Group configuration settings.

To restore Response Group configuration settings

1. At the command line, type:

```
Import-CsRgsConfiguration -Destination "service:ApplicationServer:<pod
```

For example:

```
Import-CsRgsConfiguration -Destination "service: ApplicationServer:poo
```

1.7.19.3.6 Restoring an Enterprise Edition Member Server

Restoring an Enterprise Edition Member Server

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-18*

If a server running one of the following server roles fails, follow the procedure in this topic to restore the server. If multiple servers fail independently, follow the procedure for each server.

- Front End Server
- Mediation Server
- Director
- Persistent Chat Server
- Edge Server

Tip:

We recommend that you take an image copy of the system before you start restoration. You can use this image as a rollback point, in case something goes wrong during restoration. You might want to take the image copy after you install the operating system and SQL Server, and restore or reenroll the certificates.

⊟To restore a member server

1. Start with a clean or new server that has the same fully qualified domain name (FQDN) as the failed server, install the operating system, and then restore or reenroll the certificates.

   Note:
   Follow your organization's server deployment procedures to perform this step.

2. From a user account that is a member of the RTCUniversalServerAdmins group, log on to the server that you are restoring.
3. Browse to the Lync Server installation folder or media, and start the Lync Server Deployment Wizard located at \setup\amd64\Setup.exe.
4. Follow the Deployment Wizard to do the following:
   4.a. Run **Step 1: Install Local Configuration Store** to install the local configuration files.
   4.b. Run **Step 2: Setup or Remove Lync Server Components** to install the Lync Server server role.
   4.c. Run **Step 3: Request, Install or Assign Certificates** to assign the certificates.
   4.d. Run **Step 4: Start Services** to start services on the server.

   For details about running the Deployment Wizard, see the Deployment documentation for the server role that you are restoring.

1.7.19.3.7 Restoring a Lync Server Pool

Restoring a Lync Server Pool

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-18*

Your Lync Server deployment may include any of the following types of pools:

- Front End Server
- Mediation Server
- Persistent Chat Server
- Edge Server

If an entire pool experiences an outage, follow these procedures for each member server in the pool.

- For a Front End pool, restore the Back End Server first, and then restore each Front End Server. For details, see Restoring an Enterprise Edition Back End Server and Restoring an Enterprise Edition Member Server.
- For all other types of pools, restore each member server. For details, see Restoring an Enterprise Edition Member Server.

1.7.19.3.8 Performing an ABC Front End Pool Failover

Performing an ABC Front End Pool Failover

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-21*

The two topics in this section describe the procedure for performing an ABC pool failover in Lync Server 2013, where there are paired Lync Server Front End pools A and B, and pool A becomes unrecoverable. Using this procedure, you create a new Front End pool C with a new fully qualified domain name (FQDN). Pool C is constructed from the information from failed pool A. The procedure also includes pairing together pools B and C.

- Backup Prerequisites for ABC Pool Failover
- Front End Pool ABC Failover Procedure

1.7.19.3.8.1 Backup Prerequisites for ABC Pool Failover

Backup Prerequisites for ABC Pool Failover

Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings > Performing an ABC Front End Pool Failover >

Topic Last Modified: *2013-02-18*

To get the maximum benefit from using the ABC pool failover procedure, you must perform certain backups before the disaster and failover happen:

- You must regularly back up the Location Information Service (LIS) configuration data from pool A by using the **Export-CsLISConfiguration** cmdlet.

  ```
  Export-csLisConfiguration -FileName <C:\LISExportPrimary.zip>
  ```

- You must regularly back up the Response Group configuration data in pool A by using the **Export-CsRgsConfiguration** cmdlet.

  ```
  Export-CsRgsConfiguration -Source "service:ApplicationServer:<Pool A FQ
  ```

  In general, we recommend that you perform daily backups, but if you have a high volume of changes, you might want to schedule more frequent backups. The amount of information that you can lose in the event of a disaster depends on the frequency of your backups, as well as on the frequency and volume of changes.

  The Response Group application can store only one set of application-level settings per pool. These settings can be accessed through the **Get-CsRgsConfiguration** cmdlets. The settings include the default music-on-hold configuration, the default music-on-hold audio file, the agent ring-back grace period, and the call context configuration. These settings can be transferred from one pool to another through the **Import-CsRgsConfiguration** cmdlet by using the **ReplaceExistingSettings** parameter, but this operation will override any application-level settings in the destination pool.

  Tip:

  In a separate location, keep a backup copy of all the original audio files that have been used to configure the Response Group application (that is, any recordings or music-on-hold files).

  If you have any customized music-on-hold files that have been uploaded for Call Park in a pool, you should keep a copy of these in another location. These files are not backed up as part of the Lync Server 2013 disaster recovery process, and they will be lost if the files uploaded to the pool are damaged, corrupted, or erased.

  ```
  Xcopy  <Source: Pool A CPS File Store Path>  <Destination>
  Example: Xcopy  "<Pool A File Store Path>\LyncFileStore\coX-Application
  ```

  Note:

  The Call Park application can store only one set of settings and one customized music-on-hold audio file per pool. These settings can be accessed through the **Get-CsCpsConfiguration** cmdlet. Because the disaster recovery mechanism for Call Park relies on the Call Park application of the backup pool, the settings of the primary pool are not backed up or preserved if a disaster occurs. If the primary pool is lost, these settings cannot be recovered, and when a new pool is deployed to replace the primary pool, the Call Park settings and any customized music-on-hold audio file would need to be reconfigured.

- If you configure any announcements as part of the Unassigned Number Voice Feature, we recommend that you keep in another location a copy of any original audio file used during the initial configuration. If you did not do that, you can get a copy of the configured audio files in the file store of the server or pool to which the audio files were imported. These files are not backed up as part of the Lync Server 2013 disaster recovery process, and they will be lost if the files uploaded to the pool are damaged, corrupted, or erased. To copy all the audio files used to configure the Unassigned Number Voice Feature from the file store of a server or a pool, use:

```
Use: Xcopy  <Source: Pool A Announcement Service File Store Path>  <Des
Example Usage:  Xcopy  "<Pool A File Store Path>\X-ApplicationServer-X\
```

- If you have Monitoring and Archiving databases in a pool, you should use SQL Server management tools to back them up. In the ABC failover procedure, Monitoring and Archiving databases are not preserved if they are collocated in pool A, because these databases are not backed up through Lync Server Backup Service.
  Note that Lync Server supports only the Simple Recovery model for Monitoring and Archiving databases. With the Simple Recovery model, databases are recovered to the point of the last full backup. This means that you cannot restore a database to the point of failure or to a specific point in time.

1.7.19.3.8.2 Front End Pool ABC Failover Procedure

Front End Pool ABC Failover Procedure

Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings > Performing an ABC Front End Pool Failover >

Topic Last Modified: *2013-02-21*

Use the following steps to perform the ABC failover procedure. This procedure contains a high-level description of each step, followed by commands and cmdlets to be run for each step.

To run the cmdlets, open a Lync Server Management Shell using Run as Administrator.

To Perform an ABC Failover

1. Check whether the pool A is the host for the Central Management Server (CMS).
   - Run the following cmdlet:

     ```
     Get-CsService -CentralManagement
     ```

     If the Identity field of the active CMS points to the fully qualified domain name (FQDN) of Pool A, then you use steps 2 and 3 of this procedure to fail over the Central Management Server first. Otherwise, skip to step 4.
2. Fail over the CMS to Pool B in disaster recovery mode by running the following cmdlet:

   ```
   Invoke-CsManagementServerFailover -BackupSqlServerFqdn <Pool B BE FQDN
   ```

   After you do this, we recommend that you move the CMS from pool B to another existing paired pool for extra resiliency. For details, see Move-

CsManagementServer..

3. If Pool A contains CMS, import the LIS configuration from pool A into pool B’s LIS database (Lis.mdf). This will work only if you have been backing up LIS data on a regular basis. To import the LIS configuration, run the following cmdlets:

```
Import-CsLisConfiguration -FileName <String>
Publish-CsLisConfiguration
```

4. Import backed-up Lync Server Response Group service workflows from pool A into pool B.

Note:

Currently, the **Import-CsRgsConfiguration** cmdlet requires that the queue and workflow names on pool A are distinct from the queue and workflow names on pool B. If the names are not distinct, you will get an error when running the **Import-CsRgsConfiguration** cmdlet, and the queues and workflows will need to be renamed in pool B before proceeding with **Import-CsRgsConfiguration** cmdlet.

You have two options for importing the Response Group configuration from pool A to pool B. Which option you use depends on whether you want to overwrite the application-level settings of pool B with the application-level settings in pool A.

- If you want to overwrite the Pool B settings, run the **Import-CsRgsConfiguration** cmdlet with the **ReplaceExistingSettings** option:

```
Import-CsRgsConfiguration -Destination "service:ApplicationS
```

- If you do not want to overwrite the Pool B settings, use the **Import-CsRgsConfiguration** cmdlet without the **ReplaceExistingSettings** option.

```
Import-CsRgsConfiguration -Destination "service:ApplicationS
```

Warning:

Keep in mind that if you do not want to overwrite the application-level settings of the backup pool (pool B) with the settings of the primary pool (pool A), pool A’s application-level settings will be lost if pool A is lost, because the Response Group application can store only one set of application-level settings per pool. When pool C is deployed to replace pool A, the application-level settings must be reconfigured, including the default music-on-hold audio file.

5. Verify that the Response Group configuration import was successful by running the following cmdlets to display the imported response groups. Note that the imported response groups are still owned by pool A.

```
Get-CsRgsWorkflow -Identity "service:ApplicationServer:<Pool B FQDN>"
Get-CsRgsQueue -Identity "service:ApplicationServer:<Pool B FQDN>" -Ow
Get-CsRgsAgentGroup -Identity "service:ApplicationServer:<Pool B FQDN>
```

6. For Unassigned Numbers, move the Unassigned Number ranges that are using "Announcement" as the selected announcement service from pool A to pool B. To do so:

- Re-create all announcements that were deployed in pool A on pool B. If any audio files were used when deploying the announcements in pool A, these files will be needed to re-create the announcements in pool B. To re-create the announcements in pool B, use the **New-CsAnnouncement** cmdlets, with pool B as the Parent service.
- Retarget all the Unassigned Number ranges that are targeting an announcement in pool A to the newly deployed announcements in pool B. Run the following cmdlet for every Unassigned Number range targeting an announcement of pool A:

```
Set-CsUnassignedNumber -Identity "<Range Name>" -Announcemer
```

Note:

This step is not required for unassigned number ranges that use "Exchange UM" as the selected announcement service.

7. Fail over Pool A to Pool B in Disaster Recovery (DR) mode, by running the following cmdlet:

```
Invoke-CsPoolFailover -PoolFqdn <Pool A FQDN> -DisasterMode
```

8. Build pool C, but do not start any services on pool C.
   If pool C is an Enterprise Edition pool, see Deploying Lync Server 15 Enterprise Edition Cookbook for details. If pool C is a Standard Edition pool, see Deploying Lync Server 15 Standard Edition Cookbook for details.
   Note that this step can be carried out concurrently with steps 5 and 6.
9. Force users homed on pool A to move to pool C by running the following cmdlet:

```
Get-csuser -Filter {RegistrarPool -eq "<Pool A FQDN>"} | Move-CsUser -
```

   At this point, users homed on pool A will begin to experience a service outage. This outage will continue until step 16, at which point services are started on pool C.
10. Force the conference directory of pool A to move to pool C by running the following cmdlet:

```
Move-CsConferenceDirectory -Identity <Conference Directory ID of Pool
```

11. Force the Conference Auto Attendant (CAA) Contact Object to move from pool A to pool C by running the following cmdlet:

```
Move-csApplicationEndpoint -Identity "<Pool A CAA Uri>" -targetApplica
```

12. Copy conference content from pool B to pool C. For details, see HADR Scenario – Bulk meeting content hydration/dehydration.
13. Export user data from pool B and import the user data into pool C by running the following cmdlets:

```
Export-CsUserData -PoolFqdn <Pool B Fqdn> -FileName <String>
Import-CsUserData -PoolFqdn <Pool C Fqdn> -FileName <String>
```

14. Restore backed-up Call Park application data from pool A into pool C and assign the Call Park orbit ranges of pool A to pool C.
    - You can reassign a Call Park orbit range of pool A to pool C either through the Lync Server Control Panel or the Lync Server Management Shell. For the Lync Server Management Shell, run the following cmdlet for every Call Park orbit range assigned to pool A (note that the Identity parameter refers to the Call Park Orbit Ranges that belong to pool A):

```
Set-CsCallParkOrbit -Identity "<Call Park Orbit Identity>" -
```

    - If a customized music-on-hold has been configured for Call Park in pool A, restore the Call Park customized music-on-hold file in pool C.

```
Xcopy <Source> <Destination: Pool C CPS File Store Path>
```

      For example:

```
Xcopy "Source Path" "<Pool C File Store Path>\OcsFileStore\c
```

    - Finally, reconfigure the Call Park settings on pool C by using the **Set-CsCpsConfiguration** cmdlet. The Call Park application can store only one set of settings and one customized music-on-hold audio file per pool, and these settings are not backed up or preserved in the event of a disaster.
15. If the next hop pool for Persistent Chat is pointing to pool A, make and publish topology changes so that the next hop server points to pool C.
    - In Topology Builder, change the Persistent Chat pool to point to Pool C as its next hop. To do so, right-click on the Persistent Chat pool, then click the **General** tab, and then type the name of Pool C in **Next Hop Pool**.
    - Start services on pool C by running the following cmdlet:

```
Start-csWindowsService
```

   At this point, the service outage ends for users originally homed on pool A.

16. Export Lync Server Response Group service workflows from pool B owned by pool A for import into pool C by running the following cmdlet:

```
Export-CsRgsConfiguration -Source "service:ApplicationServer:<Pool B F
```

17. Import Lync Server Response Group service workflows into pool C from pool B.
    You have two options are for importing the Response Group configuration from pool B to pool C. Which option you use depends on whether you want to overwrite the application-level settings of pool C with the application-level settings in pool B.
    - If you want to overwrite the Pool C settings, run the **Import-CsRgsConfiguration** cmdlet with the **ReplaceExistingSettings** option:

      ```
      Import-CsRgsConfiguration -Destination "service:ApplicationS
      ```

    - If you do not want to overwrite the Pool C settings, use the **Import-CsRgsConfiguration** cmdlet without the **ReplaceExistingSettings** option.

      ```
      Import-CsRgsConfiguration -Destination "service:ApplicationS
      ```

Warning:

Keep in mind that if you do not want to overwrite the application-level settings of Pool C with the settings of the backup pool (pool B), pool B's application-level settings will be lost because the Response Group application can store only one set of application-level settings per pool.

18. Verify that the Response Group configuration import was successful by running the following cmdlets to display the response groups that have been imported to Pool C.

```
Get-CsRgsWorkflow -Identity "service:ApplicationServer:<Pool C FQDN>"
 Get-CsRgsQueue -Identity "service:ApplicationServer:<Pool C FQDN>" -S
Get-CsRgsAgentGroup -Identity "service:ApplicationServer:<Pool C FQDN>
```

19. When the imported configuration has been verified in pool C, remove the response groups owned by the primary pool from pool B. This will minimize the downtime of the response groups.
    This step creates a new file with the exported configuration, and then removes the file from pool B.

```
Export-CsRgsConfiguration -Source "service:ApplicationServer:<Pool B F
```

20. Move to pool C the Unassigned Number ranges that were moved from pool A to pool B.
    - Re-create in pool C all announcements that were re-created from pool A in pool B. If any audio files were used when deploying the announcements to be moved, you will need to use these files to re-create the announcements in pool C. To re-create the announcements in pool C, use the **New-CsAnnouncement** cmdlets, with pool C as the Parent service.
    - Retarget to pool C all the unassigned number ranges that were retargeted from pool A to pool B. Run the following cmdlet for every Unassigned Number range that needs to be retargeted:

      ```
      Set-CsUnassignedNumber -Identity "<Range Name>" -Announcemen
      ```

    - (Optional) Remove from pool B the announcements that were re-created in pool C if they are no longer in use in pool B. To remove announcements, use the **Remove-CsAnnouncement** cmdlet.

      Note:

      This step is not required for unassigned number ranges that use "Exchange UM" as the announcement service.

21. Clean up user data of pool A in pool B by running the following cmdlet:

```
Remove-CsUserStoreBackupData -PoolFqdn <Pool B FQDN> -Verbose
```

22. Do the following in Topology Builder:
    - Unpair pool A and pool B. Pair pool B and pool C. Then remove Pool A from

the topology and publish it. To do so:

- In Topology Builder, right-click on Pool B, and then click **Edit Properties**.
- Click **Resiliency** in the left pane.
- In the box below **Associated Backup Pool**, select Pool C. Note that the Associated Backup Pool selection box will initially display pool A, because pool B was previously associated with this pool.
- Select **Automatic failover and failback for Voice**, and then click **OK**.

  When you view the details about this pool, the associated pool now appears in the right pane under **Resiliency**.
- In the console tree, right-click pool A, and then click Delete.
- Publish the topology.

23.Run the bootstrapping application on pool C to install the backup service application, and then start the backup service application by running the following from the deployment folder on a local machine in pool C:

```
Run "%SYSTEMROOT%\Program Files\Microsoft Lync Server 2013\Deployment\
Start-CsWindowsService -name LyncBackup
```

24.Restart the backup service application on pool B by running the following cmdlets:

```
Stop-CsWindowsService -name LyncBackup
Start-CsWindowsService -name LyncBackup
```

25.If pool C is a Standard Edition (SE) Pool and pool B has CMS, install the CMS database manually on pool C by running the following cmdlet:

```
Install-CsDatabase -CentralManagementDatabase -SqlServerFqdn <Pool C F
```

26.Invoke the backup service to sync old conferencing content from pool B to pool C that was generated before pairing B and C together, and to sync new conferencing content from pool C to pool B that was generated after starting pool C and before B and C were paired together. To do so, run the following cmdlets:

```
Invoke-CsBackupServiceSync -PoolFqdn <Pool C FQDN>
Invoke-CsBackupServiceSync -PoolFqdn <Pool B FQDN>
```

27.For each Survivable Branch Appliance X associated with pool A:

- Shut down SBA X by running the following cmdlet:

  ```
  Stop-CsWindowsService
  ```

- Create a file that contains a list of users homed on SBA X. The list will be needed when the users are moved back to SBA X in step 30. To do so, run the following cmdlet:

  ```
  Get-CsUser -Filter {RegistrarPool -eq "<SBA X FQDN>"} | Expo
  ```

- Force users homed on SBA X to move to pool C by running the following cmdlet:

  ```
  Get-CsUser -Filter {RegistrarPool -eq "<SBA X FQDN>"} | Move
  ```

- Update the data of these users by first running the following cmdlets:

  ```
  Convert-csUserData -InputFile <Data file exported from PoolB
  $a=get-csuser -Filter {RegistrarPool -eq "FQDN of SBA X"} |
  foreach($x in $a) {$x.SipAddress.Substring(4) >> users.txt}
  ```

  And then run this script:

  ```
  $users=gc c:\logs\users.txt
  foreach ($user in $users)
  {
  Update-CsUserData -FileName c:\logs\exportedUserDAta.xml -Us
  }
  ```

  Note:

  A service outage will occur for users who are homed on SBAs that are associated with pool A until these users are moved to pool C.

28. In Topology Builder, for each SBA X previously associated with Pool A, do the following:
    - Change the association to Pool C. To do so, click the branch site, expand the Survivable Branch Appliances or Servers node, and click **Survivable Branch Appliance**. Then select the **Front End pool, User Services Pool** that this Survivable Branch Appliance will connect to as Pool C, and then click **Next**.
    - Publish the topology. To do so, in the console tree, right-click the new **Survivable Branch Appliance**, click **Topology**, and then click **Publish**.
29. For each SBA X now associated with pool C:
    - Start SBA X by running the following cmdlet on the survivable branch appliance:

      ```
      Start-CsWindowsService
      ```

    - Move users who were originally homed on SBA X from pool C to SBA X by running the following cmdlet.

      ```
      Import-Csv d:\sbaxusers.txt | Move-CsUser -Target <SBA X FQD
      ```

1.7.19.3.9 Restoring a File Store

Restoring a File Store

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-18*

File Stores for Standard Edition are typically located on the Standard Edition server. File Stores for Enterprise Edition are typically located on a file server or cluster. The following procedure describes how to restore a File Store.

To restore a File Store

1. If a File Store fails, copy the appropriate File Store from $Backup\ to the File Store location on the file server or Standard Edition server, and then share the folder.

   > **Important:**
   > The path and file name for the restored File Store should be exactly the same as the backed up File Store, so that components that use the files can access them.

2. If necessary, set the access control lists (ACLs) for the File Store. At the command line, type:

   ```
   Enable-CsTopology
   ```

   > **Note:**
   > You need to perform this step only if you have not otherwise run Topology Builder during your restoration process.

1.7.19.3.10 Restoring Monitoring or Archiving Data

Restoring Monitoring or Archiving Data

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-18*

Restoring monitoring and archiving data is not required to get Lync Server up and running after a failure. However, if monitoring and archiving data is critical to your organization, you will want to restore the data after you re-create the databases.

The following procedure describes how to use SQL Server Management Studio to restore archiving or monitoring data.

⊟To restore monitoring or archiving data from a backup file

1. Log on to the server that you are restoring as a member of the Administrators group on the local computer or a group with equivalent user rights.
2. Open SQL Server Management Studio: click **Start**, click **All Programs**, click **Microsoft SQL Server 2012** or **Microsoft SQL Server 2008 R2**, and then click **SQL Server Management Studio**.
3. In **Connect to Server**, connect to the SQL Server instance by providing at least the name of the server and the authentication information.
4. In **Object Explorer**, right-click **Databases**, and then click **Restore Database**.
5. Under **Select a page**, click **General**, and then in **To database** select the database name as follows:
   - For an Archiving database, select **LcsLog**.
   - For a call detail recording (CDR) database, select **LcsCDR**.
   - For a Quality of Experience (QoE) database, select **QoEMetrics**.
6. Click **From device**.
7. Under **Select the backup sets to restore**, click the backup file, and then click **Restore**.
8. Under **Select a page**, click **Options**, verify that the data file path and log path are in the correct folder, and then click **OK**.

⊟To make sure that access control lists (ACLs) are correct

1. Expand **Databases**, expand the archiving or monitoring database, expand **Security**, and then expand **Users**.
2. Verify that the domain group RTCComponentUniversalServices exists as a user.
3. If RTCComponentUniversalServices does not exist under **Users**, do the following:
   3.a. Right-click **Users**, and then click **New User**.
   3.b. In **Login name**, type the missing group name, RTCComponentUniversalServices.
   3.c. Under **Database role membership**, select the **ServerRole** permission, and then click **OK**.

Note:
You do not need to restart the archiving or monitoring service.

1.7.19.3.11 Restoring Persistent Chat Data

Restoring Persistent Chat Data

Operations > Backing Up and Restoring Lync Server 2013 > Restoring Data and Settings >

Topic Last Modified: *2013-02-18*

Persistent Chat room content is stored in the Persistent Chat database (mgc.mdf). This is business-critical data that should be backed up regularly. In addition to the chat room content, principals (such as users and groups) and the roles and access that they have to chat rooms and chat room content, is also stored in the Persistent Chat database.

How you restore your Persistent Chat data depends on the method that you used to back it up.

- If you used SQL Server backup procedures, you must use SQL Server restore procedures.

- If you used the **Export-CsPersistentChatData** cmdlet to back up Persistent Chat data, then you must use the **Import-CsPersistentChatData** cmdlet to restore the data.

1.7.19.4 Backup and Restoration Worksheets

Backup and Restoration Worksheets

Microsoft Lync Server 2013 > Operations > Backing Up and Restoring Lync Server 2013 >

Topic Last Modified: *2013-02-18*

The backup and restoration plan for your organization should contain details about how and when you back up data and settings. You can use the worksheets presented here to help you document this information for your specific deployment and for your organization's backup and restoration requirements.

Use the following worksheets to record the information that you need to back up and restore database, File Store, and settings information for a Lync Server pool or Standard Edition server. Keep one or more copies of these worksheets in a secure location so that they are readily accessible if you need to restore Lync Server.

Note:

The worksheets in this section cover only the information that is required to restore the data and settings of Lync Server databases and servers. If you need to document other restoration information, such as the information for reinstalling operating systems and other software, use your organization's deployment plans and backup and restoration plans to address those requirements.

Database Backup and Restoration Worksheet

Use the following table to record the information that you need to back up and restore Lync Server databases.

Database Information for Backup and Restoration

Database	Server name (FQDN)	Backup schedule	Database backup tool	Backup set	Backup destination	Notes
Rtc database on Back End Server for user data			**Export-CsUserData** cmdlet	Name: Expiration:		
LcsLog (default name) database on Archiving database server			SQL Server management tool	Name: Expiration:		
LcsCdr database			SQL Server managemen	Name:		

on Monitoring database server for call detail records (CDRs)			t tool	Expiration:		
QoEMetrics database on Monitoring database server for Quality of Experience (QoE) data			SQL Server management tool	Name: Expiration:		
Persistent Chat Database			SQL Server management tool or **Export-CsPersistentChatData** cmdlet	Name: Expiration:		

No backup or restoration is required of the following databases:

- Rtcdyn. The transient user data in this database is not necessary for restoration of service.
- Rtcab. The Address Book database is automatically recreated from the Global Address List (GAL) in Active Directory Domain Services (AD DS).
- Rgsdyn. The transient Response Group service data in this database is not necessary for restoration of service.
- Cpsdyn. The dynamic information for the Call Park application is not necessary for restoration of service.
- MgcComp. The compliance database for Persistent Chat is not necessary for restoration of service.

File Store Backup and Restoration Worksheet

Use the following table to record the information that you need to back up and restore the File Stores. File Stores contain data such as meeting content metadata, meeting compliance logs, update logs for device updates, and audio files for the Response Group, Call Park, and Announcement applications.

File Store Information for Backup and Restoration

Content	Server name (FQDN)	Backup schedule	File system backup tool	File share to be backed up *	Backup destination	Notes
Lync Server File Store			Standard backup tool, such as Robocopy	On file server for Enterprise Edition. On Standard		Files named **Meeting.Active** should not be backed up.

				Edition by default, for Standard Edition deployment. Typically, one per site.		These files are in use and are locked while a meeting takes place.

Settings Backup and Restoration Worksheet

Use the following table to record the information that you need to back up and restore settings.

Settings Information for Backup and Restoration

Database	Server name (FQDN)	Backup schedule	Backup tool	Configuration file (.xml) name	Backup location	Notes
Xds database in Central Management store for topology configuration (global)			**Export-CsConfiguration** cmdlet			
Lis database in Central Management store for E9-1-1 location information (global)			**Export-CsLisConfiguration** cmdlet			
RgsConfig database on Back End Server for Response Group configuration (pool)			**Export-CsRgsConfiguration** cmdlet

Call Detail Recording (CDR)

See Also

Microsoft Lync Server 2013 > Operations > Monitoring and Health Configuration >

Topic Last Modified: *2012-10-22*

Call detail recording (CDR) records usage and diagnostic information about peer-to-peer activities, including instance messaging, Voice over Internet Protocol (VoIP) calls, application sharing, file transfer, and meetings. The usage data can be used to calculate return on investment (ROI) and the diagnostic data can be used to troubleshoot peer-to-peer activities and meetings. When you install Lync Server 2013, you will also install a predefined collection of global configuration settings for CDR. Use the topics in this section to configure CDR.

- View CDR Configuration Information
- Enable Call Detail Recording
- Create or Modify a Collection of CDR Configuration Settings
- Delete an Existing Collection of CDR Configuration Settings
- Manually Purging the Call Detail Recording and Quality of Experience Databases

⊟See Also

Configuring Call Detail Recording and Quality of Experience Settings

1.7.20.1.1 View CDR Configuration Information

View CDR Configuration Information

Operations > Monitoring and Health Configuration > Call Detail Recording (CDR) >

Topic Last Modified: *2013-02-23*

Call Detail Recording (CDR) enables you to track usage of such things as peer-to-peer instant messaging sessions, Voice over Internet Protocol (VoIP) phone calls, and conferencing calls. This usage data includes information about who called whom, when they called, and how long they talked.

When you install Microsoft Lync Server 2013, a single, global collection of CDR configuration settings is created for you. Administrators also have the option of creating custom setting collections that can be applied to individual sites. You can view the CDR configuration settings in use in your organization by using Lync Server Control Panel or the Get-CsCdrConfiguration cmdlet.

To view CDR configuration information by using Lync Server Control Panel

1. In Lync Server Control Panel click **Monitoring and Archiving**.
2. A list of all your CDR configuration settings will be displayed in the **Call Detail Recording** tab; for each collection of settings you will see the collection **Name**; whether or not CDR has been enabled (the **CDR** property); and whether or not purging has been enabled (the **CDR purging** property). To see detailed information about a collection, double-click the collection, or select the appropriate collection, click **Edit**, and then click **Show Details**. Note that you can only view detailed information for a single collection of CDR configuration settings at a time.

Viewing CDR Configuration Information by Using Windows PowerShell Cmdlets

You can view CDR configuration settings by using Windows PowerShell and the Get-CsCdrConfiguration cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To view CDR configuration information

- To view information about all your CDR configuration settings, type the following command in the Lync Server Management Shell and then press ENTER:

  ```
  Get-CsCdrConfiguration
  ```

  That will return information similar to this:

  ```
  Identity                 : Global
  EnableCDR                : True
  EnablePurging            : True
  KeepCallDetailForDays    : 90
  KeepErrorReportForDays   : 60
  PurgeHourOfDay           : 2
  ```

For more information, see the help topic for the Get-CsCdrConfiguration cmdlet.

1.7.20.1.2 Enable Call Detail Recording

Enable Call Detail Recording

See Also

Operations > Monitoring and Health Configuration > Call Detail Recording (CDR) >

Topic Last Modified: *2013-02-23*

Call detail recording (CDR) records usage and diagnostic information about peer-to-peer activities including instance messaging, Voice over Internet Protocol (VoIP) calls, application sharing, file transfer, and meetings. The usage data can be used to calculate return on investment (ROI) and the diagnostic data can be used to troubleshoot peer-to-peer activities and meetings.

Use the following procedure to enable CDR for your whole organization or each site in your organization.

Note:
In order to enable CDR you must configure monitoring and a monitoring database. For details, see Deploying Monitoring.

To enable CDR with Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Call Detail Recording**.
4. On the **Call Detail Recording** page, click the appropriate site from the table, click **Action**, and then click **Enable CDR**.

   Note:
   CDR is enabled by default.

Enabling CDR by Using Windows PowerShell Cmdlets

You can enable CDR by using Windows PowerShell and the **Set-CsCdrConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable CDR for a single location

- To disable CDR, set the EnableCDR parameter to True ($True).

```
Set-CsCdrConfiguration -Identity "site:Redmond" -EnableCDR $True
```

To disable CDR for a single location

- To disable CDR, set the EnableCDR parameter to False ($False). Disabling CDR does not uninstall monitoring. It pauses the collection and storage of CDR data.

```
Set-CsCdrConfiguration -Identity "site:Redmond" -EnableCDR $False
```

To use a single command to enable CDR in multiple locations

- This command enables CDR for all the CDR configuration settings currently in use in your organization.

```
Get-CsCdrConfiguration | Set-CsCdrConfiguration "site:Redmond" -EnableC
```

For more information, see the help topic for the Set-CsCdrConfiguration cmdlet.

1.7.20.1.3 Specifying Retention of CDR Data

Specifying Retention of CDR Data

See Also

Operations > Monitoring and Health Configuration > Call Detail Recording (CDR) >

Topic Last Modified: *2013-02-23*

By default, call detail recording (CDR) data is purged after 60 days. You can use the settings on the **Call Detail Recording** page to retain the data for a longer or shorter period of time. If you disable CDR, data that was captured before CDR was enabled will also be subject to purging.

Note:
You should configure CDR and Quality of Experience (QoE) to retain data for the same number of days. Each call in the call detail reports (CDRs), available from the Monitoring Server Reports webpage, includes CDR and QoE information. If the purging duration for CDR and QoE is different, some calls might only include CDR data, while other may only include QoE data.

Use the following procedures to configure purge settings for CDR data.

⊟To specify retention of CDR data

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Call Detail Recording**.
4. On the **Call Detail Recording** page, click the appropriate site in the table, click **Edit**, and then click **Show Details**.
5. To turn on purging, select **Enable purging of CDRs**.
6. In **Keep CDRs for maximum duration (days):** select the maximum number of days that call detail recordings should be retained.
7. In **Keep error report data for maximum duration (days):** select the maximum number of days that error reports should be retained.
8. Click **Commit**.

Specifying CDR Retention by Using Windows PowerShell Cmdlets

You can create CDR retention settings by using Windows PowerShell and the Set-CsCdrConfiguration cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To specify CDR retention for a specific location

- This command enables purging of CDR data for the Redmond site, and configures the site to maintain both CDR data and error reports data for 20 days.

```
Set-CsCdrConfiguration -Identity "site:Redmond" -EnablePurging -KeepCal
```

To specify CDR retention for multiple locations

- This command configures CDR retention for all the CDR configuration settings in use in an organization.

```
Get-CsCdrConfiguration | Set-CsCdrConfiguration-EnablePurging -KeepCall
```

For more information, see the help topic for the Set-CsCdrConfiguration cmdlet.

Call Detail Recording (CDR)

1.7.20.1.4 Create or Modify a Collection of CDR Configuration Settings

Create or Modify a Collection of CDR Configuration Settings

Operations > Monitoring and Health Configuration > Call Detail Recording (CDR) >

Topic Last Modified: *2013-02-23*

Call detail recording (CDR) enables you to track usage of such things as peer-to-peer instant messaging sessions, Voice over Internet Protocol (VoIP) phone calls, and conferencing calls. This usage data includes information about who called whom, when they called, and how long they talked.

When you install Microsoft Lync Server 2013 a single, global collection of CDR configuration settings is created for you. Administrators also have the option of creating custom settings at the site scope. Whenever these site-scoped settings are used, they take precedence over the global settings. For example, if you create site-scoped settings for the Redmond site then those settings (rather than the global settings) will be used to manage CDR in Redmond.

You can create CDR configuration settings by using either Lync Server Control Panel or the New-CsCdrConfiguration cmdlet. You can use Lync Server Control Panel or the Set-CsCdrConfiguration cmdlet to modify existing settings. If you are using Lync Server Control Panel to create or modify settings, the following options will be available to you:

UI Setting	PowerShell Parameter	Description
Name	Identity	Unique identifier for the CDR configuration settings being created. These settings can only be created at the site scope.
Enable monitoring of CDRs	EnableCDR	Indicates whether or not CDR is enabled.
Enable purging of CDRs	EnablePurging	Indicates whether or not CDR records will periodically be

		deleted from the CDR database.
Keep CDRs for maximum duration (days)	KeepCallDetailForDays	Indicates the number of days that CDR records will be kept in the CDR database. Any records older than the specified number of days will automatically be deleted. (Note that purging will take only place if purging has been enabled.)
Keep error report data for maximum duration (days)	KeepErrorReportForDays	Indicates the number of days that CDR error reports are kept. Any reports older than the specified number of days will automatically be deleted. CDR error reports are diagnostic reports uploaded by client applications.

Note:

The New-CsCdrConfiguration and Set-CsCdrConfiguration cmdlets include additional options not available in Lync Server Control Panel. See the New-CsCdrConfiguration and the Set-CsCdrConfiguration help topics for more information.

To create CDR configuration settings by using Lync Server Control Panel

1. In Lync Server Control Panel click **Monitoring and Archiving**.
2. On the **Call Detail Recording** tab, click **New**.
3. In the **Select a Site** dialog box, select the site where the new configuration settings are to be created. If the dialog box is empty, that means all of your sites have already been assigned a collection of CDR configuration settings. Each site is limited to a single such collection. In that case you can either delete and then re-create the settings, or simply modify the existing settings.
4. In the **New Call Detail Recording (CDR) Setting** dialog, make the desired selections and then click **Commit**.

To modify existing CDR configuration settings by using Lync Server Control Panel

1. In Lync Server Control Panel click **Monitoring and Archiving**.
2. Double-click the collection of settings to be modified, or select the collection, click **Edit**, and then click **Show Details**. Note that you can only modify a single collection at a time. To make the same changes to multiple collections, use the Lync Server Management Shell instead.
3. In the **Edit Call Detail Recording (CDR) Setting** dialog, make the desired selections and then click **Commit**.

Creating CDR Configuration Settings by Using Windows PowerShell Cmdlets

You can create CDR configuration settings can also be created by using Windows PowerShell and the **New-CsCdrConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/

p/?linkId=255876.

⊟To create a new collection of CDR configuration settings

- This command creates a new collection of CDR configuration settings applied to the Redmond site:

```
New-CsCdrConfiguration -Identity "site:Redmond"
```

⊟To create a collection of CDR configuration settings that disable call detail recording

- Because no parameters (other than the mandatory Identity parameter) were specified in the preceding command, the new collection of configuration settings will use the default values for all its properties. To create settings that use different property values, simply include the appropriate parameter and parameter value. For example, to create a collection of Call Detail configuration settings that, by default, allow disable Call Detail recording use a command like this:

```
New-CsCdrConfiguration -Identity "site:Redmond" -EnableCDR $False
```

⊟To specify multiple property values when creating a new collection of CDR configuration settings

- You can modify multiple property values by including multiple parameters. For example, this command configures the new settings to keep Call Detail records for 30 days and error reports for 90 days:

```
New-CsCdrConfiguration -Identity "site:Redmond" -KeepCallDetailForDays
```

For more information, see the help topic for the New-CsCdrConfiguration cmdlet.

1.7.20.1.5 Delete an Existing Collection of CDR Configuration Settings

Delete an Existing Collection of CDR Configuration Settings

Operations > Monitoring and Health Configuration > Call Detail Recording (CDR) >

Topic Last Modified: *2013-02-23*

Call Detail Recording (CDR) enables you to track usage of such things as peer-to-peer instant messaging sessions, Voice over Internet Protocol (VoIP) phone calls, and conferencing calls. This usage data includes information about who called whom, when they called, and how long they talked.

When you install Microsoft Lync Server 2013, a single, global collection of CDR configuration settings is created for you. Administrators also have the option of creating custom setting collections that can be applied to individual sites. By design, settings configured at the site scope take precedence over settings configured at the global scope. If you delete site-scoped settings, then CDR will be managed in that site by using the global settings.

Note that you can also “delete” the global settings. However, the global settings will not actually be removed. Instead, all the properties in that collection will be reset to their default values. For example, by default purging is enabled in a collection of CDR configuration settings. Suppose you modify the global collection so that purging is disabled. If you later delete the global settings, all the properties will be reset to their default values. In this case, that means that purging will once again be enabled.

You can remove CDR configuration settings by using the Lync Server Control Panel or the Remove-CsCdrConfiguration cmdlet.

To remove CDR configuration settings with Lync Server Control Panel

1. In Lync Server Control Panel, click **Monitoring and Archiving**.
2. On the **Call Detail Recording** tab, select the collection (or collections) of CDR settings to be removed. To select multiple collections, click the first collection, hold down the Ctrl key, and click additional collections.
3. Click **Edit**, and then click **Delete**.
4. In the Lync Server Control Panel dialog box, click **OK**.

Removing CDR Configuration Settings by Using Windows PowerShell Cmdlets

You can delete call detail recording configuration settings by using Windows PowerShell and the **Remove-CsCdrConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specified collection of CDR configuration settings

- This command removes the CDR configuration settings applied to the Redmond site:

```
Remove-CsCdrConfiguration -Identity "site:Redmond"
```

To remove all the CDR configuration settings applied to the site scope

- This command removes all the CDR configuration settings applied to the site scope:

```
Get-CsCdrConfiguration -Filter "site:*" | Remove-CsCdrConfiguration
```

To remove all the CDR configuration settings that disable call detail recording

- This command removes all the CDR configuration settings where Call Detail recording has been disabled:

```
Get-CsCdrConfiguration | Where-Object {$_.EnableCDR -eq $False} | Remov
```

For more information, see the help topic for the Remove-CsCdrConfiguration cmdlet.

1.7.20.1.6 Manually Purging the Call Detail Recording and Quality of Experience Databases

Manually Purging the Call Detail Recording and Quality of Experience Databases

Microsoft Lync Server 2013 > Deployment > Deploying Monitoring >

Topic Last Modified: *2012-11-01*

Administrators can configure the Call Detail Recording (CDR) and/or the Quality of Experience (QoE) databases to automatically purge old records from the database; this occurs if purging has been enabled for the specified database (CDR or QoE) and if there are any records that have been in the database longer than the specified amount of time.

For example, every day at 1:00 AM administrators might configure the system so that QoE records more than 60 days old will be deleted from the QoE database.

In addition to that automatic purging, two new cmdlets -- Invoke-CsCdrDatabasePurge and Invoke-CsQoEDatbasePurge -- have been added to Microsoft Lync Server 2013; these cmdlets allow administrators to manually purge records from the CDR and the QoE databases at any time. For example, to manually purge all the records more than 10 days old from the CDR database you can use a command similar to this:

```
Invoke-CsCdrDatabasePurge -Identity MonitoringDatabase:atl-sql-001.litwareinc.com
```

In the preceding command both call detail records and diagnostic data records older than 10 days are deleted from the monitoring database on atl-sql-001.litwareinc.com. (Call detail records are user/session reports. Diagnostic data records are diagnostic logs uploaded by client applications such as Lync 2013.)

As shown above, when you run the Invoke-CsCdrDatabasePurge cmdlet you must include both the PurgeCallDetaiDataOlderThanDays and the PurgeDiagnosticDataOlderThanDays parameters. However, these parameters do not have to be set to the same value. For example, it's possible to purge call detail records more than 10 days old and yet, at the same time, leave all the diagnostic data records in the database. To do that, set PurgeCallDetailDataOlderThanDays to 10 and PurgeDiagnosticDataOlderThanDays to 0. For example:

```
Invoke-CsCdrDatabasePurge -Identity MonitoringDatabase:atl-sql-001.litwareinc.com
```

By default, any time you run Invoke-CsCdrDatabasePurge you will see a prompt similar to this one for each database table that must be purged:

```
Confirm
Are you sure you want to perform this action?
Performing operation "Stored procedure: RtcCleanupDiag" on Target "Target SQL Ser
[Y] Yes  [A] Yes to All  [N] No  [L] No to All [S] Suspend  [?] Help (default is
```

You must type either Y (for Yes) or A (for Yes to All) before the database purging will actually take place. If you would prefer to suppress these confirmation prompts, add the following parameter to the end of your call to Invoke-CsCdrDatabasePurge:

```
-Confirm:$False
```

For example:

```
Invoke-CsCdrDatabasePurge -Identity MonitoringDatabase:atl-sql-001.litwareinc.com
```

If you do that, confirmation prompts will not be displayed, and database purging will immediately be performed.

To purge the QoE database, use the Invoke-CsQoEDatabasePurge cmdlet and specify the age (in days) of the records to be deleted:

```
Invoke-CsQoEDatabasePurge -Identity MonitoringDatabase:atl-sql-001.litwareinc.com
```

1.7.20.2 Quality of Experience (QoE)

Quality of Experience (QoE)

Microsoft Lync Server 2013 > Operations > Monitoring and Health Configuration >

Topic Last Modified: *2012-11-01*

Quality of Experience (QoE) records numeric data that indicates the media quality and information about participants, device names, drivers, IP addresses, and endpoint types involved in calls and sessions. When you install Lync Server 2013, you will also install a predefined collection of global configuration settings for QoE. Use the topics in this section to configure QoE settings.

- Create Quality of Experience Configuration Settings
- Enable Quality of Experience
- Modify Quality of Experience Settings
- Delete Quality of Experience Configuration Settings
- Manually Purging the Call Detail Recording and Quality of Experience Databases

Configuring Call Detail Recording and Quality of Experience Settings

1.7.20.2.1 Create Quality of Experience Configuration Settings

Create Quality of Experience Configuration Settings

Operations > Monitoring and Health Configuration > Quality of Experience (QoE) >

Topic Last Modified: *2013-02-23*

Quality of Experience (QoE) metrics track the quality of audio and video calls made in your organization, including such things as the number of network packets lost, background noise, and the amount of "jitter" (differences in packet delay). These metrics are stored in a database apart from other data (such as call detail records), which allows you to enable and disable QoE independent of other data recording.

When you install Microsoft Lync Server 2013, a single, global collection of QoE configuration settings is created for you. Administrators also have the option of creating custom settings at the site scope. Whenever these site-scoped settings are used, they take precedence over the global settings. For example, if you create site-scoped settings for the Redmond site then those settings (rather than the global settings) will be used to manage QoE in Redmond.

QoE configuration settings can be created by using either Lync Server Control Panel or the New-CsQoEConfiguration cmdlet. If you are using Lync Server Control Panel to create new settings the following options will be available to you:

UI Setting	PowerShell Parameter	Description
Name	Identity	Unique identifier for the settings to be created. QoE configuration settings can only be created at the site scope.
Enable monitoring of QoE data	EnableQoE	Specifies whether QoE records will be collected and saved to the monitoring database.
Enable purging of QoE data	EnablePurging	Specifies whether records will be purged after the duration defined in the **Keep QoE data for a maximum**

		duration (days) property has elapsed.
Keep QoE data for maximum duration (days)	KeepQoEDataForDays	Number of days QoE data will be stored before being purged from the database. This value is ignored if purging is disabled.

Note:

The New-CsQoEConfiguration cmdlet includes additional options not available in Lync Server Control Panel. For more information, see the New-CsQoEConfiguration help topic.

To create QoE configuration settings by using Lync Server Control Panel

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Quality of Experience Data**.
4. On the **Quality of Experience Data** page, click **New**.
5. In **Select a Site**, click the site to which the policy is to be applied, and click **OK**.
6. In **New Quality of Experience Setting**, do the following:
   - Select **Enable monitoring of QoE data** to turn on monitoring.
   - Select **Enable purging of QoE data** to turn on purging.
   - In **Keep QoE for maximum duration (days)**, select the maximum number of days that QoE records should be retained.
7. Click **Commit**.

Creating QoE Configuration Settings by Using Windows PowerShell Cmdlets

You can create QoE configuration settings by using Windows PowerShell and the New-CsQoEConfiguration cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To create a new collection of QoE configuration settings

- This command creates a new collection of QoE configuration settings applied to the Redmond site:

```
New-CsQoEConfiguration -Identity "site:Redmond"
```

To create a new collection of QoE configuration settings where QoE monitoring is disabled

- Because no parameters (other than the mandatory Identity parameter) were specified in the preceding command, the new collection of configuration settings will use the default values for all its properties. To create settings that use different property values, simply include the appropriate parameter and parameter value. For example, to create a collection of Quality of Experience configuration settings that, by default, allow disable QoE recording use a command like this:

```
New-CsQoEConfiguration -Identity "site:Redmond" -EnableQoE $False
```

To specify multiple property values when creating a new collection of QoE configuration settings

- You can multiple property values by including multiple parameters. For example, this command configures the new settings to keep QoE data for 30 days and to purge old data at 3:00 AM:

```
New-CsQoEConfiguration -Identity "site:Redmond" -KeepQoEDataForDays 30
```

For more information, see the help topic for the New-CsQoEConfiguration cmdlet.

1.7.20.2.2 Enable Quality of Experience

Enable Quality of Experience

See Also

Operations > Monitoring and Health Configuration > Quality of Experience (QoE) >

Topic Last Modified: *2013-02-23*

Quality of Experience (QoE) records numeric data that indicates the media quality and information about participants, device names, drivers, IP addresses, and endpoint types involved in calls and sessions. For details, see Planning for Monitoring in the Planning documentation.

Use the following procedure to enable QoE for your whole organization or each site in your organization.

> **Note:**
>
> To enable QoE, you must first configure monitoring and a monitoring back-end database. For details, see Deploying Monitoring.

To enable QoE by using Lync Server Control Panel

1. From a user account that is a member of the RTCUniversalServerAdmins group (or has equivalent user rights), or assigned to the CsServerAdministrator or CsAdministrator role, log on to any computer that is in the network in which you deployed Lync Server 2013.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Quality of Experience Data**.
4. On the **Quality of Experience Data** page, click the appropriate collection from the table, click **Action**, and then click **Enable QoE**.

Enabling QoE by Using Windows PowerShell Cmdlets

You can enable QoE by using Windows PowerShell and the **Set-CsQoEConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To enable QoE for a single location

- To enable QoE, set the EnableQoE parameter to True ($True).

```
Set-CsQoEConfiguration -Identity "site:Redmond" -EnableQoE $True
```

To disable QoE for a single location

- To disable QoE, set the EnableQoE parameter to False ($False). This does not uninstall monitoring. It pauses the collection and storage of QoE data.

```
Set-CsQoEConfiguration -Identity "site:Redmond" -EnableQoE $False
```

To use a single command to enable QoE in multiple locations

- This command enables QoE for all the QoE configuration settings currently in use in your organization.

```
Get-CsQoEConfiguration | Set-CsQoEConfiguration "site:Redmond" -EnableQ
```

For details, see Set-CsQoEConfiguration.

1.7.20.2.3 Modify Quality of Experience Settings

Modify Quality of Experience Settings

See Also

Operations > Monitoring and Health Configuration > Quality of Experience (QoE) >

Topic Last Modified: *2013-02-23*

By default, Quality of Experience (QoE) data is purged after 60 days. You can use the settings on the **Quality of Experience Data** page to retain the data for a longer or shorter period of time. If you disable QoE, data that was captured before QoE was enabled will also be subject to purging.

Note:

You should configure call detail recording (CDR) and QoE to retain data for the same number of days. Each call in the call detail reports (CDRs), available from the Monitoring Reports homepage, includes CDR and QoE information. If the purging duration for CDR and QoE is different, some calls may only include CDR data, while other may only include QoE data.

The following procedure describes how to configure purge settings for QoE data.

To specify retention of QoE data by using Lync Server Control Panel

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click

Quality of Experience Data.

4. On the **Quality of Experience Data** page, click the appropriate site from the table, click **Edit**, and then click **Show Details**.
5. To turn on purging, select **Enable Purging of QoE**.
6. In **Keep QoE for maximum duration (days)** select the maximum number of days that QoE data should be retained.
7. Click **Commit**.

Specifying QoE Retention by Using Windows PowerShell Cmdlets

You can create QoE retention settings by using Windows PowerShell and the **Set-CsQoEConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To specify QoE retention for a specific location

- This command enables purging of QoE data for the Redmond site, and configures the site to maintain QoE data for 20 days.

```
Set-CsQoeConfiguration -Identity "site:Redmond" -EnablePurging -KeepQoE
```

To specify QoE retention for multiple locations

- This command configures QoE retention for all the QoE configuration settings in use in an organization.

```
Get-CsQoEConfiguration | Set-CsQoEConfiguration-EnablePurging -KeepQoED
```

For more information, see the help topic for the Set-CsQoEConfiguration cmdlet.

1.7.20.2.4 Delete Quality of Experience Configuration Settings

Delete Quality of Experience Configuration Settings

Operations > Monitoring and Health Configuration > Quality of Experience (QoE) >

Topic Last Modified: *2013-02-23*

Quality of Experience (QoE) metrics track the quality of audio and video calls made in your organization, including such things as the number of network packets lost, background noise, and the amount of "jitter" (differences in packet delay). These metrics are stored in a database apart from other data (such as call detail records), which allows you to enable and disable QoE independent of other data recording.

When you install Microsoft Lync Server 2013, a single, global collection of QoE configuration settings is created for you. Administrators also have the option of creating custom setting collections that can be applied to individual sites. By design, settings configured at the site scope take precedence over settings configured at the global scope. If you delete site-scoped settings, then QoE will be managed in that site by using the global settings.

Note that you can also “delete” the global settings. However, the global settings will not actually be removed. Instead, all the properties in that collection will be reset to their default values. For example, by default purging is enabled in a collection of QoE configuration settings. Suppose you modify the global collection so that purging is disabled. If you later delete the global settings, all the properties will be reset to their default values. In this case, that means that purging will once again be enabled.

You can remove QoE configuration settings by using the Lync Server Control Panel or by using the Remove-CsQoEConfiguration cmdlet.

To delete QoE configuration settings by using Lync Server Control Panel

1. Log on to the computer as a member of the RTCUniversalServerAdmins group, or as a member of the CsVoiceAdministrator, CsServerAdministrator, or CsAdministrator role. For details, see Delegate Setup Permissions.
2. Open a browser window, and then enter the Admin URL to open the Lync Server Control Panel. For details about the different methods you can use to start Lync Server Control Panel, see Open Lync Server Administrative Tools.
3. In the left navigation bar, click **Monitoring and Archiving**, and then click **Quality of Experience Data**.
4. On the **Quality of Experience Data** page, click the policy that you want, click **Edit**, and then click **Delete**.
5. Click **OK**.

Removing QoE Configuration Settings by Using Windows PowerShell Cmdlets

You can delete QoE configuration settings by using Windows PowerShell and the **Remove-CsQoEConfiguration** cmdlet. You can run this cmdlet either from the Lync Server 2013 Management Shell or from a remote session of Windows PowerShell. For details about using remote Windows PowerShell to connect to Lync Server, see the Lync Server Windows PowerShell blog article "Quick Start: Managing Microsoft Lync Server 2010 Using Remote PowerShell" at http://go.microsoft.com/fwlink/p/?linkId=255876.

To remove a specified collection of QoE configuration settings

- This command removes the QoE configuration settings applied to the Redmond site:

```
Remove-CsQoEConfiguration -Identity "site:Redmond"
```

To remove all of the QoE configuration settings applied to the site scope

- This command removes all the QoE configuration settings applied to the site scope:

```
Get-CsQoEConfiguration -Filter "site:*" | Remove-CsQoEConfiguration
```

To remove all of the QoE configuration settings where QoE monitoring is disabled

- This command removes all the QoE configuration settings where QoE monitoring has been disabled:

```
Get-CsQoEConfiguration | Where-Object {$_.EnableQoE -eq $False} | Remov
```

For details, see Remove-CsQoEConfiguration.

1.7.20.2.5 Manually Purging the Call Detail Recording and Quality of Experience Databases

Manually Purging the Call Detail Recording and Quality of Experience Databases

Microsoft Lync Server 2013 > Deployment > Deploying Monitoring >

Topic Last Modified: *2012-11-01*

Administrators can configure the Call Detail Recording (CDR) and/or the Quality of Experience (QoE) databases to automatically purge old records from the database; this occurs if purging has been enabled for the specified database (CDR or QoE) and if there are any records that have been in the database longer than the specified amount of time. For example, every day at 1:00 AM administrators might configure the system so that QoE records more than 60 days old will be deleted from the QoE database.

In addition to that automatic purging, two new cmdlets -- Invoke-CsCdrDatabasePurge and Invoke-CsQoEDatbasePurge -- have been added to Microsoft Lync Server 2013; these cmdlets allow administrators to manually purge records from the CDR and the QoE databases at any time. For example, to manually purge all the records more than 10 days old from the CDR database you can use a command similar to this:

```
Invoke-CsCdrDatabasePurge -Identity MonitoringDatabase:atl-sql-001.litwareinc.com
```

In the preceding command both call detail records and diagnostic data records older than 10 days are deleted from the monitoring database on atl-sql-001.litwareinc.com. (Call detail records are user/session reports. Diagnostic data records are diagnostic logs uploaded by client applications such as Lync 2013.)

As shown above, when you run the Invoke-CsCdrDatabasePurge cmdlet you must include both the PurgeCallDetaiDataOlderThanDays and the PurgeDiagnosticDataOlderThanDays parameters. However, these parameters do not have to be set to the same value. For example, it's possible to purge call detail records more than 10 days old and yet, at the same time, leave all the diagnostic data records in the database. To do that, set PurgeCallDetailDataOlderThanDays to 10 and PurgeDiagnosticDataOlderThanDays to 0. For example:

```
Invoke-CsCdrDatabasePurge -Identity MonitoringDatabase:atl-sql-001.litwareinc.com
```

By default, any time you run Invoke-CsCdrDatabasePurge you will see a prompt similar to this one for each database table that must be purged:

```
Confirm
Are you sure you want to perform this action?
Performing operation "Stored procedure: RtcCleanupDiag" on Target "Target SQL Ser
[Y] Yes  [A] Yes to All  [N] No  [L] No to All [S] Suspend  [?] Help (default is
```

You must type either Y (for Yes) or A (for Yes to All) before the database purging will actually take place. If you would prefer to suppress these confirmation prompts, add the following parameter to the end of your call to Invoke-CsCdrDatabasePurge:

```
-Confirm:$False
```

For example:

```
Invoke-CsCdrDatabasePurge -Identity MonitoringDatabase:atl-sql-001.litwareinc.com
```

If you do that, confirmation prompts will not be displayed, and database purging will immediately be performed.

To purge the QoE database, use the Invoke-CsQoEDatabasePurge cmdlet and specify the age (in days) of the records to be deleted:

```
Invoke-CsQoEDatabasePurge -Identity MonitoringDatabase:atl-sql-001.litwareinc.com
```

1.7.20.3 Monitoring Mobility for Performance

Monitoring Mobility for Performance

Microsoft Lync Server 2013 > Operations > Monitoring and Health Configuration >

Topic Last Modified: *2013-02-14*

The Lync Server Mobility Service (Mcx) and the Unified Communications Web API (UCWA) increase the load on Front End Servers and Front End pools. Mobile devices that maintain a connection to the server even when the mobile application is minimized, such as Android and Nokia devices running Lync 2010 Mobile, as well as Android and Apple devices running Lync 2013 Mobile, impose a greater load than devices that terminate their connection to the server when the mobile application is minimized. As your mobility usage increases, you must monitor mobility performance to determine when you need to increase your capacity.

Several limits influence mobility performance:

- Available memory
- Request queue limit
- Concurrent connections
- IIS queue length

Other limits on servers that can influence mobility performance are a maximum of twelve concurrent sign-ins, authentications, session renewals, and terminations. These maximums do not need to be modified for most deployments.

- Monitoring for Server Memory Capacity Limits
- Monitoring Mobility Service and UCWA Usage
- Configuring Mobility Service for High Performance
- Monitoring IIS Request Tracing Log Files
- Mobility Performance Counters

1.7.20.3.1 Monitoring for Server Memory Capacity Limits

Monitoring for Server Memory Capacity Limits

See Also

Operations > Monitoring and Health Configuration > Monitoring Mobility for Performance >

Topic Last Modified: *2013-02-16*

```
Some information in this topic pertains to Cumulative Updates for Lync Server 201
```

> ⚠**Warning:**
> The information in this topic that refers to Capacity Planning pertains only to Lync 2010 Mobile clients and the Mobility Service (Mcx). Capacity Planning for the Unified Communications Web API (UCWA), used by the Lync 2013 Mobile clients, is provided by the Lync Server 2013, Planning Tool.

Two mobility performance counters can help you to determine your current usage and help you plan capacity for the Lync Server 2013 Mobility Service (Mcx), as well as to monitor memory usage for UCWA. For UCWA, the counter category is **LS:WEB – UCWA**.

For the Mobility Service (Mcx), the counters are under the category **LS:WEB - Mobile Communication Service**. The counters to monitor are:

- **Currently Active Session Count with Active Presence Subscriptions**, which is the current number of endpoints registered through UCWA or the Mobility Service (Mcx) that have active presence subscriptions (number of always-connected mobile users)
- **Currently Active Session Count**, which is the current number of endpoints registered through UCWA or the Mobility Service

If the difference between **Currently Active Session Count with Active Presence Subscriptions** and **Currently Active Session Count** is small over time, this means that most mobile device users have an always-connected device, such as an Android or Nokia mobile device (for Mcx only). UCWA always-connected devices include Apple and Android devices running Lync 2013 Mobile clients). If **Currently Active Session Count** is much higher than **Currently Active Session Count with Active Presence Subscriptions**, this indicates that more users are using a background endpoint device, such as an Apple iOS device or Windows Phone under Mcx. (Windows Phone is the only Lync 2013 Mobile client that will register as this).

You should set a limit on the **Currently Active Session Count with Active Presence Subscriptions** and **Currently Active Session Count** performance counters based on your expected usage, capacity planning results, and ongoing monitoring of Mobility Service and other Front End Server counters. The limits you set should enable you to evaluate server capacity and raise alerts when capacity is exceeded.

To determine the appropriate limits, you need to first determine how much memory is available on the Front End Server for the Mobility Service. Monitor the counters to determine when you need to plan for extra capacity, according to the following formula:

Total memory used by the Mcx Mobility Service (MB) = 164 + (400 + 134) / 1024 * **Currently Active Session Count with Active Presence Subscriptions** + 400 / 1024 * (**Currently Active Session Count** – **Currently Active Session Count with Active Presence Subscriptions**)

Important:

The Microsoft Lync Server 2010 Capacity Calculator is a spreadsheet that is prepopulated with all of the formulas that enable a planner to determine what the requirements will be for the servers, including CPU, memory, and hard drive. You can download the spreadsheet and an associated document at: http://go.microsoft.com/fwlink/p/?LinkID=212657

The Front End Server needs enough available memory to support the Mobility Service in failover situations. You can monitor the current available memory on the Front End Server by using the **Memory\Available Mbytes** counter, or by using the equation mentioned earlier, to plan for the amount of memory that you expect the Mobility Service to use.

If the amount of memory available on the Front End Server is lower than 1,500 MB when you plan for the expected number of mobility users, you need to add more hardware to support the Mobility Service. For more details, see Monitoring Mobility for Performance in the Operations documentation.

Other Resources

Monitoring Mobility for Performance

1.7.20.3.2 Monitoring Mobility Service and UCWA Usage

Monitoring Mobility Service and UCWA Usage

See Also

Operations > Monitoring and Health Configuration > Monitoring Mobility for Performance >

Topic Last Modified: *2013-02-14*

On an ongoing basis, you should monitor the CPU and memory that is used by the Lync Server Mobility Service (Mcx) and the Unified Communications Web API (UCWA). To monitor usage, you can use the following:

For Unified Communications Web API (UCWA):

- The **LyncUcwa** worker process in Internet Information Services (IIS) Manager. In the **Worker Processes** pane, look at the **CPU %** and **Private Bytes (KB)** (memory) columns.
- The **CPU** and **Processor** performance counters.

For most deployments, UCWA CPU usage should be below 15 percent on average. Memory usage should fall within the limits described in Monitoring for Server Memory Capacity Limits.

In addition to CPU and memory usage counters, you can use the following performance counters to help determine when a server is overloaded with requests:

- **LS:WEB – Throttling and Authentication\WEB – Total Requests in Processing**, which indicates the number of pending web requests on the server. When this counter reaches 10,000, subsequent requests will fail, with the error message, "503 - Service Unavailable."
- **ASP.NET\Requests Queued** (should always be zero).

Note:

If you meet or exceed these values, you should revisit and re-compute your capacity planning for the correct sizing of CPU, number of cores and memory for the computers hosting the Web services.

For the Mobility Service (Mcx):

- The **CSIntMcxAppPool** and **CSExtMcxAppPool** worker processes in Internet Information Services (IIS) Manager. In the **Worker Processes** pane, look at the **CPU %** and **Private Bytes (KB)** (memory) columns.
- The **CPU** and **Processor** performance counters.

For most deployments, Mobility Service CPU usage should be below 15 percent, on average. Memory usage should fall within the limits described in Monitoring for Server Memory Capacity Limits.

In addition to CPU and memory usage counters, you can use the following ASP.NET performance counters to help determine when a server is overloaded with requests:

- **ASP.NET v2.0.50727\Requests Current**, which indicates the number of pending web requests on the server. When this counter reaches 5,000, subsequent requests will fail with the error message, "503 - Service Unavailable."
- **ASP.NET\Requests Queued** (should always be zero).

Note:

If you meet or exceed these values, you should revisit and recompute your capacity planning for the correct sizing of CPU, number of cores, and memory for the computers hosting the Web services.

Concepts

Monitoring for Server Memory Capacity Limits

1.7.20.3.3 Monitoring IIS Request Tracing Log Files

Monitoring IIS Request Tracing Log Files

Operations > Monitoring and Health Configuration > Monitoring Mobility for Performance >

Topic Last Modified: *2013-02-14*

```
This topic applies to deployments supporting Lync 2010 Lync Mobile clients only,
```

When you enable Internet Information Services (IIS) request tracing for the Lync Server Mobility Service (Mcx), the log files that are generated can consume up to three gigabytes of disk space per day. IIS trace logging is enabled by default. You should monitor the Front End Servers to make sure that they do not run out of disk space.

By default, IIS stores the log files at %SystemDrive%\inetpub\logs\LogFiles.

To turn off IIS request tracing for an entire server, at the command line, type the following:

```
%SystemDrive%\Windows\System32\inetsrv\appcmd set config /section:httpLogging /do
```

For details about the **httpLogging** command, see http://go.microsoft.com/fwlink/p/?linkId=234927.

1.7.20.3.4 Configuring Mobility Service for High Performance

Configuring Mobility Service for High Performance

Operations > Monitoring and Health Configuration > Monitoring Mobility for Performance >

Topic Last Modified: *2013-02-17*

Important:

This topic applies only to the Lync Server 2013 Mobility Service (Mcx), and does not apply to Unified Communications Web API (UCWA), as delivered in the Cumulative Updates for Lync Server 2013: February 2013.

When you install the Mobility Service (Mcx) on Internet Information Services (IIS) 7.5, the Mobility Service installer configures some performance settings on the Front End Server. We recommend that you use IIS 7.5 for mobility. The settings affect the maximum number of concurrent user requests and the maximum number of threads that are allowed for the Mobility Service.

Here are the performance settings:

Settings for Mcx on IIS 7.5

1. **maxConcurrentThreadsPerCPU** is set to zero (0).
2. **maxConcurrentRequestsPerCPU** is set to zero (0).
3. ASP.NET process model is set to AutoConfig (for IIS 7.5 only).
4. HTTP.sys queue limit is set to 1,000 (by default).

Mobility Performance Counters

Operations > Monitoring and Health Configuration > Monitoring Mobility for Performance >

***Topic Last Modified:** 2013-02-22*

The following tables list the names and descriptions of performance counters that you can use to monitor servers running the Unified Communications Web API (UCWA) and the Lync Server 2013 Mcx Mobility Service.

The category name for the counters in the UCWA table is **LS:WEB – UCWA**.

The category name for the counters in the Mcx Mobility Service table is **LS:WEB - Mobile Communication Service**.

Performance Counters for UCWA

Counter	Description
Active Application Count	The current number of applications
Active Application Sharing Modality Count	The current number of Application Sharing modality
Active Audio Modality Count	The current number of Audio modality
Active Data Collaboration Modality Count	The current number of Data Collaboration modality
Active Directory Photo Get Latency (ms)	This counter shows the average time (in milliseconds) to retrieve a photo from active directory
Active Messaging Modality Count	The current number of Messaging modality
Active Panoramic Video Modality Count	The current number of Panoramic Video modality
Active Pending Get Count	The number of currently active pending gets; long-held connections to the server
Active Session Count	The current number of endpoints registered in UCWA per application and total
Active User Instance Count	The current number of user instances
Active User Instances without Application	The current number of user instances without application
Active Video Modality Count	The current number of Video modality
Application Creation Requests Received/ Second	The per second rate of received application creation requests
AS MCU Join Failures	The number of AS MCU Join Failures
AV MCU Join Failures	The number of AV MCU Join Failures
Average Application Startup Time (ms)	The average application startup time in Milliseconds

Average Lifetime for Session (ms)	The average lifetime for a session in milliseconds
Data MCU Join Failures	The number of Data MCU Join Failures
Exchange Contact Search Latency (ms)	This counter shows the average time (in milliseconds) to search contact in Exchange
Exchange HD Photo Get Latency (ms)	This counter shows the average time (in milliseconds) to retrieve a photo from Exchange
HTTP 4xx Responses/Second	The per second rate of responses with HTTP 4xx code
HTTP 5xx Responses/Second	The per second rate of responses with HTTP 5xx code
IM MCU Join Failures	The number of IM MCU Join Failures
Number of Active Directory Photo Get Failures	The total number of failures to retrieve photos from Active Directory
Number of Contact Search failures	The total number of failures to search contacts in Exchange
Number of Deserialization Failures	The total number of deserialization failures
Number of HD Photo Get Failures	The total number of failures to retrieve HD photos from Exchange
Over The Maximum Subscriptions Per Application	The number of Subscription requests over the maximum allowed per application
Over The Maximum Subscriptions Per Batch	The number of Subscription requests over the maximum allowed per batch
Presence Subscription Failures	The number of failures to subscribe presence
Registering Endpoint Failures	The number of failures to register endpoints
Requests Received/Second	The per second rate of received requests
Requests Succeeded/Second	The per second rate of successful requests (HTTP 2xx/3xx response codes)
Succeeded Create Application Requests/ Second	The per second rate of successful application creation requests
Timed Out Pending Get Count	The number of pending gets that timed out
Total Application Creation Requests Received	The total number of application creation requests received since the service was started
Total HTTP 4xx Responses	The total number of HTTP 4xx responses
Total HTTP 5xx Responses	The total number of HTTP 5xx responses
Total Requests Received on the Command Channel	The total number of requests received on the command channel
Total Requests Succeeded	The total number of requests that

	succeeded
Total Sessions Initiated	The total number of sessions that were initiated since the service was started
Total Sessions Terminated Because of Idle Timeout	The total number of sessions that were terminated because of user idle timeout
Total Throttled Applications	The number of throttled applications

Performance Counters for Mcx Mobility Service

Counter	Description
Average Lifetime for a Session in Milliseconds	The average lifetime for a session in milliseconds
Current Push Notification Subscriptions	The current number of push notification subscriptions. This number, in conjunction with Currently Active Session Count, represents the subset of currently active sessions that are registered for Windows Mobile or iPhone devices.
Currently Active Network Timeout Poll Count	The number of network polls that timed out
Currently Active Poll Count	The number of currently active polls (long-held connections to the server)
Currently Active Session Count	Current number of endpoints registered in the Mobility Service
Currently Active Session Count with Active Presence Subscriptions	The number of currently active sessions with active presence subscriptions
Push Notification Requests Failed/Second	The per second rate of failed push notifications
Push Notification Requests Succeeded/Second	The per second rate of successful push notifications
Push Notification Requests Throttled/Second	The per second rate of throttled push notifications
Push Notification Requests/Second	The per second rate of sent push notifications
Requests Failed/Second	The per second rate of failed requests
Requests Received/Second	The per second rate of received requests
Requests Rejected/Second	The per second rate of rejected requests
Requests Succeeded/Second	The per second rate of successful requests
Succeeded Initiate Session Requests/Second	The per second rate of successful Get Location requests. Requests to initiate a session consume the most CPU on the server. Peak supported load is 12/second. Sustainability depends on other loads on the server. Initiate a session typically means a sign-in for a user that has been signed out for an extended period of time.

Total Declined Inbound Voice Calls	The total number of inbound voice calls that were declined
Total Failed Inbound Voice Calls	The total number of inbound voice calls that failed
Total Failed Outbound Voice Calls	The total number of outbound voice calls that failed
Total number of sessions terminated by user	The total number of sessions terminated by users
Total Push Notification Requests	The total number of push notification requests
Total Push Notification Requests Failed	The total number of push notification requests that failed
Total Push Notification Requests Succeeded	The total number of push notification requests that were successful
Total Push Notification Requests Throttled	The total number of push notification requests that were throttled
Total Requests Failed	The total number of requests that failed
Total Requests received on the Command Channel	The total number of requests received on the command channel
Total Requests Rejected	The total number of requests that were rejected
Total Requests Succeeded	The total number of requests made to the Mobility Service that succeeded
Total Session Initiated Count	The total number of sessions that were initiated since the Mobility Service was started
Total Sessions Terminated Because of User Idle Timeout	The total number of sessions that were terminated because of user idle timeout
Total Successful Inbound Voice Calls	The total number of inbound voice calls that were successful
Total Successful Outbound Voice Calls	The total number of outbound voice calls that were successful

1.7.20.3.6 UCWA Events

UCWA Events

Operations > Monitoring and Health Configuration > Monitoring Mobility for Performance >

Topic Last Modified: *2013-02-15*

`The information in this topic pertains to Cumulative Updates for Lync Server 2013`

Lync Server 2013 uses the Unified Communications Web API (UCWA) for a number of purposes, from accessing Microsoft Exchange for contact searches to updating presence for mobile clients.

UCWA will write records of operational behavior as event types Informational, Warning, and Error. The following table describes the events that can be written by the UCWA components.

Event ID	Event Type	Summary	Cause and Resolution
20001	Informational	UCWA initialized	N/A N/A
20002	Error	UCWA encountered an unexpected exception during initialization	An unexpected error has occurred during initialization Examine the exception details in the associated event log entry to determine the possible cause
20003	Error	UCWA encountered an unhandled exception	An unhandled exception happened Restart the server. If the problem persists contact product support
20004	Error	Cannot access Exchange for HD photo	Connection to Exchange is not available Make sure the connection to Exchange is available
20005	Informational	Recovered from failing to access Exchange for HD photo	N/A
20006	Error	Cannot access Exchange for contact search	Connection to Exchange is not available Make sure the connection to Exchange is available
20007	Informational	Recovered from failing to search contact in Exchange	N/A
20008	Warning	Attempt to subscribe more than the allowed presence subscriptions per application	Attempt to subscribe more than the allowed presence subscriptions per application Check the clients for

			unnecessary subscriptions
20009	Warning	Attempt to subscribe more than the allowed presence subscriptions per batch	Attempt to subscribe more than the allowed presence subscriptions per batch Check the clients for unnecessary subscriptions
20010	Error	Cannot retrieve inband data	Cannot retrieve inband data If the problem persists contact product support
20011	Error	Cannot subscribe presence	Cannot subscribe presence If the problem persists contact product support
20012	Error	Failed to register endpoint	Failed to register endpoint If the problem persists contact product support
20013	Error	IM MCU is unavailable	IM MCU is unavailable See whether IM MCU is running
20014	Informational	Recovered from failing to connect to IM MCU	N/A
20015	Error	AV MCU is unavailable	AV MCU is unavailable See whether AV MCU is running
20016	Informational	Recovered from failing to connect to AV MCU	N/A
20017	Error	AS MCU is unavailable	AS MCU is unavailable See whether AS MCU is running
20018	Informational	Recovered from failing to connect to AS MCU	N/A
20019	Error	Data MCU is unavailable	Data MCU is unavailable

			See whether Data MCU is running
20020	Informational	Recovered from failing to connect to Data MCU	N/A
20021	Error	Cannot join IM MCU	Cannot join IM MCU See whether IM MCU is running
20022	Error	Cannot join AV MCU	Cannot join AV MCU See whether AV MCU is running
20023	Error	Cannot join AS MCU	Cannot join AS MCU See whether AS MCU is running
20024	Error	Cannot join Data MCU	Cannot join Data MCU See whether Data MCU is running
20025	Error	Cannot access active directory for photo	Connection to active directory is not available Make sure the connection to active directory is available
20026	Informational	Recovered from failing to access active directory for photo	N/A
20027	Warning	Cannot deserialize	Cannot deserialize If the problem persists contact product support

1.7.20.4 Using Monitoring Reports

Using Monitoring Reports

Microsoft Lync Server 2013 > Operations > Monitoring and Health Configuration >

Topic Last Modified: *2012-10-21*

Lync Server 2013 includes a set of standard reports that are published by Microsoft SQL Server Reporting Service. These reports, which are accessible by using a web browser, provide usage, call diagnostic information, and media quality information, all based on call detail recording (CDR) and Quality of Experience (QoE) records stored in the CDR and QoE databases.

In order to use these reports, you must install Monitoring Reports on a computer that is running an instance of the SQL Server.

In This Section

- Using the Monitoring Dashboard Provides administrators with a quick overview of their system health and system usage.
- System Usage Reports Provides system usage information based on CDR data collected by Lync Server.
- Call Diagnostic Reports (per user) Provides per-user information about failed peer-to-peer and conferencing sessions.
- Call Diagnostic Reports Provides summary information and diagnostic data for failed peer-to-peer and conferencing sessions.
- Media Quality Diagnostic Reports Provides information about call quality as well as diagnostic and troubleshooting information for failed calls.

Locating Records

Monitoring Reports only show a limited number of records on the screen at any one time. The actual number of records displayed on a screen varies depending on the report. To view the records that are not currently shown on the screen you can use the standard forward and backward control (found on each report’s toolbar) that enable you to page through the data. You can also quickly jump to the first page or the last page of the dataset.

In addition to using the forward and backward controls, you can also jump to any page in the dataset simply by typing the page number in the **Current Page** box, and then press ENTER.

In addition to providing the ability to page through the data, each report also includes the limited ability to find records. To find records based on a given value, type that value into the **Find** box, and then click **Find**. The report begins searching through the data and stops on the first instance of the value that you entered in the **Find** box. To find the next record that meets the search criteria, click **Next**.

As noted, the Monitoring Reports provide only the most basic search functions. For example, you cannot specify which field the value should be found in. The search mechanism automatically searches for matching values in every field in every record. You cannot use wildcards in your searches, and all searches look for partial values. That means that if you search for 111 the search returns the value 111 along with the values 11100, 811, 3112, 611A5B, and any other fields that include the value 111 anywhere within that field.

Each report is configured to show a default set of records. For example, by default the User Registration Report shows user registration activities for the past week. In some cases, this might result in a report that returns no records. In this case, it means that no user registrations have taken place in the past week. If you see the message “No results match the report filters,” try changing the filter values (for example, change the time period to the past month rather than the past week) and rerun the query. For details, see the "Filtering Data" section later in this topic.

Filtering Data

There will likely be times when you want to look at only a subset of records. For example, only peer-to-peer sessions as opposed to both peer-to-peer sessions and conference sessions. Likewise, there will be times when you need to reduce the number of records that are returned. By default, a report can only display the first 1,000 records in a data set. To address these issues, most reports include a number of filtering options. For example, if you want to view only records for the time period January 1, 2011 through January 15, 2011, you can enter January 1, 2011 in the **From** box and January 15, 2011 in the **To** box. If you then click **View Report**, the returned data will be limited to activities that took place between January 1, 2011 and January 15, 2011.

The filters available to you vary depending on the report that you are viewing. For details about a specific report, see the help topic for that report.

Exporting Data

The Monitoring Reports provide at least two different ways to export the data included in a report. You can use the **Export** option in the toolbar that appears at the top of each report. To use this option, select the desired export format from the **Select a format** drop-down list. The following formats are available to you:

- XML file with report data
- CSV (comma delimited)
- Acrobat (PDF) file
- MHTML (web archive)
- Excel
- TIFF file
- Word

After selecting a format, click **Export**. When the **File Download** dialog box appears, click **Save**. In the **Save As** dialog box, select a destination folder, enter a file name, and then click **Save**.

If you have Microsoft OneNote installed, you can also copy the report data to OneNote. To do this, right-click the **View Report** button on the toolbar. In the **Select Location in OneNote** dialog box select the section in OneNote where you want to copy the data, and then click **OK**.

1.7.20.4.1 Using the Monitoring Dashboard

Using the Monitoring Dashboard

Operations > Monitoring and Health Configuration > Using Monitoring Reports >

Topic Last Modified: *2012-10-21*

The Monitoring Dashboard provides administrators with a quick overview of their Microsoft Lync Server 2013 system health and system usage. The Dashboard is designed to show an aggregate view of key system metrics and to do so by displaying either:

- Totals for the current day. Note that values shown for the current day represent data that has been recorded from midnight until the current time (based on the local time of the reporting server). That means that you will typically be viewing data for a partial day and not for a 24-hour period. For example, if the local time of the server is 8:00 AM, you see eight hours’ worth of data because there are eight hours between midnight and the current time of 8:00 AM.
- Totals for the week, and trend totals for the past six weeks.
- Totals for the month, and trend totals for the past six months (for system usage only).

By default, the Monitoring Dashboard shows data for the following metrics for the current week (and trend totals for the previous six weeks):

System Usage Metrics

Registration

- Unique user logons

Peer-to-peer

- Total sessions
- IM sessions
- Audio sessions
- Video sessions
- Application sharing
- Total audio session minutes
- Avg. audio session minutes

Conference

- Total conferences
- IM conferences
- A/V conferences
- Application sharing conferences
- Web conferences
- Total organizers
- Total A/V conference minutes
- Avg. A/V conference minutes
- Total PSTN conferences
- Total PSTN participants
- Total PSTN participant minutes

In addition to the System Usage metrics, the following metrics displays total for the current day and the previous six days (if you select **Weekly View**) or for the current week and the past six weeks if you select **Monthly View**.

Per-User Call Diagnostics

Users with call failures

- Total users with call failures
- Conference organizers with call failures

Users with poor quality calls

- Total users with poor quality calls

Call Diagnostics

Peer-to-peer

- Total failures
- Overall failure rate
- IM failure rate
- Audio failure rate
- Application sharing failure rate

Conference

- Total failures
- Overall failure rate
- IM failure rate
- A/V failure rate
- Application sharing failure rate

Top five servers by failed sessions

Media Quality Diagnostics

Peer-to-peer

- Total poor quality calls
- Poor quality call percentage
- PSTN calls with poor quality

Conference

- Total poor quality calls
- Poor quality call percentage
- PSTN calls with poor quality

Top worst servers by poor quality call percentage

Working with the Monitoring Dashboard

As noted, by default totals are shown for the current week and trend values are shown for the past six weeks. If you would prefer to see totals for the current month (as well as trend values for the past six months), click the **Monthly View** link in the upper right corner of the dashboard. If you decide to view monthly totals, the link text will change to **Weekly View**. You can switch back to the weekly view by clicking that link.

Tip:

The Monitoring Dashboard restricts you to looking at totals for the current week (or month) and trend values for the past six weeks (or months). You cannot change these dates and times. For example, you cannot use the Dashboard to view report totals for the time period beginning nine months ago.

The values shown in the **This week**, **This month**, or **Today** columns link you to more detailed information about the item. Keep in mind that the column name and the values displayed in that column will often differ depending on the metric chosen and depending on whether you have selected weekly view or monthly view. For example, if you click the totals shown for the **Unique user logons** metric you will see the **User Registration Report** for the specified time period. You can return to the Monitoring Dashboard at any time by clicking **Dashboard**.

Tip:

You can also access the Monitoring Server Reports home page by clicking the **Reports** link in the upper right corner of the Dashboard.

The **Trend** column displays a simple line graph that shows totals for the past six weeks (or, depending on the metric and the time interval, the past six days or the past six months). These simple line graphs display one unlabeled data point for each time period (for example, one unlabeled data point for each of the past six weeks). However, you can retrieve actual values for these graphs by holding your mouse pointer over the graph. In that case, a tooltip shows you the maximum and minimum values in the graph.

Exporting Data from the Monitoring Dashboard

The Monitoring Dashboard provides a number of ways to export the current dashboard view. On the Dashboard toolbar, you'll see an icon that looks like a floppy disk with a green arrow attached to it. If you click this icon, a dropdown list will appear giving you the following data export formats:

- XML file with report data
- CSV (comma delimited)
- PDF
- MHTML (web archive)
- Excel
- TIFF file
- Word

To export the current dashboard view (and its values), click the desired export option. Lync Server 2013 generates a report in the specified format and then give you the option of opening that report or saving it. Note that, by default, Lync Server titles the report **Monitoring Dashboard** and saves it to your Downloads folder. To give the report a different name or to store it in a different folder, click the arrow next to the **Save** button and then click **Save As**. If you are fine with name **Monitoring Dashboard** and with having the report saved in the Downloads folder you can just click the **Save** button.

It's possible that, when you try to export dashboard data, a **Security Alert** dialog box will appear along with the message "Your current settings do not allow this file to be downloaded." If that occurs, do the following:

- In Internet Explorer, select **Internet Options**.
- In the **Internet Options** dialog box, on the **Security** tab, click **Trusted sites** and then click **Sites**.
- In the **Trusted sites** dialog box, click **Add** to add the Lync Server 2013 that is running Lync Server 2013 Reports to the collections of trusted websites.
- Click **Close** and then click **OK**.

You will then need to refresh the Monitoring Dashboard before the changes take effect. To do that, either press F5 or click the **Refresh** icon in the Dashboard toolbar. (The **Refresh** icon is a circle with a pair of green arrows in it.)

You can also create an Excel spreadsheet that includes live data feeds, which includes links to the latest Monitoring Dashboard data. To create a live data feed file, click the orange **Export to Data Feed** icon in the toolbar.

If you would prefer to print the current Dashboard then click the printer icon in the toolbar.

1.7.20.4.2 System Usage Reports

System Usage Reports

Operations > Monitoring and Health Configuration > Using Monitoring Reports >

Topic Last Modified: *2012-10-21*

The System Usage Reports provide system usage information based on call detail recording (CDR) data collected by the Lync Server.

- User Registration Report
  Provides a summary of user connectivity to the Lync Server 2013 deployment based on registration events such as user logons. The report provides a way to view both internal and external logons, and to compare the number of users who logged on to Lync Server 2013 with the number of users who actually used the service while they were logged on.
- Peer-to-Peer Activity Summary Report
  Provides a summary of peer-to-peer instant messaging (IM), audio, video, file transfer, and application sharing sessions. Peer-to-peer sessions are sessions involving just two users.
- Conference Summary Report

Provides a summary of all conference activities. Conferences are sessions involving three or more people.

- PSTN Conference Summary Report
  Provides a summary of all PSTN conferences. These are conferences where at least one user dials in using the public switched telephone network (PSTN), which is also referred to as *dial-in conferencing*.
- Response Group Usage Report
  Provides a summary of Response Group usage. The Response Group application provides a way for you to automatically route phone calls to entities such as a help desk or customer support line.
- IP Phone Inventory Report
  Provides information about the IP phones currently in use in the organization. The report is based on phone registrations and logons. It should not be considered a complete inventory. For example, you might have removed phones that are still listed in the report because they logged on at least once. Likewise, you might also have new phones that do not show up in the report simply because users have not logged on to Lync Server with their new phones yet.
- Call Admission Control Report
  Provides a list of peer-to-peer and conference activities that use call admission control. Call admission control (CAC) is a way of determining whether you should allow real-time communications sessions, such as voice or video calls, based on bandwidth constraints.

1.7.20.4.2.1 User Registration Report

User Registration Report

Monitoring and Health Configuration > Using Monitoring Reports > System Usage Reports >

***Topic Last Modified:** 2012-10-21*

The User Registration Report provides an overview of user logon activity, most notably information about the number of users who logged on to Microsoft Lync Server 2013 during a specified time period (hourly, daily, weekly, monthly). Keep in mind that the report only tells you how many people logged on. It does not tell you *which* people logged on. Monitoring Reports do not provide information about which specific users are using Lync Server 2013 (and which ones are not). However, you can get a rough estimate of user information by using the User Activity Report.

When providing information about user logons, the User Registration Report draws two important distinctions. First, it breaks logons down into two primary categories: internal logons and external logons. Internal logons represent users who logged on from inside your organization's firewall (that is, while connected to the corporate network). External logons represent users who logged on from outside the firewall through an Edge Server (for example, a user who logged on from an Internet café counts as an external logon). If you need to know how many of your users are logging on from outside the firewall, the User Registration Report can provide you with this information.

In addition, the User Registration Report notes how many *active* users were present during a given time period. An active user is a user who took part in an instant messaging (IM) session, participated in a Lync Meeting, made or received a phone call, or otherwise used Lync Server during that period of time. This is different from a user who logged on, but never actually used the system.

Accessing the User Registration Report

You access the User Registration Report only from the Monitoring Reports home page. The User Registration Report does not link to any other reports.

Making the Best Use of the User Registration Report

After you've deployed Lync Server one commonly-asked question is this: How do I know if my users are actually using this new technology? Although it has a few limitations in this regard, the User Registration Report can help you answer this question. To determine whether or not users are using Lync Server, you need to do two things. First, get the value of the Unique logon users metric from the User Registration Report. This value tells you how many distinct individuals logged on to Lync Server.

By comparison, the Total logons metric shows how many total times anyone logged on to Lync Server. For example, suppose Ken Myer logged on to Lync Server five different times in a single day. In that case, Ken Myer would count as five separate logon sessions for the Total logons metric, but just one logon user for the Unique logon users metric. Likewise, it's not uncommon for a user to log on from multiple devices or multiple locations. For example, a user can log on using her desktop computer, her laptop computer, and she can have an IP phone that automatically logs on to Lync Server. In this example, there is one unique user with three logons.

To further explain the difference between total logons and unique logons, consider the logons for a given time period in the following table.

User	Logon time
Ken Myer	7/7/2012 8:45 AM
Ken Myer	7/7/2012 8:46 AM
Pilar Ackerman	7/7/2012 9:17 AM
Ken Myer	7/7/2012 9:22 AM
Pilar Ackerman	7/7/2012 9:31 AM

Notice that there is a total of five logons; however, there are only two unique logon users: Ken Myer (who logged on three times) and Pilar Ackerman (who logged on twice). That's the difference between logons and unique logon users.

In addition to knowing the number of unique logons, you need to know the total number of users who have been enabled for Lync Server. That value can be retrieved by opening the Lync Server 2013 Management Shell and running the following Windows PowerShell command:

```
(Get-CsUser).Count
```

If the preceding command returns a value of 1,236 and Unique logon users metric returns an average value of 667, that suggests that a little over half of your users enable for Lync are actually logging on to the system each day (that is, 667 divided by 1,236, which is approximately 54%).

⚠Warning:

Keep in mind that the logon metrics record users who actually logged on during the specified time period. They don't keep track of users who were already logged on to the system. For example, if your Unique logon users metric shows 667 logons and you have 1,236 users, that suggests that about half your users are logging on to the system. However, suppose 300 users were already logged on to the system at the time you began checking the logon data. That would mean that you actually had nearly 1,000 users logged on to Lync Server, which would mean that closer to 80% of your users were logged on.

You should also compare the Unique logon users value with the value of the Unique active users metric. The Unique active users metric tells you how many unique users actually used Lync Server: they made a phone call, they joined a Lync Meeting, or they participated in an IM session. This is useful information, because Microsoft Lync 2013 can be configured to automatically start each time a user starts Windows. Because of that, you might have a large number of users who automatically log on to Lync when they log on to Windows each day, but then never actually use Lync Server during that time period.

The Unique active users metric also provides more meaningful data in an organization where users typically do not log off Windows at the end of the day. Instead, they simply lock their computers and leave Windows and Lync running. In a situation like that, you might end up with very few logons per day because your users logged on several days ago and never logged off. However, Unique active users tells you whether users are actively using Lync or another Lync Server client.

Filters

Filters provide a way for you to return a more finely targeted set of data or to view the returned data in different ways. For example, the User Registration Report enables you to view data for all your Registrar pool and Edge Servers or to view data for an individual pool. You can also choose how data should be grouped. In this case, registrations grouped by hour, day, week, or month.

The following table lists the filters that you can use with the User Registration Report.

User Registration Report Filters

Name	Description
From	Start date and time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date and time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date:

	7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) are displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or choose **[All]** to view data for all the pools. This drop-down list is automatically populated for you based on the records in the database.

Metrics

The following table lists the information provided in the User Registration Report.

User Registration Report Metrics

Name	Can you sort on this item?	Description
Hourly **Daily** **Weekly** **Monthly**	No	Indicates the time interval that you selected on the filter toolbar. Where applicable, you can click a given time interval to view detailed information for that interval. For example, if you are using the Daily interval and you click 7/7/2012, you see an hourly breakdown of user registration activity for that date.

Total logons	No	Total number of successful logon sessions.
Internal logons	No	Total number of logons within the internal network.
External logons	No	Total number of logons from outside the internal network, using the Edge Server.
Unique logon users	No	Total number of users who had at least one logon session. A user who had multiple logon sessions counts as one user, the same as a person who had just a single logon session.
Unique active users	No	Total number of users who were involved in a peer-to-peer or conferencing session. A user who had multiple sessions counts as one user, the same as a person who had just a single session.

1.7.20.4.2.2 Peer-to-Peer Activity Summary Report

Peer-to-Peer Activity Summary Report

Monitoring and Health Configuration > Using Monitoring Reports > System Usage Reports >

***Topic Last Modified:** 2012-10-21*

The Peer-to-Peer Activity Summary Report provides an overall view of your peer-to-peer communication sessions. A peer-to-peer session typically involves just two users, and does not require the use of the Lync Server conferencing services. By comparison, a conference typically involves more than two users and requires the use of Microsoft Lync Server 2013 conferencing services. Conference activity is reported on the Conference Summary Report.

The Peer-to-Peer Activity Summary Report helps you answer questions like the following:

- How many peer-to-peer instant messages do my users send on a typical day?
- Are any of my users actually taking advantage of the Lync Server application sharing and file transfer capabilities?
- Users have been complaining that the network seems slow at certain times of the day. How many minutes are devoted to peer-to-peer audio and video sessions during those time periods?

Accessing the Peer-to-Peer Activity Summary Report

You access the Peer-to-Peer Activity Summary Report from the Monitoring Reports home page. You open the Peer-to-Peer IM Report by clicking either of the following metrics:

- Total peer-to-peer IM sessions
- Total peer-to-peer IM messages

Likewise, you can open the Peer-to-Peer Voice and Video Report by clicking any of these metrics:

- Total peer-to-peer audio sessions
- Total peer-to-peer audio session minutes
- Total peer-to-peer audio sessions
- Total peer-to-peer audio session minutes

Making the Best Use of the Peer-to-Peer Activity Summary Report

At the bottom of the Peer-to-Peer Activity Summary Report you'll find totals for metrics such as Total peer-to-peer IM sessions and Total peer-to-peer IM messages. This provides a quick summary of the detailed information found in the body of the report.

Filters

Filters provide a way for you to return a more finely targeted set of data or to view the returned data in different ways. For example, the Peer-to-Peer Activity Summary Report enables you to choose how data should be grouped. In this case, activity grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Peer-to-Peer Activity Summary Report.

Peer-to-Peer Activity Summary Report Filters

Name	Description
From	Start date and time for the time range. To view data by hours, enter both the start date and time as follows: 7/17/12012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/17/12012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/13/2012 Weeks always run from Sunday through Saturday.
To	End date and time for the time range. To view data by hours, enter both the end date and time as follows: 7/17/12012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date:

	7/17/12012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/13/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/17/12012 and an end date of 2/28/2012, data is displayed for the days 8/7/12012 12:00 AM to 9/7/12012 12:00 AM (that is, a total of 31 days' worth of data).

Metrics

The following table lists the information provided in the Peer-to-Peer Activity Summary Report.

Peer-to-Peer Activity Summary Report Metrics

Name	Can you sort on this item?	Description
Hourly **Daily** **Weekly** **Monthly**	No	Indicates the time interval that you selected on the filter toolbar. Where applicable, you can click a given time interval to view detailed information for that interval. For example, if you are using the Daily interval and you click 7/17/12012, you see an hourly breakdown of user registration activity for that date.
Total peer-to-peer sessions	No	Total number of peer-to-peer sessions conducted, regardless of session type.
Total peer-to-peer IM	No	Total number of peer-to-peer

sessions		instant messaging (IM) sessions. When you click this item, the report shows you the Peer-to-Peer IM Report for the selected time period.
Total peer-to-peer IM messages	No	Total number of instant messages sent in peer-to-peer sessions. When you click this item, the report shows you the Peer-to-Peer IM Report for the selected time period.
Total peer-to-peer audio sessions	No	Total number of peer-to-peer audio calls. When you click this field, the report shows you the Peer-to-Peer Voice and Video Report for the selected time period.
Total peer-to-peer audio session minutes	No	Total amount of time spent in peer-to-peer audio sessions. When you click this item, the report shows you the Peer-to-Peer Voice and Video Report for the selected time period.
Average peer-to-peer audio session minutes	No	Average amount of time spent in peer-to-peer audio sessions. Calculated by dividing the total audio session time by the total number of audio sessions.
Total peer-to-peer video sessions	No	Total number of peer-to-peer video calls. Note that video sessions are also counted as audio sessions: each video session is counted as one video session and one audio session. When you click this item, the report shows you the Peer-to-Peer Voice and Video Report for the selected time period.
Total peer-to-peer video session minutes	No	Total amount of time spent in peer-to-peer video sessions. When you click this item, the report shows you the Peer-to-Peer Voice and Video Report for the selected time period.
Average peer-to-peer video session minutes	No	Average amount of time spent in peer-to-peer video sessions. Calculated by dividing the total video

		session time by the total number of video sessions.
Total peer-to-peer file transfer sessions	No	Total number of peer-to-peer sessions that included file transfers.
Total peer-to-peer application sharing sessions	No	Total number of peer-to-peer sessions that included application sharing.

Peer-to-Peer IM Report

Using Monitoring Reports > System Usage Reports > Peer-to-Peer Activity Summary Report >

Topic Last Modified: *2012-11-01*

The Peer-to-Peer IM Report provides trend information about peer-to-peer instant messaging (IM) sessions, broken down by pool and by authentication type. The report can show either the total number of sessions held during the specified time period (for example, day-by-day or hour-by-hour), or it can show the total number of instant messages sent during that time period.

Accessing the Peer-to-Peer IM Report

You can access the Peer-to-Peer IM Report only by opening the Peer-to-Peer Activity Summary Report and then clicking either of the following metrics:

- Total peer-to-peer IM sessions
- Total peer-to-peer IM messages

Making the Best Use of the Peer-to-Peer IM Report

By default, the Peer-to-Peer IM Report shows you the message count per-hour (or day, depending on your settings). However, you can also choose to view the day by sessions per hour. To do that, click **Hide/Show Parameters** in the upper-right corner of the Reports window, and then click **Session Count** from the **Report by** list.

Filters

Filters provide a way for you to return a more finely targeted set of data or to view the returned data in different ways. The following table lists the filters that you can use with the Peer-to-Peer IM Report.

Peer-to-Peer IM Report Filters

Name	Description
From	Start date and time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified

	day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date and time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval then only the maximum number of values (starting from the start date) are displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Report by	Indicates the values to be used in the report. Select one of the following: • Session count • Message count

Metrics for Peer-to-Peer IM Session by Pool

The following table lists the information provided in the Peer-to-Peer IM Report.

Metrics for Peer-to-Peer IM Session by Pool

Name	Can you sort on this item?	Description
Pool	No	Name of the Registrar pool or Edge Server.
Date/Time	No	Date and time that the sessions took place.
Total	No	Total number of sessions or total message count.

Metrics for Peer-to-Peer IM Session by Authentication Type

The following table lists the information provided in the Peer-to-Peer IM Report for each type of authentication used by the participants in a peer-to-peer session.

Metrics for Peer-to-Peer IM Session by Authentication Type

Name	Can you sort on this item?	Description
Authentication type	No	Type of authentication used by the session participants. Values are typically one of the following: • Enterprise • Federated • PIC
Date/Time	No	Date and time that the sessions took place.
Total	No	Total number of sessions or total message count.

Peer-to-Peer Voice and Video Report

Using Monitoring Reports > System Usage Reports > Peer-to-Peer Activity Summary Report >

Topic Last Modified: *2012-10-21*

The Peer-to-Peer Voice and Video Report provides a detailed look at the distribution of voice and video calls over a specified period of time (for example, calls per hour or calls per day). The report also gives you the option of viewing all the voice and video calls that were made, or of viewing only the successful or failed calls. The reports shows call information broken down into the following groupings:

- Calls per pool
- Calls per call type (for example, a Lync to Lync call vs. a Lync call to a person on the PSTN network)

- Calls per access type (users logged on to the internal network vs. users logged on to the external network)
- Calls per Mediation Server

To access the peer-to-peer voice and video report

You can access the Peer-to-Peer Voice and Video Report only by opening the Peer-to-Peer Activity Summary Report and then clicking any of the following metrics:

- Total peer-to-peer audio sessions
- Total peer-to-peer audio minutes
- Total peer-to-peer video sessions
- Total peer-to-peer video minutes

To make the best use of the peer-to-peer voice and video report

There are a number of ways you can filter the Peer-to-Peer Voice and Video Report. However, those filtering options are hidden from view by default. To view the filtering options available to you, click **Show/Hide Parameters** button in the upper-right corner of the Report window.

Filters

Filters provide a way for you to return a more finely targeted set of data or to view the data in different ways. The following table lists the filters that you can use with the Peer-to-Peer Voice and Video Report.

Peer-to-peer voice and video report filters

Name	Description
From	Start date and time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows:

	7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Media type	Indicates the type of media used in the session. Select one of the following: • Both • Audio • Video
Call disposition	Indicates the success or failure of the session. Select one of the following: • [All] • Success Calls • Failed Calls
Report by	Indicates the values to be used in the report. Select one of the following: • Session count • Call minutes

Metrics for peer-to-peer voice and video activity by Pool

The following table lists the information provided in the Peer-to-Peer Voice and Video

Report for each pool.

Metrics for peer-to-peer voice and video activity by pool

Name	Can you sort on this item?	Description
Pool	No	Name of the Registrar pool or Edge Server used for the call.
Date/Time	No	Date and time period in which the call took place.
Total	No	Total number of sessions or total message count.

Metrics for peer-to-peer voice and video activity by call type

The following table lists the information provided in the Peer-to-Peer Voice and Video Report for each type of call that was made.

Metrics for peer-to-peer voice and video activity by call type

Name	Can you sort on this item?	Description
Call type	No	Indicates the type of call that was made. Values are one of the following: • UC-to-UC • UC-to-PSTN • PSTN-to-UC • PSTN-to-PSTN
Date/Time	No	Date and time period in which the call took place.
Total	No	Total number of sessions or total message count.

Metrics for peer-to-peer voice and video activity by access type

The following table lists the information provided in the Peer-to-Peer Voice and Video Report for each network access type.

Metrics for peer-to-peer voice and video activity by access type

Name	Can you sort on this item?	Description
Activity type	No	Indicates whether the clients were logged on to the internal network or the external network when the call was placed. Values are typically one of the following: • Internal • External • Mixed
Date/Time	No	Date and time period in which the call

		took place.
Total	No	Total number of sessions or total message count.

Metrics for peer-to-peer voice and video activity by mediation server

The following table lists the information provided in the Peer-to-Peer Voice and Video Report for each Mediation Server.

Metrics for peer-to-peer voice and video activity by mediation server

Name	Can you sort on this item?	Description
Mediation Server	No	Name of the Mediation Server.
Date/Time	No	Date and time period in which the call took place.
Total	No	Total number of sessions or total message count.

1.7.20.4.2.3 Conference Summary Report

Conference Summary Report

Monitoring and Health Configuration > Using Monitoring Reports > System Usage Reports >

Topic Last Modified: *2012-06-06*

The Conference Summary Report provides an overall view of your online conferencing sessions. A conference typically involves more than 2 users and requires the use of Microsoft Lync Server 2013 conferencing services. By comparison, a peer-to-peer session typically involves just 2 users and does not require the use of Lync Server's conferencing services. Peer-to-peer activities are reported on the Peer-to-Peer Activity Summary Report.

The Conference Summary Report not only tells you how many conferences were held during a given time period (hourly, daily, weekly, monthly) but also tells you the total number of people who took part in those conferences, and the total number of unique conference organizers.

A "unique” organizer is anyone who schedules at least one conference. For example, if Pilar Ackerman schedules one conference she counts as one unique organizer. If Ken Myer schedules 148 conferences he, too counts as one unique organizer. For example, the table below shows 8 conferences scheduled, but just three unique organizers (Ken Myer, Pilar Ackerman, and David Ahs).

Conference Organizer	Conference Date
Ken Myer	7/7/2012 10:00 AM
David Ahs	7/7/2012 10:00 AM
Ken Myer	7/7/2012 11:00 AM
Pilar Ackerman	7/7/2012 11:00 AM

Ken Myer	7/7/2012 1:00 PM
Pilar Ackerman	7/7/2012 2:00 PM
Ken Myer	7/2/2012 10:00 AM
Pilar Ackerman	7/2/2012 10:00 AM

The Conference Summary Report also indicates how many conferences included audio and/or video.

Accessing the Conference Summary Report

The Conference Summary Report is accessed from the Monitoring Reports home page. You can drill down to the Conference Activity report by clicking either of the following metrics:

- Total conferences
- Total participants

Making the Best Use of the Conference Summary Report

Total values for most of the metrics used on the Conference Summary Report can be found at the bottom of the report; scroll down to see values such as the total number of conferences held during the specified time period, and the total number of people who participated in those conferences. One metric that is not totaled at the bottom of the report is Total unique conference organizers. Why not? Here’s one reason. Suppose you are looking at a month's worth of data. On day 1 you had 34 unique conference organizers; on day 2 you had 27 unique conference organizers. Does that mean you had 61 unique conference organizers for those two days? Not necessarily. After all, all 27 people who organized conferences on day 2 might be among the 34 people who organized conferences on day 1. For example, in this simple report, note that Ken Myer and Pilar Ackerman scheduled conferences both on 7/7/2012 and on 7/2/2012:

Conference Organizer	Conference Date
Ken Myer	7/7/2012 10:00 AM
David Ahs	7/7/2012 10:00 AM
Ken Myer	7/7/2012 11:00 AM
Pilar Ackerman	7/7/2012 11:00 AM
Ken Myer	7/7/2012 1:00 PM
Pilar Ackerman	7/7/2012 2:00 PM
Ken Myer	7/2/2012 10:00 AM
Pilar Ackerman	7/2/2012 10:00 AM

To get a better idea of the total number of unique users who organized conferences, change your time interval; for example, look at the data by month instead of by day.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Conference Summary Report enables you to choose how data should be grouped. In this case, conferences grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Conference Summary Report.

Conference Summary Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed)

	If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) are displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).

Metrics

The following table the information provided by the Conferences Summary Report.

Conference Summary Report Metrics

Name	Can you sort on this item?	Description
Hourly **Daily** **Weekly** **Monthly**	No	Indicates the time interval that you selected on the filter toolbar. Where applicable, you can click a given time interval to view detailed information for that interval. For example, if you are using the Daily interval and you click 7/7/2012, you see an hourly breakdown of user registration activity for that date.
Total conferences	No	Total number of conferences (regardless of conference type) that were held. When you click this item, the report shows you the Conference Activity Report for the selected time period.
Total participants	No	Total number of people who took part in the conferences. When you click this item, the report shows you the Conference Activity Report for the selected time period.
Average participants per conference	No	Average number of people who took part in a given conference. Determined by dividing the total conferences by the total participants.
Total A/V conferences	No	Total number of conferences that included audio or video.
Total A/V conference minutes	No	Total number of minutes devoted to audio/video conferencing.

Total A/V conference participant minutes	No	Total number of participant minutes devoted to audio/ video conferencing. For example, suppose one user spends 5 minutes in an audio/video conference and a second user spends 3 minutes in that same conference. That makes a total of 8 participant minutes: 5 minutes plus 3 minutes.
Average A/V conference minutes	No	Average number of minutes per audio/video conference.
Total number of unique organizers of conferences	No	Total number of users who organized at least one conference. Users who organized more than one conference are counted as one unique organizer, just like users who only organized a single conference.
Total conference messages	No	Total number of instant messages sent during the conferences.

Conference Activity Report

Using Monitoring Reports > System Usage Reports > Conference Summary Report >

Topic Last Modified: *2012-10-22*

The Conference Activity Report makes it easy for you to answer questions like these: how many conferences are being held each day, and when are those conferences being held? Information like this is useful not only in its own right, but also as a troubleshooting tool. For example, suppose users are complaining that the network seems particularly slow in the middle of the day. A quick glance at the Conference Activity reports might suggest one possible reason: far more conferences are being scheduled between the hours of 10:00 AM and 2:00 PM then at any other time.

If the slow network is causing problems, you can encourage users to reschedule some of their conferences during the less-heavily trafficked times of the day.

Accessing the Conference Activity Report

The Conference Activity Report is accessed from the Conference Summary Report by clicking either one of the following metrics:

- Total conferences
- Total participants

Making the Best Use of the Conference Activity Report

By default the Conference Activity Report shows you the total number of conferences for the specified time period (for example, the total number of conferences per day, or the total number of conferences per hour of the day). However, you can also choose to display the total number of participants for that time period or the total number of participant minutes. To do that, click the Show/Hide Parameters button to display the filtering options, and then select one of the following from the Report by dropdown list:

- Participant count
- Participant minutes
- Conference count

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. The following table lists the filters that you can use with the Conference Activity Report.

Conference Activity Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.

Interval	Time interval. Select any of the following: - Hourly (a maximum of 25 hours can be displayed) - Daily (a maximum of 31 days can be displayed) - Weekly (a maximum of 12 weeks can be displayed) - Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Report by	Indicates the values to be used in the report. You can select one of the following: - Participant Count - Participant Minutes - Conference Count

Metrics for Conferences by Pool

The following table lists the information in the Conference Activity Report for each pool.

Metrics for Conferences by Pool

Name	Can you sort on this item?	Description
Pool	No	Name of the Registrar pool or Edge Server used in the conference.
Date/Time	No	Date and time when the conference was held.
Total	No	Total participant count, total participant minutes, or total conference count.

Metrics for Conferences by Server Type

The following table lists the information in the Conference Activity Report for each type of server.

Metrics for Conferences by Server Type

Name	Can you sort on this item?	Description
Conferencing server type	No	Type of server used in the conference, typically one of the following: - Web Conferencing Server - IM Conferencing Server - Telephony Conferencing

		Server - AV Conferencing Server - Application Sharing
Date/Time	No	Date and time when the conference was held.
Total	No	Total participant count, total participant minutes, or total conference count.

Conference Detail Report

Using Monitoring Reports > System Usage Reports > Conference Summary Report >

Topic Last Modified: *2012-10-22*

The Conference Detail Report provides detailed information about all the users who participated in a conference. For example, you can see such information as the date and time that a user joined the conference, the date and time that the user left the conference, and the user agent of the endpoint that was used to connect that user to the conference. You can also see information the user's role in each conference (for example, Presenter or Attendee). Perhaps most important, you get quickly see which users successfully join and complete the conference, and which users were not able to successfully join and complete the conference.

Accessing the Conference Detail Report

The Conference Detail Report can be accessed from the following reports:

- The Call Admission Control Report (by clicking the Detail metric for a conference)
- The Failure List Report (by clicking the Conference metric)
- The User Activity Report (by clicking the Conference URI metric)

From the Conference Detail Report you can access the Diagnostic Report by clicking the Diagnostic Report (Detail) metric.

Filters

None. You cannot filter on the Conference Detail Report.

Metrics

The following table lists the information provided in the Conference Information section of the Conference Detail Report.

Conference Information Metrics

Name	Can you sort on this item?	Description
Conference URI		URI assigned to the conference. For example: sip:kmyer@litwareinc.com;gruu;opaque=app:conf:focus:id:drg2y8v4

Pool FQDN		Fully-qualified domain name of the Registrar pool or Edge Server involved in a session.
Start time		Date and time that the conference started.
Organizer		SIP address of the user who organized the conference.
End time		Date and time that the conference ended.

The following table lists the information provided in the Conference Participation Section of the Conference Detail Report.

Conference Participation Metrics

Name	**Can you sort on this item?**	**Description**
User		SIP address of the user who participated in the conference.
Role		Role (for example, Presenter) played by the conference participant.
Connectivity		Network connectivity (typically From Internal or From External) for the participant.
Join time		Date and time that the participant joined the conference.
Leave time		Date and time that the participant left the conference.
User agent		Identifier for the software used by the participant’s endpoint.
Diagnostic reports		Provides diagnostic and troubleshooting information. Including SIP response codes, diagnostic headers, conference join times, and diagnostic IDs for failed sessions.

The following table lists the information provided in the Conference Modalities section of the Conference Detail Report.

Conference Modalities Metrics

Name	**Can you sort on this item?**	**Description**
User		SIP address of the user who

		participated in the conference.
Join time		Date and time that the participant joined the conference.
Leave time		Date and time that a participant left the conference.
Conferencing server URI		URI for the Conferencing server used in the conference.
Diagnostic reports		Provides diagnostic and troubleshooting information. Including SIP response codes, diagnostic headers, conference join times, and diagnostic IDs for failed sessions.

Conference Join Time Report

Using Monitoring Reports > System Usage Reports > Conference Summary Report >

Topic Last Modified: *2012-10-01*

The Conference Join Time Summary enables you to determine how long it takes your users to join a conference. The report shows the average join time (in milliseconds), and also provides a breakdown that lets you know how many users were able to join a conference in 2 seconds or less, how many users required between 2 and 5 seconds to join the conference, and so on.

Accessing the Conference Join Time Report

The Conference Join Time Report is accessed from the Monitoring Reports home page.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. The following table lists the filters that you can use with the Conference Join Time Report.

Conference Join Time Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report

	automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or click **[All]** to view data

	for all the pools. This drop-down list is automatically populated for you based on the records in the database.
Conference sessions	Type of session. Allowed values are: - [All] - Focus sessions - Application sharing - A/V conferencing If you select [All], the total conference join time will be displayed at the top of the report. Note that these totals are only for conferences which were scheduled by using Microsoft Exchange or Microsoft Outlook.

Metrics

The following table lists the information provided in the Conference Join Time Report.

Conference Join Time Report Metrics

Name	Can you sort on this item?	Description
Date The actual title for this metric will vary depending on the Interval that was selected.	No	Date and time that the conference took place.
Total sessions	No	Total number of sessions, including successful sessions, failed sessions (both expected failures and unexpected failures), and uncategorized sessions.
Average (ms)	No	Average amount of time (in milliseconds) that it took participants to join the conference.
Sessions < 2 seconds, Volume	No	Number of participants who were able to join the conference in less than 2 seconds.
Sessions < 2 seconds, Percentage	No	
Sessions 2-5 seconds, Volume	No	Number of participants who took between 2 seconds and 5 seconds to join the conference.
Sessions 2-5 seconds, Percentage	No	Percentage of the total call participants who took between 2 seconds and 5 seconds to join the conference.

Sessions 5-10 seconds, Volume	No	Number of participants who took between 5 seconds and 10 seconds to join the conference.
Sessions 5-10 seconds, Percentage	No	Percentage of the total call participants who took between 5 seconds and 10 seconds to join the conference.
Sessions > 10 seconds, Volume	No	Number of participants who required more than 10 seconds to join the conference.
Sessions > 10 seconds, Percentage	No	Percentage of the total call participants who required more than 10 seconds to join the conference.

1.7.20.4.2.4 PSTN Conference Summary Report

PSTN Conference Summary Report

Monitoring and Health Configuration > Using Monitoring Reports > System Usage Reports >

Topic Last Modified: *2012-10-22*

In Microsoft Lync Server 2013, a PSTN conference is any conference in which at least one participant dials in to the audio portion by a using a PSTN (public switched telephone network) phone. (A PSTN phone is a "landline," a cell phone, or any other phone which does not make use of Voice over IP.) Although referred to as PSTN conferences in the Monitoring Reports, these conferences are perhaps more-commonly known as dial-in conferences.

The PSTN Conference Summary Report provides information about all the PSTN conferences held in your organization (that is, all the conferences that had at least one dial-in user). The report includes information about the total number of PSTN conferences, the total number of people who participated in those conferences, and, perhaps, most important, the total number of dial-in users (the Total PSTN participants metric).

Accessing the PSTN Conference Summary Report

The PSTN Conference Summary Report can only be accessed from the Monitoring Reports home page. This report is not linked to any other reports. Note that you cannot retrieve detailed call information for a PSTN conference, in part because individual endpoints are responsible for submitting this information. PSTN phones are not capable of tracking or submitting call detail information.

Making the Best Use of the PSTN Conference Summary Report

To determine the percentage of all your conferences that include dial-in users, compare the value of the Total PSTN conferences metric with the Total conferences metric found on the Conference Summary Report.

If you don't see as many PSTN conferences as you might have expected to see, keep in mind that the ability to organize a conference that allows dial-in users depends on the conferencing policy that has been assigned to a user: if very few of your users are allowed to hold PSTN conferences you would obviously see very few PSTN conferences. You can quickly verify which of your conferencing policies (if any) allow users to schedule PSTN conferences by running the following command from within the Lync Server Management Shell:

```
Get-CsConferencingPolicy | Select-Object Identity, EnableDialInConferencing
```

That will return data similar to this:

```
Identity                                EnableDialInConferencing
--------                                ------------------------
Global                                                      True
site:Redmond                                               False
site:Dublin                                                False
Tag:RedmondDialInUsers                                      True
Tag:DublinDialInUsers                                       True
```

That will return data similar to this:

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the PSTN Conference Summary Report enables you to choose how data should be grouped. In this case, conferences are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the PSTN Conference Summary Report.

PSTN Conference Summary Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.

To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).

Metrics

The following table lists the information in the PSTN Conference Summary Report.

PSTN Conference Summary Report Metrics

Name	Can you sort on this item?	Description
Hourly **Daily** **Weekly** **Monthly**	No	Indicates the selected time interval. Where applicable, you can click a given time interval to view detailed information for that interval. For example, if you are using the Daily interval and you click 7/7/2012, you see an hourly breakdown of user registration activity for that

		date.
Total PSTN conferences	No	Total number conferences that allowed dial-in access.
Total participants	No	Total number of people who participated in conferences that allowed dial-in access.
Total A/V conference minutes	No	Total amount of audio/visual conference time.
Total A/V conference participant minutes	No	Total amount of audio/visual participant time. For example, if one participant spent five minutes in an A/V conference and another participant spent three minutes in the same conference, the total A/V conference participant time would be eight minutes.
Total PSTN participants	No	Total number of users who dialed in to conferences that allowed dial-in access.
Total PSTN participant minutes	No	Total amount of conference time spent by dial-in users. For example, if one dial-in participant spent five minutes in a conference and another participant spent three minutes in the same conference, the total PSTN participant time would be eight minutes.
Unique conference organizers	No	Total number of users who organized at least one conference that allowed dial-in access. Users who organized more than one conference are counted as one unique organizer, just like users who only organized a single conference.

1.7.20.4.2.5 Response Group Usage Report

Response Group Usage Report

Monitoring and Health Configuration > Using Monitoring Reports > System Usage Reports >

Topic Last Modified: *2013-02-22*

The Response Group application provides a way for Microsoft Lync Server 2013 to answer and route phone calls based on the number that was dialed and, optionally, on the caller's responses to a series of questions. Typically, Response Group calls are not routed to an individual person but, instead, are routed to a team of people referred to as an agent group. For example, if someone calls the phone number for your help desk, Lync Server 2013 can automatically route that call to the first available help desk agent. Alternatively, Lync Server could ask a series of questions ("Press 1 if you are having hardware problems. Press 2 if you are having software problems. Press 3 if you are having network problems.") and then route the call to the most appropriate help desk agent based on the answer to those questions.

The Response Group Usage Report provides a detailed look at the number of phone calls received by all your Response Group workflows, then breaks those calls down into more finite categories such as Offered calls, Answered calls, and Abandoned calls.

The key to working with the Response Group Usage Report is to understand the difference between the reported call types:

- **Received calls**. Total number of calls received by all instances of the Response Group application.
- **Successful calls**. Total number of calls that were picked up by the Response Group application.
- **Offered calls**. Total number of calls that were transferred to a Response Group agent.
- **Answered calls**. Total number of calls that were actually answered by a Response Group agent.
- **Percentage of abandoned calls**. Percentage of calls that were received by the Response Group application but were never answered by an agent. This value is calculated by subtracting the Answered calls from the Received calls, and then dividing that value by the number of Received calls. For example, if you received 10 calls and 7 were answered, you would subtract 7 from 10, leaving 3 unanswered calls. That value would then be divided by 10, giving you an abandoned call percentage of 30%.
- **Transferred calls**. Total number of Response Group calls that were transferred because of a queue timeout or queue overflow.

If you are looking at the Response Group Usage Report and can't remember the definition for any of these call types, simply hold your mouse over the appropriate call type label. A tooltip will appear that offers a brief description of the call type.

The Response Group Usage Report allows you to filter on a workflow URI (the SIP address associated with that workflow). However, workflow URIs do not actually appear on the report itself. If you would like to know things such as which workflows are answering the most calls or which workflows are experiencing the most transferred calls, click the appropriate metric to open the Response Group Call List Report for that given time period. That reports does list the workflow URIs.

Accessing the Response Group Usage Report

The Response Group Usage Report is accessed from the Monitoring Reports home page. You can drill down to the Response Group Call List Report by clicking any of the following metrics:

- Received calls
- Successful calls
- Offered calls
- Answered calls
- Transferred calls

Making the Best Use of the Response

Group Usage Report

One of the more interesting uses of the Response Group Usage Report might not be readily apparent: the ability to retrieve usage information for a single Response Group workflow.

> ⚠**Warning:**
>
> A Response Group workflow is basically a set of instructions that determines what Lync Server does when a user dials a particular phone number. To that end, each workflow is uniquely associated with a phone number. When someone calls that number, the workflow determines how the call will be handled. For example, the workflow might cause the call to be routed to a series of interactive voice response (IVR) questions that prompt the caller to enter additional information ("Press 1 for hardware support. Press 2 for software support."). Alternatively, the workflow might cause the call to be placed in a queue , with the caller put on hold until an agent is available to answer the call. The availability of agents to answer calls is also dictated by the workflow: workflows are used to configure both business hours (the days of the week and the times of day when agents are available to answer calls) and holidays (days when no agents are available to answer calls). Any time you dial a phone number that belongs to the Response Group application you are essentially calling a Response Group workflow.

Although workflow URIs do not appear in the Response Group Usage Report, it's still possible to view the usage statistics for a single workflow, something that is often extremely useful. For example, suppose you recently unveiled a new ad campaign and are curious to know whether people are calling in to ask about that product. If you have associated a Response Group workflow with the phone number given in the ad campaign, you can easily check to see how many people (if any) are calling that number.

You might also use a similar approach to gauge the number of calls being handled by your internal help desk or your customer service department.

To review usage statistics for a particular workflow, enter the workflow URI in the Workflow URI box. Of course, as noted, workflow URIs (the SIP address associated with a workflow) do not appear on the report. That means you need to find some other way to determine the URI of a workflow. One way to do this is to use Windows PowerShell and the Lync Server Management Shell. For example, this command returns the URIs for all your Response Group workflows:

```
Get-CsRgsWorkflow | Select-Object Name, PrimaryUri
```

That will return data similar to this:

```
Name                            PrimaryUri
----                            ----------
Customer Support                sip:support@litwareinc.com
Help Desk                       sip:helpdesk@litwareinc.com
New Ad Campaign                 sip:newads@litwareinc.com
```

This command returns information for a single workflow, the one with the name New Ad Campaign:

```
Get-CsRgsWorkflow -Name "New Ad Campaign" | Select-Object Name, PrimaryUri
```

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Response Group Usage Report enables you to view data for all your Response Group workflows or to view data for an individual workflow. You can also choose how data should be grouped. In this case, usages are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Response Group Usage Report.

Response Group Usage Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum

	number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Workflow URI	Enables you to limit the returned data to the specified Response Group workflow. To use this filter, enter the Workflow SIP address. For example: sip:helpdesk@litwareinc.com

Metrics

The following table lists the information provided in the Response Group Usage Report.

Response Group Usage Report Metrics

Name	Can you sort on this item?	Description
Hourly **Daily** **Weekly** **Monthly**	No	Indicates the selected time interval. Where applicable, you can click a given time interval to view detailed information for that interval. For example, if you are using the Daily interval and you click 7/7/2012, you see an hourly breakdown of user registration activity for that date.
Received calls	No	Total number of calls received by all instances of the Response Group application. When you click this item, the report shows you the Response Group Call List report for the selected time period.
Successful calls	No	Total number of calls that were picked up the Response Group application. When you click this item, the report shows you the Response Group Call List report for the selected time period.
Offered calls	No	Total number of calls that were transferred to a Response Group agent. When you click this item, the report shows you the

		Response Group Call List report for the selected time period.
Answered calls	No	Total number of calls that were actually answered by a Response Group agent. When you click this item, the report shows you the Response Group Call List report for the selected time period.
Percentage of abandoned calls	No	Total number of calls that were received by the Response Group application but were never answered by an agent. This is calculated by subtracting the Answered calls from the Received calls, and then dividing that value by the number of received calls. For example, if you have 10 received calls and seven were answered, you would subtract seven from 10, leaving three unanswered calls. That value would then be divided by 10, giving you an abandoned call percentage of 30%.
Average call minutes by agent	No	Average amount of time a Response Group agent spent on a call.
Transferred calls	No	Total number of Response Group calls that were transferred because of a queue timeout or queue overflow. When you click this item, the report shows you the Response Group Call List report for the selected time period.

Response Group Call List Report

Using Monitoring Reports > System Usage Reports > Response Group Usage Report >

Topic Last Modified: *2013-02-22*

The Response Group application provides a way for Microsoft Lync Server 2013 to answer and route phone calls based on the number that was dialed and, optionally, on the caller's responses to a series of questions. Typically, Response Group calls are not routed to an individual person but, instead, are routed to a team of people referred to as an agent group. For example, if someone calls the phone number for your help desk, Lync Server 2013 can automatically route that call to the first available help desk agent. Alternatively, Lync Server could ask a series of questions ("Press 1 if you are having hardware problems. Press 2 if you are having software problems. Press 3 if you are having network problems.") and then route the call to the most appropriate help desk agent based on the answer to those questions.

The Response Group Call List Report represents a collection of calls made for a specified period of time and for a specified type of call. The Response Group Usage Report (which must be opened first before you can open the Response Group Call List Report) recognizes the following call types:

- **Received calls**. Total number of calls received by all instances of the Response Group application.
- **Successful calls**. Total number of calls that were picked up by the Response Group application.
- **Offered calls**. Total number of calls that were transferred to a Response Group agent.
- **Answered calls**. Total number of calls that were actually answered by a Response Group agent.
- Percentage of abandoned calls. Percentage of calls that were received by the Response Group application but were never answered by an agent. This value is calculated by subtracting the Answered calls from the Received calls, and then dividing that value by the number of Received calls. For example, if you received 10 calls and 7 were answered, you would subtract 7 from 10, leaving 3 unanswered calls. That value would then be divided by 10, giving you an abandoned call percentage of 30%.
- **Transferred calls**. Total number of Response Group calls that were transferred because of a queue timeout or queue overflow.

Accessing the Response Group Call List Report

The Response Group Call List Report can only be accessed by clicking one of the following metrics found on the Response Group Usage Report:

- Received calls
- Successful calls
- Offered calls
- Answered calls
- Transferred calls

Making the Best Use of the Response Group Call List Report

The Response Group Call List Report allows you to limit the displayed data to calls involving a particular Response Group workflow. To do that, you need to enter the workflow URI (the workflow's SIP address) in the Workflow URI box. Before you can do that, however, you must actually be able to see the Workflow URI box. To display the filtering options for the Response Group Call List Report, click the Show/Hide Parameters button in the upper left-hand portion of the report window.

Note that the Response Group Call List does not display information about either the Response code or the Diagnostic ID if you hold the mouse over either of those metrics. If you need more information, you might note the Response code and/or Diagnostic ID, and then search for those values in the Top Failures Report.

a question like this one: "Which individual workflow received the most calls?", you can do the following:

1. On the Response Group Usage Report, set the desired time period and then click the Received Calls metric. That will open the Response Group Call List

Report.

2. Export the data shown on the Response Group Call List Report. For example, you might export the data in Microsoft Excel format, and then use Excel to convert that data to a comma-separated values file.
3. Run your analyses using Windows PowerShell.

For example, if you have saved the data to a file named C:\Data \Response_Group_Call_List_Report.csv, you can then use the following command to return the total number of received calls for each workflow listed in the report:

```
$calls = Import-Csv -Path "C:\ Data\Response_Group_Call_List_Report.csv"
$calls | Group-Object Workflow | Select-Object Count, Name | Sort-Object Count -D
```

That will information similar to this:

```
Count    Name
-----    ----
  160    Redmond Help Desk
   47    Dublin Help Desk
   31    North America Customer Support
   16    EMEA Customer Support
   14    Employment Opportunities
```

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. The following table lists the filters that you can use with the Response Group Call List Report.

Response Group Call List Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date:

	7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Workflow URI	Enables you to limit the returned data to the specified Response Group workflow. To use this filter, enter the Workflow SIP address. For example: sip:helpdesk@litwareinc.com
Calls	You can select one of the following call types: • Received Calls • Successful Calls • Offered Calls • Answered Calls • Transferred Calls

Metrics

The following table lists the information provided in the Response Group Call List Report for each call received by the Response Group application.

Response Group Call List Report Metrics

Name	**Can you sort on this item?**	**Description**
Caller	No	SIP address of the caller.
Workflow	No	SIP address of the Response Group workflow.
Start time	No	Date and time that the call started.
End time	No	Date and time that the call ended.
Response code	No	SIP response code sent when the session failed.
Diagnostic ID	No	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors.

1.7.20.4.2.6 IP Phone Inventory Report

IP Phone Inventory Report

Monitoring and Health Configuration > Using Monitoring Reports > System Usage Reports >

Topic Last Modified: *2012-11-12*

The IP Phone Inventory Report reports information about the IP phones currently in use in your organization. The IP Inventory Report provides a detailed list of the IP phones that were actually used during the specified reporting period. Among other things, this report lets administrators know if there are any old, outdated phones still in use that should be replaced; it can also alert administrators to the fact that there are expensive phones in the organization that are rarely being used. That type of information can be invaluable when it comes time to purchase new phones or to redistribute existing phones. (For example, a user who rarely uses his or her expensive phone might be asked to swap phones with a user who uses his or her phone much more frequently.)

It should be noted that this report does have a few limitations when it comes to being used as a true inventory report. For one thing, the IP Phone Report simply lists all the phones that logged on to Lync Server during the specified time period, sorted by their last logon time. If a phone did not log on during the specified time period then it will not be listed in the inventory report. That includes phones that logged on before the time period started and were still logged on during the specified time interval. For example, suppose you wanted to look at all the phone inventory for July, 2012. Suppose, as well, that several phones logged on to Lync Server on June 30, 2012 and were still logged on as of July 1st. Those phones will not show up on the inventory report for July 1st.

It's also important to note that the inventory report could include phones that your organization no longer uses. For example, suppose a number of Fabrikam phones logged on to the system on July 1, 2012; 5 days later your organization got rid of all those Fabrikam phones and replaced them with a newer Contoso model. The Fabrikam phones will still appear on the "inventory" report simply because they logged on to the system during the month of July.

In addition, the IP Phone Inventory Report does not report summary totals for the different types of phones. For example, suppose you have 105 Polycom CX600 phones. The report will not tell you that you have 105 of these phones; instead, you will simply see 105 separate entries for the Polycom Cx600. The only way to know that there are 105 entries for the Polycom Cx600 would be to count each of those entries manually.

⚠**Warning:**
Or, export the data and use Microsoft Excel or Windows PowerShell to do that counting for you.

Accessing the IP Phone Inventory Report

The IP Phone Inventory Report is accessed from the Monitoring Reports home page. If you click the User URI metric you can access the User Activity Report for that user. Clicking the Last activity metric for a peer-to-peer call will take you to the Peer-to-Peer Session Detail Report; clicking that same metric for a conference will take you to the Conference Detail Report.

Making the Best Use of the IP Phone Inventory Report

If you're only interested in usage information for one particular kind of phone (for example, "How often are users using a Polycom CX600 phone?") you can get that information directly from the IP Phone Inventory Report by filtering for that particular kind of phone. However, if you want summary information for all your phones (how many people are using a Polycom CX600, how many are using an LG-Nortel IP8540, etc.) then you will need to export the data and use another application (such as Windows PowerShell) to do that type of analysis. For example, suppose you export the data to a comma-separated values file (C:\Data\IP_Phone_Inventory_Report.csv). In that case, you could use these two commands to provide summary data for all your phones:

```
$phones = Import-Csv "C:\Data\IP_Phone_Inventory_Report.csv"
$phones |Group-Object Manufacturer, "Hardware version" | Select-Object Count, Nam
```

That will return data similar to this:

```
Count    Name
-----    ----
  267    POLYCOM, CX700
  267    POLYCOM, CX600
  166    POLYCOM, C
   68    Microsoft, CPE
   64    LG-Nortel, IP8540
   59    Aastra, 6725ip
   37    LG-Nortel, IP
   22    POLYCOM, CX3000
   11    Microsoft, CPE_A
    9    POLYCOM, CX500
    7    Aastra, 6721ip
```

Similarly, these two commands tell you which phones logged on to the system but were never actually used to make a call (the value of the Last activity metric is blank, indicating that there hasn't been any last activity):

```
$phones = Import-Csv "C:\Data\IP_Phone_Inventory_Report.csv"
$phones | Where-Object {$_."Last activity" -eq ""}
```

That returns data similar to this for each phone that has not been used:

```
Manufacturer     : POLYCOM
Hardware version : CX600
MAC address      : 00-04-F2-00-01-76
User URI         : 422
User agent       : CPE/4.0.7423.1 OCPhone/4.0.7423.1 (Microsoft Lync 2010 (Beta)
Last logon time  : 8/30/2010 4:44:48 PM
Last logoff time : 8/30/2010 5:59:07 PM
Last activity    :
```

Another interesting way to use the IP Phone Inventory Report is this: if you have the MAC address of an IP Phone you can find out the user who last used that phone simply by entering that address in the MAC address text box. The IP Phone Inventory report will then report back (among other things) the SIP address of the user who last logged on with that phone. Alternatively, you can enter a user SIP address (in the User URI prefix box) to find out all the phones that have been used by that user.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the IP Phone Inventory enables you to view only the phones manufactured by a specific company, or even a specific version of those phones. You can also choose how data should be grouped. In this case, registrations are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the IP Phone Inventory Report.

IP Phone Inventory Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Manufacturer	Name of the company that manufactured the IP phone. The values for this filter are automatically populated for you based on the IP phones that are currently in the database.
Hardware version	Version number of the IP phone; by using the Manufacturer and the Hardware version filters you can uniquely identity a particular type of phone. The values for this filter are automatically populated for you based on the IP phones that are currently in the database.
User agent	Identifier for the software used by the IP phone. The values for this filter are automatically populated for you based on the IP phones currently in the database.

MAC address	Unique identifier for the network interface on the IP phone. The Media Access Control (MAC) address is typically assigned at the time the phone is manufactured and is hard-wired into the device hardware. To search for records pertaining to a specific MAC address simply enter that address. For example: 00-08-5D-16-16-48 You must enter the complete address. A partial address (for example 00-08-5D) does not return any data.
Last activity before days	Select one of the following values: • [All] • 10 • 20 • 30
Last logoff time before days	Select one of the following values: • [All] • 10 • 20 • 30
User URI prefix	SIP address of the user who used the IP phone.

Metrics

The following table lists the information provided in the IP Phone Inventory Report.

IP Phone Inventory Report Metrics

Name	Can you sort on this item?	Description
Manufacturer	Yes	Name of the company that manufactured the IP phone.
Hardware version	Yes	Version number of the IP phone.
MAC address	Yes	Unique identifier for the network interface on the IP phone. The MAC address is typically assigned at the time the phone is manufactured and is hard-wired into the device hardware.
User URI	Yes	SIP address of the user who used the IP phone.
User agent	Yes	Identifier for the software used by the IP phone.
Last logon time	Yes	Date and time that the IP phone last logged on to Lync Server.

Last logoff time	Yes	Date and time that the IP phone last logged off from Lync Server.
Last activity	Yes	Date and time that the IP phone was last used.

1.7.20.4.2.7 Call Admission Control Report

Call Admission Control Report

Monitoring and Health Configuration > Using Monitoring Reports > System Usage Reports >

Topic Last Modified: *2012-06-29*

The Call Admission Control Report provides information about peer-to-peer and conferencing sessions that were conducted under restrictions set in place by Call Admission Control. Call Admission Control, introduced in Microsoft Lync Server 2010, provides a way for administrators to allow (or not allow) communication sessions based on bandwidth constraints. For example, administrators can create policies that impose a limit on the amount of bandwidth available for voice and video calls. If that bandwidth limit has been reached, then no new voice or video calls can be placed until one of the current calls has ended and freed up the required network resources.

Accessing the Call Admission Control Report

The Call Admission Control Report is accessed from the Monitoring Reports home page. From the Call Admission Control Report you can drill down to either of the following reports:

- Conference Detail Report – To access this report, click the Details metric from a conference session.
- Peer-to-Peer Session Detail Report – To access this report, click the Details metric for a peer-to-peer session.

Making the Best Use of the Call Admission Control Report

To get a list of calls that failed because of insufficient bandwidth, select Calls rejected because of call admission control from the Call category dropdown list. Most of the returned calls will likely have a diagnostic ID of 5:

Insufficient bandwidth to establish session. Attempt PSTN re-route.

That indicates that Call Admission Control limitations were preventing the call from being made on the VoIP network.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Call Admission Control Report enables you to filter calls by the user who initiated the call or by the user who was being called. You can also choose how data should be grouped. In this case, calls are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Call Admission Control Report.

Call Admission Control Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/17/12012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/17/12012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/13/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/17/12012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/17/12012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/13/2012 Weeks always run from Sunday through Saturday.
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or click **[All]** to view data for all the pools. This drop-down list is automatically populated for you based on the records in the database.
Activity type	Type of activity. Select one of the following activities: • [All] • Peer-to-Peer • Conference

Call category	Indicates the reason that CAC was used for the call. Select one of the following: • [All] • Call rejected because of call admission control • Calls rerouted through PSTN because of call admission control

Metrics for Peer-to-Peer Sessions

The following table lists the information provided in the Call Admission Control Report for peer-to-peer sessions (that is, sessions involving just two participants).

Metrics for Peer-to-Peer Sessions

Name	Can you sort on this item?	Description
Detail	No	When you click this item, the report shows you a Peer-to-Peer Session Detail Report for the specified session.
From user	Yes	SIP address of the user who initiated the session.
To user	Yes	SIP address of the user who was invited to join the session.
Modalities	Yes	Communication modalities (such as audio and video) that were used during the session.
Invite time	Yes	Date and time the initial session invitation was sent to the From user.
Response time	Yes	Date and time that the invitation acceptance was received.
End time	Yes	Date and time that the session ended.
Diagnostic ID	Yes	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors. Diagnostics headers are optional (it is possible to have SIP sessions that do not include these headers), and diagnostic IDs are reported only for sessions that experienced problems of some kind.

Metrics for Conferencing Sessions

The following table lists the information provided in the Call Admission Control Report for conferencing sessions (that is, sessions involving three or more participants).

Metrics for Conferencing Sessions

Name	Can you sort on this item?	Description
Conference URI	Yes	Unique identifier for the conference. When you click this item, the report shows the individual conference participants.
Organizer	Yes	SIP address of the user who organized the conference.
Pool	Yes	Edge Server used in the conference.
Start time	Yes	Date and time that the conference started.
End time	Yes	Date and time that the conference ended.

Metrics for Individual Conference Participants

The following table lists the information provided in the Call Admission Control Report for individual conference participants.

Metrics for Individual Conference Participants

Name	Can you sort on this item?	Description
Role	No	Role (for example, Presenter) played by the conference participant.
Participant	No	SIP address of the conference participant.
Connectivity	No	Network connectivity (typically From Internal or From External) for the participant.
Modality	No	Conference type (for example, A/V conferencing).
Join time	No	Date and time that the participant joined the conference.
Leave time	No	Date and time that the participant left the conference.

Diagnostic ID	No	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors. Diagnostics headers are optional (it is possible to have SIP sessions that do not include these headers), and diagnostic IDs are reported only for sessions that experienced problems of some kind.

Peer-to-Peer Session Detail Report

Using Monitoring Reports > System Usage Reports > Call Admission Control Report >

Topic Last Modified: *2012-06-06*

The Peer-to-Peer Session Detail Report returns detailed information about a peer-to-peer session. For example, if you select an instant messaging session, the report will tell you the number of messages sent by each of the two users in the session.

Accessing the Peer-to-Peer Session Detail Report

The Peer-to-Peer Session Detail Report can be accessed from any of the following reports (all of which can be accessed from the Monitoring Reports home page):

- IP Phone Inventory Report
- User Activity Report
- Call Admission Control Report
- Failure List Report

From within the Peer-to-Peer Session Detail Report you can access the Diagnostic Report by clicking the Diagnostic Report (Details) metric. You can also access the Top Failures Report by clicking either of these two metrics:

- Response
- Diagnostic ID

Making the Best Use of the Peer-to-Peer session Detail Report

The Peer-to-Peer Session Detail Report includes a large number of metrics, many of which might not be familiar to system administrators. Often-times, however, you can view a tooltip that offers a brief description of that metric simply by holding your mouse over the metric label.

Note that the actual metrics shown on a given report will depend on the type of peer-to-peer session you selected. An audio/video session will report a different set of metrics than an instant messaging session.

You can also hold your mouse over the Response code and Diagnostic ID metrics in order to obtain a description of those values:

Filters

None. You cannot filter the Peer-to-Peer Session Detail Report.

Session Information Metrics

The following table lists the information provided in the Peer-to-Peer Session Detail Report for each session.

Session Information Metrics

Name	Description
Pool FQDN	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server involved in the session.
Invite time	Date and time the session invitation was originally sent.
Response time	Date and time that the invitation acceptance was received.
From user	SIP address of the user who initiated the session.
From user agent	Software used by the endpoint of the user who initiated the session.
Is From user internal	Indicates whether the user who initiated the session was logged on to the internal network.
Is From user integrated with desk phone	Indicates whether the endpoint used by the user who initiated the session is integrated with his or her desktop phone.
Session Priority	Priority assigned to the session. Valid priorities are: Unknown; Non-Urgent; Normal; Urgent; and Emergency.
Response code	SIP response code sent when the session failed.
Front end	Name of the Front End Server used in the conference.
Capture time	Date and time that the session information was recorded.
End time	Date and time the session ended.
To user	SIP address of the user who was invited to the session.
To user agent	Software used by the endpoint of the user who was invited to the session.

Is To user internal	Indicates whether the user who was invited to the session was logged on to the internal network.
Is To user integrated with desk phone	Indicates whether the endpoint used by the user who was invited to the session is integrated with his or her desktop phone.
Is retried session	Indicates whether the session is an attempt to retry a session that previously failed.
Diagnostic ID	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors. Hold the mouse over the ID number to view additional information about that ID.

Metrics for Modalities

The following table lists the information provided in the Peer-to-Peer Session Detail Report for each session modality.

Metrics for Modalities

Name	Can you sort on this item?	Description
Modalities	No	Modalities used in the session. For example, instant messaging (IM) or file transfer.
From user messages	No	Number of messages sent by the user who initiated the session.
To user messages	No	Number of messages sent by the user who was invited to join the session.

Metrics for Diagnostic Reports

The following table lists the information provided in the Peer-to-Peer Session Detail Report for each diagnostic report.

Metrics for Diagnostic Reports

Name	Can you sort on this item?	Description
Detail	No	When you click this item, the report shows the Diagnostic Report for the session.
Report time	No	Date and time the report was recorded.
Request	No	SIP request type. For example, INVITE or BYE.
Diagnostic ID	No	Unique identifier (in the form

		of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors.
Content type	No	Type of media content used in the conference. For example, a common content type is Application/sdp. Session Description Protocol (SDP) is a standard Internet protocol used for session announcements, session invitations, and other forms of multimedia session initiation.
Reported by	No	Computer (that is, client or server) that reported the problem.

1.7.20.4.3 Call Diagnostic Reports (per user)

Call Diagnostic Reports (per user)

Operations > Monitoring and Health Configuration > Using Monitoring Reports >

Topic Last Modified: *2012-10-21*

The Call Diagnostic Reports provide per-user information about failed peer-to-peer and conferencing sessions.

- User Activity Report   Provides information about peer-to-peer and conference activities for each of your users.

1.7.20.4.3.1 User Activity Report

User Activity Report

Monitoring and Health Configuration > Using Monitoring Reports > Call Diagnostic Reports (per user) >

Topic Last Modified: *2012-10-22*

The User Activity Report provides a detailed list of the peer-to-peer and conferencing sessions carried out by your users in a given time period. Unlike many of the Monitoring Reports, the User Activity Report ties each call to individual users. For example, peer-to-peer sessions specify the SIP URIs of the person who initiated the call (the From user) and the person who was being called (the To user). If you expand the information for a conference, you'll see a list of all the conference participants and the role they held for that conference.

The User Activity Report is sometimes referred to as the "help desk" report. That's because the report is often used by help desk personnel to retrieve session information for a specific user. You can filter for calls made to or made by an individual user simply by typing the user's SIP URI in the User URI prefix box.

If you do this, keep in mind that the User Activity Report will search anywhere in the Uri field for the value entered in this box. For example, suppose you are searching for this user:

Ken.Myer@litwareinc.com

If you type **ken** in the URI box, the User Activity Report will locate **Ken**.Myer@litwareinc.com. It will also locate these users:

- Ronen.Ash**ken**azi@litwareinc.com
- Markus.Ran**ken**burg@litwareinc.com
- **Ken**.Sanchez@litwareinc.com
- Will. **Ken**nedy@litwareinc.com

In other words, the more specific the information you enter, the more likely it will be that you will get back just the information of interest to you.

To access the user activity report

The User Activity Report is accessed from the Monitoring Reports home page. You can also reach the User Activity Report by clicking the User URI metric on the IP Phone Inventory Report. From within the User Activity Report, clicking the Conference URI (for a conference) takes you to the Conference Detail Report. Similarly, clicking the Detail metric for a peer-to-peer call takes you to the Peer-to-Peer Session Detail Report.

Making the best user of the user activity report

Although there is a lot of good information in the User Activity Report, that information can sometimes be difficult to locate. For example, all the user activity that takes place in your organization during a specified period is included in the User Activity Report; that means that, buried, within the report is information about which users actually used Microsoft Lync Server 2013 in some way.

⚠**Warning:**

Technically, it’s possible that some s user activity might go unrecorded: while Lync Server strives to keep information about all phone calls it's possible that a call could have been made without the information about that call being written to the database. Lync Server is designed to give an extremely accurate but not necessarily perfect look at how Lync Server 2013 is being used. (The fact that there is no guarantee that 100% of all calls are recorded explains why Lync Server monitoring should not be used as a billing system.) Second, a Monitoring Report report can only display, at most, 1,000 records. Depending on the amount of user activity you have, and depending on the time period you are working with, that means your query might not return all the data actually stored in the database.

In addition to that, the User Activity Report indicates the type of session (modality) that a user participated in (for example, instant messaging, file transfer, audio, etc.). However, you can't filter by modality. The Modality filter only offers one choice: All. The only way to filter by modality is to export the data and then do your filtering in another application (such as Microsoft Excel or Windows PowerShell).

This means is that you can easily retrieve detailed information about any one user in your organization. What you can't do, at least not directly, is answer questions like this:

- Which users actually used the system during this time period?
- Which of my users were the most active during this time period?
- Are the users who make the most phone calls also the users who participate

in the most instant messaging sessions?

If you need to answer questions like this, you can export the data retrieved by the Monitoring Reports to an Excel spreadsheet. You then use that spreadsheet and/or a comma-separated values file to analyze the data in ways that the User Activity Report. For example, suppose you have exported the report data to Excel and then to a comma-separated values file. At that point, you can import the data from the .CSV file to Windows PowerShell by using a command similar to this:

```
$x = Import-Csv -Path "C:\Data\User_Activity_Report.csv"
```

After the data has been imported you can then use simple Windows PowerShell commands to help answer your questions. For example, this command returns a list of unique users who served as the "From user" in at least one session:

```
$x | Group-Object "From user" | Select Name | Sort-Object Name
```

In other words:

```
Name
----
David.Ahs@litwareinc.com
Gilead.Amosnino@litwareinc.com
Henrik.Jensen@litwareinc.com
Ken.Myer@litwareinc.com
Pilar.Ackerman@litwareinc.com
```

This command lists the unique users (based on the total number of sessions that they participated in:

```
$x | Group-Object "From user" | Select Count, Name | Sort-Object Count -Descendin
```

That returns data similar to this:

```
Count    Name
-----    ----
  523    Ken.Myer@litwareinc.com
   63    David.Ahs@litwareinc.com
   29    Pilar.Ackerman@litwareinc.com
   17    Gilead.Amosnino@litwareinc.com
   10    Henrik.Jensen@litwareinc.com
```

This command limits the reported sessions to those that included audio as a modality:

```
$x | Where-Object {$_.Modalities -match "audio"} | Group-Object "From user" | Sel
```

If you hold your mouse over any Diagnostic ID shown on the report, a tooltip will appear describing that ID.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the User Activity Report enables you to filter the returned data based on such things as activity type (that is, peer-to-peer sessions or conferencing sessions) or by the user's SIP address (allowing you to view the activities for one user). You can also choose how data should be grouped. In this case, usages are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the User Activity Report.

User activity report filters

Name	Description

From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/17/12012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/17/12012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/13/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/17/12012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/17/12012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/13/2012 Weeks always run from Sunday through Saturday.
Activity type	Type of activity. Select one of the following: • [All] • Peer-to-peer • Conference
Modality	You can only select **[All]**, which shows information for all modalities, including audio, video, instant messaging (IM), and file transfer.
Session category	Indicates whether the activity in question succeeded or failed. Select one of the following: • [All] • Success • Expected failure • Unexpected failure An "expected failure" is a failure that is expected to happen; for example, if a user has set his or her

	status to Do Not Disturb you would expect any call to that user to fail. An "unexpected failure" is a failure that occurs in what would appear to be an otherwise healthy system. For example, a call should not be terminated if the caller is placed on hold. If that occurs, that would be flagged as an unexpected failure.
User URI prefix	SIP address for the user. To view records only for the user Ken Myer you need to enter Ken Myer's SIP address. For example: sip:kenmyer@litwareinc.com

Metrics for peer-to-peer sessions

The following table lists the information provided in the User Activity Report for peer-to-peer sessions (that is, sessions involving just two participants).

Metrics for peer-to-peer sessions

Name	Can you sort on this item?	Description
Detail	No	When you click this item, the report shows you the Peer-to-Peer Session Detail Report for the selected session.
From user	Yes	SIP address of the user who initiated the peer-to-peer session.
To user	Yes	SIP address of the user who joined the peer-to-peer session.
Modalities	Yes	Type of communication used in the session. For example, IM, audio, or file transfer.
Invite time	Yes	Date and time the initial invitation to join the peer-to-peer session was sent.
Response time	Yes	Date and time that the "To" user accepted the session invitation.
End time	Yes	Date and time the peer-to-peer session ended.
Diagnostic ID	Yes	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors. Diagnostics headers are optional (it is possible to

		have SIP sessions that do not include these headers), and diagnostic IDs are reported only for sessions that experienced problems of some kind.

Metrics for conferencing sessions

The following table lists the information provided in the User Activity Report for conferencing sessions (that is, sessions involving three or more participants).

Metrics for conferencing sessions

Name	Can you sort on this item?	Description
Conference URI	Yes	Unique conference identifier. When you click this item, the report shows you the Conference Detail Report for the selected session. When you expand this item, the report shows you information about the conference participants. For details, see the "Metrics for Conference Participants" section later in this topic.
Organizer	Yes	SIP address of the user who organized the conference.
Pool	Yes	Name of the Edge Server (if any) used in the conference.
Start time	Yes	Date and time that the conference began.
End time	Yes	Date and time that the conference ended.

Metrics for conference participants

The following table lists the information provided in the User Activity Report provides for each participant in a conference.

Metrics for conference participants

Name	Can you sort on this item?	Description
Role	No	Conference role (for example, Presenter) for the user.
Participant	No	SIP address of the user.
Connectivity	No	Network connection type. For example "From Internal" for internal connection or "From PSTN" for dial-in users.

Join time	No	Date and time that the user joined the conference.
Leave time	No	Date and time that the user left the conference.
Diagnostic ID	No	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors. Diagnostics headers are optional (it is possible to have SIP sessions that do not include these headers), and diagnostic IDs are reported only for sessions that experienced problems of some kind.

1.7.20.4.4 Call Diagnostic Reports

Call Diagnostic Reports

Operations > Monitoring and Health Configuration > Using Monitoring Reports >

Topic Last Modified: *2012-10-21*

The Call Diagnostic Reports provide summary information and diagnostic data for failed peer-to-peer and conferencing sessions.

- Call Diagnostic Summary Report Provides an overall summary of failed peer-to-peer sessions and conference sessions. Peer-to-peer sessions are sessions that involve just two participants. Conferencing sessions involve three or more participants.
- Peer-to-Peer Activity Diagnostic Report Provides an overall trend view of failed peer-to-peer sessions. A peer-to-peer session involves just two participants.
- Conference Diagnostic Report Provides an overall trend view of failed conferencing sessions and trend views for each conference modality. Conferencing sessions involve at least three participants.
- Top Failures Report Provides a list of the most frequent failures and their trends over time.
- Failure Distribution Report Provides an analysis of failed sessions.
- Failure List Report Provides detailed information about the individual participants involved in a failed conference.
- Diagnostic Report Provides diagnostic and troubleshooting information (including SIP response codes and diagnostic headers and IDs) for failed sessions.

1.7.20.4.4.1 Call Diagnostic Summary Report

Call Diagnostic Summary Report

Monitoring and Health Configuration > Using Monitoring Reports > Call Diagnostic Reports >

Topic Last Modified: *2012-06-06*

The Call Diagnostic Summary Report provides an overall look at failed peer-to-peer and conferencing sessions. The report shows the overall failure rate for both types of sessions, and further breaks the failure information down by session modality type:

- Instant messaging
- Application sharing
- File transfer
- Audio
- Video

Accessing the Call Diagnostic Summary Report

The Call Diagnostic Summary Report is accessed from the Monitoring Reports Home page. From the Call Diagnostic Summary Report you can access the Peer-to-Peer Activity Diagnostic Report by clicking the Failure rate metric under the Peer-to-Peer Session Summary section of the report. You can also access the Conference Diagnostic Report by clicking any of the following conference metrics:

- Overall session failure rate
- Focus failure rate
- MCU failure rate

Making the Best Use of the Call Diagnostic Summary Report

The Call Diagnostic Summary Report includes graphs that compare failure rates for the various modalities used in Microsoft Lync Server 2013. The columns in these graphs are actually hotlinks; for example, if you click the Instant messaging column for peer-to-peer sessions, you'll drill down to an instance of the Peer-to-Peer Activity Diagnostic Report, a report that provides additional details about all the instant messaging sessions included in the Call Diagnostic Summary Report.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Call Diagnostic Summary Report enables you to filter on such things as the Registrar pool or Edge Server used in the session. You can also choose how data should be grouped. In this case, calls are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Call Diagnostic Summary Report.

Call Diagnostic Summary Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date:

	7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or click **[All]** to view data for all the pools. This drop-down list is automatically populated for you based on the records in the database.

Metrics for Peer-to-Peer Sessions

The following table lists the information provided in the Call Diagnostic Summary Report for peer-to-peer sessions (that is, sessions involving just two participants).

Metrics for Peer-to-Peer Sessions

Name	Can you sort on this item?	Description
Total sessions	No	Total number of peer-to-peer sessions conducted.
Failure rate	No	Percentage of peer-to-peer sessions that failed. When you click this item, the report shows the Peer-to-Peer Activity Diagnostic report, which displays more detailed information about the failed peer-to-peer sessions.

Metrics for Conferencing Sessions

The following table lists the information provided in the Call Diagnostic Report for conferencing sessions (that is, sessions involving three or more participants).

Metrics for Conferencing Sessions

Name	Can you sort on this item?	Description
Total conferences	No	Total number of conferences conducted.
Total conference sessions	No	Total number of conferencing sessions conducted.
Overall session failure rate	No	Percentage of the total conferencing sessions that failed.
Focus sessions	No	Total number of Focus-based conferencing sessions that failed.
Focus failure rate	No	Percentage of the Focus-based conferencing sessions that failed.
MCU sessions	No	Total number of conferencing server-based (formerly known as Multipoint Control Unit or MCU) conferences that failed.
MCU failure rate	No	Percentage of the conferencing server-based (formerly known as Multipoint Control Unit or MCU) conferences that failed.

Conference Summary Subreport

Using Monitoring Reports > Call Diagnostic Reports > Call Diagnostic Summary Report >

Topic Last Modified: *2012-06-06*

The Conference Summary Subreport provides an overall view of failed conference sessions. These failed sessions are further broken down by session type: Focus sessions and MCU sessions.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. The following table lists the filters that you can use with the Conference Summary Subreport.

Conference Summary Subreport Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not

	have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or click **[All]** to view data for all the pools. This drop-down list is automatically populated for you based on the records in the database.

Metrics

The following table lists the information provided in the Conference Summary Subreport.

Conference Summary Subreport Metrics

Name	Can you sort on this item?	Description
Total conferences	No	Total number of conferences held.
Total conference sessions	No	Total number of conference sessions. A single conference can have multiple sessions; for example, a conference might include both a Focus session and an MCU session.
Overall session failure rate	No	Percentage of all conferences that failed.
Focus sessions	No	Total number of Focus sessions.
Focus failure rate	No	Percentage of Focus sessions that failed.
MCU sessions	No	Total number of MCU sessions.
MCU failure rate	No	Percentage of MCU sessions that failed.
MCU sessions by modality	No	Total number of MCU sessions, grouped by modality (for example, IM conferencing).
Failure rate by modality	No	Percentage of MCU sessions that failed, grouped by modality (for example, IM conferencing).

P2P Summary Subreport

Using Monitoring Reports > Call Diagnostic Reports > Call Diagnostic Summary Report >

Topic Last Modified: *2012-10-21*

The P2P Summary Subreport provides an overall view of your failed peer-to-peer communication sessions.

Filters

Filters provide a way for you to return a more finely targeted set of data or to view the returned data in different ways. The following table lists the filters that you can use with the P2P Summary Subreport.

P2P Summary Subreport Filters

Name	Description
From	Start date and time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date and time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month):

	7/3/2012 Weeks always run from Sunday through Saturday.
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or click **[All]** to view data for all the pools. This drop-down list is automatically populated for you based on the records in the database.

Metrics

The following table lists the information provided in the P2P Summary Subreport.

P2P Summary Subreport Metrics

Name	Can you sort on this item?	Description
Total sessions	No	Total number of sessions, including successful sessions, failed sessions (both expected failures and unexpected failures), and uncategorized sessions.
Failure rate	No	Percentage of peer-to-peer sessions that failed.
Sessions by Modality	No	Total number of sessions grouped by modality (for example, instant messaging).
Failure rate by modality	No	Total number of failed sessions grouped by modality (for example, instant messaging).

1.7.20.4.4.2 Peer-to-Peer Activity Diagnostic Report

Peer-to-Peer Activity Diagnostic Report

Monitoring and Health Configuration > Using Monitoring Reports > Call Diagnostic Reports >

Topic Last Modified: *2012-10-01*

The Peer-to-Peer Activity Diagnostic Report provides information about the success and failure of your peer-to-peer communication sessions. Note that Microsoft Lync Server 2013 distinguishes between different kinds of failure:

- **Expected failure**. An expected failure is typically a failure only in the most technical sense. For example, suppose you call someone, but he or she is away from the office and is unable to answer the phone. Because the call was not answered, the call is technically considered a failure. On the other hand, this was an expected failure: Microsoft Lync Server 2013 does not expect you to answer the phone if you're not available to answer the phone. Likewise, an expected failure will occur if you attempt to send an instant message to a user

who is offline, or is logged on only to a phone that does not support instant messaging.
- **Unexpected failure**. An unexpected error is exactly what the name implies: an error that, based on the circumstances, you would not expect to occur. For example, suppose you call someone and that person is available to answer the call; however, when Lync Server 2013 tries to route your call to voicemail the call fails because connectivity to Exchange Unified Messaging has been lost. That's an unexpected error: you would expect that calls could always be routed to voicemail. As a general rule, unexpected failures are true failures: they are problems that likely cannot be remedied through user education or similar measures.

Note that the Success, Expected failure, and Unexpected failure metrics might not add up to the Total sessions metric. For example, in the preceding illustration, we have the following values:

Successes	Expected failures	Unexpected failures	Total sessions
2024	469	16	2521

If you add 2024 + 469 + 16 you get a total of 2,509 sessions, yet the Total sessions column shows a total of 2,521 sessions. The "missing" 12 sessions are sessions that the system was unable to categorize as successful or unsuccessful. That will sometimes be the case when a third-party product introduces a new diagnostic code that is unfamiliar to Lync Server. When that happens, calls made using that product, and reporting that diagnostic code, cannot always be categorized as being a Success, an Expected failure, or an Unexpected failure.

Accessing the Peer-to-Peer Activity Diagnostic Report

The Peer-to-Peer Diagnostic Report is accessed from the Monitoring Reports home page. You can access the Failure Distribution Report by clicking either of the following metrics:

- Unexpected failure volume
- Expected failure volume

Making the Best Use of the Peer-to-Peer Activity Diagnostic Report

There are a number of ways you can filter the Peer-to-Peer Activity Diagnostic Report but, by default, those filtering options are hidden from view. To view the filtering options available to you, click the Show/Hide Parameters button in the upper right-hand corner of the report window. Once you do that the filtering options will be available for use.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Peer-to-Peer Activity Diagnostic Report enables you to filter on such things as the session modality (for example, instant messaging, file transfer, or application sharing). You can also choose how data should be grouped. In this case, calls are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Peer-to-Peer Activity Diagnostic Report.

Peer-to-Peer Activity Diagnostic Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is

	displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or click **[All]** to view data for all the pools. This drop-down list is automatically populated for you based on the records in the database.
Modality	Indicates the type of communication activity that took place. Select one of the following: • [All] • Instant messaging • File transfer • Application sharing • Audio • Video

Metrics (per modality)

The following table lists the information provided in the Peer-to-Peer Activity Diagnostic Report for each modality.

Metrics (per modality)

Name	Can you sort on this item?	Description
Success volume	No	Total number of successful peer-to-peer sessions.
Success percentage	No	Percentage of peer-to-peer sessions that completed with significant problems. Calculated by dividing the Success volume by the Total sessions.
Expected failure volume	No	Total number of sessions where an "expected failure" occurred. An expected failure is a failure that is expected to happen. For example, if a user has set his or her status to Do Not Disturb you would expect any call to that user to fail.
Expected failure percentage	No	Percentage of peer-to-peer sessions that experienced an expected error. Calculated by dividing the Expected failure volume by the Total sessions.
Unexpected failure volume	No	Total number of sessions where an "unexpected failure" occurred.

		An unexpected failure is a failure that occurs in what would appear to be an otherwise healthy system. For example, a call should not be terminated if the caller is placed on hold. If that occurs, that would be flagged as an unexpected failure.
Unexpected failure percentage	No	Percentage of peer-to-peer sessions that experienced an unexpected error. Calculated by dividing the Unexpected failure volume by the Total sessions.
Total sessions	No	Total number of sessions, including successful sessions, failed sessions (both expected failures and unexpected failures), and uncategorized sessions.

1.7.20.4.4.3 Conference Diagnostic Report

Conference Diagnostic Report

Monitoring and Health Configuration > Using Monitoring Reports > Call Diagnostic Reports >

***Topic Last Modified:** 2012-10-22*

The Conference Diagnostic Report provides information about the success and failure of all conferencing sessions. Note that Microsoft Lync Server distinguishes between different kinds of failure:

- **Expected failure**. An expected failure is typically a failure only in the most technical sense. For example, suppose someone starts a conference but hangs up before anyone can join. Technically that's a failure: the conference was initiated, but not completed. However, that's a failure that you would expect to happen: if the organizer cancels the conference before anyone can join then you would not expect that conference to be completed.
- **Unexpected failure**. An unexpected error is exactly what the name implies: an error that, based on the circumstances, you would not expect to occur. For example, suppose a conference could not be held because the organizer's meeting policy could not be retrieved. That's an unexpected error: after all, you should always be able to retrieve a user's meeting policy.

Note that the Success, Expected failure, and Unexpected failure metrics might not add up to the Total sessions metric. For example, you might see the following values in the Report:

Successes	Expected failures	Unexpected failures	Total sessions
2024	469	16	2521

If you add 2024 + 469 + 16 you get a total of 2,509 sessions and yet, the Total sessions column shows a total of 2,521 sessions. The "missing" 12 sessions for are sessions that the system was unable to categorize as successful or unsuccessful. That will sometimes be the case when a third-party product introduces a new diagnostic code that is unfamiliar to Monitoring Server. When that happens, calls made using that product, and reporting that diagnostic code, cannot always be categorized as being a Success, an Expected failure, or an Unexpected failure.

Accessing the Conference Diagnostic Report

The Conference Diagnostic Report is accessed from the Monitoring Reports home page. You can access the Failure Distribution Report by clicking either of the following metrics:

- Unexpected failure volume
- Expected failure volume

Making the Best Use of the Conference Diagnostic Report

The Conference Diagnostic Report includes a series of graphs. Each of the columns shown in the graph is actually a hyperlink. If you click a column, you'll drill down to the Failure Distribution Report for that time period and that conference type.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Conference Diagnostic Report enables you to filter on such things as the type of conference being conducted (for example, a Focus-based conference) or by the Edge Server used in the conference. You can also choose how data should be grouped. In this case, conferences are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Conference Diagnostic Report.

Conference Diagnostic Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012

	Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) • Monthly (a maximum of 12 months can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or click **[All]** to view data for all the pools. This drop-down list is automatically populated for you based on the records in the database.
Conference sessions	Indicates the type of conferencing session. Select one of the following: • [All] • Focus sessions • All MCU sessions • IM conferencing • Application sharing • A/V conferencing

Metrics

The following table lists the information provided in the Conference Diagnostic Report for each type of conferencing session.

Conference Diagnostic Report Metrics

Name	Can you sort on this item?	Description
Success volume	No	Total number of successful conferences.
Success percentage	No	Percentage of conferences that completed with significant problems. Calculated by dividing the Success volume by the Total sessions.
Expected failure volume	No	Total number of conferences where an "expected failure" occurred. An expected failure is a failure that is expected to happen. For example, if a user has set his or her status to Do Not Disturb you would expect any call to that user to fail.
Expected failure percentage	No	Percentage of conferences that experienced an expected error. Calculated by dividing the Expected failure volume by the Total sessions.
Unexpected failure volume	No	Total number of conferences where an "unexpected failure" occurred. An unexpected failure is a failure that occurs in what would appear to be an otherwise healthy system. For example, a call should not be terminated if the caller is placed on hold. If that occurs, that would be flagged as an unexpected failure.
Unexpected failure percentage	No	Percentage of conferences that experienced an unexpected error. Calculated by dividing the Unexpected failure volume by the Total sessions.
Total sessions	No	Total number of conferences, including successful conferences, failed

		conferences (both expected failures and unexpected failures), and uncategorized conferences.

1.7.20.4.4.4 Top Failures Report

Top Failures Report

Monitoring and Health Configuration > Using Monitoring Reports > Call Diagnostic Reports >

Topic Last Modified: *2012-10-01*

The Top Failures Report provides a look at the most-commonly reported failures and their trends over time. Failures are based on a combination of the following two metrics:

- **Diagnostic ID**. Unique identifier (in the form of an ms-diagnostics header) that is attached to a SIP message. Diagnostic IDs provide information useful in troubleshooting call-related problems.
- **Response code**. Response codes are used in SIP communication sessions to respond to SIP requests. For example, suppose Ken sends the INVITE request to Pilar Ackerman (that is, suppose Ken Myer calls Pilar Ackerman). If Pilar answers, her phone will send the response code 200 (OK), letting Ken's phone know that Pilar has answered. The Top Failures Report only includes response codes that were sent in response to a call failure; Lync Server does not keep track of all the response codes issued during the course of a call.

Information is reported not only for the total number of sessions where a failure occurred but also for the total number of users who were impacted by the failure.

Accessing the Top Failures Report

The Top Failures Report is accessed from the Monitoring Reports home page. Clicking the Reported sessions metric will take you to the Failure Distribution Report.

Making the Best Use of the Top Failures Report

The Top Failures Report is unusual in one regard: it allows you to filter on as many as 5 diagnostic IDs at once. (Typically you can only filter on one item – such as one user SIP address – at a time.) To filter on multiple diagnostic IDs, simply enter each ID in the Diagnostic IDs box, separating the IDs by using commas. (If you want to, you can leave a blank space after each comma.) For example:

1011, 2412, 1033, 52116, 1008

Do that, and only failed calls that reported at least one of those five diagnostic IDs will be displayed.

If you hold your mouse over a Response code you'll see a tooltip that tells you what the Response code in question means. For example, if you hold the mouse over the Response code 486 you'll see this message:

Busy Here.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Top Failures Report enables you to filter the returned data based on such things as the activity type (peer-to-peer session or conferencing session) or by the SIP response code that accompanied the failed session. You can also choose how data should be grouped. In this case, usages are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Top Failures Report.

Top Failures Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Activity type	Type of activity. Select one of the following: • [All] • Peer-to-peer

	- Conference
Modality	At this time the only option available is **[All]**.
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or click **[All]** to view data for all the pools. This drop-down list is automatically populated for you based on the records in the database.
Category	Type of failure experienced. Select one of the following: • Both expected and unexpected failure • Unexpected failure An "expected failure" is a failure that is expected to happen. For example, if a user has set his or her status to Do Not Disturb you would expect any call to that user to fail. An "unexpected failure" is a failure that occurs in what would appear to be an otherwise healthy system. For example, a call should not be terminated if the caller is placed on hold. If that occurs, that would be flagged as an unexpected failure.
Response code	SIP response code sent when the conference failed. Enter the entire response code For example: 400
Diagnostic ID	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors. Diagnostics headers are optional (it is possible to have SIP sessions that do not include these headers), and diagnostic IDs are reported only for sessions that experienced problems of some kind.

Metrics

The following table lists the information provided in the Top Failures Report.

Top Failures Report Metrics

Name	Can you sort on this item?	Description
Rank	Yes	Relative rank based on the number of reported sessions.
Reported sessions	Yes	Total number of failed sessions based on diagnostic ID and SIP response code.
Users impacted	Yes	Total number of users affected by the failed session.
Failure information	No	Detailed information about

		the failure, including diagnostic ID, SIP response code, and description of why the session failed.
Trend in the past	No	Graphs failed sessions over time.

1.7.20.4.4.5 Failure Distribution Report

Failure Distribution Report

Monitoring and Health Configuration > Using Monitoring Reports > Call Diagnostic Reports >

Topic Last Modified: *2012-10-21*

The Failure Distribution Report ranks failed sessions in the following categories:

- Top diagnostic reasons
- Top modalities
- Top pools
- Top sources
- Top components
- Top from users
- Top to users
- Top from user agents

You can use these categories to determine exactly where a problem is occurring and, in some cases, why the problem is occurring. For example, suppose you recorded 242 failed audio/video sessions during a given day. If you look at the Failure Distribution Report, it might show that 237 of those failed sessions took place in your Dublin pool. That gives you a good place to start when it comes to tracking down and diagnosing the causes behind those failures. If you click on the Dublin pool under the **Top pools** category, you will see a Failure Distribution Report just for that pool. You can then begin analyzing why the Dublin pool was experiencing so many difficulties.

Viewing the Failure Distribution Report

You can access the Failure Distribution Report from any of the following reports by clicking either the **Expected failure volume** or the **Unexpected failure volume** metric:

- Top Failures Report
- Conference Diagnostic Report
- Peer-to-Peer Activity Diagnostic Report

From the Failure Distribution Report, you can click any of the following metrics to view the Failure List Report:

- Top diagnostic reasons (sessions)
- Top modalities (sessions)
- Top pools (sessions)
- Top sources (sessions)
- Top components (sessions)
- Top from users (sessions)
- Top to users (sessions)
- Top from user agents (sessions)

Using the Failure Distribution Report

Depending on your monitor size and screen resolution, it's possible that some of the data shown in the Failure Distribution Report might be truncated when you view it onscreen. This is especially true for metrics such as user agents, which can have very long labels. For example, a user agent with a name like "UCCAPI/4.0.7400.0 OC/4.0.7400.0 (Microsoft Lync 2013)" might only partially appear onscreen:

UCCAPI/4.0.7400.0 OC/4.0.7400.0 (Microsoft Ly...

Fortunately, you can see the entire label simply by holding your mouse over the truncated value.

One interesting metric that you can filter on by using the Failure Distribution Report is Diagnostic ID. If you see the same Diagnostic ID cropping up in other reports you can filter on that ID in the Failure Distribution Report and get a very detailed look at exactly where, and how often, that ID has been reported during a failed session.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Failed Distribution Report enables you to filter on such things as the activity type (peer-to-peer session or conferencing session) or by the diagnostic ID that accompanied each failed session.

The following table lists the filters that you can use with the Failure Distribution Report.

Failure Distribution Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012

	To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Pool	Fully qualified domain name (FQDN) of the Registrar pool or Edge Server. You can either select an individual pool or click **[All]** to view data for all the pools. This drop-down list is automatically populated for you based on the records in the database.
Activity type	Type of activity to filter on. Select one of the following: • [All] • Peer-to-peer • Conference
Session category	Indicates whether the activity in question succeeded or failed. Select one of the following: • [All] • Success • Expected failure • Unexpected failure An "expected failure" is a failure that is expected to happen. For example, if a user has set his or her status to Do Not Disturb you would expect any call to that user to fail. An "unexpected failure" is a failure that occurs in what would appear to be an otherwise healthy system. For example, a call should not be terminated if the caller is placed on hold. If that occurs, that would be flagged as an unexpected failure.
Diagnostic ID	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors. Diagnostics headers are optional (it is possible to have SIP sessions that do not include these headers), and diagnostic IDs are reported only for sessions that experienced problems of some kind.

Metrics for Top Diagnostic Reasons

The following table lists the information provided in the Failure Distribution Report based on the most frequently reported diagnostic ID.

Metrics for Top Diagnostic Reasons

Name	Can you sort on this item?	Description
Rank	No	Relative ranking of failed sessions based on diagnostic

		IDs. The diagnostic ID is a unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors.
Top diagnostic reasons	No	Diagnostic ID generated in a session.
Sessions	No	Total number of failed sessions where the specified diagnostic ID was generated.

Metrics for Top Modalities

The following table lists the information provided in the Failure Distribution Report based on the session modalities that experienced the most failures.

Metrics for Top Modalities

Name	Can you sort on this item?	Description
Rank	No	Relative ranking based of failed session based on session type (for example, an audio/video conference or a peer-to-peer file transfer session).
Top modalities	No	Session type.
Sessions	No	Total number of failed sessions involving the specified modality.

Metrics for Top Pools

The following table lists the information provided in the Failure Distribution Report based on the pools that experienced the most failures.

Metrics for Top Pools

Name	Can you sort on this item?	Description
Rank	No	Relative ranking of failed sessions based on the Registrar pool or Edge Server where the session was conducted.
Top pools	No	Name of the Registrar pool or Edge Server.
Sessions	No	Total number of failed sessions per Registrar pool or Edge Server.

Metrics for Top Sources

The following table lists the information provided in the Failure Distribution Report based on the computers that experienced the most failures.

Metrics for Top Sources

Name	Can you sort on this item?	Description
Rank	No	Relative ranking failed sessions per computer.
Top sources	No	Name of the computer involved in the failed session.
Sessions	No	Total number of failed sessions per computer.

Metrics for Top Components

The following table lists the information provided in the Failure Distribution Report based on the Microsoft Lync Server 2010 components that experienced the most failures.

Metrics for Top Components

Name	Can you sort on this item?	Description
Rank	No	Relative ranking of failed sessions based on Lync Server 2010 component (for example, ExumRouting, GroupChat, or MediationServer).
Top components	No	Name of the component involved in the failed session.
Sessions	No	Total number of failed sessions per component.

Metrics for Top From Users

The following table lists the information provided in the Failure Distribution Report based on users who experienced the most failures when they tried to call someone else (known as "From" users).

Metrics for Top From Users

Name	Can you sort on this item?	Description
Rank	No	Relative ranking of failed sessions based on the user who was invited to join the session.
Top from users	No	SIP address of the user invited to join the session.
Sessions	No	Total number of failed sessions per user.

Metrics for Top To Users

The following table lists the information provided in the Failure Distribution Report based on the users who experienced the most failures when another user tried to call them (known as "To" users).

Name	Can you sort on this item?	Description
Rank	No	Relative ranking of failed sessions based on the user who initiated the session.
Top to users	No	SIP address of the user who initiated the session.
Sessions	No	Total number of failed sessions per user.

Metrics for Top User Agents

The following table lists the information provided in the Failure Distribution Report based on the endpoint software that experienced the most failures.

Metrics for Top User Agents

Name	Can you sort on this item?	Description
Rank	No	Relative ranking of failed sessions based on the user agent (software) involved in the session. For example: RTCC/4.0.0.0 Inbound Routing/4.0.0.0.
Top user agents	No	Name of the user agent involved in the failed session.
Sessions	No	Total number of failed sessions per user agent.

1.7.20.4.4.6 Failure List Report

Failure List Report

Monitoring and Health Configuration > Using Monitoring Reports > Call Diagnostic Reports >

Topic Last Modified: *2012-07-02*

The Failure List report provides information about the individual participants who took part in a failed peer-to-peer or conferencing session. This information includes the URI of the user who experienced the problem, as well as the SIP Response code and Diagnostic ID associated with the failure.

Accessing the Failure List Report

The Failure List Report is accessed by clicking any of the following metrics on the Failure Distribution Report:

- Top diagnostic reasons (sessions)
- Top modalities (sessions)

- Top pools (sessions)
- Top sources (sessions)
- Top components (sessions)
- Top from users (sessions)
- Top to users (sessions)
- Top from user agents (sessions)

From the Failure List Report you can access the Peer-to-Peer Session Detail Report by clicking the Session detail metric for a peer-to-peer session. You can also access the Conference Detail Report by clicking the Conference metric for a conference.

Making the Best Use of the Failure List Report

In the Failure List Report, you can view a description for each Response code or each Diagnostic ID simply by holding your mouse over that value. For example, if you hold your mouse over Diagnostic ID 7025 you'll see the following displayed in a tooltip:

Internal server error creating media for user.

It's important to note that the Failure List Report does not provide a straightforward way to directly retrieve a list of all the users who participated in at least one failed session, nor does it provide a way to determine which users were most-often involved in a failed session. (For one thing, the Failure List Report has no filtering capabilities.) However, if you export the data and then convert it to a comma-separated values file, you can use Windows PowerShell to find the answers to questions like those. For example, suppose you save the data to a .CSV file named C:\Data\Failure_List.csv. Based on the data saved in that file, this command lists all the users who were involved in at least one failed session:

```
$failures = Import-Csv -Path " C:\Data\Failure_List.csv"
$failure |Sort-Object "From user" | Select-Object "From user" -Unique
```

That command will return a list similar to this:

```
From user
----
Pilar.Ackerman@litwareinc.com
Henrik.Jensen@litwareinc.com
Gilead.Amosnino@litwareinc.com
David.Ahs@litwareinc.com
Ken.Myer@litwareinc.com
```

These two commands report back the total number of failed sessions that each user was involved in:

```
$failures = Import-Csv -Path "C:\Data\Failure_List.csv"
$failures | Group-Object "From user" | Select-Object Count, Name | Sort-Object -P
```

That will return data similar to this:

```
Count    Name
 -----    ----
    20    Pilar.Ackerman@litwareinc.com
    20    David.Ahs@litwareinc.com
    16    Gilead.Amosnino@litwareinc.com
    16    Ken.Myero@litwareinc.com
    14    Henrik.Jensen@litwareinc.com
```

Filters

None. You cannot filter the Failure List Report.

Metrics

The following table lists the information provided in the Failure List Report for each failed call.

Failure List Report Metrics

Name	Can you sort on this item?	Description
Reported time	No	Date and time the report was recorded.
Request	No	SIP request type that failed. For example, INVITE or BYE.
Response code	No	SIP response code sent when the conference failed.
Diagnostic ID	No	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors.
Join cost time (ms)	No	Amount of time (in milliseconds) required for the user to join the conference.
From user	No	SIP address of the user who initiated the call.
From user agent	No	Software used by the endpoint of the user who initiated the call.
To user	No	SIP address of the user who was being called.

1.7.20.4.4.7 Diagnostic Report

Diagnostic Report

Monitoring and Health Configuration > Using Monitoring Reports > Call Diagnostic Reports >

Topic Last Modified: *2012-07-02*

The Diagnostic Report provides diagnostic and troubleshooting information for a failed session. This information includes both the Diagnostic ID and the Diagnostic header that were reported when the session failed. The Diagnostic ID is a unique identifier (in the form of an ms-diagnostics header) that gets attached to a SIP message, while the Diagnostic header provides an accompanying description for the Diagnostic ID. The report might also contain valuable troubleshooting details that are known by the reporting component. For example:

- The cause code provided by the PSTN gateway that generated the failure. When an outgoing call fails on the PSTN network, an ISDN User Part (ISUP) cause code is automatically generated. For example, a PSTN gateway might send cause code 34 to indicate that no circuit or channel was available for

completing the call.
- Peer FQDN, port, and Winsock errors for connectivity failures.
- Names being looked up for DNS resolution failures. DNS resolution takes place any time a client contacts a name server and requests the IP address that corresponds to specified device name.

Accessing the Diagnostic Report

The Diagnostic Report can be accessed by clicking the Diagnostic Report (Detail) metric on either the Peer-to-Peer Session Detail Report or the Conference Detail Report.

Filters

None. You cannot filter the Diagnostic Report.

Metrics

The following table lists the information provided in the Diagnostic Report for each session.

Diagnostic Report Metrics

Name	Can you sort on this item?	Description
Report time	No	Date and time that the report was recorded.
Response code	No	SIP response code sent when the session failed.
Request type	No	SIP request type that failed. For example, INVITE, BYE, or SERVICE.
Source	No	Source of the error.
From user URI	No	SIP address of the user who initiated the session.
From user agent	No	Software used by the endpoint of the user who initiated the session.
Diagnostic ID	No	Unique identifier (in the form of an ms-diagnostics header) attached to a SIP message that often provides information useful in troubleshooting errors.
Content type	No	Type of media content that failed. For example, a common content type is Application/sdp. Session Description Protocol (SDP) is a standard Internet protocol used for session announcements, session invitations, and other forms

		of multimedia session initiation.
Application	No	Application involved in the error.
To user URI	No	SIP address of the user who was invited to the session.
Conference join times (ms)	No	Amount of time (in milliseconds) it took for the user to join the conference.
Diagnostic header	No	Diagnostic ID description.

1.7.20.4.5 Media Quality Diagnostic Reports

Media Quality Diagnostic Reports

Operations > Monitoring and Health Configuration > Using Monitoring Reports >

Topic Last Modified: *2013-02-22*

The Media Quality Diagnostic Reports provide information about call quality, and diagnostic and troubleshooting information for failed calls.

- Media Quality Summary Report Provides overall quality data for different endpoint types, including Enterprise Voice peer-to-peer calls, Enterprise Voice conference calls, and calls that rely, at least in part, on the public switched telephone network (PSTN).
- Media Quality Comparison Report Provides a comparison of call quality values for different types of audio calls (for example, calls made over a wireless network vs. calls made across a wired connection).
- Server Performance Report Lists the servers that have experienced the most problems, based on measurements of such key quality metrics as degradation, packet loss, and jitter.
- Location Report Provides a list of network locations and a summary of the media quality of the calls that occur at each location. For purposes of this report, locations are based on IP subnets.
- Device Report Provides a summary of devices that are used for Enterprise Voice calls and it includes the average media quality of the calls by device.
- Call List Report Provides detailed information about phone calls made or received within your organization.
- Call Detail Report Provides detailed information about phone calls made from or received within your organization.
- Server Media Quality Trend Report Provides a way for you to graphically compare up to 5 servers on Quality of Experience metrics such as call volume, poor call percentage, packet loss, and jitter.
- The Media Quality Metrics Distribution Report Provides a graph that shows the distribution values for a Quality of Experience metric such as jitter or packet loss.
- Location Trend Report Provides call quality trend information for network locations.

1.7.20.4.5.1 Media Quality Summary Report

Media Quality Summary Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic Reports >

Topic Last Modified: *2012-10-22*

The Media Quality Summary Report is perhaps your best bet for analyzing call quality in your organization: this report provides detailed Quality of Experience (QoE) call metrics broken down into the following categories:

- UC Peer to Peer Calls (such as a Microsoft Lync 2013 to Microsoft Lync 2013 call)
- UC Conference Sessions
- PSTN Conference Sessions
- PSTN Calls: Media Bypass
- PSTN Calls (Non-Bypass): UC Leg
- PSTN Calls (Non-Bypass): Gateway Leg
- Other Call Types

When you first open the report, you see summary information for each of these categories. Without leaving the report, you can expand each category to look at subcategories such as calls made from Office Communicator 2007 R2 to Lync 2013. In turn, you can then drill down into these subcategories to see details about each call made within that subcategory.

In Microsoft Lync Server 2013 the Media Quality Summary Report further breaks the data down into three call types: audio calls, video calls, and application sharing calls. Each call type has its own section in the report, and its own custom set of call metrics.

The Media Quality Summary Report also allows you to apply filters that enable you to compare the call quality of wired calls vs. wireless calls, internal calls vs. external calls, and VPN calls vs. non-VPN calls.

Accessing the Media Quality Summary Report

The Media Quality Summary Report is accessed from the Monitoring Reports home page. You can drill down to the Call List Report by clicking either of the following metrics:

- Call volume
- Poor call percentage

In addition, you can access the Media Quality Metrics Distribution Report by clicking any of the following audio call metrics:

- Round trip (ms)
- Degradation (MOS)
- Packet loss
- Jitter (ms)
- Healer concealed ratio
- Healer stretched ratio
- Healer compressed ratio

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Media Quality Summary Report enables you to filter the returned data by such things as access type (that is, interval access vs.

external access) or by wired/wireless network connection. You can also choose how data should be grouped. In this case, calls are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Media Quality Summary Report.

Media Quality Summary Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Access type	Indicates whether the client was logged on to the internal network or the external network when the call was placed. Select one of the following: • [All] • Internal • External
Network type	Indicates the type of network the client was connected to when the call was placed. Select one of the following:

	- [All] - Wired - Wireless
VPN	Indicates whether an external client was using a virtual private network (VPN) connection when the call was placed. Select one of the following: - [All] - VPN - Non-VPN

Metrics

The following table lists the information provided in the Media Quality Summary Report.

Media Quality Summary Report Metrics: Audio Call Summary

Name	**Can you sort on this item?**	**Description**
Call type/Endpoint type	No	When you click this item, the report shows detailed information about calls based on that type. Call types include: - UC Peer-to-Peer Calls - UC Conference Sessions - PSTN Conference Sessions - PSTN Calls: Media Bypass - PSTN Calls (Non-Bypass): UC Leg - PSTN Calls (Non-Bypass): Gateway Leg - Other Call Types
Call volume	No	Total number of calls per call type.
Poor call percentage	No	Total number of calls classified as poor. A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Call volume (wireless call)	No	Total number of calls that used a wireless connection.
Call volume (VPN call)	No	Total number of calls that used a VPN connection.
Call volume (external call)	No	Number of calls that used an external connection (that is, a connection outside the internal network).
Round trip (ms)	No	Average amount of (in milliseconds) required for a real-time transport protocol (RTP) packet to travel to another endpoint and then back. Round-trip times of 100 milliseconds or less are considered of acceptable quality. High round-trip values can be caused by international call routing, a routing

		misconfiguration, or an overloaded media server. High round-trip times result in difficulties with two-way, real-time audio conversations.
Degradation (MOS)	No	Average amount of mean opinion score (MOS) degradation experienced during a call. Degradation values can range from a low of 0.0 to a high of 5.0. A value of 0.5 or less represents acceptable degradation. Historically, mean options scores were calculated by having users rate the quality of a call on a scale of 1-to-5. In Lync Server, Lync Server uses a set of algorithms to predict how users would have rated a call. High degradation values can be caused by congestion, lack of bandwidth, wireless congestion or interference, or an overloaded media server or endpoint. High degradation results in distorted or lost audio.
Packet loss	No	Average rate of RTP packet loss. (Packet loss occurs when RTP packets, a protocol used for transmitting audio and video across the Internet, failed to reach their destination.) High loss rates are generally caused by congestion, lack of bandwidth, wireless congestion or interference, or an overloaded media server. Packet loss typically results in distorted or lost audio.
Jitter (ms)	No	Average jitter detected between RTP packet arrivals. (Jitter is a measure of the "shakiness" of a call.) High jitter values are typically caused by congestion or an overloaded media server, and result in distorted or lost audio.
Healer concealed ratio	No	Average ratio of concealed audio samples to the total to the total number of samples. (A concealed audio sample is a technique used to smooth out the abrupt transition that would usually be caused by dropped network packets.) High values indicate significant levels of loss concealment applied caused by packet loss or jitter, and results in distorted or lost audio.
Healer stretched ratio	No	Average ratio of stretched audio samples to the total to the total number of samples. (Stretched audio

		is audio that has been expanded to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample stretching caused by jitter, and result in audio sounding robotic or distorted.
Healer compressed ratio	No	Average ratio of compressed audio samples to the total number of samples. (Compressed audio is audio that has been compressed to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample compression caused by jitter, and result in audio sounding accelerated or distorted.

Media Quality Summary Report Metrics: Video Call Summary

Name	Can you sort on this item?	Description
Call type/Endpoint type	No	When you click this item, the report shows detailed information about calls based on that type. Call types include: • UC Peer-to-Peer Calls • UC Conference Sessions • PSTN Conference Sessions • PSTN Calls: Media Bypass • PSTN Calls (Non-Bypass): UC Leg • PSTN Calls (Non-Bypass): Gateway Leg • Other Call Types
Call volume	No	Total number of calls per call type.
Poor call percentage	No	Total number of calls classified as poor. A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Call volume (wireless call)	No	Total number of calls that used a wireless connection.
Call volume (VPN call)	No	Total number of calls that used a VPN connection.
Call volume (external call)	No	Number of calls that used an external connection (that is, a connection outside the internal network).
Avg bit-rate (Kbits/s)	No	Average video bit rate (in kilobits per second).
Low bit-rate %	No	Percentage of the call where the bit rate was low.

Outbound packet loss	No	Real-Time Transport Protocol (RTP) packet loss for outbound packets. (Packet loss occurs when RTP packets, a protocol used for transmitting audio and video across the Internet, failed to reach their destination.) High loss rates are generally caused by congestion, lack of bandwidth, wireless congestion or interference, or an overloaded media server. Packet loss typically results in distorted or lost audio.
Frozen frame %	No	Percentage of "frozen" frames. In a frozen frame, the video stops advancing while the audio portion of the call continues.
Outbound avg frame rate	No	Average frame rate for outbound transmissions during the call.
Inbound avg frame rate	No	Average frame rate for incoming transmissions during the call.
Inbound low frame rate %	No	Percentage of the call where the bit rate for incoming video was low.
Client health %		Indicates the relative health of the client device during the call.

Media Quality Summary Report Metrics: Application Sharing Call Summary

Name	Can you sort on this item?	Description
Call type/Endpoint type	No	When you click this item, the report shows detailed information about calls based on that type. Call types include: • UC Peer-to-Peer Calls • UC Conference Sessions • PSTN Conference Sessions • PSTN Calls: Media Bypass • PSTN Calls (Non-Bypass): UC Leg • PSTN Calls (Non-Bypass): Gateway Leg • Other Call Types
Call volume	No	Total number of calls per call type.
Poor call percentage	No	Total number of calls classified as poor. A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Call volume (wireless call)	No	Total number of calls that used a wireless connection.
Call volume (VPN call)	No	Total number of calls that used a VPN

		connection.
Call volume (external call)	No	Number of calls that used an external connection (that is, a connection outside the internal network).
Jitter (ms)	No	Average jitter detected between RTP packet arrivals. (Jitter is a measure of the "shakiness" of a call.) High jitter values are typically caused by congestion or an overloaded media server, and result in distorted or lost audio.
Avg. relative one way	No	Average relative one-way delay between two media endpoints. This is a single-hop latency measure.
Avg. RDP tile processing latency	No	The average RDP tile processing latency in the AS Conferencing Server over the duration of the viewing session. This metric does not cover network latency. A high average reflects a longer delay in the viewing experience. An overloaded conferencing server may experience higher average delays.
Total spoiled tile %	No	Total percentage of spoiled RDP tiles.

1.7.20.4.5.2 Media Quality Comparison Report

Media Quality Comparison Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic Reports >

Topic Last Modified: *2012-10-01*

The Media Quality Comparison Report enables you to compare call quality values for different types of audio calls (for example, calls made over a wireless network vs. calls made across a wired connection).

Accessing the Media Quality Comparison Report

The Media Quality Comparison Report is accessed from the Monitoring Reports home page.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. The following table lists the filters that you can use with the Media Quality Comparison Report.

Media Quality Comparison Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Calls	Type of call to be used as the main comparison item. Allowed values are: • [All] • External • Internal • VPN • Non-VPN • Wired • Wireless • External and wired • External and wireless • External and VPN • External and non-VPN • Internal and wired • Internal and wireless

Compare with calls	Type of call to be used as the secondary comparison item. Allowed values are: • [All] • External • Internal • VPN • Non-VPN • Wired • Wireless • External and wired • External and wireless • External and VPN • External and non-VPN • Internal and wired • Internal and wireless
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 7/7/2012 and an end date of 2/28/2012, data is displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).

Metrics

The following table lists the information provided in the Media Quality Comparison Report.

Media Quality Comparison Report Metrics

Name	**Can you sort on this item?**	**Description**
Call volume	No	Total number of calls.
Degradation (MOS)	No	Average amount of MOS (mean option score) degradation experienced during a call. Degradation values can range from a low of 0.0 to a high of 5.0; a value of 0.5 or less represents acceptable degradation. Historically, mean options scores were calculated by having users rate the quality of a call on a scale of 1-to-5. Lync Server uses a set of algorithms to predict how users would

		have rated a call. High degradation values can be caused by congestion; lack of bandwidth; wireless congestion or interference, or an overloaded media server or endpoint. High degradation results in distorted or lost audio.
Poor call percentage	No	The total number of calls classified as poor. A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Round trip (ms)	No	Average amount of (in milliseconds) required for a Real-Time Transport Protocol packet to travel to another endpoint and then back. Round-trip times of 200 milliseconds or less are considered of acceptable quality. High round-trip values can be caused by international call routing; a routing misconfiguration; or an overloaded media server. High round-trip times result in difficulties with two-way, real-time audio conversations.
Packet loss	No	Average rate of Real-Time Transport Protocol (RTP) packet loss. (Packet loss occurs when RTP packets, a protocol used for transmitting audio and video across the Internet, failed to reach their destination.) High loss rates are generally caused by congestion; lack of bandwidth; wireless congestion or interference; or an overloaded media server. Packet loss typically results in distorted or lost audio.
Jitter (ms)	No	Average jitter detected between RTP packet arrivals. (Jitter is a measure of the "shakiness" of a call.) High

		jitter values are typically caused by congestion or an overloaded media server, and result in distorted or lost audio.
Healer concealed ratio	No	Average ratio of concealed audio samples to the total to the total number of samples. (A concealed audio sample is a technique used to smooth out the abrupt transition that would usually be caused by dropped network packets.) High values indicate significant levels of loss concealment applied caused by packet loss or jitter, and results in distorted or lost audio.
Healer stretched ratio	No	Average ratio of stretched audio samples to the total to the total number of samples. (Stretched audio is audio that has been expanded to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample stretching caused by jitter, and result in audio sounding robotic or distorted.
Healer compressed ratio	No	Average ratio of compressed audio samples to the total number of samples. (Compressed audio is audio that has been compressed to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample compression caused by jitter, and result in audio sounding accelerated or distorted.

1.7.20.4.5.3 Server Performance Report

Server Performance Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic Reports >

Topic Last Modified: *2012-10-01*

The Server Performance Report provides a list of Microsoft Lync Server 2013 servers that have experienced the highest-percentage of poor calls. The report breaks down servers by server type, reporting separate statistics for the following types:

- Mediation Server
- A/V Conferencing Server
- A/V Edge Server
- Gateway (Mediation Server)
- Gateway (Mediation Server bypass)
- Video (including video metrics for A/V Conferencing servers and A/V Edge servers)
- Application Sharing (including application sharing metrics for A/V Conferencing servers and A/V Edge servers)

It's important to note that the ranking shown in this report as relative rankings. For example, suppose your worst-performing server had one poor call among its 1,000 placed calls. That's a more-than-acceptable percentage of .1%. However, if that's the worst-performing server you have (that is, if all your other servers have a poor call percentage even lower than .1%), then that server will still appear on the Server Performance Report.

Accessing the Server Performance Report

The Server Performance Report is accessed from the Monitoring Reports home page. You can drill down to the Call List Report by clicking either of the following metrics:

- Call volume
- Poor call percentage

In addition, you can drill down to the Server Media Quality Trend Report by clicking the following metric:

- Trend

Making the Best Use of the Server Performance Report

The Server Performance Report provides a number of ways to filter data; for example, you can filter on network type (calls made from a wired connection vs. calls made from a wireless connection) and access type (calls made from inside the firewall vs. calls made from outside the firewall). It's a good idea when viewing the server performance report to make use of these filters. For example, suppose you have a Mediation Server that has a poor call percentage of 3.24%. If you look solely at wireless calls, that same server might have a poor call percentage approaching 20%. That means that the server was having difficulty with wireless calls, a problem that is partially obscured because the server was not having problems with wired calls.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Server Performance Report enables you to do such things as filter the returned data by server type or by network type (that is, wired or wireless). You can also choose how data should be grouped. In this case, data is grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Server Performance Report.

Server Performance Report Filters

Name	Description

From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Server type	Indicates the type of server whose performance should be reported. Select one of the following: 1.[All] 2.Mediation Server 3.A/V Conferencing Server 4.A/V Edge Server
Top N	Indicates the number of servers (based on their poor call percentage) to be displayed in each category. For example, if you select **5** then the five poorest-performing servers are displayed. Select one of the following: 1.[All] 2.5 3.10
Access type	Indicates whether the client was logged on to the internal network or the external network when the call was placed. Select one of the following: 1.[All] 2.Internal

	3.External
Network type	Indicates the type of network the client was connected to when the call was placed. Select one of the following: 1.[All] 2.Wired 3.Wireless
VPN	Indicates whether an external client was using a virtual private network (VPN) connection when the call was placed. Select one of the following: 1.[All] 2.VPN 3.Non-VPN

Metrics

The following table lists the information provided in the Server Performance Report.

Server Performance Report Metrics: Audio Call Summary

Name	Can Sort On	Description
Server	No	Name/IP address of the server.
Call volume	No	Total number of calls made.
Poor call percentage	No	Total number of calls classified as poor. A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Round trip (ms)	Yes	Average amount of (in milliseconds) required for a real-time transport protocol (RTP) packet to travel to another endpoint and then back. Round-trip times of 100 milliseconds or less are considered of acceptable quality. High round-trip values can be caused by international call routing; a routing misconfiguration; or an overloaded media server. High round-trip times result in difficulties with two-way, real-time audio conversations.
Degradation (MOS)	Yes	Average amount of mean opinion score (MOS) degradation experienced during a call. Degradation values can range from a low of 0.0 to a high of 5.0. A

		value of 0.5 or less represents acceptable degradation. Historically, mean options scores were calculated by having users rate the quality of a call on a scale of 1-to-5. In Lync Server, the Monitoring Server uses a set of algorithms to predict how users would have rated a call. High degradation values can be caused by congestion, lack of bandwidth, wireless congestion or interference, or an overloaded media server or endpoint. High degradation results in distorted or lost audio.
Packet loss	Yes	Average rate of real-time transport protocol (RTP) packet loss. (Packet loss occurs when RTP packets, a protocol used for transmitting audio and video across the Internet, failed to reach their destination.) High loss rates are generally caused by congestion, lack of bandwidth, wireless congestion or interference, or an overloaded media server. Packet loss typically results in distorted or lost audio.
Jitter (ms)	Yes	Average jitter detected between RTP packet arrivals. (Jitter is a measure of the "shakiness" of a call.) High jitter values are typically caused by congestion or an overloaded media server, and result in distorted or lost audio.
Healer concealed ratio	Yes	Average ratio of concealed audio samples to the total to the total number of samples. (A concealed audio sample is a technique used to smooth out the abrupt transition that would usually be caused by dropped network packets.) High values indicate significant levels of loss concealment applied caused by packet loss or jitter, and results in distorted or lost

		audio.
Healer stretched ratio	Yes	Average ratio of stretched audio samples to the total to the total number of samples. (Stretched audio is audio that has been expanded to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample stretching caused by jitter, and result in audio sounding robotic or distorted.
Healer compressed ratio	Yes	Average ratio of compressed audio samples to the total number of samples. (Compressed audio is audio that has been compressed to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample compression caused by jitter, and result in audio sounding accelerated or distorted.

Server Performance Report Metrics: Video Call Summary

Name	**Can you sort on this item?**	**Description**
Call type/Endpoint type	No	When you click this item, the report shows detailed information about calls based on that type. Call types include: • UC Peer-to-Peer Calls • UC Conference Sessions • PSTN Conference Sessions • PSTN Calls: Media Bypass • PSTN Calls (Non-Bypass): UC Leg • PSTN Calls (Non-Bypass): Gateway Leg • Other Call Types
Call volume	No	Total number of calls per call type.
Poor call percentage	No	Total number of calls classified as poor. A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Call volume (wireless call)	No	Total number of calls that used a wireless connection.
Call volume (VPN call)	No	Total number of calls that used a VPN connection.

Call volume (external call)	No	Number of calls that used an external connection (that is, a connection outside the internal network).
Avg bit-rate (Kbits/s)	No	Average video bit rate (in kilobits per second).
Low bit-rate %	No	Percentage of the call where the bit rate was low.
Outbound packet loss	No	Real-Time Transport Protocol (RTP) packet loss for outbound packets. (Packet loss occurs when RTP packets, a protocol used for transmitting audio and video across the Internet, failed to reach their destination.) High loss rates are generally caused by congestion; lack of bandwidth; wireless congestion or interference; or an overloaded media server. Packet loss typically results in distorted or lost audio.
Frozen frame %	No	Percentage of "frozen" frames. In a frozen frame, the video stops advancing while the audio portion of the call continues.
Outbound avg frame rate	No	Average frame rate for outbound transmissions during the call.
Inbound avg frame rate	No	Average frame rate for incoming transmissions during the call.
Inbound low frame rate %	No	Percentage of the call where the bit rate for incoming video was low.
Client health %		Indicates the relative health of the client device during the call.

Server Performance Report Metrics: Application Sharing Call Summary

Name	Can you sort on this item?	Description
Call type/Endpoint type	No	When you click this item, the report shows detailed information about calls based on that type. Call types include: • UC Peer-to-Peer Calls • UC Conference Sessions • PSTN Conference Sessions • PSTN Calls: Media Bypass • PSTN Calls (Non-Bypass): UC Leg • PSTN Calls (Non-Bypass): Gateway Leg • Other Call Types
Call volume	No	Total number of calls per call type.
Poor call percentage	No	Total number of calls classified as

		poor. A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Call volume (wireless call)	No	Total number of calls that used a wireless connection.
Call volume (VPN call)	No	Total number of calls that used a VPN connection.
Call volume (external call)	No	Number of calls that used an external connection (that is, a connection outside the internal network).
Jitter (ms)	No	Average jitter detected between RTP packet arrivals. (Jitter is a measure of the "shakiness" of a call.) High jitter values are typically caused by congestion or an overloaded media server, and result in distorted or lost audio.
Avg. relative one way	No	Average relative one-way delay between two media endpoints. This is a single-hop latency measure.
Avg. RDP tile processing latency	No	The average RDP tile processing latency in the AS Conferencing Server over the duration of the viewing session. This metric does not cover network latency. A high average reflects a longer delay in the viewing experience. An overloaded conferencing server may experience higher average delays.
Total spoiled tile %	No	Total percentage of spoiled RDP tiles.

1.7.20.4.5.4 Location Report

Location Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic Reports >

Topic Last Modified: *2012-10-01*

The Location Report provides information about call quality metrics grouped by network location (that is, by network subnet). If your users are experiencing problems with their calls, this report can help you determine if those problems are widespread or if they are largely confined to a given network segment.

Accessing the Location Report

The Location Report is accessed from the Monitoring Reports home page. You can drill down to the Call List Report by clicking either of the following metrics:

- Call volume
- Poor call percentage

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Location Report enables you to filter on such things as the location where a call was originated or whether the call took place on a wireless or a wired connection. You can also choose how data should be grouped. In this case, calls are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Location Report.

Location Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Caller location	IP subnet of the user who placed the call. You can only select **[All]** to indicate all subnets.
Callee location	IP subnet of the user who received the call. You can only select **[All]** to indicate all subnets.

Network type	Indicates the type of network the client was connected to when the call was placed. Select one of the following: 1. [All] 2. Wired 3. Wireless
VPN	Indicates whether an external client was using a virtual private network (VPN) connection when the call was placed. Select one of the following: 1. [All] 2. VPN 3. Non-VPN

Metrics

The following table lists the information provided in the Location Report.

Location Report Metrics

Name	Can you sort on this item?	Description
Caller subnet	No	IP subnet of the user who placed the call.
Callee subnet	No	IP subnet of the user who received the call.
Call volume	Yes	Total number of calls placed.
Poor call percentage	Yes	Percentage of calls classified as poor calls. A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Round trip (ms)	Yes	Average amount of (in milliseconds) required for a real-time transport protocol (RTP) packet to travel to another endpoint and then back. Round-trip times of 100 milliseconds or less are considered of acceptable quality. High round-trip values can be caused by international call routing, a routing misconfiguration, or an overloaded media server. High round-trip times result in difficulties with two-way, real-time audio conversations.
Degradation (MOS)	Yes	Average amount of mean opinion score (MOS) degradation experienced during a call. Degradation

		values can range from a low of 0.0 to a high of 5.0. A value of 0.5 or less represents acceptable degradation. Historically, mean options scores were calculated by having users rate the quality of a call on a scale of 1-to-5. In Lync Server, Lync Server uses a set of algorithms to predict how users would have rated a call. High degradation values can be caused by congestion, lack of bandwidth, wireless congestion or interference, or an overloaded media server or endpoint. High degradation results in distorted or lost audio.
Packet loss	Yes	Average rate of RTP packet loss. (Packet loss occurs when RTP packets, a protocol used for transmitting audio and video across the Internet, failed to reach their destination.) High loss rates are generally caused by congestion, lack of bandwidth, wireless congestion or interference, or an overloaded media server. Packet loss typically results in distorted or lost audio.
Jitter	Yes	Average jitter detected between RTP packet arrivals. (Jitter is a measure of the "shakiness" of a call.) High jitter values are typically caused by congestion or an overloaded media server, and result in distorted or lost audio.
Healer concealed ratio	Yes	Average ratio of concealed audio samples to the total to the total number of samples. (A concealed audio sample is a technique used to smooth out the abrupt transition that would usually be caused by dropped network packets.) High values indicate significant levels of loss concealment applied caused

		by packet loss or jitter, and results in distorted or lost audio.
Healer stretched ratio	Yes	Average ratio of stretched audio samples to the total to the total number of samples. (Stretched audio is audio that has been expanded to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample stretching caused by jitter, and result in audio sounding robotic or distorted.
Healer compressed ratio	Yes	Average ratio of compressed audio samples to the total number of samples. (Compressed audio is audio that has been compressed to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample compression caused by jitter, and result in audio sounding accelerated or distorted.

1.7.20.4.5.5 Device Report

Device Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic Reports >

Topic Last Modified: *2012-07-02*

The Device Report might be better titled the Microphone and Speakers Report; that's because the Device Report retrieves call-related metrics (such as poor call percentage, echo, and voice switch time) grouped by the microphones and speakers used in the call. If you are interested in IP phones (also commonly referred to as "devices"), use the IP Phone Inventory Report instead.

The Device Report is extremely useful for administrators in determining if a specific type of device is experiencing high volumes of poor quality calls than others. In turn, this could influence any decisions you must make when it comes time to buy new devices or to replace existing devices.

By default, the information displayed in the Device Report is also based on the microphone (the capture device) and speakers/headset (the render device) used in the call. For example, suppose you have several users who use the following capture device and the following render device: By default, the information displayed in the Device Report is also based on the microphone (the capture device) and speakers/headset (the render device) used in the call. For example, suppose you have several users who use the following capture device and the following render device:

- Capture device -- Microphone (SoundMAX Integrated Digital HD Audio)
- Render device -- Headset Earphone (Microsoft LifeChat LX-3000)

If those users made a total of 254 calls you'll see an entry like this in the report:

Capture device	Render device	Call volume
Microphone (SoundMAX Integrated Digital HD Audio)	Headset Earphone (Microsoft LifeChat LX-3000)	254

Now, suppose you have a number of users who use that same capture device but a different render device. In that case, you'll have a second line entry in the report, one for that unique combination of capture device and render device:

Capture device	Render device	Call volume
Microphone (SoundMAX Integrated Digital HD Audio)	Headset Earphone (Microsoft LifeChat LX-3000)	254
Microphone (SoundMAX Integrated Digital HD Audio)	Speakers (SoundMAX Integrated Digital HD Audio)	319

If you would rather see combined totals for a given device (for example, for the SoundMAX capture device, regardless of the render device used), select the appropriate option from the Device type dropdown list (either Capture device or Render device). If you select Capture device in this example, that will give you output similar to this:

Capture device	Call volume
Microphone (SoundMAX Integrated Digital HD Audio)	573

Accessing the Device Report

The Device Report is typically accessed from the Monitoring Reports home page. However, if you are viewing the Call Detail Report you can drill down to the Device Report for a specific device by clicking either of the following metrics:

- Capture Device
- Render Device

From the Device Report you can drill down to the Call List Report by clicking either of the following metrics:

- Call volume
- Poor call percentage

Making the Best Use of the Device Report

When it comes to device names, the Device Report is extremely detailed; for example, suppose you have the following capture devices:

- Aastra 3002 Microphone (2- Aastra 3002)
- Aastra 3002 Microphone (3- Aastra 3002)
- Aastra 3002 Microphone (Aastra 3002)
- Aastra 6725ip
- Aastra 6725ip Microphone (10- Aastra 6725ip)
- Aastra 6725ip Microphone (10- Aastra 6725ip)-V0
- Aastra 6725ip Microphone (2- Aastra 6725ip)
- Aastra 6725ip Microphone (3- Aastra 6725ip)
- Aastra 6725ip Microphone (4- Aastra 6725ip)
- Aastra 6725ip Microphone (5- Aastra 6725ip)
- Aastra 6725ip Microphone (6- Aastra 6725ip)

- Aastra 6725ip Microphone (7- Aastra 6725ip)
- Aastra 6725ip Microphone (9- Aastra 6725ip)
- Aastra 6725ip Microphone (9- Aastra 6725ip)-V0
- Aastra 6725ip Microphone (Aastra 6725ip)
- Aastra 6725ip Microphone (Aastra 6725ip)-V0
- Aastra 6725ip Microphone (USB Audio Device)
- Aastra 6725ip Microphone (USB Audio Device)-V0

Note:

Keep in mind that capture device names might not be the same if you are running localized versions of Lync Server 2013. A device named Aastra 6725ip Microphone (Aastra 6725ip)-V0 in US English could have a different name in French or Spanish.

Often times you'll want that level of detail; at other times, however, you might only be interested in how many calls use any Aastra microphone, regardless of model number. One way to get information like that is to export the Device Report data to Microsoft Excel and then save that data to a comma-separated values file (for example, C:\Data\Devices_Report.csv). You can then use a set of commands similar to these to import the .CSV file into Windows PowerShell and report back the total number of calls made using an Aastra capture device:

```
$devices = Import-Csv "C:\Data\Device_Report.csv
$sum = $devices | Where-Object {$_."Capture device" -match "Aastra"}
$sum | foreach-object {[Int]$x = [Int]$x + [Int]$_."call volume"}
$x
```

That will return a single value representing the total number of calls made using an Aastra capture device. For example:

```
384
```

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Device Report enables you to filter on such things as call type (that is, was the call a client call), a conference call, or a public switched telephone network (PSTN) call. You can also choose how data should be grouped. In this case, devices are grouped by hour, day, week, or month.

The following table lists the filters that you can use with the Device Report.

Device Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month):

	7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Voice switch cause	Reason why a call had to be placed into half duplex mode in order to prevent echo. In half duplex mode, communication can travel in only one direction at a time, similar to the way users take turns when communicating with a walkie-talkie. Select one of the following: • [All] • None • Bad timestamp • Echo • DNLP (dynamic nonlinear processor) • Low complexity • Bad device state • Post-AEC echo (acoustic echo cancellation)
Echo cause	Reason why echo above the accepted level was detected in a call. (In telecommunications, echo is a reflection of sound, the same phenomenon you will hear if you yell down to the bottom of a well.) Select one of the following: • [All] • None • Bad timestamp • Post-AEC echo (acoustic echo cancellation) • ANLP (adaptive nonlinear processor) • DNLP (dynamic nonlinear processor) • Microphone clipping
Call type	Indicates the type of call that was made. Select one of the following: • [All] • Client call

	- PSTN call - Conference call
Access type	Indicates whether the client was logged on to the internal network or the external network when the call was placed. Select one of the following: - [All] - Internal - External
Network type	Indicates the type of network the client was connected to when the call was placed. Select one of the following: - [All] - Wired - Wireless
VPN	Indicates whether an external client was using a virtual private network (VPN) connection when the call was placed. Select one of the following: - [All] - VPN - Non-VPN
Device type	Indicates the type of device. Select one of the following: - Capture device - Render device - Capture/Render device pair
Device name	Name of the capture or render device. You can enter the complete device name or any portion of the device name. For example, to find the device Microphone (Microsoft LifeCam VX-1000.), you can enter the complete device name as follows: Microphone (Microsoft LifeCam VX-1000.) Or, you can enter just a portion of the name. For example: LifeCam Note that the preceding filter returns any device that contains the string "LifeCam" anywhere in its name.

Metrics

The following table lists the information provided in the Device Report.

Device Report Metrics

Name	Can you sort on this item?	Description
Capture device	Yes	Device (for example, a microphone or webcam) used for transmitting audio.
Render device	Yes	Device (for example, a headset or speakers) used for receiving audio.

Call volume	Yes	Total number of calls placed.
Poor call percentage	Yes	Percentage of calls that were classified as "poor." A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Unique users	Yes	Unique users who used the device. If a user used the device 13 times he or she would count as one unique user, the same as a user who only used the device a single time.
Ratio of voice switch time	Yes	Percentage of the call that had to be conducted in half duplex mode in order to prevent echo. In half duplex mode, communication can travel in only one direction at a time, similar to the way users take turns when communicating with a walkie-talkie.
Ratio of microphone not functioning	Yes	Percentage of the call in which the capture device was not functioning at an acceptable level. A high values suggests that quality issues with the call were primarily due to the capture device not working as expected.
Ratio of speaker not functioning	Yes	Percentage of the call in which the render device was not functioning at an acceptable level. A high values suggests that quality issues with the call were primarily due to the render device not working as expected.
Calls with voice switch (%)	Yes	Percentage of the total calls which had to be placed into half duplex mode. In half duplex mode, communication can travel in only one direction at a time, similar to the way users take turns when communicating with a walkie-talkie.
Echo microphone in (%)	Yes	Percentage of echo that was

		present in the microphone. (In telecommunications, echo is a reflection of sound, the same phenomenon you will hear if you yell down to the bottom of a well.) Typically you will see low values for headsets or handsets, and higher values for speaker phones or stand-alone speakers.
Echo send (%)	Yes	Percentage of echo transmitted to other users.
Calls with echo (%)	Yes	Percentage of the total calls that had echo exceeding the acceptable level.

1.7.20.4.5.6 Call List Report

Call List Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic Reports >

Topic Last Modified: *2012-10-01*

The Call List Report provides Quality of Experience (QoE) metrics for individual calls made and received in your organization. Note that the actual metrics reported will depend on how you access the Call List report. For example, if you open the report from the Device Report, you'll see metrics such as the following, metrics that are also reported on the Device Report:

- Caller's microphone
- Caller's speaker
- Callee's microphone
- Callee's speaker
- Ratio of voice switch time

However, if you open the Call List Report from the Location Report, you won't see any of those metrics; instead, you'll see metrics like these:

- Round trip (ms)
- Degradation (MOS)
- Packet loss
- Jitter (ms)

Those are the metrics reported on the Location Report. However, from the Call List Report you can always click the Detail metric to provide complete QoE information for any call.

Accessing the Call List Report

The Call List Report can be accessed from any of the following reports:

- The Location Report (by clicking the Call volume or Poor call percentage metric)
- The Device Report (by clicking the Call volume or Poor call percentage metric)
- The Media Quality Summary Report (by clicking the Call volume or Poor call percentage metric)
- The Server Performance Report (by clicking the Call volume or Poor call percentage metric)

From within the Call List Report you can access the Call Detail Report by clicking the Detail metric.

Making the Best Use of the Call List Report

If you can't remember what some of the Call List Report metrics (such as Ratio voice switch time) actually measure, hold your mouse over the metric label; a tool tip will then appear giving you a brief description of the metric.

Filters

None. You cannot filter the Call List Report.

Metrics

The following table lists the information provided in the Call List Report for each call.

Call List Report Metrics

Name	Can you sort on this item?	Description
Details	No	When you click this item, the report shows additional information on the call.
Caller	Yes	SIP address of the person who initiated the call.
Callee	Yes	SIP address of the person who was called.
Start time	Yes	Date and time that the call started.
End time	Yes	Date and time that the call ended.
Caller user agent	Yes	Software used by the endpoint of the person who initiated the call.
Callee user agent	Yes	Software used by the endpoint of the person who was called.
Round trip (ms)	Yes	Average amount of (in milliseconds) required for a real-time transport protocol (RTP) packet to travel to another endpoint and then back. Round-trip times of 100 milliseconds or less are considered of acceptable quality. High round-trip values can be caused by international call routing, a routing misconfiguration, or an overloaded media server. High round-trip times result in difficulties with two-way, real-time audio conversations.

Degradation (MOS)	Yes	Average amount of mean opinion score (MOS) degradation experienced during a call. Degradation values can range from a low of 0.0 to a high of 5.0. A value of 0.5 or less represents acceptable degradation. Historically, mean options scores were calculated by having users rate the quality of a call on a scale of 1-to-5. In Lync Server, Lync Server uses a set of algorithms to predict how users would have rated a call. High degradation values can be caused by congestion, lack of bandwidth, wireless congestion or interference, or an overloaded media server or endpoint. High degradation results in distorted or lost audio.
Packet loss	Yes	Average rate of RTP packet loss. (Packet loss occurs when RTP packets, a protocol used for transmitting audio and video across the Internet, failed to reach their destination.) High loss rates are generally caused by congestion, lack of bandwidth, wireless congestion or interference, or an overloaded media server. Packet loss typically results in distorted or lost audio.
Jitter	Yes	Average jitter detected between RTP packet arrivals. (Jitter is a measure of the "shakiness" of a call.) High jitter values are typically caused by congestion or an overloaded media server, and result in distorted or lost audio.
Healer concealed ratio	Yes	Average ratio of concealed audio samples to the total to the total number of samples. (A concealed audio sample is a technique used to smooth out the abrupt transition that would usually be caused by dropped network packets.) High values indicate significant levels of loss concealment applied caused by packet loss or jitter, and results in distorted or lost audio.
Healer stretched ratio	Yes	Average ratio of stretched audio samples to the total to the total number of samples. (Stretched audio is audio that has been expanded to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample stretching caused by jitter, and result in audio

		sounding robotic or distorted.
Healer compressed ratio	Yes	Average ratio of compressed audio samples to the total number of samples. (Compressed audio is audio that has been compressed to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample compression caused by jitter, and result in audio sounding accelerated or distorted.
Connectivity	Yes	Type of wireless communication link. Typically, this is one of the following: • Relay • Direct

1.7.20.4.5.7 Call Detail Report

Call Detail Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic Reports >

Topic Last Modified: *2012-10-01*

The Call Detail Report provides a detailed look at an individual call; the report includes nearly all the Quality of Experience metrics and statistics collected by Lync Server, divided into report sections such as:

- Call Information
- Caller Device and Signal Metrics
- Callee Device and Signal metrics
- Caller Client Event
- Callee Client Event
- Audio Stream (Caller to Callee)
- Video Stream (Caller to Callee)
- Audio Stream (Callee to Caller)
- Video Stream (Callee to Caller)

Keep in mind that the categories and the metrics you see on a given report depend on two things: the type of session and the type of endpoints used in the session. For example, an audio-only call will not report metrics for video streams; that's because the call didn't have a video stream. Likewise, you might have a report that lists caller statistics but not callee statistics. That's typically because the callee was not using a SIP-compliant device. Endpoints are responsible for reporting statistics at the end of a call; however, a cell phone (which knows nothing about SIP or SIP statistics) is unable to report that kind of information. If you call someone and they answer you on their cell phone, you will not get a report from that cell phone when the call ends.

The Call Detail Report is most useful when you are trying to determine exactly why a given call experienced media quality problems.

Accessing the Call Detail Report

The Call Detail Report can be accessed from any of the following reports:

- The Location Report (by clicking either the Call volume or the Poor call percentage metric)
- The Media Quality Summary Report (by clicking either the Call volume or Poor call percentage metric)
- The Media Quality Comparison Report (by clicking the Call List Report and then clicking the Detail metric).
- The Server Performance Report (by clicking either the Call volume or Poor call percentage metric)
- The Call List Report (by clicking the Detail metric)

From within the Call Detail Report you can access the Device Report by clicking either of the following metrics:

- Capture device
- Render device

You can also access the Server Media Quality Trend Report by clicking the A/V edge server metric.

Making the Best Use of the Call Detail Report

The Call Detail Report typically includes over 250 different metrics, including such items as Microphone timestamp drift, Low SNR time, and Near end to echo time. If you can't remember what all of these metrics actually measure, try holding your mouse over the metric label; often-times, a tooltip will appear describing that metric.

If you have problems locating a metric, type part of the metric label in the search box and then click Find. For example, if you can't find the Low SNR time metric, type SNR in the search box and then click Find.

Filters

None. You cannot filter the Call Detail Report.

Metrics

The following table lists the information provided in the Call Detail Report for each call.

Call Detail Report Metrics

Name	Can you sort on this item?	Description
Caller PAI	No	P-Asserted-Identity of the user who initiated the call. The P-Asserted-Identity is used to convey the proven identity of a user within a trusted network.
Caller URI	No	SIP address of the user who initiated the call.
Caller endpoint	No	Device used to make the call.
Caller user agent	No	Software used on the device that made the call.

Call start	No	Date and time that the call was initially placed.
Mediation Server bypass call	No	Indicates whether the call connected to a PSTN voice gateway or qualified IP-PBX without passing through the Mediation Server.
Caller OS	No	Operating system of the caller's computer.
Callee CPU	No	CPU installed in the computer of the user who initiated the call.
Caller CPU core number	No	Processor number in the computer used by the person who initiated the call.
Caller CPU speed	No	Clock speed of the CPU of the computer used by the person who initiated the call.
Caller CPU virtualization	No	Virtualization (if any) used on the computer used by the person who initiated the call.
Callee PAI	No	P-Asserted-Identity of the user who was invited to join the call. The P-Asserted-Identity is used to convey the proven identity of a user within a trusted network.
Callee URI	No	SIP address of the user who was called.
Callee endpoint	No	Device used to receive the call.
Callee user agent	No	Software used on the device that received the call.
Duration	No	Length of time for the call.
Media bypass warning flag	No	Warning issued when the Mediation Server was bypassed.
Callee OS	No	Operating system of the computer for the user who was called.
Callee CPU	No	CPU installed in the computer of the user who was called.
Callee core number	No	Processor number in the computer used by the person who was called.
Callee CPU speed	No	Clock speed of the CPU of

		the computer used by the person who was called.
Callee CPU virtualization	No	Virtualization (if any) used on the computer used by the person who was called.

1.7.20.4.5.8 Server Media Quality Trend Report

Server Media Quality Trend Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic Reports >

Topic Last Modified: *2012-11-12*

The Server Media Quality Trend Report provides a way for you to graphically compare up to 5 servers on Quality of Experience metrics such as call volume, poor call percentage, packet loss, and jitter. This makes it easier to do such things as identify servers that are performing poorly, identify servers that are underutilized, or identify servers that are being overused.

Accessing the Server Media Quality Trend Report

The Server Media Quality Trend Report can be accessed from either one of the following report:

- Server Performance Report (by clicking the Trend metric)
- Call Detail Report (by clicking the A/V edge server metric. If the caller or callee is a server, you can also reach the Server Quality Media Trend Report by clicking the endpoint name.)

Making the Best Use of Server Media Quality Trend Report

When you click the Trend metric on the Server Performance Report for a specific server, the Server Media Quality Trend Report will open. However, you will see only a blank instance of that report; the server you selected on the Server Performance Report will not be displayed onscreen. Instead, you will need to select that server from the Servers dropdown. Note, too that the Servers dropdown includes a Select All option. This option will not work if you have more than 5 servers; the Server Media Quality Trend Report can only display data for a maximum of 5 servers at a time.

On the graphs displayed by the Server Media Quality Trend Report, the points labeled Call Volume and Poor Call Percentage are hotlinks; clicking a point on the graph will open an instance of the Call List Report showing the total calls (or poor calls) for the specified time period.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. The following table lists the filters that you can use with the Server Media Quality Trend Report.

Server Media Quality Trend Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 8/7/2012 and an end date of 9/28/2012, data is

	displayed for the days 8/7/2012 12:00 AM to 9/7/2012 12:00 AM (that is, a total of 31 days' worth of data).
Server type	Type of server involved in the call. Allowed values are: • Mediation Server • A/V Conferencing Server • A/V Edge Server • Gateway (Mediation Server) • Gateway (Mediation Server Bypass) • AS Conferencing Server
Servers	Name of the server involved in the session; this dropdown list is automatically populated for you based on the value of the Server type filter. You can select up to 5 different servers when compiling a report.
Access type	Indicates whether the participant was logged on to the internal network or from the external network. Allowed values are: • [All] • Internal • External
Network type	Indicates the type of network the participant was connected to. Allowed values are: • [All] • Wired • Wireless
VPN	Indicates whether an external participant was using a virtual private network (VPN) connection during the session. Allowed values are: • [All] • VPN • Non-VPN

Metrics

The following table lists the information provided in the Server Media Quality Trend Report.

Server Media Quality Trend Report Metrics

Name	Can you sort on this item?	Description
Call volume	No	Total number of calls.
Degradation (MOS)	No	Average amount of MOS (mean option score) degradation experienced during a call. Degradation values can range from a low of 0.0 to a high of 5.0; a value of 0.5 or less represents acceptable degradation. Historically, mean options scores were calculated by having users

		rate the quality of a call on a scale of 1-to-5. Lync Server uses a set of algorithms to predict how users would have rated a call. High degradation values can be caused by congestion; lack of bandwidth; wireless congestion or interference, or an overloaded media server or endpoint. High degradation results in distorted or lost audio.
Poor call percentage	No	The total number of calls classified as poor. A poor call is any call which at least one of the measured metrics exceeded the allowed value (for example, a call that experienced excessive jitter).
Round trip (ms)	No	Average amount of time (in milliseconds) required for a Real-Time Transport Protocol packet to travel to one endpoint and then back. Round-trip times of 200 milliseconds or less are considered of acceptable quality. High round-trip values can be caused by international call routing; a routing misconfiguration; or an overloaded media server. High round-trip times result in difficulties with two-way, real-time audio conversations.
Packet loss	No	Average rate of Real-Time Transport Protocol (RTP) packet loss. (Packet loss occurs when RTP packets, a protocol used for transmitting audio and video across the Internet, failed to reach their destination.) High loss rates are generally caused by congestion; lack of bandwidth; wireless congestion or interference; or an overloaded media server. Packet loss typically results in distorted or lost audio.

Jitter (ms)	No	Average jitter detected between RTP packet arrivals. (Jitter is a measure of the "shakiness" of a call.) High jitter values are typically caused by congestion or an overloaded media server, and result in distorted or lost audio.
Healer concealed ratio	No	Average ratio of concealed audio samples to the total to the total number of samples. (A concealed audio sample is a technique used to smooth out the abrupt transition that would usually be caused by dropped network packets.) High values indicate significant levels of loss concealment applied caused by packet loss or jitter, and results in distorted or lost audio.
Healer stretched ratio	No	Average ratio of stretched audio samples to the total to the total number of samples. (Stretched audio is audio that has been expanded to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample stretching caused by jitter, and result in audio sounding robotic or distorted.
Healer compressed ratio	No	Average ratio of compressed audio samples to the total number of samples. (Compressed audio is audio that has been compressed to help maintain call quality when a dropped network packet has been detected.) High values indicate significant levels of sample compression caused by jitter, and result in audio sounding accelerated or distorted.

1.7.20.4.5.9 Media Quality Metrics Distribution Report

The Media Quality Metrics Distribution Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic

Reports >

Topic Last Modified: *2012-06-06*

The Media Quality Metrics Distribution Report enables you to see a graph that shows the distribution values for a Quality of Experience metric such as jitter or packet loss. For example, suppose your users make a total of 10 phone calls; those 10 calls report the following roundtrip times:

Call Number	Roundtrip Time (milliseconds)
1	50
2	50
3	50
4	50
5	50
6	50
7	50
8	4550
9	50
10	50

The average for those roundtrip times is 500 milliseconds (5000 divided by 10). Five hundred milliseconds is an extremely large roundtrip time; as a result, you might believe that you have a serious problem with network congestion. (Long roundtrip times are typically the result of overloaded networks.)

In reality, of course, 90% of your calls had excellent round trip times; you merely had one bad call that skewed the overall results. If you only look at the average roundtrip time you might jump to a very wrong conclusion.

The Media Quality Metrics Distribution Report helps you avoid jumping to wrong conclusions by showing you a graphical distribution of a specified metric (such as round trip time). These graphs can help make it clear that you had nine very good calls and one very bad call. Admittedly, you might still want to further investigate that one call; however, the fact that 9 out of the 10 calls were very good suggests that there is no reason to make any drastic changes to your network, at least not at this point in time.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. The following table lists the filters that you can use with the Media Quality Metrics Distribution Report.

Media Quality Metrics Distribution Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM

	If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Minimum in x axis	Lowest value to be displayed on the X axis of the graph.
Maximum in x axis	Highest value to be displayed on the X axis of the graph.
Access type	Indicates whether the client was logged on to the internal network or the external network when the call was placed. Select one of the following: • [All] • Internal • External
VPN	Indicates whether an external client was using a virtual private network (VPN) connection when the call was placed. Select one of the following: • [All] • VPN • Non-VPN
Network type	Indicates the type of network the client was connected to when the call was placed. Select one of the following: • [All] • Wired

	- Wireless

1.7.20.4.5.10 Location Trend Report

Location Trend Report

Monitoring and Health Configuration > Using Monitoring Reports > Media Quality Diagnostic Reports >

Topic Last Modified: *2012-06-06*

The Location Trend Report provides call quality trend information for network locations.

Filters

Filters provide a way for you to return a more finely-targeted set of data or to view the returned data in different ways. For example, the Location Trend Report enables you to filter the returned data by such things as access type (that is, interval access vs. external access) or by wired/wireless network connection. You can also choose how data should be grouped. In this case, calls are grouped by hour, day, or week.

The following table lists the filters that you can use with the Location Trend Report.

Location Trend Report Filters

Name	Description
From	Start date/time for the time range. To view data by hours, enter both the start date and time as follows: 7/7/2012 1:00 PM If you do not enter a start time, the report automatically begins at 12:00 AM on the specified day. To view data by day, enter just the date: 7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
To	End date/time for the time range. To view data by hours, enter both the end date and time as follows: 7/7/2012 1:00 PM If you do not enter an end time, the report automatically ends at 12:00 AM on the specified day. To view data by day, enter just the date:

	7/7/2012 To view by week or by month, enter a date that falls anywhere within the week or month that you want to view (you do not have to enter the first day of the week or month): 7/3/2012 Weeks always run from Sunday through Saturday.
Interval	Time interval. Select one of the following: • Hourly (a maximum of 25 hours can be displayed) • Daily (a maximum of 31 days can be displayed) • Weekly (a maximum of 12 weeks can be displayed) If the start and end dates exceed the maximum number of values allowed for the selected interval, only the maximum number of values (starting from the start date) is displayed. For example, if you select the Daily interval with a start date of 1/1/2011 and an end date of 2/28/2011, data is displayed for the days 8/1/2011 12:00 AM to 9/1/2011 12:00 AM (that is, a total of 31 days' worth of data).
Access type	Indicates whether the client was logged on to the internal network or the external network when the call was placed. Select one of the following: • [All] • Internal • External
Network type	Indicates the type of network the client was connected to when the call was placed. Select one of the following: • [All] • Wired • Wireless
VPN	Indicates whether an external client was using a virtual private network (VPN) connection when the call was placed. Select one of the following: • [All] • VPN • Non-VPN

1.7.21 Lync Server 2013 Best Practices Analyzer

Lync Server 2013 Best Practices Analyzer

Microsoft Lync Server 2013 > Operations >

Topic Last Modified: *2012-06-13*

Lync Server 2013, Best Practices Analyzer is a diagnostic tool that gathers configuration information from Lync Server 2013 environments and determines whether the configuration is set according to Microsoft best practices.

> **Note:**
>
> Lync Server 2013, Best Practices Analyzer scans and reports issues only with Lync Server 2013 components. If your deployment includes Lync Server 2010 or Office Communications Server 2007 R2 components, use the previous version of Best Practices Analyzer to analyze those components. For details, see Requirements for Running Best Practices Analyzer.

- Overview of Best Practices Analyzer
- Preparing for and Installing Best Practices Analyzer
- Using Best Practices Analyzer to Identify Potential Issues in Your Deployment
- Using Scan Results to Analyze and Resolve Issues Reported by Best Practices Analyzer

1.7.21.1 Overview of Best Practices Analyzer

Overview of Best Practices Analyzer

Microsoft Lync Server 2013 > Operations > Lync Server 2013 Best Practices Analyzer >

Topic Last Modified: *2012-09-19*

You can use Lync Server 2013, Best Practices Analyzer to identify and resolve problems with your Lync Server 2013 deployment. The Lync Server 2013, Best Practices Analyzer gathers configuration information from Lync Server 2013 components.

With the proper network access, the Best Practices Analyzer can examine servers running Active Directory Domain Services, Exchange Server Unified Messaging (UM), and Lync Server 2013. You can use Best Practices Analyzer to do the following:

- Proactively perform checks, verifying that the configuration is set according to recommended best practices.
- Automatically detect required updates to Lync Server 2013.
- Generate a list of issues, such as suboptimal configuration settings, unsupported options, missing updates, or practices that we do not recommend.
- Help you troubleshoot and fix specific problems.

Best Practices Analyzer provides the following features:

- Minimal installation prerequisites.
- Online documentation about reported issues, including troubleshooting tips.
- Configuration information that you can save for later review.
- State-of-the-art system analysis.

Best Practices Analyzer uses a set of XML configuration files to determine the information to gather from your Lync Server 2013 environment. In addition to checking Active Directory Domain Services, it checks sources such as the Windows Server operating system registry and settings in Windows Management Instrumentation (WMI).

Best Practices Analyzer compares the data it gathers with a set of predefined rules for the settings and configurations of Lync Server 2013 deployments.

After comparing the collected data with the predefined rules, the tool reports issues. For every issue that it reports, Best Practices Analyzer provides information about what was found in the scanned Lync Server 2013 environment and the recommended configuration. Best Practices Analyzer also provides links to more detailed information about the specific issues.

Note:
The Lync Server 2013, Best Practices Analyzer gathers configuration information only from Lync Server 2013 components. You can use the previous versions of the tool to scan previous environments. For details, see Requirements for Running Best Practices Analyzer.

1.7.21.2 Preparing for and Installing Best Practices Analyzer

Preparing for and Installing Best Practices Analyzer

Microsoft Lync Server 2013 > Operations > Lync Server 2013 Best Practices Analyzer >

Topic Last Modified: *2012-10-21*

You must be logged on as a member of the Administrators group to perform the tasks that are described in this topic.

System Requirements for Best Practices Analyzer Installation

To run Lync Server 2013, Best Practices Analyzer to scan your environment, the computer must be running a 64-bit edition of one of the following operating systems:

- Windows Server 2008 R2 with Service Pack 1 (SP1) Standard operating system
- Windows Server 2008 R2 with SP1 Enterprise operating system
- Windows Server 2008 R2 with SP1 Datacenter operating system
- Windows Server 2012 Standard operating system
- Windows Server 2012 Enterprise operating system
- Windows Server 2012 Datacenter operating system
- Windows 8 operating system
- Windows 7 operating system

The computer must also be running the following:

- Microsoft .NET Framework 4.5. For Lync Server 2013, you must manually install the 64-bit edition of Microsoft .NET Framework 4.5 on the server prior to installing Lync Server 2013.
- Lync Server 2013, Core Components.
- WMI Backward Compatibility Package. For details, see Install WMI Backward Compatibility Package in the Migration documentation.
- Windows PowerShell 3.0. For details, see Installing Windows PowerShell 3.0 in the Deployment documentation.

You can install Best Practices Analyzer on computers with a supported operating system that are not running Lync Server 2013, Core Components or WMI Backward Compatibility Package, but you can use Best Practices Analyzer on those computers only to view reports, not to run scans.

Choosing a Computer for Installation

We recommend that you install Lync Server 2013, Best Practices Analyzer on a computer that is dedicated to Lync Server 2013 management. You can install the tool on a server running Lync Server 2013 or an administrative computer running Lync Server 2013 administrative tools. If you install the tool on a server that is running Lync Server, we recommend that you use the tool to scan only that server.

Installing Best Practices Analyzer

You can download the Best Practices Analyzer for Lync Server 2013 at http://go.microsoft.com/fwlink/p/?linkId=266539.

To install Best Practices Analyzer, start the Microsoft Installer file RtcBPA.msi on the computer where you want to install the tool, and then follow the instructions on the screen. The default location for installing the program files is <*system drive*>\Program Files\Lync Server 2013\BPA.

1.7.21.3 Using Best Practices Analyzer to Identify Potential Issues in Your Deployment

Using Best Practices Analyzer to Identify Potential Issues in Your Deployment

Microsoft Lync Server 2013 > Operations > Lync Server 2013 Best Practices Analyzer >

Topic Last Modified: *2012-09-21*

To use Best Practices Analyzer to scan your Lync Server 2013 environment, your system must meet specific prerequisites before you start the scan. After you ensure that your system meets the prerequisites, you can complete the scan process by using Best Practices Analyzer.

- Prerequisites for Running Best Practices Analyzer
- Checking for Updates to Best Practices Analyzer
- Using Best Practices Analyzer to Scan Your Deployment for Potential Issues

1.7.21.3.1 Prerequisites for Running Best Practices Analyzer

Prerequisites for Running Best Practices Analyzer

Operations > Lync Server 2013 Best Practices Analyzer > Using Best Practices Analyzer to Identify Potential Issues in Your Deployment >

Topic Last Modified: *2012-06-25*

You can use Best Practices Analyzer to scan your Lync Server 2013 environment for issues and create reports, and to view results of a current or previous scan. Prior to running Best Practices Analyzer to scan your environment, you need to verify that the account that you plan to use to run the scan has the required rights and permissions and that all installation prerequisites have been met.

- Group Memberships and User Rights Requirements for Best Practices Analyzer
- Requirements for Running Best Practices Analyzer

1.7.21.3.1.1 Group Memberships and User Rights Requirements for Best Practices Analyzer

Group Memberships and User Rights Requirements for Best Practices Analyzer

Lync Server 2013 Best Practices Analyzer > Using Best Practices Analyzer to Identify Potential Issues in Your Deployment > Prerequisites for Running Best Practices Analyzer >

Topic Last Modified: *2012-10-21*

To successfully run Best Practices Analyzer, the user account that you use to log on must be a member of the Administrators group on the local computer. Additionally, to scan your environment, the user account must be a member of the following groups:

- **Domain Admins** To enumerate Active Directory Domain Services information and to call the Windows Management Instrumentation (WMI) providers on domain controllers and global catalog servers.
- **Administrators** Required on each Lync Server 2013 internal computer and each Edge Server to call the Windows Management Instrumentation (WMI) providers and to access the registry.
- **RTCUniversalReadOnlyAdmins** Full or delegated read only Lync Server 2013 administrative rights.
- **Exchange View Only Administrator** Full or delegated Exchange View Only Administrator on the Microsoft Exchange organization.

If your user account does not have sufficient user rights, you have two options:

- At a command prompt, use the **runas** command to run the tool under an account that does have sufficient user rights. The syntax is as follows:

  ```
  runas /netonly /user:<domain>\<userName> rtcbpa.exe
  ```

- On the **Connect to Active Directory** page, set the credentials for the accounts that you plan to use to run Best Practices Analyzer. Click **Show advanced login options**. You can enter three accounts: one for connecting to Active Directory Domain Services, one for connecting to Lync Server 2013 Edge Servers, and one for connecting to the Exchange Servers. If you do not specify any of these accounts, the user account that you used to log on and run Best Practices Analyzer is used.

1.7.21.3.1.2 Requirements for Running Best Practices Analyzer

Requirements for Running Best Practices Analyzer

Lync Server 2013 Best Practices Analyzer > Using Best Practices Analyzer to Identify Potential Issues in Your Deployment > Prerequisites for Running Best Practices Analyzer >

Topic Last Modified: *2012-09-19*

You can use Lync Server 2013, Best Practices Analyzer to scan your Lync Server 2013 environment. You cannot use it to scan previous environments, but you can use the previous versions of the tool to scan those environments. For details about downloading and using the Lync Server 2010 and Office Communications Server 2007 R2 versions of Best Practices Analyzer, see "Lync Server 2010, Best Practices Analyzer" at http://go.microsoft.com/fwlink/p/?linkId=210536 and "Best Practices Analyzer for Office Communications Server 2007 and Office Communications Server 2007 R2" at http://go.microsoft.com/fwlink/p/?linkId=256358.

Prior to starting your scan, you should ensure that all components in your Lync Server 2013 environment are running and online.

Note:

Depending on the configuration of your Edge Servers and any related perimeter network settings, including firewall settings and permissions, Best Practices Analyzer might not be able to access and scan your Edge Servers. If you include Edge Servers in your scan and the reports indicate that there is an issue with accessing Edge Servers, you might want to remove Edge Servers from the scan options and run the scan again so that the issues do not show up in the report.

1.7.21.3.2 Checking for Updates to Best Practices Analyzer

Checking for Updates to Best Practices Analyzer

Operations > Lync Server 2013 Best Practices Analyzer > Using Best Practices Analyzer to Identify Potential Issues in Your Deployment >

Topic Last Modified: *2012-10-02*

When you start Best Practices Analyzer, the tool provides you with an option to search for the latest updates to the tool. If an update is available, you can download the update. If you choose not to download updates, or if Best Practices Analyzer cannot access the Internet, you can continue to use the version that is already on the computer.

Note:

If you need proxy authentication to access the Internet, Best Practices Analyzer cannot access new updates for you to download. However, you can manually download the latest version of RtcBPA.msi from the Microsoft Download Center at http://go.microsoft.com/fwlink/p/?linkId=266539. After downloading the file, you can copy it to the computer on which you want to update Best Practices Analyzer and use the .msi file to install the new version of the tool on that computer.

To update Best Practices Analyzer rules, you must run the tool as an Administrator on the local computer. If you are not logged on using an account that is a member of the Administrators group and updates are detected, close Best Practices Analyzer, and then use the following procedure to start the program.

To open Best Practices Analyzer as Administrator to check for updates

1. On a computer on which Best Practices Analyzer is installed, click **Start**, point to **Microsoft Lync Server 2013**, right-click **Best Practices Analyzer**, and then click **Run as administrator**.
2. Specify credentials of an account that is a member of the Administrators group.

1.7.21.3.3 Using Best Practices Analyzer to Scan Your Deployment for Potential Issues

Using Best Practices Analyzer to Scan Your Deployment for Potential Issues

Operations > Lync Server 2013 Best Practices Analyzer > Using Best Practices Analyzer to Identify Potential Issues in Your Deployment >

Topic Last Modified: *2012-10-21*

To run a Best Practices Analyzer scan, you must specify the following:

- **Credentials** To run a scan, you must log on to a computer on which Best Practices Analyzer is installed by using an account that is a member of the local Administrators group. Additionally, you need to log on by using a user account that has the user rights and permissions required to run the appropriate scans, or you must specify credentials that have the appropriate user rights and permissions when you run Best Practices Analyzer. For details, see Group Memberships and User Rights Requirements for Best Practices Analyzer.
- **Scope of scan** To specify the scope of the scan, select the categories and

servers that you want to scan. You can select all categories, one or more categories, or one or more servers within a specific category in your Lync Server environment.

- **Type of scan** Currently, the Health Check scan is the only type of scan available (selected by default). The Health Check scan generates a report that includes errors, warnings, and other information for all servers specified in the scope.
- **Network speed** Network speed options include Fast LAN (100 Mbps or more), LAN (10 Mbps), Fast WAN (1.5 Mbps), or WAN (64 kbps). The estimated time to complete the scan is based on this setting. This setting is also used to set the time-out period. During the scan, the Best Practices Analyzer waits for a response from a server for a specified time. If it does not receive a response within the specified time-out period, it moves to the next server in the scan. On slower networks, this specified time-out period is longer to account for longer network latencies. We recommend that you select the slowest link in your topology for this parameter so that the tool does not time out too quickly.

⊟To scan your Lync Server 2013 deployment

1. Log on to a computer on which Best Practices Analyzer is installed by using an account that is a member of the local Administrators group, and has other required user rights and permissions.
2. Click **Start**, point to **All Programs**, click **Microsoft Lync Server 2013**, and then click **Best Practices Analyzer**.
3. On the **Welcome** screen, click **Select options for a new scan**.
4. On the **Connect to Active Directory** page, verify the name specified in **Active Directory Server**, and then do one of the following:
   - To run a scan using the credentials that you used to log on to the computer, click **Connect to the Active Directory server**.
   - To specify different credentials that you want to use for Active Directory Domain Services, Edge Server, or Exchange Server, click **Show advanced logon options**, select each check box for which separate credentials are required, specify the credentials for each selected check box, and then click **Connect to the Active Directory server**.

   Note:
   Before beginning the scan, Best Practices Analyzer performs a network and permissions check to ensure that the specified account credentials are valid and that Best Practices Analyzer can connect to Active Directory Domain Services. If the tool is running on a workgroup server, the tool also verifies that it can connect to Edge Servers in the perimeter network (that is, if they are included in the scan).
5. On the **Start a new Best Practices scan** page, select the options that you want to include in the scan, specify the network speed, and then click **Start scanning**.
6. On the **Scanning Completed** page, click **View a report of this Best Practices scan**.
7. On the **View Best Practices Report** page, do one of the following:
   - To view reports in a list organized by server component, click **List Reports**, and then click either the **All Issues** tab or the **Informational Items** tab.
   - To view reports as a hierarchical list organized by types of results, click **Tree Reports**, and then click either the **Detailed View** tab or the **Summary View** tab.
   - To view other reports, click **Other Reports**.

   Note:
   For details about the Best Practices Analyzer reports and the issues they identify, see Viewing and Working with Reports Created by Best Practices Analyzer and Analyzing and Resolving Issues Identified by Best Practices Analyzer.

1.7.21.4 Using Scan Results to Analyze and Resolve Issues Reported by Best Practices Analyzer

Using Scan Results to Analyze and Resolve Issues Reported by Best Practices Analyzer

Microsoft Lync Server 2013 > Operations > Lync Server 2013 Best Practices Analyzer >

Topic Last Modified: *2012-06-14*

When you run Lync Server 2013, Best Practices Analyzer in your Lync Server 2013 environment, the tool uses the scan results to generate reports of issues with your deployment. You can use the reports generated by Best Practices Analyzer to identify and resolve specific issues.

> **Note:**
> Lync Server 2013, Best Practices Analyzer scans and reports issues only with Lync Server 2013 components. If your deployment includes Microsoft Lync Server 2010 or Office Communications Server 2007 R2 components, use the previous version of Best Practices Analyzer to analyze those components. For details, see Requirements for Running Best Practices Analyzer.

- Viewing and Working with Reports Created by Best Practices Analyzer
- Analyzing and Resolving Issues Identified by Best Practices Analyzer

1.7.21.4.1 Viewing and Working with Reports Created by Best Practices Analyzer

Viewing and Working with Reports Created by Best Practices Analyzer

Operations > Lync Server 2013 Best Practices Analyzer > Using Scan Results to Analyze and Resolve Issues Reported by Best Practices Analyzer >

Topic Last Modified: *2012-06-14*

When you use Best Practices Analyzer to scan your environment, Best Practices Analyzer creates reports that identify issues and other information about your deployment. You can use Best Practices Analyzer to view the reports that contain the scan results and understand the issues identified in the reports.

- Viewing Reports from Best Practices Analyzer
- Understanding Reports Created by Best Practices Analyzer

1.7.21.4.1.1 Viewing Reports from Best Practices Analyzer

Viewing Reports from Best Practices Analyzer

Lync Server 2013 Best Practices Analyzer > Using Scan Results to Analyze and Resolve Issues Reported by Best Practices Analyzer > Viewing and Working with Reports Created by Best Practices Analyzer >

Topic Last Modified: *2012-09-21*

When you use Best Practices Analyzer to scan your environment, you specify a name for the scan. After Best Practices Analyzer completes a scan, it stores the scan results in reports and saves them under the name of the scan. Upon completion of the scan, you can view the reports generated for that scan by clicking **View a report of this Best Practices scan** directly from the **Scanning Completed** page. You can also view the reports from that scan or previous scans at a later time. You can view reports on the local computer on which the scan was run, import scan results from another computer, or export scan results to view the reports on another computer on which Best Practices Analyzer is installed.

Scan results are presented in the following types of reports:

- List reports
- Tree reports
- Other reports

These reports include errors, warnings, and other information. For details about each of these types of reports and issues, see Understanding Reports Created by Best Practices Analyzer.

Use the following procedure to view scan results previously generated by Best Practices Analyzer.

⊟To view reports from a previous scan

1. Log on to a computer on which Best Practices Analyzer is installed using an account that is a member of the local User account.

   Note:
   You can view the results of a scan using an account that is a member of the local Administrators group, but you cannot run a scan unless you have appropriate user rights and permissions. For details, see Group Memberships and User Rights Requirements for Best Practices Analyzer.

2. Click **Start**, point to **All Programs**, click **Microsoft Lync Server 2013**, and then click **Best Practices Analyzer**.
3. On the **Welcome** screen, click **Select the scan results to view**.
4. On the **Select a Best Practices Scan to View** page, do one of the following:
   - To view reports from the list of locally stored scan results, click the name of scan, and then click **View a report of this scan**.

     Note:
     The Best Practices Analyzer creates the list of local files from the folder <*systemDrive*>\Documents and Settings\<*user*>\Application Data\Microsoft\RtcBPA.

   - To view reports for results of a scan that are stored at another location, click **Import scan**, locate the file containing the scan results, and then click **Open**.

     Note:
     If the version of Best Practices Analyzer on this computer does not match the version that was used to collect the data in the imported file, the tool on your computer might analyze the file again, after it is imported.

5. On the **View Best Practices Report** page, do one of the following:
   - To view reports in a list organized by server component, click **List Reports**, and then click either the **All Issues** tab or the **Informational Items** tab.
   - To view reports as a hierarchical list organized by types of results, click **Tree Reports**, and then click either the **Detailed View** tab or the **Summary View** tab.
   - To view other reports, click **Other Reports**.

   Note:
   For details about the Best Practices Analyzer reports and the issues that they identify, see Viewing and Working with Reports Created by Best Practices Analyzer and Analyzing and Resolving Issues Identified by Best Practices Analyzer.

Understanding Reports Created by Best Practices Analyzer

Lync Server 2013 Best Practices Analyzer > Using Scan Results to Analyze and Resolve Issues Reported by Best Practices Analyzer > Viewing and Working with Reports Created by Best Practices Analyzer >

Topic Last Modified: *2012-10-10*

Best Practices Analyzer provides multiple types of reports that are organized to facilitate the analysis and resolution of issues. Best Practices Analyzer identifies issues such as errors, warnings, and other information.

Reports

You can access the results of a scan by viewing each of the following reports:

- **List reports** List reports are organized by specific criteria. You can arrange the results by class, severity, or issue. For example, if you organize results by class, issues related to Directors are included under the Directors section of the report. You can view all of the issues, or just the informational items. You can search a list report for specific items, such as memory. You can also print the report or export it.
- **Tree reports** Tree reports are organized by the rules that are used to run the scan and other options that you specified at the time the scan was run. For example, issues related to the Test Topology rules are included under the Test Topology section of the report. You can view the details of all the issues, or just a summary of the issues. You can search a tree report for specific items, such as memory. You can also print the report or export it.
- **Other reports** Items in other reports include the run-time log of tasks that were included in the scan. You can search the items in other reports for specific items, such as memory. You can also print the report or export it.

Issues

The reports generated by Best Practices Analyzer indicate specific issues that are identified during the scan of your environment, including following types of issues:

- **Errors** Critical issues that require you to make a change in your environment. For example, if Lync Server 2013 Core Components are not installed, an error is logged.
  Issues that are classified as errors are identified in the report by a red X symbol. Errors are displayed on the **All Issues** tab of the **List Reports** view, and on the **Detailed View** tab and the **Summary View** tab of the **Tree Reports** view. If you do not want to see a specific error in a report, you can specify that the error not be shown for a single instance or for all instances of that error in the report. The error is then displayed only on the **Hidden Items** tab of the **Other Reports** view, unless you change the setting and specify that the error be displayed in the report.
- **Warnings** Issues that are not consistent with the implementation of a best practice. This may or may not indicate the need for a change in your environment. The issue could be a known issue with a specific setting that you do not need to change. For example, services that are not started on a server are logged as warnings.
  Issues that are classified as warnings are identified in the report by a triangular yellow warning symbol. Warnings are displayed on the **All Issues** tab of the **List Reports** view, as well as on the **Detailed View** tab and the **Summary View** tab of the **Tree Reports** view. If you do not want to see a specific error in a report, you can specify that the error not be shown for a

single instance or for all instances of that error in the report. The warning is then displayed only on the **Hidden Items** tab of the **Other Reports** view, unless you change the setting and specify that the warning be displayed in the report.

- **Information** Includes all issues that are not classified as errors or warnings. For example, the number of Lync Server 2013 Standard Edition server objects in Active Directory Domain Services (AD DS) is classified as an information issue.
  Information issues are displayed on the **All Issues** tab of the **List Reports** view, and on the **Detailed View** tab of the **Tree Reports** view.

The Lync Server 2013, Best Practices Analyzer does not make changes to your environment to resolve issues. The scan only detects potential issues and provides reports that contain information about how to resolve each issue.

If you click an issue, an explanation and some options are displayed for specific issues. Then, you can do any of the following:

- Find more detailed information about the issue, and how to resolve it.
- Stop showing issues in reports:
  - Stop showing issues for the selected instance.
  - Stop showing issues for all instances of that issue.

  To see the issues you have stopped showing in reports, go to the **Hidden Items** tab of the **Other Reports** view. From there, you can specify to start showing issues in reports again.

For details about resolving specific issues, see Analyzing and Resolving Issues Identified by Best Practices Analyzer.

1.7.21.4.2 Analyzing and Resolving Issues Identified by Best Practices Analyzer

Analyzing and Resolving Issues Identified by Best Practices Analyzer

Operations > Lync Server 2013 Best Practices Analyzer > Using Scan Results to Analyze and Resolve Issues Reported by Best Practices Analyzer >

Topic Last Modified: *2012-06-25*

Best Practices Analyzer does not make changes to your environment to resolve issues. It only detects potential issues and displays information about how to resolve them. If you identify issues that you need to resolve, you must determine the appropriate solution. The topics in this section help you identify and resolve some of the most significant potential issues.

- Issues with the Environment Test
- Issues with the Topology Test

1.7.21.4.2.1 Issues with the Environment Test

Issues with the Environment Test

Lync Server 2013 Best Practices Analyzer > Using Scan Results to Analyze and Resolve Issues Reported by Best Practices Analyzer > Analyzing and Resolving Issues Identified by Best Practices Analyzer >

Topic Last Modified: *2012-09-21*

Best Practices Analyzer provides a way for you to verify that your Lync Server 2013 environment is a supported configuration. As part of the Active Directory Domain Services check, Best Practices Analyzer does the following:

- Verifies the Active Directory Domain Services forest and schema preparation.
- Identifies the number of Active Directory Domain Services sites and domains in the deployment.
- Checks the forest and domain levels.
- Checks the domain controller version.
- Identifies the domain, configuration, and schema naming context.
- Identifies the number of enabled users.
- Checks where the global Active Directory Domain Services settings are stored.
- Checks for the service connection points (SCPs) for Lync Server.
- Identifies the database version.

Resolving Issues with the Environment

If the environment test found problems with your environment, these problems are probably caused by issues with your Active Directory configuration or the level of software running on specific servers. For example, if Best Practices Analyzer identifies any domain controllers in your environment that are running Windows Server 2000, it will issue a warning and you will need to upgrade those domain controllers to a supported version of Windows Server.

1.7.21.4.2.2 Issues with the Topology Test

Issues with the Topology Test

Lync Server 2013 Best Practices Analyzer > Using Scan Results to Analyze and Resolve Issues Reported by Best Practices Analyzer > Analyzing and Resolving Issues Identified by Best Practices Analyzer >

Topic Last Modified: *2012-09-21*

Like the **Test-CsTopology** cmdlet, Best Practice Analyzer provides a way for you to verify that Lync Server 2013 is functioning correctly at a global level. By default, Best Practice Analyzer, like the cmdlet, checks your entire Lync Server 2013 infrastructure, verifying that the required services are running, and that the appropriate user rights and permissions have been set for these services and for the universal security groups created when you install Lync Server 2013.

In addition to verifying the validity of Lync Server as a whole, **Test-CsTopology** also checks the validity of a specific service. For details about using the cmdlet to test specific services, see Test-CsTopology in the Lync Server Management Shell documentation. Use the following information to help resolve issues with your topology.

Note:
Depending on the configuration of your Edge Servers and any related perimeter network settings, including firewall settings and permissions, Best Practices Analyzer might not be able to access and scan your Edge Servers. If you include Edge Servers in your scan and the reports indicate that there is an issue accessing Edge Servers, clear the **Edge Servers** check box and run the scan again to prevent the issue from showing up in reports.

Resolving Issues with Your Topology

If the topology test found issues with your topology, these issues are probably caused by issues that occurred when you published or enabled your topology.

When you make changes to your topology, the changes take effect only when they have been both published and enabled. You must use Topology Builder to make topology changes. After you make changes, you can then publish and enable those changes by using Topology Builder.

When you publish the changes, the new information (for example, a new site or a new server role) is written to the Central Management store. However, these new (or the newly modified) objects do not immediately join your topology. Objects join your topology only when you enable the updated topology. If you select the Publish option in Topology Builder both of these steps occur: the changes are published (that is, they are written to the Central Management store) and then the new topology is enabled.

By default, members of the RTCUniversalServerAdmins group are authorized to run the **Publish-CsTopology** cmdlet and the **Enable-CsTopology** cmdlet. However, if setup permissions have not been delegated, you must be logged on as a domain administrator to run **Publish-CsTopology**. To give RTCUniversalServerAdmins the right to actually use the **Publish-CsTopology** cmdlet, you must run the **Grant-CsSetupPermission** cmdlet on every Active Directory container that contains computers running Lync Server services. To give RTCUniversalServerAdmins the right to use the **Enable-CsTopology** cmdlet, you must run the **Set-CsSetupPermission** cmdlet against every Active Directory Domain Services container that contains computers running Lync Server services. Note that this applies to enabling and publishing a topology by using Topology Builder. If you have not delegated permissions by using **Set-CsSetupPermission**, only a domain administrator can enable and publish a topology through Topology Builder.

1.8 Glossary

Glossary

Microsoft Lync Server 2013 >

Topic Last Modified: *2013-01-11*

This topic contains terms and definitions that pertain to Microsoft Lync Server 2013 and Microsoft Lync 2013.

Term	Definition
A/V Edge server	Enables internal users to share audio and video data with external users (that is, users who are not logged on to your internal network).
ACP	A third-party organization that provides audio conferencing services over public switched telephone network (PSTN).
active monitoring	Gives Lync system administrators the ability to monitor pools, servers, and networks across data centers through the public Internet.
audio conferencing provider	A third-party organization that provides audio conferencing services over public switched telephone network (PSTN).
Audio Test service	A built-in tool whereby a test call can be made before the actual call is. This ensures that there aren't any severe network or other issues that could affect call quality.

broadcast	Sent to more than one recipient. In communications and on networks, a broadcast message is one distributed to all stations.
bypass call	A call that bypasses the Mediation Server.
Call Park orbit	A number assigned to a parked call by the Call Park application.
Call via Work	A callback option whereby an outgoing call can be made by using the work number. The person who is receiving the call will see the work number of the caller, in their caller ID.
callee	The person whom, or place that, a caller is calling.
caller	The person who is calling another person or place.
camera	A digital video device that is used for recording moving images and audio in a digital format.
Central Management Server	The server role (one per organization) on one Front End pool in the deployment that manages and deploys basic configuration data to all servers that are running Lync Server. Also provides Lync Server Management Shell and file transfer capabilities.
client version filter	Restricts the client versions that are used in a Lync Server environment.
client version policy	A set of client version rules that defines the actions to be taken when users try to log on with specific clients and client versions.
conference call	A telephone conversation between three or more people.
conferencing service	An internally or externally hosted service for users to host multiparty conferences from their computers.
Contacts list	A list of people, groups, or organizations with whom you communicate.
Conversation History	The folder in Outlook where instant messages and phone conversations are stored.
data conferencing	A method of real-time communication wherein participants share and collaborate on several data and document types. The session can be hosted on an in-house server, an Internet-based service, or both.
dial-out conferencing	A feature whereby the A/V Conferencing Server calls the user, and the user answers the phone to join the conference.
dual-tone multiple-frequency	The signaling system used in telephones with touchtone keypads, in which each digit is associated with two specific frequencies.
Dynamic Memory	A Hyper-V feature in which the memory available to

	a running virtual machine is adjusted in response to changes in the amount of memory required by the virtual machine.
Edge pool	A single computer pool or a multiple computer pool that, by default, supports remote users in your organization who sign in to Lync Server from outside the firewall by using a virtual private network (VPN).
Enhanced 9-1-1	A service that provides information about the location of a caller who calls 9-1-1.
enhanced presenter controls	A collection of Lync Meeting host and presenter controls that optimizes for the type of meeting, size of audience, content, and/or video sources available to participants.
Front End pool	A set of Front End Servers, configured identically, that work together to provide services for a common group of users.
IM Conferencing service	A service that runs on a Lync Server or Office Communications Server front-end server to mix and manage inputs from multiple clients in a multiparty instant messaging (IM) session.
Join Launcher	Part of the existing Lync Web App IIS web component. Lets users optionally join meetings by using a mobile device.
Location Information Server	A network node originally defined in the National Emergency Number Association i2 network architecture that addresses the intermediate solution for providing Enhanced 9-1-1 (E9-1-1) service for VoIP telephony users.
Location Information service	A web service that manages a table of network elements and locations for use by clients of Enhanced 9-1-1 (E9-1-1).
long message	A message in a persistent chat room that exceeds the character limit. If the character limit is exceeded, the message will show as "long message."
Lync 2013 VDI plug-in	Provides the ability to have softphone-based audio, video, and meetings (peer-to-peer and multiparty) without the problems of latency, jitter, and packet loss.
Lync Meeting	Denotes the experience with Lync that can be scheduled, or ad-hoc. A Lync Meeting provides the ability to interact with people through video, audio, instant messaging, and content sharing.
Lync Meeting window	Denotes the Conversation window that handles escalations (peer-to-peer to conference) and scalable views that display people and content together inside a Lync Meeting.

Lync Server Management Shell	The management command line interface built on Windows PowerShell technology that includes a set of cmdlets to help control administration and automation.
Lync Web Scheduler	A web-based meeting scheduling and management tool for users who don't have access to Microsoft Outlook, or are on an operating system not based on Windows. With Lync Web Scheduler, you can create new meetings, change your existing meetings, and send invitations using your favorite email program.
Lync-to-phone	An optional feature of Lync Online that enables users to make calls to, and receive calls from, the traditional network by using Lync. This feature is available to Voice Plan customers only, and administrators must sign in with a Lync-to-phone provider to get the feature.
mic	A device that converts sound waves into analog electrical signals. Additional hardware can convert the microphone's output into digital data that a computer can process; for example, to record multimedia documents or analyze the sound signal.
Microsoft Lync Server Mobility Service	This service supports Lync functionality, such as instant messaging (IM), presence, and contacts on the following mobile devices: iPhone, iPad, Android, Windows Phone, and Nokia.
Microsoft Push Notification Service	A notification service that sends new events, such as an instant messaging invitation or a missed call, to the Windows Phone mobile device.
multiple points of presence	The ability of a single user to sign in to a Lync Server or Office Communications Server server with multiple clients.
network inter-site policy	Defines bandwidth limitations between sites that are directly linked within a call admission control (CAC) configuration.
network regions	The network hubs or backbones that are used in the configuration of call admission control, E9-1-1, and media bypass. They interconnect parts of a network across multiple geographic areas, and every network region must be associated with a central site.
network site	A collections of subnets with similar bandwidth, for example, a branch office location, a set of buildings, or a campus.
Office Web Apps Server	A server role used with Office Web Applications in Lync Server to handle the sharing and rendering of PowerPoint presentations.
OneNote share	The feature that lets users create and share OneNote meeting notes in a Lync Meeting. Notes appear as docked in a Lync Meeting, with

	participant lists that can be updated in meeting notes for participants to see.
outbound translation rule	A rule that converts phone numbers to the local dialing format for interaction with private branch exchange (PBX) systems.
persistent chat	A type of chat in which messages are posted to a chat room where they can be viewed and responded to in real time by multiple participants. Users can search for other rooms by name, member/owner, keywords, and content across groups from Lync.
personal preview	A video preview for a Lync user that provides options to answer with video from within the notification.
presence status	One of the attributes that makes up presence and that indicates a person’s availability and willingness to communicate.
present	Indicates the sharing activity of presenting a PowerPoint presentation. Only the PowerPoint document is shown and only the presenter can edit the content being presented.
PSTN usage records	Public switched telephone network (PSTN) usage records specify a class of call (such as internal, local, or long distance) that can be made by various users or groups of users in an organization.
public cloud	A cloud infrastructure typically owned and managed by an organization that sells cloud services. The resources are shared by the general public or a group of customers in order to optimize utilization rates.
public IM connectivity contact	A contact who uses an instant messenger client from AOL, Yahoo!, MSN, or the Windows Live network of Internet services. ◆**Important:** • As of September 1st, 2012, the Microsoft Lync Public IM Connectivity User Subscription License (“PIC USL”) is no longer available for purchase for new or renewing agreements. Customers with active licenses will be able to continue to federate with Yahoo! Messenger until the service shut down date (exact date TBD, but no sooner than June 2013). • The PIC USL is a per-user per-month subscription license that is required for Lync Server or Office Communications Server to federate with Yahoo! Messenger. Microsoft’s ability to provide this service has been contingent upon support from Yahoo!, the underlying agreement for which is

	winding down. • More than ever, Lync is a powerful tool for connecting across organizations and with individuals around the world. Federation with Windows Live Messenger requires no additional user/ device licenses beyond the Lync Standard CAL. Skype federation will be added to this list, enabling Lync users to reach hundreds of millions of people with IM and voice.
Quick Lync	A menu bar that appears beside the picture area of a contact in the Lync Contacts list that shows the available communication modes: IM, Call, Video, and View card.
ringback	A feature that transfers a call back to the person who parked it, after a specified amount of time, so a caller doesn't remain on hold indefinitely.
Scalable Video Coding	A video compression standard that encodes high-quality video bitstreams. Support for the capability enables the conferencing server to determine how bitstreams should flow among receiving clients, based on the capabilities and bandwidth of the receiving endpoint.
secret chat room	In the Lync persistent chat feature, a room that has been set up with the most restricted level of privacy. Only members of a secret chat room can find it, see who is participating in it, follow it, or read and post in it.
Survivable Branch Server	A server running Windows Server that meets specified hardware requirements, and that has Lync Server Registrar and Mediation Server software installed on it. Like Survivable Branch Appliances, this device can provide voice mail survivability for branch users during a WAN outage.
topic feeds	Feeds that provide information and notifications based on the persistent chat room that you are following.
Topology Builder	An installation component of Lync Server used to display, adjust, and validate a planned topology.
User Services	Configuration settings that are used to help maintain presence information and manage conferencing.
User Services pool	Provides presence information and helps to manage preferences.
User Services service	A Lync Server service that is used to help maintain presence information for users and to manage meetings and conferences.
video call	A call that connects Lync users with peer-to-peer capabilities. Users can start a video call by pointing

	to a contact in the Contacts view and then clicking the video call icon.
Video Capable	A status on a Lync contact card that indicates a camera is enabled.
video quality notifications	Alerts to Lync users about the quality of the network, computer, camera, and lighting conditions.
Video Spotlight	A mode that enables presenters to select one person’s video feed so that every participant in the meeting sees that participant only.
voice policies	Define the following for each user, site, or organization that is assigned the policy: A set of calling features that can be enabled or disabled to determine the Enterprise Voice functionality that is available to users. Also, a set of PSTN usage records that define what types of calls are authorized.
voice route	A route that contains instructions that tell Lync Server how to route calls from Enterprise Voice users to phone numbers on the public switched telephone network (PSTN), or a private branch exchange (PBX).
web conferencing	Functionality supplied by the Web Conferencing service such as data sharing, and uploading documents and PowerPoint presentations, by using whiteboards and desktop sharing.

Back Cover
